

mlpack
3.1.0

Generated by Doxygen 1.8.13

Contents

1	mlpack Documentation	1
1.1	Introduction	1
1.2	How To Use This Documentation	1
1.3	Tutorials	1
1.4	Final Remarks	2
2	mlpack automatic bindings to other languages	3
2.1	Overview	3
2.2	Introduction	4
2.3	Writing code that can be turned into a binding	5
2.4	How to write mlpack bindings	7
2.4.1	Documenting a program with PROGRAM_INFO()	8
2.4.2	Defining parameters for a program	10
2.4.3	Using CLI in an mlpackMain() function	13
2.4.4	More documentation on using CLI	14
2.5	Structure of CLI module and associated macros	14
2.6	Command-line program bindings	16
2.6.1	mlpackMain() definition	16
2.6.2	Matrix and model parameter handling	17
2.6.3	Parsing the command line	17
2.7	Python bindings	18
2.7.1	Passing matrices to/from Python	18
2.7.2	Passing model parameter to/from Python	18
2.7.3	CMake generation of setup.py	19
2.7.4	Generation of .pyx files	19
2.7.5	Building the .pyx files	19
2.7.6	Testing the Python bindings	19
2.8	Adding new binding types	20

3	Building mlpack From Source	21
3.1	Introduction	21
3.2	Simple Linux build instructions	22
3.3	Creating Build Directory	22
3.4	Dependencies of mlpack	22
3.5	Configuring CMake	23
3.6	Building mlpack	24
3.7	Installing mlpack	25
3.8	Using mlpack without installing	25
4	Building mlpack From Source on Windows	27
4.1	Introduction	27
4.2	Build Environment	27
4.3	Pre-requisites	28
4.4	Windows build instructions	28
4.5	Dependencies	28
4.6	Building mlpack	29
4.7	Appendix	30
4.8	Additional Information	30
5	mlpack command-line quickstart guide	31
5.1	Introduction	31
5.2	Installing mlpack	31
5.3	Simple mlpack quickstart example	32
5.4	What else does mlpack implement?	32
5.5	Using mlpack for movie recommendations	33
5.6	Next steps with mlpack	34

6	Cross-Validation	35
6.1	Introduction	35
6.2	Simple cross-validation examples	36
6.2.1	10-fold cross-validation on softmax regression	36
6.2.2	10-fold cross-validation on weighted decision trees	37
6.2.3	10-fold cross-validation with categorical decision trees	37
6.2.4	Simple cross-validation for linear regression	38
6.3	Performance measures	38
6.4	The KFoldCV and SimpleCV classes	39
6.4.1	The KFoldCV and SimpleCV constructors	39
6.4.2	The Evaluate() method	40
6.5	Further references	41
7	File formats and loading data in mlpack	43
7.1	Introduction	43
7.2	Simple examples to load data in C++	43
7.3	Supported dataset types	44
7.4	Loading simple matrices in C++	45
7.5	Dealing with sparse matrices	45
7.6	Categorical features and command line programs	46
7.7	Categorical features and C++	46
7.8	Loading and saving models	47
7.9	Loading and saving models in C++	48
7.10	Final notes	48
8	Hyper-Parameter Tuning	49
8.1	Introduction	49
8.2	Basic Usage	49
8.3	Fixed Arguments	50
8.4	Gradient-Based Optimization	51
8.5	The HyperParameterTuner class	51
8.6	Further documentation	52

9	Writing an mlpack binding	53
9.1	Introduction	53
9.2	Simple Logging Example	53
9.3	Simple CLI Example	55
10	Matrices in mlpack	57
10.1	Introduction	57
10.2	Column-major Matrices	57
10.3	Loading Matrices	58
11	mlpack in Python quickstart guide	59
11.1	Introduction	59
11.2	Installing mlpack	59
11.3	Simple mlpack quickstart example	60
11.4	What else does mlpack implement?	60
11.5	Using mlpack for movie recommendations	61
11.6	Next steps with mlpack	61
12	Simple Sample mlpack Programs	63
12.1	Introduction	63
12.2	Covariance Computation	63
12.3	Nearest Neighbor	64
12.4	Other examples	64
13	Sample C++ ML App for Windows	65
13.1	Introduction	65
13.2	Creating the VS project	65
13.3	Project Configuration	65
13.4	The app goal	66
13.5	Headers and namespaces	66
13.6	Loading the dataset	67
13.7	Training	67
13.8	Cross-Validating	68
13.9	Saving the model	68
13.10	Loading the model	68
13.11	Classifying a new sample	68
13.12	Final thoughts	68

14 mlpack Timers	69
14.1 Introduction	69
14.2 Timer API	69
14.3 Timer Example	70
15 mlpack version information	71
15.1 mlpack versions in code	71
15.2 mlpack executable versions	71
16 Alternating Matrix Factorization tutorial	73
16.1 Introduction	73
16.2 Table of Contents	73
16.3 The 'AMF' class	74
16.3.1 Using different termination policies	74
16.3.2 Using different initialization policies	75
16.3.3 Using different update rules	75
16.3.4 Using Non-Negative Matrix Factorization with AMF	76
16.3.5 Using Singular Value Decomposition with AMF	76
16.4 Further documentation	76
17 Neural Network tutorial	77
17.1 Introduction	77
17.2 Table of Contents	77
17.3 Model API	78
17.4 Layer API	81
17.5 Model Setup & Training	83
17.6 Saving & Loading	84
17.7 Extracting Parameters	86
17.8 Further documentation	86

18 Approximate furthest neighbor search (mlpack_approx_kfn) tutorial	87
18.1 Introduction	87
18.2 Table of Contents	88
18.3 Which algorithm should be used?	89
18.4 Command-line 'mlpack_approx_kfn' and 'mlpack_kfn'	90
18.4.1 Calculate 5 furthest neighbors with default options	90
18.4.2 Specifying algorithm parameters for DrusillaSelect	91
18.4.3 Using QDAFN instead of DrusillaSelect	91
18.4.4 Printing results quality with exact distances	92
18.4.5 Using cached exact distances for quality results	93
18.4.6 Using tree-based approximation with mlpack_kfn	93
18.4.7 Different algorithms with 'mlpack_kfn'	94
18.4.8 Saving a model for later use	95
18.4.9 Final command-line program notes	96
18.5 DrusillaSelect C++ class	96
18.5.1 Approximate furthest neighbors with defaults	96
18.5.2 Custom numbers of tables and projections	97
18.5.3 Accessing the candidate set	97
18.5.4 Retraining on a new reference set	98
18.5.5 Running on sparse data	98
18.6 QDAFN C++ class	98
18.6.1 Approximate furthest neighbors with defaults	99
18.6.2 Custom numbers of tables and projections	99
18.6.3 Accessing the candidate set	99
18.6.4 Retraining on a new reference set	100
18.6.5 Running on sparse data	100
18.7 KFN C++ class	100
18.7.1 Simple furthest neighbors example	101
18.7.2 Retraining on a new reference set	101
18.7.3 Searching in single-tree mode	101
18.7.4 Searching in brute-force mode	102
18.8 Further documentation	102

19 Collaborative filtering tutorial	103
19.1 Introduction	103
19.2 Table of Contents	104
19.3 The 'mlpack_cf' program	104
19.3.1 Input format for mlpack_cf	105
19.3.2 mlpack_cf with default parameters	105
19.3.3 Saving mlpack_cf models	106
19.3.4 Loading mlpack_cf models	106
19.3.5 Specifying rank of mlpack_cf decomposition	106
19.3.6 mlpack_cf with single-user recommendation	106
19.3.7 mlpack_cf with non-default factorizer	107
19.3.8 mlpack_cf with non-default neighborhood size	107
19.4 The 'CF' class	107
19.4.1 CF with default parameters	108
19.4.2 CF with other factorizers	108
19.4.3 Predicting individual user/item ratings	109
19.4.4 Other operations with the W and H matrices	109
19.5 Template parameters for the 'CF' class	109
19.6 Further documentation	110
20 Density Estimation Tree (DET) tutorial	111
20.1 Introduction	111
20.2 Table of Contents	111
20.3 Command-Line mlpack_det	112
20.3.1 Plain-vanilla density estimation	113
20.3.2 Estimation on a test set	113
20.3.3 Computing the variable importance	114
20.3.4 Saving trained DETs	114
20.3.5 Loading trained DETs	114
20.4 The 'DTree' class	114
20.4.1 Public Functions	115
20.5 'namespace mlpack::det'	115
20.5.1 Utility Functions	116
20.6 Further Documentation	116

21 EMST Tutorial	117
21.1 Introduction	117
21.2 Table of Contents	118
21.3 Command-Line 'EMST'	118
21.4 The 'DualTreeBoruvka' class	119
21.5 Further documentation	119
22 Fast max-kernel search tutorial (fastmks)	121
22.1 Introduction	121
22.2 Table of Contents	122
22.3 Command-line FastMKS (mlpack_fastmks)	122
22.3.1 FastMKS with a linear kernel on one dataset	123
22.3.2 FastMKS on a reference and query dataset	124
22.3.3 FastMKS with a different kernel	124
22.3.4 Using single-tree search or naive search	124
22.3.5 Parameters for alternate kernels	124
22.3.6 Saving a FastMKS model/tree	125
22.3.7 Loading a FastMKS model for further searches	125
22.4 The 'FastMKS' class	125
22.4.1 FastMKS on one dataset	126
22.4.2 FastMKS with a query and reference dataset	126
22.4.3 FastMKS with an initialized kernel	126
22.4.4 FastMKS with an already-created tree	127
22.5 Writing a custom kernel for FastMKS	128
22.6 Using other tree types for FastMKS	128
22.7 Running FastMKS on objects	128
22.8 Further documentation	129

23 K-Means tutorial (kmeans)	131
23.1 Introduction	131
23.2 Table of Contents	132
23.3 Command-Line 'kmeans'	132
23.3.1 Simple k-means clustering	133
23.3.2 Saving the resulting centroids	133
23.3.3 Allowing empty clusters	133
23.3.4 Allowing empty clusters	133
23.3.5 Limiting the maximum number of iterations	133
23.3.6 Using Bradley-Fayyad "refined start"	134
23.3.7 Using different k-means algorithms	134
23.4 The 'KMeans' class	135
23.4.1 Running k-means and getting cluster assignments	135
23.4.2 Running k-means and getting centroids of clusters	135
23.4.3 Limiting the maximum number of iterations	136
23.4.4 Setting initial cluster assignments	136
23.4.5 Setting initial cluster centroids	137
23.4.6 Running sparse k-means	138
23.5 Template parameters for the 'KMeans' class	138
23.5.1 Changing the distance metric used for k-means	139
23.5.2 Changing the initial partitioning strategy used for k-means	139
23.5.3 Changing the action taken when an empty cluster is encountered	140
23.5.4 The LloydStepType template parameter	141
23.6 Further documentation	141

24 Linear/ridge regression tutorial (mlpack_linear_regression)	143
24.1 Introduction	143
24.2 Table of Contents	144
24.3 Command-Line 'mlpack_linear_regression'	144
24.3.1 One file, generating the function coefficients	145
24.3.2 Compute model and predict at the same time	145
24.3.3 Prediction using a precomputed model	146
24.3.4 Using ridge regression	147
24.4 The 'LinearRegression' class	148
24.4.1 Generating a model	148
24.4.2 Setting a model	148
24.4.3 Load a model from a file	148
24.4.4 Prediction	149
24.4.5 Setting lambda for ridge regression	149
24.5 Further documentation	149
25 NeighborSearch tutorial (k-nearest-neighbors)	151
25.1 Introduction	151
25.2 Table of Contents	151
25.3 Command-Line 'mlpack_knn'	152
25.3.1 One dataset, 5 nearest neighbors	152
25.3.2 Query and reference dataset, 10 nearest neighbors	153
25.3.3 One dataset, 3 nearest neighbors, leaf size of 15 points	154
25.4 The 'KNN' class	154
25.4.1 5 nearest neighbors on a single dataset	155
25.4.2 10 nearest neighbors on a query and reference dataset	155
25.4.3 Naive (exhaustive) search for 6 nearest neighbors on one dataset	155
25.5 The extensible 'NeighborSearch' class	156
25.5.1 SortPolicy policy class	156
25.5.2 MetricType policy class	156
25.5.3 MatType policy class	157
25.5.4 TreeType policy class	157
25.5.5 TraverserType policy class	157
25.6 Further documentation	157

26 RangeSearch tutorial (mlpack_range_search)	159
26.1 Introduction	159
26.2 Table of Contents	159
26.3 The 'mlpack_range_search' command-line executable	160
26.3.1 One dataset, points with distance ≤ 0.01	160
26.3.2 Query and reference dataset, range [1.0, 1.5]	161
26.3.3 One dataset, range [0.7 0.8], leaf size of 15 points	162
26.4 The 'RangeSearch' class	162
26.4.1 Distance less than 2.0 on a single dataset	163
26.4.2 Range [3.0, 4.0] on a query and reference dataset	163
26.4.3 Naive (exhaustive) search for distance greater than 5.0 on one dataset	163
26.5 The extensible 'RangeSearch' class	164
26.5.1 MetricType policy class	164
26.5.2 MatType policy class	164
26.5.3 TreeType policy class	164
26.6 Further documentation	165
27 Tutorials	167
27.1 Quickstart Tutorials	167
27.2 Introductory Tutorials	167
27.3 Method-specific Tutorials	168
27.4 Advanced Tutorials	168
27.5 Policy Class Documentation	168
28 The ElemType policy in mlpack	169
28.1 Overview	169
28.2 note for developers	169

29 The FunctionType policy in mlpack	171
29.1 Overview	171
29.2 Interface requirements	171
30 The KernelType policy in mlpack	173
30.1 Table of Contents	173
30.2 Introduction to the KernelType policy	173
30.3 The KernelTraits trait class	175
30.4 List of kernels and classes that use a \c KernelType	175
31 The MetricType policy in mlpack	177
32 The TreeType policy in mlpack	179
32.1 Introduction	179
32.2 What is a tree?	180
32.3 Template parameters required by the TreeType policy	181
32.4 The TreeType API	182
32.5 Rigorous API documentation	184
32.5.1 Template parameters	185
32.5.2 Constructors and destructors	186
32.5.3 Basic tree functionality	187
32.5.4 Complex tree functionality and bounds	188
32.5.5 Serialization	190
32.6 The TreeTraits trait class	190
32.7 A list of trees in mlpack and more information	191
33 Bug List	193
34 Namespace Index	197
34.1 Namespace List	197

35 Hierarchical Index	199
35.1 Class Hierarchy	199
36 Class Index	213
36.1 Class List	213
37 File Index	237
37.1 File List	237
38 Namespace Documentation	251
38.1 boost Namespace Reference	251
38.1.1 Detailed Description	251
38.2 boost::serialization Namespace Reference	251
38.3 ens Namespace Reference	252
38.4 mlpack Namespace Reference	252
38.4.1 Detailed Description	254
38.4.2 Function Documentation	254
38.4.2.1 CheckMatrices() [1/3]	255
38.4.2.2 CheckMatrices() [2/3]	255
38.4.2.3 CheckMatrices() [3/3]	255
38.4.2.4 SerializeObject()	255
38.4.2.5 SerializeObjectAll()	256
38.4.2.6 SerializePointerObject()	256
38.4.2.7 SerializePointerObjectAll()	256
38.4.2.8 TestAllArmadilloSerialization() [1/2]	256
38.4.2.9 TestAllArmadilloSerialization() [2/2]	257
38.4.2.10 TestArmadilloSerialization() [1/2]	257
38.4.2.11 TestArmadilloSerialization() [2/2]	257
38.5 mlpack::adaboost Namespace Reference	257
38.6 mlpack::amf Namespace Reference	257

38.6.1	Detailed Description	259
38.6.2	Typedef Documentation	259
38.6.2.1	NMFALSFactorizer	259
38.6.2.2	SVDBatchFactorizer	260
38.6.2.3	SVDCompleteIncrementalFactorizer	260
38.6.2.4	SVDIncompleteIncrementalFactorizer	260
38.6.3	Function Documentation	261
38.6.3.1	SVDBatchLearning::HUpdate< arma::sp_mat >()	261
38.6.3.2	SVDBatchLearning::WUpdate< arma::sp_mat >()	261
38.6.3.3	SVDIncompleteIncrementalLearning::HUpdate< arma::sp_mat >()	261
38.6.3.4	SVDIncompleteIncrementalLearning::WUpdate< arma::sp_mat >()	261
38.7	mlpack::ann Namespace Reference	262
38.7.1	Detailed Description	268
38.7.2	Typedef Documentation	268
38.7.2.1	CustomLayer	269
38.7.2.2	Embedding	269
38.7.2.3	GlorotInitialization	269
38.7.2.4	HardSigmoidLayer	269
38.7.2.5	IdentityLayer	269
38.7.2.6	LayerTypes	270
38.7.2.7	ReLULayer	270
38.7.2.8	Residual	270
38.7.2.9	SELU	271
38.7.2.10	SigmoidLayer	271
38.7.2.11	SoftPlusLayer	271
38.7.2.12	TanHLayer	271
38.7.2.13	XavierInitialization	271
38.7.3	Function Documentation	272

38.7.3.1	HAS_ANY_METHOD_FORM()	272
38.7.3.2	HAS_MEM_FUNC() [1/13]	272
38.7.3.3	HAS_MEM_FUNC() [2/13]	272
38.7.3.4	HAS_MEM_FUNC() [3/13]	272
38.7.3.5	HAS_MEM_FUNC() [4/13]	272
38.7.3.6	HAS_MEM_FUNC() [5/13]	273
38.7.3.7	HAS_MEM_FUNC() [6/13]	273
38.7.3.8	HAS_MEM_FUNC() [7/13]	273
38.7.3.9	HAS_MEM_FUNC() [8/13]	273
38.7.3.10	HAS_MEM_FUNC() [9/13]	273
38.7.3.11	HAS_MEM_FUNC() [10/13]	273
38.7.3.12	HAS_MEM_FUNC() [11/13]	274
38.7.3.13	HAS_MEM_FUNC() [12/13]	274

Chapter 1

mlpack Documentation

1.1 Introduction

mlpack is an intuitive, fast, and flexible C++ machine learning library with bindings to other languages. It is meant to be a machine learning analog to LAPACK, and aims to implement a wide array of machine learning methods and function as a "swiss army knife" for machine learning researchers. The mlpack website can be found at <https://mlpack.org>.

1.2 How To Use This Documentation

This documentation is API documentation similar to Javadoc. It isn't necessarily a tutorial, but it does provide detailed documentation on every namespace, method, and class.

Each mlpack namespace generally refers to one machine learning method, so browsing the list of namespaces provides some insight as to the breadth of the methods contained in the library.

To generate this documentation in your own local copy of mlpack, you can use the 'doc' CMake target, which is available if CMake has found Doxygen, from the build directory:

```
$ make doc
```

1.3 Tutorials

A few short tutorials on how to use mlpack are given below.

- **Building mlpack From Source** (p. 21)
- **Building mlpack From Source on Windows** (p. 27)
- **Matrices in mlpack** (p. 57)
- **Writing an mlpack binding** (p. 53)

- **mlpack Timers** (p. 69)
- **Simple Sample mlpack Programs** (p. 63)
- **Sample C++ ML App for Windows** (p. 65)
- **Cross-Validation** (p. 35)
- **Hyper-Parameter Tuning** (p. 49)
- **mlpack version information** (p. 71)

1.4 Final Remarks

For the list of contributors to mlpack, see <https://www.mlpack.org/community.html>. This library would not be possible without everyone's hard work and contributions!

Chapter 2

mlpack automatic bindings to other languages

2.1 Overview

mlpack has a system to automatically generate bindings to other languages, such as Python and command-line programs, and it is extensible to other languages with some amount of ease. The maintenance burden of this system is low, and it is designed in such a way that the bindings produced are always up to date across languages and up to date with the mlpack library itself.

This document describes the full functioning of the system, and is a good place to start for someone who wishes to understand the system so that they can contribute a new binding language, or someone who wants to understand so they can adapt the system for use in their own project, or someone who is simply curious enough to see how the sausage is made.

The document is split into several sections:

- **Introduction** (p. 4)
- **Writing code that can be turned into a binding** (p. 5)
- **How to write mlpack bindings** (p. 7)
 - **Documenting a program with PROGRAM_INFO()** (p. 8)
 - **Defining parameters for a program** (p. 10)
 - **Using CLI in an mlpackMain() function** (p. 13)
 - **More documentation on using CLI** (p. 14)
- **Structure of CLI module and associated macros** (p. 14)
- **Command-line program bindings** (p. 16)
 - **mlpackMain() definition** (p. 16)
 - **Matrix and model parameter handling** (p. 17)
 - **Parsing the command line** (p. 17)
- **Python bindings** (p. 18)
 - **Passing matrices to/from Python** (p. 18)
 - **Passing model parameter to/from Python** (p. 18)
 - **CMake generation of setup.py** (p. 19)
 - **Building the .pyx files** (p. 19)
 - **Testing the Python bindings** (p. 19)
- **Adding new binding types** (p. 20)

2.2 Introduction

C++ is not the most popular language on the planet, and it (unfortunately) can scare many away with its ultra-verbose error messages, confusing template rules, and complex metaprogramming techniques. Most practitioners of machine learning tend to avoid writing native C++ and instead prefer other languages—probably most notably Python.

In the case of Python, many projects will use tools like SWIG (<http://www.swig.org/>) to automatically generate bindings, or they might hand-write Cython. The same types of strategies may be used for other languages; hand-written MEX files may be used for MATLAB, hand-written RCpp bindings might be used for R bindings, and so forth.

However, these approaches have a fundamental flaw: the hand-written bindings must be maintained, and risk going out of date as the rest of the library changes or new functionality is added. This incurs a maintenance burden: each major change to the library means that someone must update the bindings and test that they are still working. mlpack is not prepared to handle this maintenance workload; therefore an alternate solution is needed.

At the time of the design of this system, mlpack shipped headers for a C++ library as well as many (~40) hand-written command-line programs that used the `mlpack::CLI` (p. 1117) object to manage command-line arguments. These programs all had similar structure, and could be logically split into three sections:

- parse the input options supplied by the user
- run the machine learning algorithm
- prepare the output to return to the user

The user might interface with this command-line program like the following:

```
$ mlpack_knn -r reference.csv -q query.csv -k 3 -d d.csv -n n.csv
```

That is, they would pass a number of input options—some were numeric values (like `-k 3`); some were filenames (like `-r reference.csv`); and a few other types also. Therefore, the first stage of the program—parsing input options—would be handled by reading the command line and loading any input matrices. Preparing the output, which usually consists of data matrices (i.e. `-d d.csv`) involves saving the matrix returned by the algorithm to the user's desired file.

Ideally, any binding to any language would have this same structure, and the actual "run the machine learning algorithm" code could be identical. For MATLAB, for instance, we would not need to read the file `reference.csv` but instead the user would simply pass their data matrix as an argument. So each input and output parameter would need to be handled differently, but the algorithm could be run identically across all bindings.

Therefore, design of an automatically-generated binding system would simply involve generating the boilerplate code necessary to parse input options for a given language, and to return output options to a user.

2.3 Writing code that can be turned into a binding

This section details what a binding file might actually look like. It is good to have this API in mind when reading the following sections.

Each mlpack binding is typically contained in the `src/mlpack/methods/` folder corresponding to a given machine learning algorithm, with the suffix `_main.cpp`; so an example is `src/mlpack/methods/pca/pca_main.cpp`.

These files have roughly two parts:

- definition of the input and output parameters with `PARAM` macros
- implementation of `mlpackMain()`, which is the actual machine learning code

Here is a simple example file:

```
// This is a stripped version of mean_shift_main.cpp.
#include <mlpack/prereqs.hpp>
#include <mlpack/core/util/cli.hpp>
#include <mlpack/core/util/mlpack_main.hpp>

#include <mlpack/core/kernels/gaussian_kernel.hpp>
#include "mean_shift.hpp"

using namespace mlpack;
using namespace mlpack::meanshift;
using namespace mlpack::kernel;
using namespace std;

// Define the help text for the program. The PRINT_PARAM_STRING() and
// PRINT_DATASET() macros are used to print the name of the parameter as seen in
// the binding type that is being used, and the PRINT_CALL() macro generates a
// sample invocation of the program in the language of the binding type that is
// being used. Note that the macros must have + on either side of them. We
// provide some extra references with the "SEE_ALSO()" macro, which is used to
// generate documentation for the website.
PROGRAM_INFO("Mean Shift Clustering",
  // Short description.
  "A fast implementation of mean-shift clustering using dual-tree range "
  "search. Given a dataset, this uses the mean shift algorithm to produce "
  "and return a clustering of the data.",
  // Long description.
  "This program performs mean shift clustering on the given dataset, storing "
  "the learned cluster assignments either as a column of labels in the input "
  "dataset or separately."
  "\n\n"
  "The input dataset should be specified with the " +
  PRINT_PARAM_STRING("input") + " parameter, and the radius used for search "
  "can be specified with the " + PRINT_PARAM_STRING("radius") + " "
  "parameter. The maximum number of iterations before algorithm termination "
  "is controlled with the " + PRINT_PARAM_STRING("max_iterations") + " "
  "parameter."
  "\n\n"
  "The output labels may be saved with the " + PRINT_PARAM_STRING("output") +
  " output parameter and the centroids of each cluster may be saved with the "
  " " + PRINT_PARAM_STRING("centroid") + " output parameter."
  "\n\n"
  "For example, to run mean shift clustering on the dataset " +
  PRINT_DATASET("data") + " and store the centroids to " +
  PRINT_DATASET("centroids") + ", the following command may be used: "
  "\n\n" +
  PRINT_CALL("mean_shift", "input", "data", "centroid", "centroids"),
  SEE_ALSO("@kmeans", "#kmeans"),
  SEE_ALSO("@dbscan", "#dbscan"),
  SEE_ALSO("Mean shift on Wikipedia",
    "https://en.wikipedia.org/wiki/Mean_shift"),
  SEE_ALSO("Mean Shift, Mode Seeking, and Clustering (pdf)",
    "http://citeseerx.ist.psu.edu/viewdoc/download?doi=10.1.1.510.1222")
);
```

```

    "&rep=repl&type=pdf"),
    SEE_ALSO("mlpack::mean_shift::MeanShift C++ class documentation",
    "@doxygen/classmlpack_1_1meanshift_1_1MeanShift.html"));

// Define parameters for the executable.

// Required option: the user must give us a matrix.
PARAM_MATRIX_IN_REQ("input", "Input dataset to perform clustering on.", "i");

// Output options: the user can save the output matrix of labels and/or the
// centroids.
PARAM_UCOL_OUT("output", "Matrix to write output labels to.", "o");
PARAM_MATRIX_OUT("centroid", "If specified, the centroids of each cluster will "
    "be written to the given matrix.", "C");

// Mean shift configuration options.
PARAM_INT_IN("max_iterations", "Maximum number of iterations before mean shift "
    "terminates.", "m", 1000);
PARAM_DOUBLE_IN("radius", "If the distance between two centroids is less than "
    "the given radius, one will be removed. A radius of 0 or less means an "
    "estimate will be calculated and used for the radius.", "r", 0);

void mlpackMain()
{
    // Process the parameters that the user passed.
    const double radius = CLI::GetParam<double>("radius");
    const int maxIterations = CLI::GetParam<int>("max_iterations");

    if (maxIterations < 0)
    {
        Log::Fatal << "Invalid value for maximum iterations (" << maxIterations <<
            ")! Must be greater than or equal to 0." << endl;
    }

    // Warn, if the user did not specify that they wanted any output.
    if (!CLI::HasParam("output") && !CLI::HasParam("centroid"))
    {
        Log::Warn << "--output_file, --in_place, and --centroid_file are not set; "
            << "no results will be saved." << endl;
    }

    arma::mat dataset = std::move(CLI::GetParam<arma::mat>("input"));
    arma::mat centroids;
    arma::Col<size_t> assignments;

    // Prepare and run the actual algorithm.
    MeanShift<> meanShift(radius, maxIterations);

    Timer::Start("clustering");
    Log::Info << "Performing mean shift clustering..." << endl;
    meanShift.Cluster(dataset, assignments, centroids);
    Timer::Stop("clustering");

    Log::Info << "Found " << centroids.n_cols << " centroids." << endl;
    if (radius <= 0.0)
        Log::Info << "Estimated radius was " << meanShift.Radius() << ".\n";

    // Should we give the user the output matrix?
    if (CLI::HasParam("output"))
        CLI::GetParam<arma::Col<size_t>>("output") = std::move(assignments);

    // Should we give the user the centroid matrix?
    if (CLI::HasParam("centroid"))
        CLI::GetParam<arma::mat>("centroid") = std::move(centroids);
}

```

We can see that we have defined the basic program information in the **PROGRAM_INFO()** (p.2733) macro. This is, for instance, what is displayed to describe the binding if the user passed the `--help` option for a command-line program.

Then, we define five parameters, three input and two output, that define the data and options that the mean shift clustering will function on. These parameters are defined with the `PARAM` macros, of which there are many. The names of these macros specify the type, whether the parameter is required, and whether the parameter is input or output. Some examples:

- `PARAM_STRING_IN()` (p. 2721) – a string-type input parameter
- `PARAM_MATRIX_OUT()` (p. 2716) – a matrix-type output parameter
- `PARAM_DOUBLE_IN_REQ()` (p. 2708) – a required double-type input parameter
- `PARAM_UMATRIX_IN()` (p. 2727) – an unsigned matrix-type input parameter
- `PARAM_MODEL_IN()` (p. 2717) – a serializable model-type input parameter

Note that each of these macros may have slightly different syntax. See the links above for further documentation.

In order to write a new binding, then, you simply must write a `PROGRAM_INFO()` (p. 2733) definition of the program with some documentation, define the input and output parameters as `PARAM` macros, and then write an `mlpackMain()` function that actually performs the functionality of the binding. Inside of `mlpackMain()`:

- All input parameters are accessible through `CLI::GetParam<type>("name")`.
- All output parameters should be set by the end of the function with the `CLI::GetParam<type>("name")` method.

Then, assuming that your program is saved in the file `program_name_main.cpp`, generating bindings for other languages is a simple addition to the `CMakeLists.txt` file:

```
add_cli_executable(program_name)
add_python_binding(program_name)
add_markdown_docs(program_name "cli;python" "category")
```

In this example, `add_markdown_docs()` will generate documentation that is typically used to build the website. The "category" parameter should be one of the categories in `src/mlpack/bindings/markdown/MarkdownCategories.cmake`.

2.4 How to write mlpack bindings

This section describes the general structure of the `CLI` code and how one might write a new binding for mlpack. After reading this section it should be relatively clear how one could use the `CLI` functionality along with CMake to add a binding for a new mlpack machine learning method. If it is not clear, then the examples in the following sections should clarify.

2.4.1 Documenting a program with `PROGRAM_INFO()`

Any mlpack program should be documented with the `PROGRAM_INFO()` (p. 2733) macro, which is available from the `<mlpack/core/util/mlpack_main.hpp` (p. 2699) header. The macro is of the form

```
PROGRAM_INFO("program name", "short documentation", "long documentation",
    SEE_ALSO("link", "description"), ...)
```

The short documentation should be two sentences indicating what the program implements and does, and a quick overview of how it can be used and what it should be used for. When writing new short documentation, it is a good idea to take a look at the existing documentation to get an idea of the general format.

For the "see also" section, you can specify as many `SEE_ALSO()` (p. 2734) calls as you see fit. These are links used at the "see also" section of the website documentation for each binding, and it's very important that relevant links are provided (also to other bindings). See the `SEE_ALSO()` (p. 2734) documentation for more details.

Although it is possible to provide very short documentation, it is certainly better to provide a long description including

- what the program does
- a basic overview of what input and output parameters the program has
- at least one example invocation

Examples are very important, and are probably what most users are going to immediately search for, instead of taking a long time to read and carefully consider all of the written documentation.

However, it is difficult to write language-agnostic documentation. For instance, in a command-line program, an output parameter `--output_file` would be specified on the command line as an input parameter, but in Python, the output parameter `'output'` would actually simply be returned from the call to the Python function. Therefore, we must be careful how our documentation refers to input and output parameters. The following general guidelines can help:

- Always refer to output parameters as "output parameters", which is a fairly close term that can be interpreted to mean both "return values" for languages like Python and MATLAB and also "arguments given on the command line" for command line programs.
- Use the provided `PRINT_PARAM_STRING()` macro to print the names of parameters. For instance, `PRINT_PARAM_STRING("shuffle")` will print `'--shuffle'` for a command line program and `'shuffle'` for a Python binding. The `PRINT_PARAM_STRING()` macro also takes into account the type of the parameter.
- Use the provided `PRINT_DATASET()` and `PRINT_MODEL()` macro to introduce example datasets or models, which can be useful when introducing an example usage of the program. So you could write `"to @c run @c with @c a @c dataset @c " + PRINT_DATASET("data") + "..."`.
- Use the provided `PRINT_CALL()` macro to print example invocations of the program. The first argument is the name of the program, and then the following arguments should be the name of a parameter followed by the value of that parameter.
- Never mention files in the documentation—files are only relevant to command-line programs. Similarly, avoid mentioning anything language-specific.

- Remember that some languages give output through return values and some give output using other input parameters. So the right verbiage to use is, e.g., 'the results may be saved using the `PRINT_PARAM_STRING("output")` parameter', and **not** 'the results are returned through the `PRINT_PARAM_STRING("output")` parameter'.

Each of these macros (`PRINT_PARAM_STRING()`, `PRINT_DATASET()`, `PRINT_MODEL()`, and `PRINT_CALL()`) provides different output depending on the language. Below are some example of documentation strings and their outputs for different languages. Note that the output might not be *exactly* as written or formatted here, but the general gist should be the same.

Input C++ (snippet):

```
"The parameter " + PRINT_PARAM_STRING("shuffle") + ", if set, will shuffle "
"the data before learning."
```

Command-line program output (snippet):

```
The parameter '--shuffle', if set, will shuffle the data before learning.
```

Python binding output (snippet):

```
The parameter 'shuffle', if set, will shuffle the data before learning.
```

Input C++ (snippet):

```
"The output matrix can be saved with the " + PRINT_PARAM_STRING("output") +
" output parameter."
```

Command-line program output (snippet):

```
The output matrix can be saved with the '--output_file' output parameter.
```

Python binding output (snippet):

```
The output matrix can be saved with the 'output' output parameter.
```

Input C++ (snippet):

```
"For example, to train a model on the dataset " + PRINT_DATASET("x") + " and "
"save the output model to " + PRINT_MODEL("model") + ", the following command"
" can be used:"
"\n\n" +
PRINT_CALL("program", "input", "x", "output_model", "model")
```

Command-line program output (snippet):

```
For example, to train a model on the dataset 'x.csv' and save the output model
to 'model.bin', the following command can be used:
```

```
$ program --input_file x.csv --output_model_file model.bin
```

Python binding output (snippet):

```
For example, to train a model on the dataset 'x' and save the output model to
'model', the following command can be used:
```

```
>>> output = program(input=x)
>>> model = output['output_model']
```

Input C++ (full program, 'random_numbers_main.cpp'):

```
PROGRAM_INFO("Random Numbers", "This program generates random numbers with a "
"variety of nonsensical techniques and example parameters. The input "
"dataset, which will be ignored, can be specified with the " +
PRINT_PARAM_STRING("input") + " parameter. If you would like to subtract "
" values from each number, specify the " +
PRINT_PARAM_STRING("subtract") + " parameter. The number of random "
"numbers to generate is specified with the " +
PRINT_PARAM_STRING("num_values") + " parameter.")
```

```

"\n\n"
"The output random numbers can be saved with the " +
PRINT_PARAM_STRING("output") + " output parameter. In addition, a "
"randomly generated linear regression model can be saved with the " +
PRINT_PARAM_STRING("output_model") + " output parameter."
"\n\n"
"For example, to generate 100 random numbers with 3 subtracted from them "
"and save the output to " + PRINT_DATASET("rand") + " and the random "
"model to " + PRINT_MODEL("rand_lr") + ", use the following "
"command:"
"\n\n" +
PRINT_CALL("random_numbers", "num_values", 100, "subtract", 3, "output",
"rand", "output_model", "rand_lr"));

```

Command line output:

Random Numbers

This program generates random numbers with a variety of nonsensical techniques and example parameters. The input dataset, which will be ignored, can be specified with the '--input_file' parameter. If you would like to subtract values from each number, specify the '--subtract' parameter. The number of random numbers to generate is specified with the '--num_values' parameter.

The output random numbers can be saved with the '--output_file' output parameter. In addition, a randomly generated linear regression model can be saved with the '--output_model_file' output parameter.

For example, to generate 100 random numbers with 3 subtracted from them and save the output to 'rand.csv' and the random model to 'rand_lr.bin', use the following command:

```
$ random_numbers --num_values 100 --subtract 3 --output_file rand.csv
--output_model_file rand_lr.bin
```

Python binding output:

Random Numbers

This program generates random numbers with a variety of nonsensical techniques and example parameters. The input dataset, which will be ignored, can be specified with the 'input' parameter. If you would like to subtract values from each number, specify the 'subtract' parameter. The number of random numbers to generate is specified with the 'num_values' parameter.

The output random numbers can be saved with the 'output' output parameter. In addition, a randomly generated linear regression model can be saved with the 'output_model' output parameter.

For example, to generate 100 random numbers with 3 subtracted from them and save the output to 'rand' and the random model to 'rand_lr', use the following command:

```
>>> output = random_numbers(num_values=100, subtract=3)
>>> rand = output['output']
>>> rand_lr = output['output_model']
```

2.4.2 Defining parameters for a program

There exist several macros that can be used after a **PROGRAM_INFO()** (p.2733) definition to define the parameters that can be specified for a given mlpack program. These macros all have the same general definition: the name of the macro specifies the type of the parameter, whether or not the parameter is required, and whether the parameter is an input or output parameter. Then as arguments to the macro, the name, description, and sometimes the single-character alias and the default value of the parameter.

To give a flavor of how these definitions look, the definition

```
PARAM_STRING_IN("algorithm", "The algorithm to use: 'svd' or 'blah'.", "a");
```

will define a string input parameter `algorithm` (referenced as `--algorithm` from the command-line or `'algorithm'` from Python) with the description `The algorithm to use: 'svd' or 'blah'`. The single-character alias `-a` can be used from a command-line program (but means nothing in Python).

There are numerous different macros that can be used:

- **PARAM_FLAG()** (p. 2710) - boolean flag parameter
- **PARAM_INT_IN()** (p. 2711) - integer input parameter
- **PARAM_INT_OUT()** (p. 2712) - integer output parameter
- **PARAM_DOUBLE_IN()** (p. 2708) - double input parameter
- **PARAM_DOUBLE_OUT()** (p. 2709) - double output parameter
- **PARAM_STRING_IN()** (p. 2721) - string input parameter
- **PARAM_STRING_OUT()** (p. 2723) - string output parameter
- **PARAM_MATRIX_IN()** (p. 2714) - double-valued matrix (`arma::mat`) input parameter
- **PARAM_MATRIX_OUT()** (p. 2716) - double-valued matrix (`arma::mat`) output parameter
- **PARAM_UMATRIX_IN()** (p. 2727) - `size_t`-valued matrix (`arma::Mat<size_t>`) input parameter
- **PARAM_UMATRIX_OUT()** (p. 2729) - `size_t`-valued matrix (`arma::Mat<size_t>`) output parameter
- **PARAM_TMATRIX_IN()** (p. 2723) - transposed double-valued matrix (`arma::mat`) input parameter
- **PARAM_TMATRIX_OUT()** (p. 2725) - transposed double-valued matrix (`arma::mat`) output parameter
- **PARAM_MATRIX_AND_INFO_IN()** (p. 2714) - matrix with categoricals input parameter (`std::tuple<data::DatasetInfo, arma::mat>`)
- **PARAM_COL_IN()** (p. 2705) - double-valued column vector (`arma::vec`) input parameter
- **PARAM_COL_OUT()** (p. 2707) - double-valued column vector (`arma::vec`) output parameter
- **PARAM_UCOL_IN()** (p. 2726) - `size_t`-valued column vector (`arma::Col<size_t>`) input parameter
- **PARAM_UCOL_OUT()** (p. 2726) - `size_t`-valued column vector (`arma::Col<size_t>`) output parameter
- **PARAM_ROW_IN()** (p. 2720) - double-valued row vector (`arma::rowvec`) input parameter
- **PARAM_ROW_OUT()** (p. 2721) - double-valued row vector (`arma::rowvec`) output parameter
- **PARAM_VECTOR_IN()** (p. 2731) - `std::vector` input parameter
- **PARAM_VECTOR_OUT()** (p. 2733) - `std::vector` output parameter
- **PARAM_MODEL_IN()** (p. 2717) - serializable model input parameter
- **PARAM_MODEL_OUT()** (p. 2718) - serializable model output parameter

And for input parameters, the parameter may also be required:

- **PARAM_INT_IN_REQ()** (p. 2712)
- **PARAM_DOUBLE_IN_REQ()** (p. 2708)

- `PARAM_STRING_IN_REQ()` (p. 2722)
- `PARAM_MATRIX_IN_REQ()` (p. 2715)
- `PARAM_UMATRIX_IN_REQ()` (p. 2728)
- `PARAM_TMATRIX_IN_REQ()` (p. 2724)
- `PARAM_VECTOR_IN_REQ()` (p. 2732)
- `PARAM_MODEL_IN_REQ()` (p. 2718)

Click the links for each macro to read further documentation. Note also that each possible combination of `IN`, `OUT`, and `REQ` is not available—output options cannot be required, and some combinations simply have not been added because they have not been needed.

The `PARAM_MODEL_IN()` (p. 2717) and `PARAM_MODEL_OUT()` (p. 2718) macros are used to serialize mlpack models. These could be used, for instance, to allow the user to save a trained model (like a linear regression model) or load an input model. The first parameter to the `PARAM_MODEL_IN()` (p. 2717) or `PARAM_MODEL_OUT()` (p. 2718) macro should be the C++ type of the model to be serialized; this type **must** have a function template `<typename Archive> void Serialize(Archive&, const unsigned int)` (i.e. the type must be serializable via mlpack's `boost::serialization` (p. 251) shim). For example, to allow a user to specify an input model of type `LinearRegression`, the follow definition could be used:

```
PARAM_MODEL_IN(LinearRegression, "input_model", "The input model to be used.",
               "i");
```

Then, the user will be able to specify their model from the command-line as `--input_model_file` and from Python using the `input_model` option to the generated binding.

From the command line, `matrix-type` and `model-type` options (both input and output) are loaded from or saved to the specified file. This means that `_file` is appended to the name of the parameter; so if the parameter name is `data` and it is of a matrix or model type, then the name that the user will specify on the command line will be `--data_file`. This displayed parameter name change **only** occurs with matrix and model type parameters for command-line programs.

The `PARAM_MATRIX_AND_INFO()` macro defines a categorical matrix parameter (more specifically, a matrix type that can support categorical columns). From the C++ program side, this means that the parameter type is `std::tuple<data::DatasetInfo, arma::mat>`. From the user side, for a command-line program, this means that the user will pass the filename of a dataset that can have categorical features, such as an ARFF dataset. For a Python program, the user may pass a Pandas matrix with categorical columns. When the program is run, the input that the user gives will be processed and the `data::DatasetInfo` object will be filled with the dimension types and the `arma::mat` object will be filled with the data itself.

To give some examples, the parameter definitions from the example "random_numbers" program in the previous section are shown below.

```
PARAM_MATRIX_IN("input", "The input matrix that will be ignored.", "i");
PARAM_DOUBLE_IN("subtract", "The value to subtract from each parameter.", "s",
                0.0); // Default value of 0.0.
PARAM_INT_IN("num_samples", "The number of samples to generate.", "n", 100);

PARAM_MATRIX_OUT("output", "The output matrix of random samples.", "o");
PARAM_MODEL_OUT(LinearRegression, "output_model", "The randomly generated "
               "linear regression output model.", "M");
```

Note that even the parameter documentation strings must be a little be agnostic to the binding type, because the command-line interface is so different than the Python interface to the user.

2.4.3 Using CLI in an mlpackMain() function

mlpack's CLI module provides a unified abstract interface for getting input from and providing output to users without needing to consider the language (command-line, Python, MATLAB, etc.) that the user is running the program from. This means that after the `PROGRAM_INFO()` (p. 2733) macro and the `PARAM_*`() macros have been defined, a language-agnostic `mlpackMain()` function can be written. This function then can perform the actual computation that the entire program is meant to.

Inside of an `mlpackMain()` function, the `mlpack::CLI` (p. 1117) module can be used to access input parameters and set output parameters. There are two main functions for this, plus a utility printing function:

- `CLI::GetParam<T>()` (p. 290) - get a reference to a parameter
- `CLI::HasParam()` - returns true if the user specified the parameter
- `CLI::GetPrintableParam<T>()` (p. 292) - returns a string representing the value of the parameter

So, to print "hello" if the user specified the `print_hello` parameter, the following code could be used:

```
using namespace mlpack;

if (CLI::HasParam("print_hello"))
  std::cout << "Hello!" << std::endl;
else
  std::cout << "No greetings for you!" << std::endl;
```

To access a string that a user passed in to the `string` parameter, the following code could be used:

```
using namespace mlpack;

const std::string& str = CLI::GetParam<std::string>("string");
```

Matrix types are accessed in the same way:

```
using namespace mlpack;

arma::mat& matrix = CLI::GetParam<arma::mat>("matrix");
```

Similarly, model types can be accessed. If a `LinearRegression` model was specified by the user as the parameter `model`, the following code can access the model:

```
using namespace mlpack;

LinearRegression& lr = CLI::GetParam<LinearRegression>("model");
```

Matrices with categoricals are a little trickier to access since the C++ parameter type is `std::tuple<data::DatasetInfo, arma::mat>`. The example below creates references to both the `DatasetInfo` and `matrix` objects, assuming the user has passed a matrix with categoricals as the `matrix` parameter.

```
using namespace mlpack;

typename std::tuple<data::DatasetInfo, arma::mat> TupleType;
data::DatasetInfo& di = std::get<0>(CLI::GetParam<TupleType>("matrix"));
arma::mat& matrix = std::get<1>(CLI::GetParam<TupleType>("matrix"));
```

These two functions can be used to write an entire program. The third function, `GetPrintableParam()` (p. 292), can be used to help provide useful output in a program. Typically, this function should be used if you want to provide some kind of error message about a matrix or model parameter, but want to avoid printing the matrix itself. For instance, printing a matrix parameter with `GetPrintableParam()` (p. 292) will print the filename for a command-line binding or the size of a matrix for a Python binding. `GetPrintableParam()` (p. 292) for a model parameter will print the filename for the model for a command-line binding or a simple string representing the type of the model for a Python binding.

Putting all of these ideas together, here is the `mlpackMain()` function that could be created for the "random_↵ numbers" program from earlier sections.

```
#include <mlpack/core/util/mlpack_main.hpp>

// The PROGRAM_INFO() and PARAM_*() definitions should go here:
// ...

using namespace mlpack;

void mlpackMain()
{
    // If the user passed an input matrix, tell them that we'll be ignoring it.
    if (CLI::HasParam("input"))
    {
        // Print the filename the user passed, if a command-line binding, or the
        // size of the matrix passed, if a Python binding.
        Log::Warn << "The input matrix "
            << CLI::GetPrintableParam<arma::mat>("input") << " is ignored!"
            << std::endl;
    }

    // Get the number of samples and also the value we should subtract.
    const size_t numSamples = (size_t) CLI::GetParam<int>("num_samples");
    const double subtractValue = CLI::GetParam<double>("subtract");

    // Create the random matrix (1-dimensional).
    arma::mat output(1, numSamples, arma::fill::randu);
    output -= subtractValue;

    // Save the output matrix if the user wants.
    if (CLI::HasParam("output"))
        CLI::GetParam<arma::mat>("output") = std::move(output); // Avoid copy.

    // Did the user request a random linear regression model?
    if (CLI::HasParam("output_model"))
    {
        LinearRegression lr;
        lr.Parameters().randu(10); // 10-dimensional (arbitrary).
        lr.Lambda() = 0.0;
        lr.Intercept() = false; // No intercept term.

        CLI::GetParam<LinearRegression>("output_model") = std::move(lr);
    }
}
```

2.4.4 More documentation on using CLI

More documentation for the CLI module can either be found on the `mlpack::CLI` (p. 1117) documentation page, or by reading the existing mlpack bindings. These can be found in the `src/mlpack/methods/` folders, by finding the `_main.cpp` files. For instance, `src/mlpack/methods/neighbor_search/knn_main.cpp` is the k-nearest-neighbor search program definition.

2.5 Structure of CLI module and associated macros

This section describes the internal functionality of the CLI module and the associated macros. If you are only interested in writing mlpack programs, this section is probably not worth reading.

There are four main components involved with mlpack bindings:

- the CLI module, a singleton class that stores parameter information
- the `mlpackMain()` function that defines the functionality of the binding
- the **PROGRAM_INFO()** (p. 2733) macro that defines the binding name and documentation
- the `PARAM_*`() macros that define parameters for the binding

The `mlpack::CLI` (p. 1117) module is a singleton class that stores, at runtime, the binding name, the documentation, and the parameter information and values. In order to do this, each parameter and the program documentation must make themselves known to the CLI singleton. This is accomplished by having the **PROGRAM_INFO()** (p. 2733) and `PARAM_*`() macros declare global variables that, in their constructors, register themselves with the CLI singleton.

The **PROGRAM_INFO()** (p. 2733) macro declares an object of type `mlpack::util::ProgramDoc` (p. 2368). The `ProgramDoc` class constructor calls `CLI::RegisterProgramDoc()` in order to register the given program name and documentation.

The `PARAM_*`() macros declare an object that will, in its constructor, call `CLI::Add()` to register that parameter with the CLI singleton. The specific type of that object will depend on the binding type being used.

The `CLI::Add()` function takes an `mlpack::util::ParamData` (p. 2356) object as its input. This `ParamData` object has a number of fields that must be set to properly describe the parameter. Each of the fields is documented and probably self-explanatory, but three fields deserve further explanation:

- the `std::string tname` member is used to encode the true type of the parameter—which is not known by the CLI singleton at runtime. This should be set to **TYPENAME (T)** (p. 2738) where `T` is the type of the parameter.
- the `boost::any value` member is used to hold the actual value of the parameter. Typically this will simply be the parameter held by a `boost::any` object, but for some types it may be more complex. For instance, for a command-line matrix option, the `value` parameter will actually hold a tuple containing both the filename and the matrix itself.
- the `std::string cppType` should be a string containing the type as seen in C++ code. Typically this can be encoded by stringifying a `PARAM_*`() macro argument.

Thus, the global object defined by the `PARAM_*`() macro must turn its arguments into a fully specified `ParamData` object and then call `CLI::Add()` with it.

With different binding types, different behavior is often required for the **GetParam<T>()** (p. 290), `HasParam()`, and **GetPrintableParam<T>()** (p. 292) functions. In order to handle this, the CLI singleton also holds a function pointer map, so that a given type of option can call specific functionality for a certain task. This function map is accessible as `CLI::functionMap` and is not meant to be used by users, but instead by people writing binding types.

Each function in the map must have signature

```
void MapFunction(const util::ParamData& d,
                 const void* input,
                 void* output);
```

The use of void pointers allows any type to be specified as input or output to the function without changing the signature for the map. The CLI function map is of type

```
std::map<std::string, std::map<std::string,
    void (*) (const util::ParamData&, const void*, void*)>>
```

and the first map key is the typename (`tname`) of the parameter, and the second map key is the string name of the function. For instance, calling

```
const util::ParamData& d = CLI::Parameters()["param"];
CLI::GetSingleton().functionMap[d.tname]["GetParam"](d, input, output);
```

will call the **GetParam()** (p. 290) function for the type of the "param" parameter. Examples are probably easiest to understand how this functionality works; see the **CLI::GetParam<T>()** (p. 290) source to see how this might be used.

The CLI singleton expects the following functions to be defined in the function map for each type:

- **GetParam** – return a pointer to the parameter in output.
- **GetPrintableParam** – return a pointer to a string description of the parameter in output.

If these functions are properly defined, then the CLI module will work correctly. Other functions may also be defined; these may be used by other parts of the binding infrastructure for different languages.

2.6 Command-line program bindings

This section describes the internal functionality of the command-line program binding generator. If you are only interested in writing mlpack programs, this section probably is not worth reading. This section is worth reading only if you want to know the specifics of how the `mlpackMain()` function and macros get turned into a fully working command-line program.

The code for the command-line bindings is found in `src/mlpack/bindings/cli`.

2.6.1 mlpackMain() definition

Any command-line program must be compiled with the `BINDING_TYPE` macro set to the value `BINDING_TYPE_CLI`. This is handled by the CMake macro **add_cli_executable()** (p. 2438).

When `BINDING_TYPE` is set to `BINDING_TYPE_CLI`, the following is set in `src/mlpack/core/util/mlpack_main.hpp` (p. 2699), which must be included by every mlpack binding:

- The options defined by `PARAM_*` macros are of type **mlpack::bindings::cli::CLIOption** (p. 975).
- The parameter and value printing macros for **PROGRAM_INFO()** (p. 2733) are set: The `PRINT_PARAMETER_STRING()` macro is defined as **mlpack::bindings::cli::ParamString()** (p. 302). The `PRINT_DATASET()` macro is defined as **mlpack::bindings::cli::PrintDataset()** (p. 302). The `PRINT_MODEL()` macro is defined as **mlpack::bindings::cli::PrintModel()** (p. 303). The `PRINT_CALL()` macro is defined as **mlpack::bindings::cli::ProgramCall()** (p. 306).
- The function `int main()` is defined as:

```
int main(int argc, char** argv)
{
    // Parse the command-line options; put them into CLI.
    mlpack::bindings::cli::ParseCommandLine(argc, argv);

    mlpackMain();

    // Print output options, print verbose information, save model parameters,
    // clean up, and so forth.
    mlpack::bindings::cli::EndProgram();
}
```

Thus any mlpack command-line binding first processes the command-line arguments with `mlpack::bindings::cli::ParseCommandLine()` (p. 302), then runs the binding with `mlpackMain()`, then cleans up with `mlpack::bindings::cli::EndProgram()` (p. 288).

The `ParseCommandLine()` (p. 302) function reads the input parameters and sets the values in CLI. For matrix-type and model-type parameters, this reads the filenames from the command-line, but does not load the matrix or model. Instead the matrix or model is loaded the first time it is accessed with `GetParam<T>()` (p. 290).

The `--help` parameter is handled by the `mlpack::bindings::cli::PrintHelp()` (p. 303) function.

At the end of program execution, the `mlpack::bindings::cli::EndProgram()` (p. 288) function is called. This writes any output matrix or model parameters to disk, and prints the program parameters and timers if `--verbose` was given.

2.6.2 Matrix and model parameter handling

For command line bindings, the matrix, model, and matrix with categorical type parameters all require special handling, since it is not possible to pass a matrix of any reasonable size or a model on the command line directly. Therefore for a matrix or model parameter, the user specifies the file containing that matrix or model parameter. If the parameter is an input parameter, then the file is loaded when `GetParam<T>()` (p. 290) is called. If the parameter is an output parameter, then the matrix or model is saved to the file when `EndProgram()` (p. 288) is called.

The actual implementation of this is that the `boost::any` value member of the `ParamData` struct does not hold the model or the matrix, but instead a `std::tuple` containing both the matrix or the model, and the filename associated with that matrix or model.

This means that functions like `GetParam<T>()` (p. 290) and `GetPrintableParam<T>()` (p. 292) (and all of the other associated functions in the CLI function map) must have special handling for matrix or model types. See those implementations for more details—the special handling is enforced via SFINAE.

2.6.3 Parsing the command line

The `ParseCommandLine()` (p. 302) function uses `boost::program_options` to read the values from the command line into the `ParamData` structs held by the CLI singleton.

In order to set up `boost::program_options`—and to keep its headers from needing to be included by the rest of the library—the code loops over each parameter known by the CLI singleton and calls the "AddToPO" function from the function map. This in turn calls the necessary functions to register a given parameter with `boost::program_options`, and once all parameters have been registered, the facilities provided by `boost::program_options` are used to parse the command line input properly.

2.7 Python bindings

This section describes the internal functionality of the mlpack Python binding generator. If you are only interested in writing new bindings or building the bindings, this section is probably not worth reading. But if you are interested in the internal working of the Python binding generator, then this section is for you.

The Python bindings are significantly more complex than the command line bindings because we cannot just compile directly to a finished product. Instead we need a multi-stage compilation:

- We must generate a `setup.py` file that can be used to compile the bindings.
- We must generate the `.pyx` (Cython) bindings for each program.
- Then we must build each `.pyx` into a `.so` that is loadable from Python.
- We must also test the Python bindings.

This is done with a combination of C++ code to generate the `.pyx` bindings, CMake to run the actual compilation and generate the `setup.py` file, some utility Python functions, and tests written in both Python and C++. This code is primarily contained in `src/mlpack/bindings/python/`.

2.7.1 Passing matrices to/from Python

The standard Python matrix library is numpy, so mlpack bindings should accept numpy matrices as input. Fortunately, numpy Cython bindings already exist, which make it easy to convert from a numpy object to an Armadillo object without copying any data. This code can be found in `src/mlpack/bindings/python/mlpack/arma_numpy.pyx`, and is used by the Python `GetParam<T>()` (p.290) functionality.

mlpack also supports categorical matrices; in Python, the typical way of representing matrices with categorical features is with Pandas. Therefore, mlpack also accepts Pandas matrices, and if any of the Pandas matrix dimensions are categorical, these are properly encoded. The function `to_matrix_with_info()` from `mlpack/bindings/python/mlpack/matrix_utils.py` is used to perform this conversion.

2.7.2 Passing model parameter to/from Python

We use (or abuse) Cython functionality in order to give the user a model object that they can use in their Python code. However, we do not want to (or have the infrastructure to) write bindings for every method that a serializable model class might support; therefore, we only desire to return a memory pointer to the model to the user.

In this way, a user that receives a model from an output parameter can then reuse the model as an input parameter to another binding (or the same binding).

To return a function pointer we have to define a Cython class in the following way (this example is taken from the perceptron binding):

```
cdef extern from "</home/ryan/src/mlpack-rc/src/mlpack/methods/perceptron/perceptron_main.cpp>" nogil:
    cdef int mlpackMain() nogil except +RuntimeError

    cdef cppclass PerceptronModel:
        PerceptronModel() nogil

    cdef class PerceptronModelType:
        cdef PerceptronModel* modelptr

        def __cinit__(self):
            self.modelptr = new PerceptronModel()

        def __dealloc__(self):
            del self.modelptr
```

This class definition is automatically generated when the `.pyx` file is automatically generated.

2.7.3 CMake generation of setup.py

A boilerplate setup.py file can be found in `src/mlpack/bindings/python/setup.py.in`. This will be configured by CMake to produce the final `setup.py` file, but in order to do this, a list of the .pyx files to be compiled must be gathered.

Therefore, the `add_python_binding()` macro is defined in `src/mlpack/bindings/python/CMakeLists.txt` (p. 2386). This adds the given binding to the `MLPACK_PYXS` variable, which is then inserted into `setup.py` as part of the `configure_file()` step in `src/mlpack/CMakeLists.txt` (p. 2389).

2.7.4 Generation of .pyx files

A binding named `program` is built into a program called `generate_pyx_program` (this a CMake target, so you can build these individually if you like). The file `src/mlpack/bindings/python/generate_pyx.cpp.in` is configured by CMake to set the name of the program and the `*_main.cpp` file to include correctly, then the `mlpack::bindings::python::PrintPYX()` (p. 354) function is called by the program. The `PrintPYX()` (p. 354) function uses the parameters that have been set in the CLI singleton by the `PROGRAM_INFO()` (p. 2733) and `PARAM_*`() macros in order to actually print a fully-working .pyx file that can be compiled. The file has several sections:

- Python imports (numpy/pandas/cython/etc.)
- Cython imports of C++ utility functions and Armadillo functionality
- Cython imports of any necessary serializable model types
- Definitions of classes for serializable model types
- The binding function definition
- Documentation: input and output parameters
- The call to `mlpackMain()`
- Handling of output functionality
- Return of output parameters

Any output parameters for Python bindings are returned in a dict containing named elements.

2.7.5 Building the .pyx files

After building the `generate_pyx_program` target, the `build_pyx_program` target is built as a dependency of the `python` target. This simply takes the generated .pyx file and uses Python `setuptools` to compile this to a Python binding.

2.7.6 Testing the Python bindings

We cannot do our tests only from the Boost Unit Test Framework in C++ because we need to see that we are able to load parameters properly from Python and return output correctly.

The tests are in `src/mlpack/bindings/python/tests/` and test both the actual bindings and also the auxiliary Python code included in `src/mlpack/bindings/python/mlpack/`.

2.8 Adding new binding types

Adding a new binding type to mlpack is fairly straightforward once the general structure of the CLI singleton and the function map that CLI uses is understood. For each different language that bindings are desired for, the route to a solution will be particularly different—so it is hard to provide any general guidance for how to make new bindings that will be applicable to each language.

In general, the first thing to handle will be how matrices are passed back and forth between the target language. Typically this might mean getting the memory address of an input matrix and wrapping an `arma::mat` object around that memory address. This can be handled in the `GetParam()` (p. 290) function that is part of the CLI singleton function map; see `get_param.hpp` for both the CLI and Python bindings for an example (in `src/mlpack/bindings/cli/` and `src/mlpack/bindings/python/`).

Serialization of models is also a tricky consideration; in some languages you will be able to pass a pointer to the model itself. This is generally best—users should not expect to be able to manipulate the model in the target language, but they should expect that they can pass a model back and forth without paying a runtime penalty. So, for example, serializing a model using a `boost::text_oarchive` and then returning the string that represents the model is not acceptable, because that string can be extremely large and the time it takes to decode the model can be very large.

The strategy of generating a binding definition for the target language, like what is done with Python, can be a useful strategy that should be considered. If this is the route that is desired, a large amount of CMake boilerplate may be necessary. The Python CMake configuration can be referred to as an example, but probably a large amount of adaptation to other languages will be necessary.

Lastly, when adding a new language, be sure to make sure it works with the Markdown documentation generator. In order to make this happen, you will need to modify all of the `add_markdown_docs()` calls in the different CMake `Lists.txt` files to contain the name of the language you have written a binding for. You will also need to modify every function in `src/mlpack/bindings/markdown/print_doc_functions_impl.hpp` to correctly call out to the corresponding function for the language that you have written bindings for.

Chapter 3

Building mlpack From Source

3.1 Introduction

This document discusses how to build mlpack from source. However, mlpack is in the repositories of many Linux distributions and so it may be easier to use the package manager for your system. For example, on Ubuntu, you can install mlpack with the following command:

```
$ sudo apt-get install libmlpack-dev
```

Note

Older Ubuntu versions may not have the most recent version of mlpack available—for instance, at the time of this writing, Ubuntu 16.04 only has mlpack 2.0.1 available. Options include upgrading Ubuntu to a newer release, finding a PPA or other non-official sources, or installing with a manual build (below).

If mlpack is not available in your system's package manager, then you can follow this document for how to compile and install mlpack from source.

mlpack uses CMake as a build system and allows several flexible build configuration options. One can consult any of numerous CMake tutorials for further documentation, but this tutorial should be enough to get mlpack built and installed on most Linux and UNIX-like systems (including OS X). If you want to build mlpack on Windows, see **Building mlpack From Source on Windows** (p. 27) (alternatively, you can read Keon's excellent tutorial which is based on older versions).

You can download the latest mlpack release from here: `mlpack-3.1.1`

3.2 Simple Linux build instructions

Assuming all dependencies are installed in the system, you can run the commands below directly to build and install mlpack.

```
$ wget https://www.mlpack.org/files/mlpack-3.1.1.tar.gz
$ tar -xvzpf mlpack-3.1.1.tar.gz
$ mkdir mlpack-3.1.1/build && cd mlpack-3.1.1/build
$ cmake ../
$ make -j4 # The -j is the number of cores you want to use for a build.
$ sudo make install
```

If the `cmake ..` command fails, you are probably missing a dependency, so check the output and install any necessary libraries. (See **Dependencies of mlpack** (p. 22).)

On many Linux systems, mlpack will install by default to `/usr/local/lib` and you may need to set the `LD_LIBRARY_PATH` environment variable:

```
export LD_LIBRARY_PATH=/usr/local/lib
```

The instructions above are the simplest way to get, build, and install mlpack. The sections below discuss each of those steps in further detail and show how to configure mlpack.

3.3 Creating Build Directory

First we should unpack the mlpack source and create a build directory.

```
$ tar -xvzpf mlpack-3.1.1.tar.gz
$ cd mlpack-3.1.1
$ mkdir build
```

The directory can have any name, not just 'build', but 'build' is sufficient.

3.4 Dependencies of mlpack

mlpack depends on the following libraries, which need to be installed on the system and have headers present:

- Armadillo $\geq 6.500.0$ (with LAPACK support)
- Boost (math_c99, program_options, serialization, unit_test_framework, heap, spirit) ≥ 1.49

For Python bindings, the following packages are required:

- setuptools
- cython ≥ 0.24

- numpy
- pandas \geq 0.15.0
- pytest-runner

In Ubuntu and Debian, you can get all of these dependencies through apt:

```
# apt-get install libboost-math-dev libboost-program-options-dev
libboost-test-dev libboost-serialization-dev libarmadillo-dev binutils-dev
python-pandas python-numpy cython python-setuptools
```

On Fedora, Red Hat, or CentOS, these same dependencies can be obtained via dnf:

```
# dnf install boost-devel boost-test boost-program-options boost-math
armadillo-devel binutils-devel python2-Cython python2-setuptools
python2-numpy python2-pandas
```

(It's also possible to use python3 packages from the package manager—mlpack will work with either.)

3.5 Configuring CMake

Running CMake is the equivalent to running `./configure` with autotools. If you run CMake with no options, it will configure the project to build without debugging or profiling information (for speed).

```
$ cd build
$ cmake ../
```

You can manually specify options to compile with debugging information and profiling information (useful if you are developing mlpack):

```
$ cd build
$ cmake -D DEBUG=ON -D PROFILE=ON ../
```

The full list of options mlpack allows:

- `DEBUG=(ON/OFF)`: compile with debugging symbols (default OFF)
- `PROFILE=(ON/OFF)`: compile with profiling symbols (default OFF)
- `ARMA_EXTRA_DEBUG=(ON/OFF)`: compile with extra Armadillo debugging symbols (default OFF)
- `BUILD_TESTS=(ON/OFF)`: compile the `mlpack_test` program (default ON)
- `BUILD_CLI_EXECUTABLES=(ON/OFF)`: compile the mlpack command-line executables (i.e. `mlpack_knn`, `mlpack_kfn`, `mlpack_logistic_regression`, etc.) (default ON)
- `BUILD_PYTHON_BINDINGS=(ON/OFF)`: compile the bindings for Python, if the necessary Python libraries are available (default ON except on Windows)

- `MATLAB_BINDINGS=(ON/OFF)`: Compile MATLAB bindings if MATLAB is found (default OFF)
- `BUILD_SHARED_LIBS=(ON/OFF)`: compile shared libraries as opposed to static libraries (default ON)
- `TEST_VERBOSE=(ON/OFF)`: run test cases in `mlpack_test` with verbose output (default OFF)
- `DOWNLOAD_ENSMALLEN=(ON/OFF)`: If `ensmallen` is not found, download it (default ON)
- `BUILD_WITH_COVERAGE=(ON/OFF)`: Build with support for code coverage tools (gcc only) (default OFF)
- `BUILD_MARKDOWN_BINDINGS=(ON/OFF)`: Build Markdown bindings for website documentation (default OFF)
- `MATHJAX=(ON/OFF)`: use MathJax for generated Doxygen documentation (default OFF)
- `FORCE_CXX11=(ON/OFF)`: assume that the compiler supports C++11 instead of checking; be sure to specify any necessary flag to enable C++11 as part of `CXXFLAGS` (default OFF)
- `USE_OPENMP=(ON/OFF)`: if ON, then use OpenMP if the compiler supports it; if OFF, OpenMP support is manually disabled (default ON)

Each option can be specified to CMake with the '-D' flag. Other tools can also be used to configure CMake, but those are not documented here.

In addition, the following directories may be specified, to find include files and libraries. These also use the '-D' flag.

- `ARMADILLO_INCLUDE_DIR=(/path/to/armadillo/include/)`: path to Armadillo headers
- `ARMADILLO_LIBRARY=(/path/to/armadillo/libarmadillo.so)`: location of Armadillo library
- `BOOST_ROOT=(/path/to/boost/)`: path to root of boost installation
- `ENSMALLEN_INCLUDE_DIR=(/path/to/ensmallen/include)`: path to include directory for `ensmallen`
- `MATHJAX_ROOT=(/path/to/mathjax)`: path to root of MathJax installation

3.6 Building mlpack

Once CMake is configured, building the library is as simple as typing 'make'. This will build all library components as well as 'mlpack_test'.

```
$ make
Scanning dependencies of target mlpack
[ 1%] Building CXX object
src/mlpack/CMakeFiles/mlpack.dir/core/optimizers/aug_lagrangian/aug_lagrangian_test_functions.cpp.o
<...>
```

It's often useful to specify `-jN` to the `make` command, which will build on `N` processor cores. That can accelerate the build significantly.

You can specify individual components which you want to build, if you do not want to build everything in the library:

```
$ make mlpack_pca mlpack_knn mlpack_kfn
```

One particular component of interest is `mlpack_test`, which runs the mlpack test suite. You can build this component with

```
$ make mlpack_test
```

and then run all of the tests, or an individual test suite:

```
$ bin/mlpack_test
$ bin/mlpack_test -t KNNTest
```

If the build fails and you cannot figure out why, register an account on Github and submit an issue and the mlpack developers will quickly help you figure it out:

<https://mlpack.org/>

<https://github.com/mlpack/mlpack>

Alternately, mlpack help can be found in IRC at `#mlpack` on `irc.freenode.net`.

3.7 Installing mlpack

If you wish to install mlpack to the system, make sure you have root privileges (or write permissions to those two directories), and simply type

```
# make install
```

You can now run the executables by name; you can link against mlpack with `-lmlpack`, and the mlpack headers are found in `/usr/include` or `/usr/local/include` (depending on the system and CMake configuration). If Python bindings were installed, they should be available when you start Python.

3.8 Using mlpack without installing

If you would prefer to use mlpack after building but without installing it to the system, this is possible. All of the command-line programs in the `build/bin/` directory will run directly with no modification.

For running the Python bindings from the build directory, the situation is a little bit different. You will need to set the following environment variables:

```
export LD_LIBRARY_PATH=/path/to/mlpack/build/lib:${LD_LIBRARY_PATH}
export PYTHONPATH=/path/to/mlpack/build/src/mlpack/bindings/python:${PYTHONPATH}
```

(Be sure to substitute the correct path to your build directory for `/path/to/mlpack/build/`.)

Once those environment variables are set, you should be able to start a Python interpreter and `import mlpack`, then use the Python bindings.

Chapter 4

Building mlpack From Source on Windows

4.1 Introduction

This tutorial will show you how to build mlpack for Windows from source, so you can later create your own C++ applications. Before you try building mlpack, you may want to install mlpack using vcpkg for Windows. If you don't want to install using vcpkg, skip this section and continue with the build tutorial.

- Install Git (<https://git-scm.com/downloads> and execute setup)
- Install CMake (<https://cmake.org/> and execute setup)
- Install vcpkg (<https://github.com/Microsoft/vcpkg> and execute setup)
- To install the mlpack library only:

```
PS> .\vcpkg install mlpack:x64-windows
```

- To install mlpack and its console programs:

```
PS> .\vcpkg install mlpack[tools]:x64-windows
```

After installing, in Visual Studio, you can create a new project (or open an existing one). The library is immediately ready to be included (via preprocessor directives) and used in your project without additional configuration.

4.2 Build Environment

This tutorial has been designed and tested using:

- Windows 10
- Visual Studio 2017 (toolset v141)
- mlpack
- OpenBLAS.0.2.14.1
- boost_1_66_0-msvc-14.1-64
- armadillo-8.500.1
- and x64 configuration

The directories and paths used in this tutorial are just for reference purposes.

4.3 Pre-requisites

- Install CMake for Windows (win64-x64 version from <https://cmake.org/download/>) and make sure you can use it from the Command Prompt (may need to add to the PATH)
- Download the latest mlpack release from here: [mlpack website](#)

4.4 Windows build instructions

- Unzip mlpack to "C:\mlpack\mlpack"
- Open Visual Studio and select: File > New > Project from Existing Code
 - Type of project: Visual C++
 - Project location: "C:\mlpack\mlpack"
 - Project name: mlpack
 - Finish
- We will use this Visual Studio project to get the OpenBLAS dependency in the next section

4.5 Dependencies

OpenBLAS Dependency

- Open the NuGet packages manager (Tools > NuGet Package Manager > Manage NuGet Packages for Solution...)
- Click on the "Browse" tab and search for "openblas"
- Click on OpenBlas and check the mlpack project, then click Install
- Once it has finished installing, close Visual Studio

Boost Dependency

You can either get Boost via NuGet or you can download the prebuilt Windows binaries separately. This tutorial follows the second approach for simplicity.

- Download the "Prebuilt Windows binaries" of the Boost library ("boost_1_66_0-msvc-14.1-64") from [Sourceforge](#)

Note

Make sure you download the MSVC version that matches your Visual Studio

- Install or unzip to "C:\boost"

Armadillo Dependency

- Download the newest version of Armadillo from [Sourceforge](#)
- Unzip to "C:\mlpack\armadillo"
- Create a "build" directory into "C:\mlpack\armadillo\"
- Open the Command Prompt and navigate to "C:\mlpack\armadillo\build"
- Run cmake:

```
cmake -G "Visual Studio 15 2017 Win64" -DBLAS_LIBRARY:FILEPATH="
C:/mlpack/mlpack/packages/OpenBLAS.0.2.14.1/lib/native/lib/x64/libopenblas.dll.a" -DLAPACK_LIBRARY:FILEPATH="
C:/mlpack/mlpack/packages/OpenBLAS.0.2.14.1/lib/native/lib/x64/libopenblas.dll.a" ..
```

Note

If you are using different directory paths, a different configuration (e.g. Release) or a different VS version, update the cmake command accordingly.

- Once it has successfully finished, open "C:\mlpack\armadillo\build\armadillo.sln"
- Build > Build Solution
- Once it has successfully finished, close Visual Studio

4.6 Building mlpack

- Create a "build" directory into "C:\mlpack\mlpack"
- You can generate the project using either cmake via command line or GUI. If you prefer to use GUI, refer to the **appendix** (p. 30)
- To use the CMake command line prompt, open the Command Prompt and navigate to "C:\mlpack\mlpack\build"
- Run cmake:

```
cmake -G "Visual Studio 15 2017 Win64" -DBLAS_LIBRARY:FILEPATH="
C:/mlpack/mlpack/packages/OpenBLAS.0.2.14.1/lib/native/lib/x64/libopenblas.dll.a" -DLAPACK_LIBRARY:FILEPATH="
C:/mlpack/mlpack/packages/OpenBLAS.0.2.14.1/lib/native/lib/x64/libopenblas.dll.a" -DARMADILLO_INCLUDE_DIR="C:/mlpack/armadillo"
-DARMADILLO_LIBRARY:FILEPATH="C:/mlpack/armadillo/build/Debug/armadillo.lib" -DBOOST_INCLUDEDIR:PATH="C:/boost/" -
DBOOST_LIBRARYDIR:PATH="C:/boost/lib64-msvc-14.1" -DDEBUG=OFF -DPROFILE=OFF ..
```

Note

cmake will attempt to automatically download the ensmallen dependency. If for some reason cmake can't download the dependency, you will need to manually download ensmallen from <http://ensmallen.org/> and extract it to "C:\mlpack\mlpack\deps". Then, specify the path to ensmallen using the flag: `-DENSMALLEN_INCLUDE_↵ DIR=C:/mlpack/mlpack/deps/ensmallen/include`

- Once CMake configuration has successfully finished, open "C:\mlpack\mlpack\build\mlpack.sln"
- Build > Build Solution (this may be by default in Debug mode)
- Once it has successfully finished, you will find the library files you need in: "C:\mlpack\mlpack\build\Debug" (or "C:\mlpack\mlpack\build\Release" if you changed to Release mode)

You are ready to create your first application, take a look at the **Sample C++ ML App** (p. 65)

4.7 Appendix

If you prefer to use cmake GUI, follow these instructions:

- To use the CMake GUI, open "CMake".
 - For "Where is the source code:" set `C:\mlpack\mlpack\`
 - For "Where to build the binaries:" set `C:\mlpack\mlpack\build`
 - Click `Configure`
 - If there is an error and Armadillo is not found, try "Add Entry" with the following variables and reconfigure:
 - * Name: `ARMADILLO_INCLUDE_DIR`; type `PATH`; value `C:/mlpack/armadillo/include/`
 - * Name: `ARMADILLO_LIBRARY`; type `FILEPATH`; value `C:/mlpack/armadillo/build/Debug/armadillo.lib`
 - * Name: `BLAS_LIBRARY`; type `FILEPATH`; value `C:/mlpack/mlpack/packages/OpenBLAS.0.2.14.1/lib/native/lib/x64/libopenblas.dll.a`
 - * Name: `LAPACK_LIBRARY`; type `FILEPATH`; value `C:/mlpack/mlpack/packages/OpenBLAS.0.2.14.1/lib/native/lib/x64/libopenblas.dll.a`
 - If there is an error and Boost is not found, try "Add Entry" with the following variables and reconfigure:
 - * Name: `BOOST_INCLUDEDIR`; type `PATH`; value `C:/boost/`
 - * Name: `BOOST_LIBRARYDIR`; type `PATH`; value `C:/boost/lib64-msvc-14.1`
 - If Boost is still not found, try adding the following variables and reconfigure:
 - * Name: `Boost_INCLUDE_DIR`; type `PATH`; value `C:/boost/`
 - * Name: `Boost_PROGRAM_OPTIONS_LIBRARY_DEBUG`; type `FILEPATH`; value should be `C:/boost/lib64-msvc-14.1/boost_program_options-vc141-mt-gd-x64-1_66.lib`
 - * Name: `Boost_PROGRAM_OPTIONS_LIBRARY_RELEASE`; type `FILEPATH`; value should be `C:/boost/lib64-msvc-14.1/boost_program_options-vc141-mt-x64-1_66.lib`
 - * Name: `Boost_SERIALIZATION_LIBRARY_DEBUG`; type `FILEPATH`; value should be `C:/boost/lib64-msvc-14.1/boost_serialization-vc141-mt-gd-x64-1_66.lib`
 - * Name: `Boost_SERIALIZATION_LIBRARY_RELEASE`; type `FILEPATH`; value should be `C:/boost/lib64-msvc-14.1/boost_program_options-vc141-mt-x64-1_66.lib`
 - * Name: `Boost_UNIT_TEST_FRAMEWORK_LIBRARY_DEBUG`; type `FILEPATH`; value should be `C:/boost/lib64-msvc-14.1/boost_unit_test_framework-vc141-mt-gd-x64-1_66.lib`
 - * Name: `Boost_UNIT_TEST_FRAMEWORK_LIBRARY_RELEASE`; type `FILEPATH`; value should be `C:/boost/lib64-msvc-14.1/boost_unit_test_framework-vc141-mt-x64-1_66.lib`
 - Once CMake has configured successfully, hit "Generate" to create the `.sln` file.

4.8 Additional Information

If you are facing issues during the build process of mlpack, you may take a look at other third-party tutorials for Windows, but they may be out of date:

Github wiki Windows Build page
 Keon's tutorial for mlpack 2.0.3
 Kirizaki's tutorial for mlpack 2

Chapter 5

mlpack command-line quickstart guide

5.1 Introduction

This page describes how you can quickly get started using mlpack from the command-line and gives a few examples of usage, and pointers to deeper documentation.

This quickstart guide is also available for **Python** (p. 59).

5.2 Installing mlpack

Installing the mlpack is straightforward and can be done with your system's package manager.

For instance, for Ubuntu or Debian the command is simply

```
sudo apt-get install mlpack-bin
```

On Fedora or Red Hat:

```
sudo dnf install mlpack
```

If you use a different distribution, mlpack may be packaged under a different name. And if it is not packaged, you can use a Docker image from Dockerhub:

```
docker run -it mlpack/mlpack /bin/bash
```

This Docker image has mlpack already built and installed.

If you prefer to build mlpack from scratch, see **Building mlpack From Source** (p. 21).

5.3 Simple mlpack quickstart example

As a really simple example of how to use mlpack from the command-line, let's do some simple classification on a subset of the standard machine learning `covertypes` dataset. We'll first split the dataset into a training set and a testing set, then we'll train an mlpack random forest on the training data, and finally we'll print the accuracy of the random forest on the test dataset.

You can copy-paste this code directly into your shell to run it.

```
# Get the dataset and unpack it.
wget https://www.mlpack.org/datasets/covertypes-small.data.csv.gz
wget https://www.mlpack.org/datasets/covertypes-small.labels.csv.gz
gunzip covertypes-small.data.csv.gz covertypes-small.labels.csv.gz

# Split the dataset; 70% into a training set and 30% into a test set.
# Each of these options has a shorthand single-character option but here we type
# it all out for clarity.
mlpack_preprocess_split \
  --input_file covertypes-small.data.csv \
  --input_labels_file covertypes-small.labels.csv \
  --training_file covertypes-small.train.csv \
  --training_labels_file covertypes-small.train.labels.csv \
  --test_file covertypes-small.test.csv \
  --test_labels_file covertypes-small.test.labels.csv \
  --test_ratio 0.3 \
  --verbose

# Train a random forest.
mlpack_random_forest \
  --training_file covertypes-small.train.csv \
  --labels_file covertypes-small.train.labels.csv \
  --num_trees 10 \
  --minimum_leaf_size 3 \
  --print_training_accuracy \
  --output_model_file rf-model.bin \
  --verbose

# Now predict the labels of the test points and print the accuracy.
# Also, save the test set predictions to the file 'predictions.csv'.
mlpack_random_forest \
  --input_model_file rf-model.bin \
  --test_file covertypes-small.test.csv \
  --test_labels_file covertypes-small.test.labels.csv \
  --predictions_file predictions.csv \
  --verbose
```

We can see by looking at the output that we achieve reasonably good accuracy on the test dataset (80%+). The file `predictions.csv` could also be used by other tools; for instance, we can easily calculate the number of points that were predicted incorrectly:

```
$ diff -U 0 predictions.csv covertypes-small.test.labels.csv | grep '^@@"' | wc -l
```

It's easy to modify the code above to do more complex things, or to use different mlpack learners, or to interface with other machine learning toolkits.

5.4 What else does mlpack implement?

The example above has only shown a little bit of the functionality of mlpack. Lots of other commands are available with different functionality. A full list of commands and full documentation for each can be found on the following page:

- [CLI documentation](#)

For more information on what mlpack does, see <https://www.mlpack.org/>. Next, let's go through another example for providing movie recommendations with mlpack.

5.5 Using mlpack for movie recommendations

In this example, we'll train a collaborative filtering model using mlpack's `mlpack_cf` program. We'll train this on the MovieLens dataset from <https://grouplens.org/datasets/movielens/>, and then we'll use the model that we train to give recommendations.

You can copy-paste this code directly into the command line to run it.

```
wget https://www.mlpack.org/datasets/ml-20m/ratings-only.csv.gz
wget https://www.mlpack.org/datasets/ml-20m/movies.csv.gz
gunzip ratings-only.csv.gz
gunzip movies.csv.gz

# Hold out 10% of the dataset into a test set so we can evaluate performance.
mlpack_preprocess_split \
  --input_file ratings-only.csv \
  --training_file ratings-train.csv \
  --test_file ratings-test.csv \
  --test_ratio 0.1 \
  --verbose

# Train the model. Change the rank to increase/decrease the complexity of the
# model.
mlpack_cf \
  --training_file ratings-train.csv \
  --test_file ratings-test.csv \
  --rank 10 \
  --algorithm RegSVD \
  --output_model_file cf-model.bin \
  --verbose

# Now query the 5 top movies for user 1.
echo "1" > query.csv;
mlpack_cf \
  --input_model_file cf-model.bin \
  --query_file query.csv \
  --recommendations 10 \
  --output_file recommendations.csv \
  --verbose

# Get the names of the movies for user 1.
echo "Recommendations for user 1:"
for i in `seq 1 10`; do
  item=`cat recommendations.csv | awk -F',' '{ print '$i' }'`;
  head -n $((($item + 2)) movies.csv | tail -1 | \
    sed 's/^[^,]*,[^,]*,/' | \
    sed 's/\/(.*)\,.*$/1/' | sed 's/"/g';
done
```

Here is some example output, showing that user 1 seems to have good taste in movies:

```
Recommendations for user 1:
Casablanca (1942)
Pan's Labyrinth (Laberinto del fauno, El) (2006)
Godfather, The (1972)
Answer This! (2010)
Life Is Beautiful (La Vita è bella) (1997)
Adventures of Tintin, The (2011)
Dark Knight, The (2008)
Out for Justice (1991)
Dr. Strangelove or: How I Learned to Stop Worrying and Love the Bomb (1964)
Schindler's List (1993)
```

5.6 Next steps with mlpack

Now that you have done some simple work with mlpack, you have seen how it can easily plug into a data science production workflow for the command line. A great thing to do next would be to look at more documentation for the mlpack command-line programs:

- `mlpack command-line program documentation`

Also, mlpack is much more flexible from C++ and allows much greater functionality. So, more complicated tasks are possible if you are willing to write C++. To get started learning about mlpack in C++, the following resources might be helpful:

- `mlpack C++ tutorials`
- `mlpack build and installation guide`
- `Simple sample C++ mlpack programs`
- `mlpack Doxygen documentation homepage`

Chapter 6

Cross-Validation

6.1 Introduction

mlpack implements cross-validation support for its learning algorithms, for a variety of performance measures. Cross-validation is useful for determining an estimate of how well the learner will generalize to un-seen test data. It is a commonly used part of the data science pipeline.

In short, given some learner and some performance measure, we wish to get an average of the performance measure given different splits of the dataset into training data and validation data. The learner is trained on the training data, and the performance measure is evaluated on the validation data.

mlpack currently implements two easy-to-use forms of cross-validation:

- **simple cross-validation**, where we simply desire the performance measure on a single split of the data into a training set and validation set
- **k-fold cross-validation**, where we split the data k ways and desire the average performance measure on each of the k splits of the data

In this tutorial we will see the usage examples and details of the cross-validation module. Because the cross-validation code is generic and can be used with any learner and performance measure, any use of the cross-validation code in mlpack has to be in C++.

This tutorial is split into the following sections:

- **Simple cross-validation examples** (p. 36) Simple cross-validation examples
 - **10-fold cross-validation on softmax regression** (p. 36) 10-fold cross-validation on softmax regression
 - **10-fold cross-validation on weighted decision trees** (p. 37) 10-fold cross-validation on weighted decision trees
 - **10-fold cross-validation with categorical decision trees** (p. 37) 10-fold cross-validation with categorical decision trees
 - **Simple cross-validation for linear regression** (p. 38) Simple cross-validation for linear regression
- **Performance measures** (p. 38) Performance measures
- **The KFoldCV and SimpleCV classes** (p. 39) The **KFoldCV** (p. 1134) and **SimpleCV** (p. 1151) classes
- **Further references** (p. 41) Further reference

6.2 Simple cross-validation examples

6.2.1 10-fold cross-validation on softmax regression

Suppose we have some data to train and validate on, as defined below:

```
// 100-point 6-dimensional random dataset.
arma::mat data = arma::randu<arma::mat>(6, 100);
// Random labels in the [0, 4] interval.
arma::Row<size_t> labels =
    arma::randi<arma::Row<size_t>>(100, arma::distr_param(0, 4));
size_t numClasses = 5;
```

The code above generates an 100-point random 6-dimensional dataset with 5 classes.

To run 10-fold cross-validation for softmax regression with accuracy as a performance measure, we can write the following piece of code.

```
KFoldCV<SoftmaxRegression, Accuracy> cv(10, data, labels, numClasses);
double lambda = 0.1;
double softmaxAccuracy = cv.Evaluate(lambda);
```

Note that the `Evaluate` method of **KFoldCV** (p. 1134) takes any hyperparameters of an algorithm—that is, anything that is not `data`, `labels`, `numClasses`, `datasetInfo`, or `weights` (those last three may not be present for every algorithm type). To be more specific, in this example the `Evaluate` method relies on the following **SoftmaxRegression** (p. 1811) constructor:

```
template<typename OptimizerType = mlpack::optimization::L_BFGS>
SoftmaxRegression(const arma::mat& data,
    const arma::Row<size_t>& labels,
    const size_t numClasses,
    const double lambda = 0.0001,
    const bool fitIntercept = false,
    OptimizerType optimizer = OptimizerType());
```

which has the parameter `lambda` after three conventional arguments (`data`, `labels` and `numClasses`). We can skip passing `fitIntercept` and `optimizer` since there are the default values. (Technically, we don't even need to pass `lambda` since there is a default value.)

In general to cross-validate you need to specify what machine learning algorithm and metric you are going to use, and then to pass some conventional data-related parameters into one of the cross-validation constructors and all other parameters (which are generally hyperparameters) into the `Evaluate` method.

6.2.2 10-fold cross-validation on weighted decision trees

In the following example we will cross-validate **DecisionTree** (p. 2065) with weights. This is very similar to the previous example, except that we also have instance weights for each point in the dataset. We can generate weights for the dataset from the previous example with the code below:

```
// Random weights for every point from the code snippet above.
arma::rowvec weights = arma::randu<arma::mat>(1, 100);
```

Given those weights for each point, we can now perform cross-validation by also passing the weights to the constructor of **KFoldCV** (p. 1134) :

```
KFoldCV<DecisionTree<>, Accuracy> cv2(10, data, labels, numClasses, weights);
size_t minimumLeafSize = 8;
double weightedDecisionTreeAccuracy = cv2.Evaluate(minimumLeafSize);
```

As with the previous example, internally this call to `cv2.Evaluate()` relies on the following **DecisionTree** (p. 2065) constructor:

```
template<typename MatType, typename LabelsType, typename WeightsType>
DecisionTree(MatType&& data,
             LabelsType&& labels,
             const size_t numClasses,
             WeightsType&& weights,
             const size_t minimumLeafSize = 10,
             const std::enable_if_t<arma::is_arma_type<
                 typename std::remove_reference<WeightsType>::type>::value>*
                 = 0>);
```

6.2.3 10-fold cross-validation with categorical decision trees

DecisionTree (p. 2065) models can be constructed in multiple other ways. For example, if we have a dataset with both categorical and numerical features, we can also perform cross-validation by using the associated **data::DatasetInfo** (p. 376) object. Thus, given some **data::DatasetInfo** (p. 376) object called `datasetInfo` (that perhaps was produced by a call to **data::Load()** (p. 379)), we can perform k-fold cross-validation in a similar manner to the other examples:

```
KFoldCV<DecisionTree<>, Accuracy> cv3(10, data, datasetInfo, labels,
    numClasses);
double decisionTreeWithDIAccuracy = cv3.Evaluate(minimumLeafSize);
```

This particular call to `cv3.Evaluate()` relies on the following **DecisionTree** (p. 2065) constructor:

```
template<typename MatType, typename LabelsType>
DecisionTree(MatType&& data,
             const data::DatasetInfo& datasetInfo,
             LabelsType&& labels,
             const size_t numClasses,
             const size_t minimumLeafSize = 10);
```

6.2.4 Simple cross-validation for linear regression

SimpleCV (p. 1151) has the same interface as **KFoldCV** (p. 1134), except it takes as one of its arguments a proportion (from 0 to 1) of data used as a validation set. For example, to validate **LinearRegression** (p. 1789) with 20% of the data used in the validation set we can write the following code.

```
// Random responses for every point from the code snippet in the beginning of
// the tutorial.
arma::rowvec responses = arma::randu<arma::rowvec>(100);

SimpleCV<LinearRegression, MSE> cv4(0.2, data, responses);
double lrLambda = 0.05;
double lrMSE = cv4.Evaluate(lrLambda);
```

6.3 Performance measures

The cross-validation classes require a performance measure to be specified. **mlpack** has a number of performance measures implemented; below is a list:

- **mlpack::cv::Accuracy** (p. 1127): a simple measure of accuracy
- **mlpack::cv::F1** (p. 1132): the **F1** (p. 1132) score; depends on an averaging strategy
- **mlpack::cv::MSE** (p. 1143): minimum squared error (for regression problems)
- **mlpack::cv::Precision** (p. 1145): the precision, for classification problems
- **mlpack::cv::Recall** (p. 1147): the recall, for classification problems

In addition, it is not difficult to implement a custom performance measure. A class following the structure below can be used:

```
class CustomMeasure
{
    //
    // This evaluates the metric given a trained model and a set of data (with
    // labels or responses) to evaluate on. The data parameter will be a type of
    // Armadillo matrix, and the labels will be the labels that go with the model.
    //
    // If you know that your model is a classification model (and thus that
    // ResponsesType will be arma::Row<size_t>), it is ok to replace the
    // ResponsesType template parameter with arma::Row<size_t>.
    //
    template<typename MAlgorithm, typename DataType, typename ResponsesType>
    static double Evaluate(MAlgorithm& model,
                          const DataType& data,
                          const ResponsesType& labels)
    {
        // Inside the method you should call model.Predict() and compare the
        // values with the labels, in order to get the desired performance measure
        // and return it.
    }
};
```

Once this is implemented, then **CustomMeasure** (or whatever the class is called) is easy to use as a custom performance measure with **KFoldCV** (p. 1134) or **SimpleCV** (p. 1151).

6.4 The KFoldCV and SimpleCV classes

This section provides details about the **KFoldCV** (p.1134) and **SimpleCV** (p.1151) classes. The cross-validation infrastructure is based on heavy amounts of template metaprogramming, so that any **mlpack** learner and any performance measure can be used. Both classes have two required template parameters and one optional parameter:

- **MLAlgorithm**: the type of learner to be used
- **Metric**: the performance measure to be evaluated
- **MatType**: the type of matrix used to store the data

In addition, there are two more template parameters, but these are automatically extracted from the given **MLAlgorithm** class, and users should not need to specify these parameters except when using an unconventional type like `arma::fmat` for data points.

The general structure of the **KFoldCV** (p.1134) and **SimpleCV** (p.1151) classes is split into two parts:

- The constructor: create the object, and store the data for the **MLAlgorithm** training.
- The `Evaluate()` method: take any non-data parameters for the **MLAlgorithm** and calculate the desired performance measure.

This split is important because it defines the API: all data-related parameters are passed to the constructor, whereas algorithm hyperparameters are passed to the `Evaluate()` method.

6.4.1 The KFoldCV and SimpleCV constructors

There are six constructors available for **KFoldCV** (p.1134) and **SimpleCV** (p.1151), each tailored for a different learning situation. Each is given below for the **KFoldCV** (p.1134) class, but the same constructors are also available for the **SimpleCV** (p.1151) class, with the exception that instead of specifying `k`, the number of folds, the **SimpleCV** (p.1151) class takes a parameter between 0 and 1 specifying the percentage of the dataset to use as a validation set.

- `KFoldCV(k, xs, ys)`: this is for unweighted regression applications and two-class classification applications; `xs` is the dataset and `ys` are the responses or labels for each point in the dataset.
- `KFoldCV(k, xs, ys, numClasses)`: this is for unweighted classification applications; `xs` is the dataset, `ys` are the class labels for each data point, and `numClasses` is the number of classes in the dataset.
- `KFoldCV(k, xs, datasetInfo, ys, numClasses)`: this is for unweighted categorical/numeric classification applications; `xs` is the dataset, `datasetInfo` is a **data::DatasetInfo** (p.376) object that holds the types of each dimension in the dataset, `ys` are the class labels for each data point, and `numClasses` is the number of classes in the dataset.
- `KFoldCV(k, xs, ys, weights)`: this is for weighted regression or two-class classification applications; `xs` is the dataset, `ys` are the responses or labels for each point in the dataset, and `weights` are the weights for each point in the dataset.

- `KFoldCV(k, xs, ys, numClasses, weights)`: this is for weighted classification applications; `xs` is the dataset, `ys` are the class labels for each point in the dataset; `numClasses` is the number of classes in the dataset, and `weights` holds the weights for each point in the dataset.
- `KFoldCV(k, xs, datasetInfo, ys, numClasses, weights)`: this is for weighted categorical/numeric classification applications; `xs` is the dataset, `datasetInfo` is a `data::DatasetInfo` (p. 376) object that holds the types of each dimension in the dataset, `ys` are the class labels for each data point, `numClasses` is the number of classes in each dataset, and `weights` holds the weights for each point in the dataset.

Note that the constructor you should use is the constructor that most closely matches the constructor of the machine learning algorithm you would like performance measures of. So, for instance, if you are doing multi-class softmax regression, you could call the constructor `"SoftmaxRegression(xs, ys, numClasses)"`. Therefore, for **KFoldCV** (p. 1134) you would call the constructor `"KFoldCV(k, xs, ys, numClasses)"` and for **SimpleCV** (p. 1151) you would call the constructor `"SimpleCV(pct, xs, ys, numClasses)"`.

6.4.2 The Evaluate() method

The other method that **KFoldCV** (p. 1134) and **SimpleCV** (p. 1151) have is the method to actually calculate the performance measure: `Evaluate()`. The `Evaluate()` method takes any hyperparameters that would follow the data arguments to the constructor or `Train()` method of the given `MLAlgorithm`. The `Evaluate()` method takes no more arguments than that, and returns the desired performance measure on the dataset.

Therefore, let us suppose that we are interested in cross-validating the performance of a softmax regression model, and that we have constructed the appropriate **KFoldCV** (p. 1134) object using the code below:

```
KFoldCV<SoftmaxRegression, Precision> cv(k, data, labels, numClasses);
```

The **SoftmaxRegression** (p. 1811) class has the constructor

```
template<typename OptimizerType = mlpack::optimization::L_BFGS>
SoftmaxRegression(const arma::mat& data,
                  const arma::Row<size_t>& labels,
                  const size_t numClasses,
                  const double lambda = 0.0001,
                  const bool fitIntercept = false,
                  OptimizerType optimizer = OptimizerType());
```

Note that all parameters after `numClasses` are optional. This means that we can specify none or any of them in our call to `Evaluate()`. Below is some example code showing three different ways we can call `Evaluate()` with the `cv` object from the code snippet above.

```
// First, call with all defaults.
double result1 = cv.Evaluate();

// Next, call with lambda set to 0.1 and fitIntercept set to true.
double result2 = cv.Evaluate(0.1, true);

// Lastly, create a custom optimizer to use for optimization, and use a lambda
// value of 0.5 and fit no intercept.
optimization::SGD<> sgd(0.05, 50000); // Step size of 0.05, 50k max iterations.
double result3 = cv.Evaluate(0.5, false, sgd);
```

The same general idea applies to any `MLAlgorithm`: all hyperparameters must be passed to the `Evaluate()` method of **KFoldCV** (p. 1134) or **SimpleCV** (p. 1151).

6.5 Further references

For further documentation, please see the associated Doxygen documentation for each of the relevant classes:

- **mlpack::cv::SimpleCV** (p. 1151)
- **mlpack::cv::KFoldCV** (p. 1134)
- **mlpack::cv::Accuracy** (p. 1127)
- **mlpack::cv::F1** (p. 1132)
- **mlpack::cv::MSE** (p. 1143)
- **mlpack::cv::Precision** (p. 1145)
- **mlpack::cv::Recall** (p. 1147)

If you are interested in implementing a different cross-validation strategy than k-fold cross-validation or simple cross-validation, take a look at the implementations of each of those classes to guide your implementation.

In addition, the **hyperparameter tuner** (p. 49) documentation may also be relevant.

Chapter 7

File formats and loading data in mlpack

7.1 Introduction

mlpack supports a wide variety of data and model formats for use in both its command-line programs and in C++ programs using mlpack via the **mlpack::data::Load()** (p. 379) function. This tutorial discusses the formats that are supported and how to use them.

7.2 Simple examples to load data in C++

The example code snippets below load data from different formats into an Armadillo matrix object (`arma::mat`) or model when using C++.

```
using namespace mlpack;

arma::mat matrix1;
data::Load("dataset.csv", matrix1);

using namespace mlpack;

arma::mat matrix2;
data::Load("dataset.bin", matrix2);

using namespace mlpack;

arma::mat matrix3;
data::Load("dataset.h5", matrix3);

using namespace mlpack;

// ARFF loading is a little different, since sometimes mapping has to be done
// for string types.
arma::mat matrix4;
data::DatasetInfo datasetInfo;
data::Load("dataset.arff", matrix4, datasetInfo);

// The datasetInfo object now holds information about each dimension.

using namespace mlpack;

regression::LogisticRegression lr;
data::Load("model.bin", "logistic_regression_model", lr);
```

7.3 Supported dataset types

Datasets in mlpack are represented internally as sparse or dense numeric matrices (specifically, as `arma::mat` or `arma::sp_mat` or similar). This means that when datasets are loaded from file, they must be converted to a suitable numeric representation. Therefore, in general, datasets on disk should contain only numeric features in order to be loaded successfully by mlpack.

The types of datasets that mlpack can load are roughly the same as the types of matrices that Armadillo can load. However, the load functionality that mlpack provides **only supports loading dense datasets**. When datasets are loaded by mlpack, **the file's type is detected using the file's extension**. mlpack supports the following file types:

- csv (comma-separated values), denoted by .csv or .txt
- tsv (tab-separated values), denoted by .tsv, .csv, or .txt
- ASCII (raw ASCII, with space-separated values), denoted by .txt
- Armadillo ASCII (Armadillo's text format with a header), denoted by .txt
- PGM, denoted by .pgm
- PPM, denoted by .ppm
- Armadillo binary, denoted by .bin
- Raw binary, denoted by .bin (**note: this will be loaded as one-dimensional data, which is likely not what is desired.**)
- HDF5, denoted by .hdf, .hdf5, .h5, or .he5 (**note: HDF5 must be enabled in the Armadillo configuration**)
- ARFF, denoted by .arff (**note: this is not supported by all mlpack command-line programs ; see Categorical features and command line programs (p. 46)**)

Datasets that are loaded by mlpack should be stored with **one row for one point** and **one column for one dimension**. Therefore, a dataset with three two-dimensional points $(0, 1)$, $(3, 1)$, and $(5, -5)$ would be stored in a csv file as:

```
0, 1
3, 1
5, -5
```

As noted earlier, for command-line programs, the format is automatically detected at load time. Therefore, a dataset can be loaded in many ways:

```
$ mlpack_logistic_regression -t dataset.csv -v
[INFO ] Loading 'dataset.csv' as CSV data. Size is 32 x 37749.
...

$ mlpack_logistic_regression -t dataset.txt -v
[INFO ] Loading 'dataset.txt' as raw ASCII formatted data. Size is 32 x 37749.
...

$ mlpack_logistic_regression -t dataset.h5 -v
[INFO ] Loading 'dataset.h5' as HDF5 data. Size is 32 x 37749.
...
```

Similarly, the format to save to is detected by the extension of the given filename.

7.4 Loading simple matrices in C++

When C++ is being written, the `mlpack::data::Load()` (p. 379) and `mlpack::data::Save()` (p. 386) functions are used to load and save datasets, respectively. These functions should be preferred over the built-in Armadillo `.load()` and `.save()` functions.

Matrices in `mlpack` are column-major, meaning that each column should correspond to a point in the dataset and each row should correspond to a dimension; for more information, see **Matrices in `mlpack`** (p. 57). This is at odds with how the data is stored in files; therefore, a transposition is required during load and save. The `mlpack::data::Load()` (p. 379) and `mlpack::data::Save()` (p. 386) functions do this automatically (unless otherwise specified), which is why they are preferred over the Armadillo functions.

To load a matrix from file, the call is straightforward. After creating a matrix object, the data can be loaded:

```
arma::mat dataset; // The data will be loaded into this matrix.
mlpack::data::Load("dataset.csv", dataset);
```

Saving matrices is equally straightforward. The code below generates a random matrix with 10 points in 3 dimensions and saves it to a file as HDF5.

```
// 3 dimensions (rows), with 10 points (columns).
arma::mat dataset = arma::randu<arma::mat>(3, 10);
mlpack::data::Save("dataset.h5", dataset);
```

As with the command-line programs, the type of data to be loaded is automatically detected from the filename extension. For more details, see the `mlpack::data::Load()` (p. 379) and `mlpack::data::Save()` (p. 386) documentation.

7.5 Dealing with sparse matrices

As mentioned earlier, support for loading sparse matrices in `mlpack` is not available at this time. To use a sparse matrix with `mlpack` code, you will have to write a C++ program instead of using any of the command-line tools, because the command-line tools all use dense datasets internally. (There is one exception: the `mlpack_cf` program, for collaborative filtering, loads sparse coordinate lists.)

In addition, the `mlpack::data::Load()` (p. 379) function does not support loading any sparse format; so the best idea is to use undocumented Armadillo functionality to load coordinate lists. Suppose you have a coordinate list file like the one below:

```
$ cat cl.csv
0 0 0.332
1 3 3.126
4 4 1.333
```

This represents a 5x5 matrix with three nonzero elements. We can load this using Armadillo:

```
arma::sp_mat matrix;
matrix.load("cl.csv", arma::coord_ascii);
matrix = matrix.t(); // We must transpose after load!
```

The transposition after loading is necessary if the coordinate list is in row-major format (that is, if each row in the matrix represents a point and each column represents a feature). Be sure that the matrix you use with `mlpack` methods has points as columns and features as rows! See **Matrices in `mlpack`** (p. 57) for more information.

7.6 Categorical features and command line programs

In some situations it is useful to represent data not just as a numeric matrix but also as categorical data (i.e. with numeric but unordered categories). This support is useful for, e.g., decision trees and other models that support categorical features.

In some machine learning situations, such as, e.g., decision trees, categorical data can be used. Categorical data might look like this (in CSV format):

```
0, 1, "true", 3
5, -2, "false", 5
2, 2, "true", 4
3, -1, "true", 3
4, 4, "not sure", 0
0, 7, "false", 6
```

In the example above, the third dimension (which takes values "true", "false", and "not sure") is categorical. mlpack can load and work with this data, but the strings must be mapped to numbers, because all dataset in mlpack are represented by Armadillo matrix objects.

From the perspective of an mlpack command-line program, this support is transparent; mlpack will attempt to load the data file, and if it detects entries in the file that are not numeric, it will map them to numbers and then print, for each dimension, the number of mappings. For instance, if we run the `mlpack_hoeffding_tree` program (which supports categorical data) on the dataset above (stored as `dataset.csv`), we receive this output during loading:

```
$ mlpack_hoeffding_tree -t dataset.csv -l dataset.labels.csv -v
[INFO ] Loading 'dataset.csv' as CSV data. Size is 6 x 4.
[INFO ] 0 mappings in dimension 0.
[INFO ] 0 mappings in dimension 1.
[INFO ] 3 mappings in dimension 2.
[INFO ] 0 mappings in dimension 3.
...
```

Currently, only the `mlpack_hoeffding_tree` program supports loading categorical data, and this is also the only program that supports loading an ARFF dataset.

7.7 Categorical features and C++

When writing C++, loading categorical data is slightly more tricky: the mappings from strings to integers must be preserved. This is the purpose of the `mlpack::data::DatasetInfo` (p. 376) class, which stores these mappings and can be used to load and save time to apply and de-apply the mappings.

When loading a dataset with categorical data, the overload of `mlpack::data::Load()` (p. 379) that takes an `mlpack::data::DatasetInfo` (p. 376) object should be used. An example is below:

```
arma::mat dataset; // Load into this matrix.
mlpack::data::DatasetInfo info; // Store information about dataset in this.

// Load the ARFF dataset.
mlpack::data::Load("dataset.arff", dataset, info);
```

After this load completes, the `info` object will hold the information about the mappings necessary to load the dataset. It is possible to re-use the `DatasetInfo` object to load another dataset with the same mappings. This is useful when, for instance, both a training and test set are being loaded, and it is necessary that the mappings from strings to integers for categorical features are identical. An example is given below.

```
arma::mat trainingData; // Load training data into this matrix.
mlpack::data::DatasetInfo info; // This will store the mappings.

// Load the training data, and create the mappings in the 'info' object.
mlpack::data::Load("training_data.arff", trainingData, info);

// Load the test data, but re-use the 'info' object with the already initialized
// mappings. This means that the same mappings will be applied to the test set.
mlpack::data::Load("test_data.arff", trainingData, info);
```

When saving data, pass the same `DatasetInfo` object it was loaded with in order to unmap the categorical features correctly. The example below demonstrates this functionality: it loads the dataset, increments all non-categorical features by 1, and then saves the dataset with the same `DatasetInfo` it was loaded with.

```
arma::mat dataset; // Load data into this matrix.
mlpack::data::DatasetInfo info; // This will store the mappings.

// Load the dataset.
mlpack::data::Load("dataset.tsv", dataset, info);

// Loop over all features, and add 1 to all non-categorical features.
for (size_t i = 0; i < info.Dimensionality(); ++i)
{
    // The Type() function returns whether or not the data is numeric or
    // categorical.
    if (info.Type(i) != mlpack::data::Datatype::categorical)
        dataset.row(i) += 1.0;
}

// Save the modified dataset using the same DatasetInfo.
mlpack::data::Save("dataset-new.tsv", dataset, info);
```

There is more functionality to the `DatasetInfo` class; for more information, see the `mlpack::data::DatasetInfo` (p. 376) documentation.

7.8 Loading and saving models

Using `boost::serialization` (p. 251), `mlpack` is able to load and save machine learning models with ease. These models can currently be saved in three formats:

- binary (.bin); this is not human-readable, but it is small
- text (.txt); this is sort of human-readable and relatively small
- xml (.xml); this is human-readable but very verbose and large

The type of file to save is determined by the given file extension, as with the other loading and saving functionality in `mlpack`. Below is an example where a dataset stored as TSV and labels stored as ASCII text are used to train a logistic regression model, which is then saved to `model.xml`.

```
$ mlpack_logistic_regression -t training_dataset.tsv -l training_labels.txt \
> -M model.xml
```

Many `mlpack` command-line programs have support for loading and saving models through the `-input_model_file` (-m) and `-output_model_file` (-M) options; for more information, see the documentation for each program (accessible by passing `-help` as a parameter).

7.9 Loading and saving models in C++

mlpack uses the `boost::serialization` (p. 251) library internally to perform loading and saving of models, and provides convenience overloads of `mlpack::data::Load()` (p. 379) and `mlpack::data::Save()` (p. 386) to load and save these models.

To be serializable, a class must implement the method

```
template<typename Archive>
void serialize(Archive& ar, const unsigned int version);
```

Note

For more information on this method and how it works, see the `boost::serialization` (p. 251) documentation at <http://www.boost.org/libs/serialization/doc/>.

Examples of `serialize()` methods can be found in most classes; one fairly straightforward example is found in the `mlpack::math::Range` class (p. 1557). A more complex example is found in the `mlpack::tree::BinarySpace↵ Tree` class (p. 2018).

Using the `mlpack::data::Load()` (p. 379) and `mlpack::data::Save()` (p. 386) classes is easy if the type being saved has a `serialize()` method implemented: simply call either function with a filename, a name for the object to save, and the object itself. The example below, for instance, creates an `mlpack::math::Range` (p. 409) object and saves it as `range.txt`. Then, that range is loaded from file into another `mlpack::math::Range` (p. 409) object.

```
// Create range and save it.
mlpack::math::Range r(0.0, 5.0);
mlpack::data::Save("range.txt", "range", r);

// Load into new range.
mlpack::math::Range newRange;
mlpack::data::Load("range.txt", "range", newRange);
```

It is important to be sure that you load the appropriate type; if you save, for instance, an `mlpack::regression::↵ LogisticRegression` (p. 1795) object and attempt to load it as an `mlpack::math::Range` (p. 409) object, the load will fail and an exception will be thrown. (When the object is saved as binary (.bin), it is possible that the load will not fail, but instead load with mangled data, which is perhaps even worse!)

7.10 Final notes

If the examples here are unclear, it would be worth looking into the ways that `mlpack::data::Load()` (p. 379) and `mlpack::data::Save()` (p. 386) are used in the code. Some example files that may be useful to this end:

- `src/mlpack/methods/logistic_regression/logistic_regression_main.cpp`
- `src/mlpack/methods/hoeffding_trees/hoeffding_tree_main.cpp`
- `src/mlpack/methods/neighbor_search/knn_main.cpp`

If you are interested in adding support for more data types to mlpack, it would be preferable to add the support upstream to Armadillo instead, so that may be a better direction to go first. Then very little code modification for mlpack will be necessary.

Chapter 8

Hyper-Parameter Tuning

8.1 Introduction

mlpack implements a generic hyperparameter tuner that is able to tune both continuous and discrete parameters of various different algorithms. This is an important task—the performance of many machine learning algorithms can be highly dependent on the hyperparameters that are chosen for that algorithm. (One example: the choice of k for a k -nearest-neighbors classifier.)

This hyper-parameter tuner is built on the same general concept as the cross-validation classes (see the **cross-validation tutorial** (p.35)): given some machine learning algorithm, some data, some performance measure, and a set of hyperparameters, attempt to find the hyperparameter set that best optimizes the performance measure on the given data with the given algorithm.

mlpack's implementation of hyperparameter tuning is flexible, and is built in a way that supports many algorithms and many optimizers. At the time of this writing, complex hyperparameter optimization techniques are not available, but the hyperparameter tuner does support these, should they be implemented in the future.

In this tutorial we will see the usage examples of the hyper-parameter tuning module, and also more details about the **HyperParameterTuner** (p.1375) class.

8.2 Basic Usage

The interface of the hyper-parameter tuning module is quite similar to the interface of the **cross-validation module** (p.35). To construct a **HyperParameterTuner** (p.1375) object you need to specify as template parameters what machine learning algorithm, cross-validation strategy, performance measure, and optimization strategy (Grid↵Search will be used by default) you are going to use. Then, you must pass the same arguments as for the cross-validation classes: the data and labels (or responses) to use are given to the constructor, and the possible hyperparameter values are given to the **HyperParameterTuner::Optimize()** (p.1378) method, which returns the best algorithm configuration as a `std::tuple<>`.

Let's see some examples.

Suppose we have the following data to train and validate on.

```
// 100-point 5-dimensional random dataset.
arma::mat data = arma::randu<arma::mat>(5, 100);
// Noisy responses retrieved by a random linear transformation of data.
arma::rowvec responses = arma::randu<arma::rowvec>(5) * data +
    0.1 * arma::randn<arma::rowvec>(100);
```

Given the dataset above, we can use the following code to try to find a good `lambda` value for **LinearRegression** (p. 1789). Here we use **SimpleCV** (p. 1151) instead of k-fold cross-validation to save computation time.

```
// Using 80% of data for training and remaining 20% for assessing MSE.
double validationSize = 0.2;
HyperParameterTuner<LinearRegression, MSE, SimpleCV> hpt(validationSize,
    data, responses);

// Finding a good value for lambda from the discrete set of values 0.0, 0.001,
// 0.01, 0.1, and 1.0.
arma::vec lambdas{0.0, 0.001, 0.01, 0.1, 1.0};
double bestLambda;
std::tie(bestLambda) = hpt.Optimize(lambdas);
```

In this example we have used `GridSearch` (the default optimizer) to find a good value for the `lambda` hyper-parameter. For that we have specified what values should be tried.

8.3 Fixed Arguments

When some hyper-parameters should not be optimized, you can specify values for them with the **Fixed()** (p. 398) method as in the following example of trying to find good `lambda1` and `lambda2` values for **LARS** (p. 1783) (least-angle regression).

```
HyperParameterTuner<LARS, MSE, SimpleCV> hpt2(validationSize, data,
    responses);

// The hyper-parameter tuner should not try to change the transposeData or
// useCholesky parameters.
bool transposeData = true;
bool useCholesky = false;

// We wish only to search for the best lambda1 and lambda2 values.
arma::vec lambda1Set{0.0, 0.001, 0.01, 0.1, 1.0};
arma::vec lambda2Set{0.0, 0.002, 0.02, 0.2, 2.0};

double bestLambda1, bestLambda2;
std::tie(bestLambda1, bestLambda2) = hpt2.Optimize(Fixed(transposeData),
    Fixed(useCholesky), lambda1Set, lambda2Set);
```

Note that for the call to `hpt2.Optimize()`, we have used the same order of arguments as they appear in the corresponding **LARS** (p. 1783) constructor:

```
LARS(const arma::mat& data,
    const arma::rowvec& responses,
    const bool transposeData = true,
    const bool useCholesky = false,
    const double lambda1 = 0.0,
    const double lambda2 = 0.0,
    const double tolerance = 1e-16);
```

8.4 Gradient-Based Optimization

In some cases we may wish to optimize a hyperparameter over the space of all possible real values, instead of providing a grid in which to search. Alternately, we may know approximately optimal values from a grid search for real-valued hyperparameters, but wish to further tune those values.

In this case, we can use a gradient-based optimizer for hyperparameter search. In the following example, we try to optimize the `lambda1` and `lambda2` hyper-parameters for **LARS** (p. 1783) with the `GradientDescent` optimizer.

```
HyperParameterTuner<LARS, MSE, SimpleCV, GradientDescent> hpt3(validationSize,
    data, responses);

// GradientDescent can be adjusted in the following way.
hpt3.Optimizer().StepSize() = 0.1;
hpt3.Optimizer().Tolerance() = 1e-15;

// We can set up values used for calculating gradients.
hpt3.RelativeDelta() = 0.01;
hpt3.MinDelta() = 1e-10;

double initialLambda1 = 0.001;
double initialLambda2 = 0.002;

double bestGDLambda1, bestGDLambda2;
std::tie(bestGDLambda1, bestGDLambda2) = hpt3.Optimize(Fixed(transposeData),
    Fixed(useCholesky), initialLambda1, initialLambda2);
```

8.5 The HyperParameterTuner class

The **HyperParameterTuner** (p. 1375) class is very similar to the **KFoldCV** (p. 1134) and **SimpleCV** (p. 1151) classes (see the "cross-validation tutorial" for more information on those two classes), but there are a few important differences.

First, the **HyperParameterTuner** (p. 1375) accepts five different hyperparameters; only the first three of these are required:

- **MLAlgorithm** This is the algorithm to be used.
- **Metric** This is the performance measure to be used; see **Performance measures** (p. 38) for more information.
- **CVType** This is the type of cross-validation to be used for evaluating the performance measure; this should be **KFoldCV** (p. 1134) or **SimpleCV** (p. 1151).
- **OptimizerType** This is the type of optimizer to use; it can be `GridSearch` or a gradient-based optimizer.
- **MatType** This is the type of data matrix to use. The default is `arma::mat`. This only needs to be changed if you are specifically using sparse data, or if you want to use a numeric type other than `double`.

The last two template parameters are automatically inferred by the **HyperParameterTuner** (p. 1375) and should not need to be manually specified, unless an unconventional data type like `arma::fmat` is being used for data points.

Typically, **SimpleCV** (p. 1151) is a good choice for **CVType** because it takes so much less time to compute than full **KFoldCV** (p. 1134); however, the disadvantage is that **SimpleCV** (p. 1151) might give a somewhat more noisy estimate of the performance measure on unseen test data.

The constructor for the **HyperParameterTuner** (p. 1375) is called with exactly the same arguments as the corresponding **CVType** that has been chosen. For more information on that, please see the **cross-validation constructor tutorial** (p. 39). As an example, if we are using **SimpleCV** (p. 1151) and wish to hold out 20% of the dataset as a validation set, we might construct a **HyperParameterTuner** (p. 1375) like this:

```
// We will use LinearRegression as the MLAlgorithm, and MSE as the performance
// measure. Our dataset is 'dataset' and the responses are 'responses'.
HyperParameterTuner<LinearRegression, MSE, SimpleCV> hpt(0.2, dataset,
    responses);
```

Next, we must set up the hyperparameters to be optimized. If we are doing a grid search with the GridSearch optimizer (the default), then we only need to pass a `std::vector` (for non-numeric hyperparameters) or an `arma::vec` (for numeric hyperparameters) containing all of the possible choices that we wish to search over.

For instance, a set of numeric values might be chosen like this, for the `lambda` parameter (of type `double`):

```
arma::vec lambdaSet = arma::vec("0.0 0.1 0.5 1.0");
```

Similarly, a set of non-numeric values might be chosen like this, for the `intercept` parameter:

```
std::vector<bool> interceptSet = { false, true };
```

Once all of these are set up, the `HyperParameterTuner::Optimize()` (p. 1378) method may be called to find the best set of hyperparameters:

```
bool intercept;
double lambda;
std::tie(lambda, intercept) = hpt.Optimize(lambdaSet, interceptSet);
```

Alternately, the `Fixed()` (p. 398) method (detailed in the **Fixed arguments** (p. 50) section) can be used to fix the values of some parameters.

For continuous optimizers like GradientDescent, a range does not need to be specified but instead only a single value. See the **Gradient-Based Optimization** (p. 51) section for more details.

8.6 Further documentation

For more information on the `HyperParameterTuner` (p. 1375) class, see the `mlpack::hpt::HyperParameterTuner` (p. 1375) class documentation and the **cross-validation tutorial** (p. 35).

Chapter 9

Writing an mpack binding

9.1 Introduction

This tutorial gives some simple examples of how to write an mpack binding that can be compiled for multiple languages. These bindings make up the core of how most users will interact with mpack.

mpack provides the following:

- **mpack::Log** (p. 1538), for debugging / informational / warning / fatal output
- **mpack::CLI** (p. 1117), for parsing command line options or other option

Each of those classes are well-documented, and that documentation should be consulted for further reference.

First, we'll discuss the logging infrastructure, which is useful for giving output that users can see.

9.2 Simple Logging Example

mpack has four logging levels:

- `Log::Debug`
- `Log::Info`
- `Log::Warn`
- `Log::Fatal`

Output to `Log::Debug` does not show (and has no performance penalty) when mlpack is compiled without debugging symbols. Output to `Log::Info` is only shown when the program is run with the `-verbose` (or `-v`) flag. `Log::Warn` is always shown, and `Log::Fatal` will throw a `std::runtime_error` exception, after a newline is sent to it. If mlpack was compiled with debugging symbols, `Log::Fatal` will also print a backtrace, if the necessary libraries are available.

Here is a simple example binding, and its output. Note that instead of `int main()`, we use `static void mlpackMain()`. This is because the automatic binding generator (see [mlpack automatic bindings to other languages](#) (p. 3)) will set up the environment and once that is done, it will call `mlpackMain()`.

```
#include <mlpack/core.hpp>
#include <mlpack/core/util/cli.hpp>
// This definition below means we will only compile for the CLI.
#define BINDING_TYPE BINDING_TYPE_CLI
#include <mlpack/core/util/mlpack_main.hpp>

using namespace mlpack;

static void mlpackMain()
{
    Log::Debug << "Compiled with debugging symbols." << std::endl;

    Log::Info << "Some test informational output." << std::endl;

    Log::Warn << "A warning!" << std::endl;

    Log::Fatal << "Program has crashed." << std::endl;

    Log::Warn << "Made it!" << std::endl;
}
```

Assuming mlpack is installed on the system and the code above is saved in `test.cpp`, this program can be compiled with the following command:

```
$ g++ -o test test.cpp -DDEBUG -g -rdynamic -lmlpack
```

Since we compiled with `-DDEBUG`, if we run the program as below, the following output is shown:

```
$ ./test --verbose
[DEBUG] Compiled with debugging symbols.
[INFO ] Some test informational output.
[WARN ] A warning!
[FATAL] [bt]: (1) /absolute/path/to/file/example.cpp:6: function()
[FATAL] Program has crashed.
terminate called after throwing an instance of 'std::runtime_error'
  what():  fatal error; see Log::Fatal output
Aborted
```

The flags `-g` and `-rdynamic` are only necessary for providing a backtrace. If those flags are not given during compilation, the following output would be shown:

```
$ ./test --verbose
[DEBUG] Compiled with debugging symbols.
[INFO ] Some test informational output.
[WARN ] A warning!
[FATAL] Cannot give backtrace because program was compiled without: -g -rdynamic
[FATAL] For a backtrace, recompile with: -g -rdynamic.
[FATAL] Program has crashed.
terminate called after throwing an instance of 'std::runtime_error'
  what():  fatal error; see Log::Fatal output
Aborted
```

The last warning is not reached, because `Log::Fatal` terminates the program.

Without debugging symbols (i.e. without `-g` and `-DDEBUG`) and without `-verbose`, the following is shown:

```
$ ./test
[WARN ] A warning!
[FATAL] Program has crashed.
terminate called after throwing an instance of 'std::runtime_error'
  what():  fatal error; see Log::Fatal output
Aborted
```

These four outputs can be very useful for both providing informational output and debugging output for your `mlpack` program.

9.3 Simple CLI Example

Through the `mlpack::CLI` (p. 1117) object, command-line parameters can be easily added with the `PROGRAM_INFO`, `PARAM_INT`, `PARAM_DOUBLE`, `PARAM_STRING`, and `PARAM_FLAG` macros.

Here is a sample use of those macros, extracted from `methods/pca/pca_main.cpp`. (Some details have been omitted from the snippet below.)

```
#include <mlpack/core.hpp>
#include <mlpack/core/util/cli.hpp>
#include <mlpack/core/util/mlpack_main.hpp>

// Document program.
PROGRAM_INFO("Principal Components Analysis",
  // Short description.
  "An implementation of several strategies for principal components analysis "
  "(PCA), a common preprocessing step. Given a dataset and a desired new "
  "dimensionality, this can reduce the dimensionality of the data using the "
  "linear transformation determined by PCA.",
  // Long description.
  "This program performs principal components analysis on the given dataset "
  "using the exact, randomized, randomized block Krylov, or QUIC SVD method. "
  "It will transform the data onto its principal components, optionally "
  "performing dimensionality reduction by ignoring the principal components "
  "with the smallest eigenvalues.",
  // "See also" section for generated documentation.
  SEE_ALSO("Principal component analysis on Wikipedia",
    "https://en.wikipedia.org/wiki/Principal_component_analysis"),
  SEE_ALSO("mlpack::pca::PCA C++ class documentation",
    "@doxygen/classmlpack_1_1pca_1_1PCA.html"));

// Parameters for program.
PARAM_MATRIX_IN_REQ("input", "Input dataset to perform PCA on.", "i");
PARAM_MATRIX_OUT("output", "Matrix to save modified dataset to.", "o");
PARAM_INT_IN("new_dimensionality", "Desired dimensionality of output dataset.",
  "d", 0);

using namespace mlpack;

static void mlpackMain()
{
  // Load input dataset.
  arma::mat& dataset = CLI::GetParam<arma::mat>("input");

  size_t newDimension = CLI::GetParam<int>("new_dimensionality");

  ...

  // Now save the results.
  if (CLI::HasParam("output"))
    CLI::GetParam<arma::mat>("output") = std::move(dataset);
}
```

Documentation is automatically generated using those macros, and when the program is run with `--help` the following is displayed:

```
$ mlpack_pca --help
Principal Components Analysis

This program performs principal components analysis on the given dataset. It
will transform the data onto its principal components, optionally performing
dimensionality reduction by ignoring the principal components with the
smallest eigenvalues.

Required options:

--input_file [string]      Input dataset to perform PCA on.
--output_file [string]     Matrix to save modified dataset to.

Options:

--help (-h)               Default help info.
--info [string]           Get help on a specific module or option.
                          Default value "".
--new_dimensionality [int] Desired dimensionality of output dataset.
                          Default value 0.
--verbose (-v)            Display informational messages and the full list
                          of parameters and timers at the end of
                          execution.
```

The **mlpack::CLI** (p. 1117) documentation can be consulted for further and complete documentation. Also useful is to look at other example bindings, found in `src/mlpack/methods/`.

Chapter 10

Matrices in mlpack

10.1 Introduction

mlpack uses Armadillo matrices for matrix support. Armadillo is a fast C++ matrix library which makes use of advanced template techniques to provide the fastest possible matrix operations.

Documentation on Armadillo can be found on their website:

<http://arma.sourceforge.net/docs.html>

Nonetheless, there are a few further caveats for mlpack Armadillo usage.

10.2 Column-major Matrices

Armadillo matrices are stored in a column-major format; this means that on disk, each column is located in contiguous memory.

This means that, for the vast majority of machine learning methods, it is faster to store observations as columns and dimensions as rows. This is counter to most standard machine learning texts!

Major implications of this are for linear algebra. For instance, the covariance of a matrix is typically

$$C = X^T X$$

but for a column-wise matrix, it is

$$C = X X^T$$

and this is very important to keep in mind! If your mlpack code is not working, this may be a factor in why.

10.3 Loading Matrices

mlpack provides a **data::Load()** (p. 379) and **data::Save()** (p. 386) function, which should be used instead of Armadillo's loading and saving functions.

Most machine learning data is stored in row-major format; a CSV, for example, will generally have one observation per line and each column will correspond to a dimension.

The **data::Load()** (p. 379) and **data::Save()** (p. 386) functions transpose the matrix upon loading, meaning that the following CSV:

```
$ cat data.csv
3,3,3,3,0
3,4,4,3,0
3,4,4,3,0
3,3,4,3,0
3,6,4,3,0
2,4,4,3,0
2,4,4,1,0
3,3,3,2,0
3,4,4,2,0
3,4,4,2,0
3,3,4,2,0
3,6,4,2,0
2,4,4,2,0
```

is actually loaded with 5 rows and 13 columns, not 13 rows and 5 columns like the CSV is written. More information on mlpack's loading functionality can be found in **File formats and loading data in mlpack** (p. 43).

This is important to remember!

Chapter 11

mlpack in Python quickstart guide

11.1 Introduction

This page describes how you can quickly get started using mlpack from Python and gives a few examples of usage, and pointers to deeper documentation.

This quickstart guide is also available for **the command-line** (p. 31).

11.2 Installing mlpack

Installing the mlpack bindings for Python is straightforward. It's easy to use conda or pip to do this:

```
pip install mlpack/mlpack3
```

```
conda install -c mlpack mlpack
```

Otherwise, we can build the Python bindings from scratch, as follows. First we have to install the dependencies (the code below is for Ubuntu), then we can build and install mlpack. You can copy-paste the commands into your shell.

```
sudo apt-get install libboost-all-dev g++ cmake libarmadillo-dev python-pip wget
sudo pip install cython setuptools distutils numpy pandas
wget https://www.mlpack.org/files/mlpack-3.1.1.tar.gz
tar -xvzpf mlpack-3.1.1.tar.gz
mkdir -p mlpack-3.1.1/build/ && cd mlpack-3.1.1/build/
cmake ../ && make -j4 && sudo make install
```

More information on the build process and details can be found on the **Building mlpack From Source** (p. 21) page. You may also need to set the environment variable `LD_LIBRARY_PATH` to include `/usr/local/lib/` on most Linux systems.

```
export LD_LIBRARY_PATH=/usr/local/lib/
```

You can also use the mlpack Docker image on Dockerhub, which has all of the Python bindings pre-installed:

```
docker run -it mlpack/mlpack /bin/bash
```

11.3 Simple mlpack quickstart example

As a really simple example of how to use mlpack from Python, let's do some simple classification on a subset of the standard machine learning `covertypes` dataset. We'll first split the dataset into a training set and a testing set, then we'll train an mlpack random forest on the training data, and finally we'll print the accuracy of the random forest on the test dataset.

You can copy-paste this code directly into Python to run it.

```
import mlpack
import pandas as pd
import numpy as np

# Load the dataset from an online URL.  Replace with 'covertypes.csv.gz' if you
# want to use on the full dataset.
df = pd.read_csv('http://www.mlpack.org/datasets/covertypes-small.csv.gz')

# Split the labels.
labels = df['label']
dataset = df.drop('label', 1)

# Split the dataset using mlpack.  The output comes back as a dictionary,
# which we'll unpack for clarity of code.
output = mlpack.preprocess_split(input=dataset,
                                input_labels=labels,
                                test_ratio=0.3)

training_set = output['training']
training_labels = output['training_labels']
test_set = output['test']
test_labels = output['test_labels']

# Train a random forest.
output = mlpack.random_forest(training=training_set,
                              labels=training_labels,
                              print_training_accuracy=True,
                              num_trees=10,
                              minimum_leaf_size=3)

random_forest = output['output_model']

# Predict the labels of the test points.
output = mlpack.random_forest(input_model=random_forest,
                              test=test_set)

# Now print the accuracy.  The 'probabilities' output could also be used
# to generate an ROC curve.
correct = np.sum(
    output['predictions'] == np.reshape(test_labels, (test_labels.shape[0],)))
print(str(correct) + ' correct out of ' + str(len(test_labels)) + ' (' +
      str(100 * float(correct) / float(len(test_labels))) + '%).')
```

We can see that we achieve reasonably good accuracy on the test dataset (80%+); if we use the full `covertypes.csv.gz`, the accuracy should increase significantly (but training will take longer).

It's easy to modify the code above to do more complex things, or to use different mlpack learners, or to interface with other machine learning toolkits.

11.4 What else does mlpack implement?

The example above has only shown a little bit of the functionality of mlpack. Lots of other commands are available with different functionality. A full list of each of these commands and full documentation can be found on the following page:

- [Python documentation](#)

For more information on what mlpack does, see <https://www.mlpack.org/>. Next, let's go through another example for providing movie recommendations with mlpack.

11.5 Using mlpack for movie recommendations

In this example, we'll train a collaborative filtering model using mlpack's `cf()` method. We'll train this on the MovieLens dataset from <https://grouplens.org/datasets/movielens/>, and then we'll use the model that we train to give recommendations.

You can copy-paste this code directly into Python to run it.

```
import mlpack
import pandas as pd
import numpy as np

# First, load the MovieLens dataset. This is taken from files.grouplens.org/
# but reposted on mlpack.org as unpacked and slightly preprocessed data.
ratings = pd.read_csv('http://www.mlpack.org/datasets/ml-20m/ratings-only.csv.gz')
movies = pd.read_csv('http://www.mlpack.org/datasets/ml-20m/movies.csv.gz')

# Hold out 10% of the dataset into a test set so we can evaluate performance.
output = mlpack.preprocess_split(input=ratings, test_ratio=0.1, verbose=True)
ratings_train = output['training']
ratings_test = output['test']

# Train the model. Change the rank to increase/decrease the complexity of the
# model.
output = mlpack.cf(training=ratings_train,
                   test=ratings_test,
                   rank=10,
                   verbose=True,
                   algorithm='RegSVD')
cf_model = output['output_model']

# Now query the 5 top movies for user 1.
output = mlpack.cf(input_model=cf_model,
                   query=[[1]],
                   recommendations=10,
                   verbose=True)

# Get the names of the movies for user 1.
print("Recommendations for user 1:")
for i in range(10):
    print(" " + str(i) + ": " + str(movies.loc[movies['movieId'] ==
        output['output'][0, i]].iloc[0]['title']))
```

Here is some example output, showing that user 1 seems to have good taste in movies:

```
Recommendations for user 1:
0: Casablanca (1942)
1: Pan's Labyrinth (Laberinto del fauno, El) (2006)
2: Godfather, The (1972)
3: Answer This! (2010)
4: Life Is Beautiful (La Vita è bella) (1997)
5: Adventures of Tintin, The (2011)
6: Dark Knight, The (2008)
7: Out for Justice (1991)
8: Dr. Strangelove or: How I Learned to Stop Worrying and Love the Bomb (1964)
9: Schindler's List (1993)
```

11.6 Next steps with mlpack

Now that you have done some simple work with mlpack, you have seen how it can easily plug into a data science workflow in Python. A great thing to do next would be to look at more documentation for the Python mlpack bindings:

- [Python mlpack binding documentation](#)

Also, mlpack is much more flexible from C++ and allows much greater functionality. So, more complicated tasks are possible if you are willing to write C++ (or perhaps Cython). To get started learning about mlpack in C++, the following resources might be helpful:

- [mlpack C++ tutorials](#)
- [mlpack build and installation guide](#)
- [Simple sample C++ mlpack programs](#)
- [mlpack Doxygen documentation homepage](#)

Chapter 12

Simple Sample mlpack Programs

12.1 Introduction

On this page, several simple mlpack examples are contained, in increasing order of complexity. If you compile from the command-line, be sure that your compiler is in C++11 mode. With modern gcc and clang, this should already be the default.

Note

The command-line programs like `knn_main.cpp` and `logistic_regression_main.cpp` from the directory `src/mlpack/methods/` cannot be compiled easily by hand (the same is true for the individual tests in `src/mlpack/tests/`); instead, those should be compiled with CMake, by running, e.g., `make mlpack_knn` or `make mlpack_test`; see **Building mlpack From Source** (p. 21). However, any program that uses mlpack (and is not a part of the library itself) can be compiled easily with g++ or clang from the command line.

12.2 Covariance Computation

A simple program to compute the covariance of a data matrix ("data.csv"), assuming that the data is already centered, and save it to file.

```
// Includes all relevant components of mlpack.
#include <mlpack/core.hpp>

// Convenience.
using namespace mlpack;

int main()
{
    // First, load the data.
    arma::mat data;
    // Use data::Load() which transposes the matrix.
    data::Load("data.csv", data, true);

    // Now compute the covariance. We assume that the data is already centered.
    // Remember, because the matrix is column-major, the covariance operation is
    // transposed.
    arma::mat cov = data * trans(data) / data.n_cols;

    // Save the output.
    data::Save("cov.csv", cov, true);
}
```

12.3 Nearest Neighbor

This simple program uses the `mlpack::neighbor::NeighborSearch` (p. 1627) object to find the nearest neighbor of each point in a dataset using the L1 metric, and then print the index of the neighbor and the distance of it to stdout.

```
#include <mlpack/core.hpp>
#include <mlpack/methods/neighbor_search/neighbor_search.hpp>

using namespace mlpack;
using namespace mlpack::neighbor; // NeighborSearch and NearestNeighborSort
using namespace mlpack::metric; // ManhattanDistance

int main()
{
    // Load the data from data.csv (hard-coded). Use CLI for simple command-line
    // parameter handling.
    arma::mat data;
    data::Load("data.csv", data, true);

    // Use templates to specify that we want a NeighborSearch object which uses
    // the Manhattan distance.
    NeighborSearch<NearestNeighborSort, ManhattanDistance> nn(data);

    // Create the object we will store the nearest neighbors in.
    arma::Mat<size_t> neighbors;
    arma::mat distances; // We need to store the distance too.

    // Compute the neighbors.
    nn.Search(1, neighbors, distances);

    // Write each neighbor and distance using Log.
    for (size_t i = 0; i < neighbors.n_elem; ++i)
    {
        std::cout << "Nearest neighbor of point " << i << " is point "
                  << neighbors[i] << " and the distance is " << distances[i] << ".\n";
    }
}
```

12.4 Other examples

For more complex examples, it is useful to refer to the main executables, found in `src/mlpack/methods/`. A few are listed below.

- `methods/neighbor_search/knn_main.cpp`
- `methods/neighbor_search/kfn_main.cpp`

Chapter 13

Sample C++ ML App for Windows

13.1 Introduction

This tutorial will help you create a sample machine learning app using mlpack/C++. Although this app does not cover all the mlpack capabilities, it will walkthrough several APIs to understand how everything connects. This Windows sample app is created using Visual Studio, but you can easily adapt it to a different platform by following the provided source code.

Note

Before starting, make sure you have built mlpack for Windows following this **Windows guide** (p. 27)

13.2 Creating the VS project

- Open Visual Studio and create a new project (Windows Console Application)
- For this sample, the project is named “sample-ml-app”

13.3 Project Configuration

There are different ways in which you can configure your project to link with dependencies. This configuration is for x64 Debug Mode. If you need Release Mode, please change the paths accordingly (assuming you have built mlpack and dependencies in Release Mode).

- Right click on the project and select Properties, select the x64 Debug profile
- Under C/C++ > General > Additional Include Directories add:
 - C:\boost\boost_1_66_0
 - C:\mlpack\armadillo-8.500.1\include
 - C:\mlpack\mlpack-3.1.1\build\include

- Under Linker > Input > Additional Dependencies add:

```
- C:\mlpack\mlpack-3.1.1\build\Debug\mlpack.lib
- C:\boost\boost_1_66_0\lib64-msvc-14.1\libboost_serialization-vc141-mt-gd-x64-1_66.lib
- C:\boost\boost_1_66_0\lib64-msvc-14.1\libboost_program_options-vc141-mt-gd-x64-1_66.lib
```

- Under Build Events > Post-Build Event > Command Line add:

```
- xcopy /y "C:\mlpack\mlpack-3.1.1\build\Debug\mlpack.dll" $(OutDir)
- xcopy /y "C:\mlpack\mlpack-3.1.1\packages\OpenBLAS.0.2.14.1\lib\native\bin\x64\*.dll" $(OutDir)
```

Note

Recent versions of Visual Studio set "Conformance Mode" enabled by default. This causes some issues with the armadillo library. If you encounter this issue, disable "Conformance Mode" under C/C++ > Language.

13.4 The app goal

This app aims to exercise an end-to-end machine learning workflow. We will cover:

- Loading and preparing a dataset
- Training (using Random Forest as example)
- Computing the training accuracy
- Cross-Validation using K-Fold
- Metrics gathering (accuracy, precision, recall, F1)
- Saving the trained model to disk
- Loading the model
- Classifying a new sample

13.5 Headers and namespaces

For this app, we will need to include the following headers (i.e. add into stdafx.h):

```
#include "mlpack/core.hpp"
#include "mlpack/methods/random_forest/random_forest.hpp"
#include "mlpack/methods/decision_tree/random_dimension_select.hpp"
#include "mlpack/core/cv/k_fold_cv.hpp"
#include "mlpack/core/cv/metrics/accuracy.hpp"
#include "mlpack/core/cv/metrics/precision.hpp"
#include "mlpack/core/cv/metrics/recall.hpp"
#include "mlpack/core/cv/metrics/F1.hpp"
```

Also, we will use the following namespaces:

```
using namespace arma;
using namespace mlpack;
using namespace mlpack::tree;
using namespace mlpack::cv;
```

13.6 Loading the dataset

First step is about loading the dataset. Different dataset file formats are supported, but here we load a CSV dataset, and we assume the labels don't require normalization.

Note

Make sure you update the path to your dataset file. For this sample, you can simply copy "mlpack/tests/data/german.csv" and paste into a new "data" folder in your project directory.

```
mat dataset;
bool loaded = mlpack::data::Load("data/german.csv", dataset);
if (!loaded)
  return -1;
```

Then we need to extract the labels from the last dimension of the dataset and remove the labels from the training set:

```
Row<size_t> labels;
labels = conv_to<Row<size_t>>::from(dataset.row(dataset.n_rows - 1));
dataset.shed_row(dataset.n_rows - 1);
```

We now have our dataset ready for training.

13.7 Training

This app will use a Random Forest classifier. At first we define the classifier parameters and then we create the classifier to train it.

```
const size_t numClasses = 2;
const size_t minimumLeafSize = 5;
const size_t numTrees = 10;

RandomForest<GiniGain, RandomDimensionSelect> rf;

rf = RandomForest<GiniGain, RandomDimensionSelect>(dataset, labels,
  numClasses, numTrees, minimumLeafSize);
```

Now that the training is completed, we quickly compute the training accuracy:

```
Row<size_t> predictions;
rf.Classify(dataset, predictions);
const size_t correct = arma::accu(predictions == labels);
cout << "\nTraining Accuracy: " << (double(correct) / double(labels.n_elem));
```

13.8 Cross-Validating

Instead of training the Random Forest directly, we could also use K-fold cross-validation for training, which will give us a measure of performance on a held-out test set. This can give us a better estimate of how the model will perform when given new data. We also define which metric to use in order to assess the quality of the trained model.

```
const size_t k = 10;
KFoldCV<RandomForest<GiniGain, RandomDimensionSelect>, Accuracy> cv(k,
    dataset, labels, numClasses);
double cvAcc = cv.Evaluate(numTrees, minimumLeafSize);
cout << "\nKFoldCV Accuracy: " << cvAcc;
```

To compute other relevant metrics, such as Precision, Recall and F1:

```
double cvPrecision = Precision<Binary>::Evaluate(rf, dataset, labels);
cout << "\nPrecision: " << cvPrecision;

double cvRecall = Recall<Binary>::Evaluate(rf, dataset, labels);
cout << "\nRecall: " << cvRecall;

double cvF1 = F1<Binary>::Evaluate(rf, dataset, labels);
cout << "\nF1: " << cvF1;
```

13.9 Saving the model

Now that our model is trained and validated, we save it to a file so we can use it later. Here we save the model that was trained using the entire dataset. Alternatively, we could extract the model from the cross-validation stage by using `cv.Model()`

```
mlpack::data::Save("mymodel.xml", "model", rf, false);
```

We can also save the model in `bin` format ("mymodel.bin") which would result in a smaller file.

13.10 Loading the model

In a real-life application, you may want to load a previously trained model to classify new samples. We load the model from a file using:

```
mlpack::data::Load("mymodel.xml", "model", rf);
```

13.11 Classifying a new sample

Finally, the ultimate goal is to classify a new sample using the previously trained model. Since the Random Forest classifier provides both predictions and probabilities, we obtain both.

```
mat sample("2 12 2 13 1 2 2 1 3 24 3 1 1 1 1 0 1 0 1 0 0 0");
mat probabilities;
rf.Classify(sample, predictions, probabilities);
u64 result = predictions.at(0);
cout << "\nClassification result: " << result << " , Probabilities: " <<
    probabilities.at(0) << "/" << probabilities.at(1);
```

13.12 Final thoughts

Building real-life applications and services using machine learning can be challenging. Hopefully, this tutorial provides a good starting point that covers the basic workflow you may need to follow while developing it. You can take a look at the entire source code in the provided sample project located here: "doc/examples/sample-ml-app".

Chapter 14

mlpack Timers

14.1 Introduction

mlpack provides a simple timer interface for the timing of machine learning methods. The results of any timers used during the program are displayed at output by any command-line binding, when `--verbose` is given:

```
$ mlpack_knn -r dataset.csv -n neighbors_out.csv -d distances_out.csv -k 5 -v
<...>
[INFO ] Program timers:
[INFO ]   computing_neighbors: 0.010650s
[INFO ]   loading_data: 0.002567s
[INFO ]   saving_data: 0.001115s
[INFO ]   total_time: 0.149816s
[INFO ]   tree_building: 0.000534s
```

14.2 Timer API

The `mlpack::Timer` (p. 1975) class provides three simple methods:

```
void Timer::Start(const char* name);
void Timer::Stop(const char* name);
timeval Timer::Get(const char* name);
```

Each timer is given a name, and is referenced by that name. You can call `Timer::Start()` and `Timer::Stop()` multiple times for a particular timer name, and the result will be the sum of the runs of the timer. Note that `Timer::Stop()` must be called before `Timer::Start()` is called again, otherwise a `std::runtime_error` exception will be thrown.

A "total_time" timer is run by default for each mlpack program.

14.3 Timer Example

Below is a very simple example of timer usage in code.

```
#include <mlpack/core.hpp>
#include <mlpack/core/util/cli.hpp>
#define BINDING_TYPE BINDING_TYPE_CLI
#include <mlpack/core/util/mlpack_main.hpp>

using namespace mlpack;

void mlpackMain()
{
    // Start a timer.
    Timer::Start("some_timer");

    // Do some things.
    DoSomeStuff();

    // Stop the timer.
    Timer::Stop("some_timer");
}
```

If the `--verbose` flag was given to this executable, the time that `"some_timer"` ran for would be printed at the end of the program's output.

Chapter 15

mlpack version information

15.1 mlpack versions in code

mlpack provides a couple of convenience macros and functions to get the version of mlpack. More information (and straightforward code) can be found in **src/mlpack/core/util/version.hpp** (p. 2746).

The following three macros provide major, minor, and patch versions of mlpack (i.e. for mlpack-x.y.z, 'x' is the major version, 'y' is the minor version, and 'z' is the patch version):

```
MLPACK_VERSION_MAJOR  
MLPACK_VERSION_MINOR  
MLPACK_VERSION_PATCH
```

In addition, the function **mlpack::util::GetVersion()** (p. 469) returns the mlpack version as a string (for instance, "mlpack 1.0.8").

15.2 mlpack executable versions

Each mlpack executable supports the `-version` (or `-V`) option, which will print the version of mlpack used. If the version is not an official release but instead from svn trunk, the version will be "mlpack trunk" (and may have a revision number appended to "trunk").

Chapter 16

Alternating Matrix Factorization tutorial

16.1 Introduction

Alternating Matrix Factorization

Alternating matrix factorization decomposes matrix V in the form $V \approx WH$ where W is called the basis matrix and H is called the encoding matrix. V is taken to be of size $n \times m$ and the obtained W is $n \times r$ and H is $r \times m$. The size r is called the rank of the factorization. Factorization is done by alternately calculating W and H respectively while holding the other matrix constant.

mlpack provides:

- a **simple C++ interface** (p. 74) to perform Alternating Matrix Factorization

16.2 Table of Contents

A list of all the sections this tutorial contains.

- **Introduction** (p. 73)
- **Table of Contents** (p. 73)
- **The 'AMF' class** (p. 74)
 - **Using different termination policies** (p. 74)
 - **Using different initialization policies** (p. 75)
 - **Using different update rules** (p. 75)
 - **Using Non-Negative Matrix Factorization with AMF** (p. 76)
 - **Using Singular Value Decomposition with AMF** (p. 76)
- **Further documentation** (p. 76)

16.3 The 'AMF' class

The AMF class is templated with 3 parameters; the first contains the policy used to determine when the algorithm has converged; the second contains the initialization rule for the W and H matrix; the last contains the update rule to be used during each iteration. This templization allows the user to try various update rules, initialization rules, and termination policies (including ones not supplied with mlpack) for factorization.

The class provides the following method that performs factorization

```
template<typename MatType> double Apply(const MatType& V,
                                       const size_t r,
                                       arma::mat& W,
                                       arma::mat& H);
```

16.3.1 Using different termination policies

The AMF implementation comes with different termination policies to support many implemented algorithms. Every termination policy implements the following method which returns the status of convergence.

```
bool IsConverged(arma::mat& W, arma::mat& H)
```

Below is a list of all the termination policies that mlpack contains.

- **mlpack::amf::SimpleResidueTermination** (p. 529)
- **mlpack::amf::SimpleToleranceTermination** (p. 535)
- **mlpack::amf::ValidationRMSETermination** (p. 549)

In **SimpleResidueTermination**, termination decision depends on two factors, value of residue and number of iteration. If the current value of residue drops below the threshold or the number of iterations goes beyond the threshold, positive termination signal is passed to AMF.

In **SimpleToleranceTermination**, termination criterion is met when the increase in residue value drops below the given tolerance. To accommodate spikes, certain number of successive residue drops are accepted. Secondary termination criterion terminates algorithm when iteration count goes beyond the threshold.

ValidationRMSETermination divides the data into 2 sets, training set and validation set. Entries of validation set are nullified in the input matrix. Termination criterion is met when increase in validation set RMSE value drops below the given tolerance. To accommodate spikes certain number of successive validation RMSE drops are accepted. This upper limit on successive drops can be adjusted with `reverseStepCount`. A secondary termination criterion terminates the algorithm when the iteration count goes above the threshold. Though this termination policy is better measure of convergence than the above 2 termination policies, it may cause a decrease in performance since it is computationally expensive.

On the other hand, **CompleteIncrementalTermination** (p. 504) and **IncompleteIncrementalTermination** (p. 510) are just wrapper classes for other termination policies. These policies are used when AMF is applied with **SVDCompleteIncrementalLearning** (p. 542) and **SVDIncompleteIncrementalLearning** (p. 547), respectively.

16.3.2 Using different initialization policies

mlpack currently has 2 initialization policies implemented for AMF:

- **RandomInitialization** (p. 528)
- **RandomAcolInitialization** (p. 526)

`RandomInitialization` initializes matrices `W` and `H` with random uniform distribution while `RandomAcolInitialization` initializes the `W` matrix by averaging `p` randomly chosen columns of `V`. In the case of `RandomAcolInitialization`, `p` is a template parameter.

To implement their own initialization policy, users need to define the following function in their class.

```
template<typename MatType>
inline static void Initialize(const MatType& V,
                             const size_t r,
                             arma::mat& W,
                             arma::mat& H)
```

16.3.3 Using different update rules

mlpack implements the following update rules for the AMF class:

- **AMFALSUpdate** (p. 516)
- **NMFMultiplicativeDistanceUpdate** (p. 519)
- **NMFMultiplicativeDivergenceUpdate** (p. 523)
- **SVDBatchLearning** (p. 539)
- **SVDIncompleteIncrementalLearning** (p. 547)
- **SVDCompleteIncrementalLearning** (p. 542)

Non-Negative Matrix factorization can be achieved with `NMFALSUpdate`, `NMFMultiplicativeDivergenceUpdate` or `NMFMultiplicativeDistanceUpdate`. `NMFALSUpdate` implements a simple Alternating Least Squares optimization while the other rules implement algorithms given in the paper 'Algorithms for Non-negative Matrix Factorization'.

The remaining update rules perform the singular value decomposition of the matrix `V`. This SVD factorization is optimized for use by mlpack's collaborative filtering code (**Collaborative filtering tutorial** (p. 103)). This use of SVD factorizers for collaborative filtering is described in the paper 'A Guide to Singular Value Decomposition for Collaborative Filtering' by Chih-Chao Ma. For further details about the algorithms refer to the respective class documentation.

16.3.4 Using Non-Negative Matrix Factorization with AMF

The use of AMF for Non-Negative Matrix factorization is simple. The AMF module defines **NMFALSFactorizer** (p. 259) which can be used directly without knowing the internal structure of AMF. For example:

```
#include <mlpack/core.hpp>
#include <mlpack/methods/amf/amf.hpp>

using namespace std;
using namespace arma;
using namespace mlpack::amf;

int main()
{
    NMFALSFactorizer nmf;
    mat W, H;
    mat V = randu<mat>(100, 100);
    double residue = nmf.Apply(V, W, H);
}
```

NMFALSFactorizer uses SimpleResidueTermination, which is most preferred with Non-Negative Matrix factorizers. The initialization of W and H in NMFALSFactorizer is random. The Apply() function returns the residue obtained by comparing the constructed matrix $W * H$ with the original matrix V.

16.3.5 Using Singular Value Decomposition with AMF

mlpack has the following SVD factorizers implemented for AMF:

- **SVDBatchFactorizer** (p. 259)
- **SVDIncompleteIncrementalFactorizer** (p. 260)
- **SVDCompleteIncrementalFactorizer** (p. 260)

Each of these factorizers takes a template parameter MatType, which specifies the type of the matrix V (dense or sparse—these have types arma::mat and arma::sp_mat, respectively). When the matrix to be factorized is relatively sparse, specifying MatType = arma::sp_mat can provide a runtime boost.

```
#include <mlpack/core.hpp>
#include <mlpack/methods/amf/amf.hpp>

using namespace std;
using namespace arma;
using namespace mlpack::amf;

int main()
{
    sp_mat V = randu<sp_mat>(100, 100);
    mat W, H;

    SVDBatchFactorizer<sp_mat> svd;
    double residue = svd.Apply(V, W, H);
}
```

16.4 Further documentation

For further documentation on the AMF class, consult the **complete API documentation** (p. 499).

Chapter 17

Neural Network tutorial

17.1 Introduction

There is vast literature on neural networks and their uses, as well as strategies for choosing initial points effectively, keeping the algorithm from converging in local minima, choosing the best model structure, choosing the best optimizers, and so forth. mlpack implements many of these building blocks, making it very easy to create different neural networks in a modular way.

mlpack currently implements two easy-to-use forms of neural networks: **Feed-Forward Networks** (this includes convolutional neural networks) and **Recurrent Neural Networks**.

17.2 Table of Contents

This tutorial is split into the following sections:

- **Introduction** (p. 77)
- **Table of Contents** (p. 77)
- **Model API** (p. 78)
- **Layer API** (p. 81)
- **Model Setup & Training** (p. 83)
- **Saving & Loading** (p. 84)
- **Extracting Parameters** (p. 86)
- **Further documentation** (p. 86)

17.3 Model API

There are two main neural network classes that are meant to be used as container for neural network layers that **mlpack** implements; each class is suited to a different setting:

- **FFN**: the Feed Forward Network model provides a means to plug layers together in a feed-forward fully connected manner. This is the 'standard' type of deep learning model, and includes convolutional neural networks (CNNs).
- **RNN**: the Recurrent Neural Network model provides a means to consider successive calls to forward as different time-steps in a sequence. This is often used for time sequence modeling tasks, such as predicting the next character in a sequence.

Below is some basic guidance on what should be used. Note that the question of "which algorithm should be used" is a very difficult question to answer, so the guidance below is just that—guidance—and may not be right for a particular problem.

- **Feed-forward Networks** allow signals or inputs to travel one way only. There is no feedback within the network; for instance, the output of any layer does only affect the upcoming layer. That makes Feed-Forward Networks straightforward and very effective. They are extensively used in pattern recognition and are ideally suitable for modeling relationships between a set of input and one or more output variables.
- **Recurrent Networks** allow signals or inputs to travel in both directions by introducing loops in the network. Computations derived from earlier inputs are fed back into the network, which gives the recurrent network some kind of memory. RNNs are currently being used for all kinds of sequential tasks; for instance, time series prediction, sequence labeling, and sequence classification.

In order to facilitate consistent implementations, the **FFN** and **RNN** classes have a number of methods in common:

- **Train()**: trains the initialized model on the given input data. Optionally an optimizer object can be passed to control the optimization process.
- **Predict()**: predicts the responses to a given set of predictors. Note the responses will reflect the output of the specified output layer.
- **Add()**: this method can be used to add a layer to the model.

Note

To be able to optimize the network, both classes implement the **OptimizerFunction** API; see **Optimizer API** for more information. In short, the **FFN** and **RNN** class implement two methods: **Evaluate()** and **Gradient()**. This enables the optimization given some learner and some performance measure.

Similar to the existing layer infrastructure, the **FFN** and **RNN** classes are very extensible, having the following template arguments; which can be modified to change the behavior of the network:

- **OutputLayerType**: this type defines the output layer used to evaluate the network; by default, **NegativeLogLikelihood** is used.

- `InitializationRuleType`: this type defines the method by which initial parameters are set; by default, `RandomInitialization` is used.

```
template<
    typename OutputLayerType = NegativeLogLikelihood<>,
    typename InitializationRuleType = RandomInitialization
>
class FNN;
```

Internally, the `FNN` and `RNN` class keeps an instantiated `OutputLayerType` class (which can be given in the constructor). This is useful for using different loss functions like the Negative-Log-Likelihood function or the `VRClassReward` function, which takes an optional score parameter. Therefore, you can write a non-static `OutputLayerType` class and use it seamlessly in combination with the `FNN` and `RNN` class. The same applies to the `InitializationRuleType` template parameter.

By choosing different components for each of these template classes in conjunction with the `Add()` method, a very arbitrary network object can be constructed.

Below are several examples of how the `FNN` and `RNN` classes might be used. The first examples focus on the `FNN` class, and the last shows how the `RNN` class can be used.

The simplest way to use the `FNN<>` class is to pass in a dataset with the corresponding labels, and receive the classification in return. Note that the dataset must be column-major – that is, one column corresponds to one point. See the **matrices guide** (p. 57) for more information.

The code below builds a simple feed-forward network with the default options, then queries for the assignments for every point in the `queries` matrix.

Note

The number of inputs in the above graph doesn't match with the real number of features in the thyroid dataset and are just used as an abstract representation.

```
// Load the training set.
arma::mat dataset;
data::Load("thyroid_train.csv", dataset, true);

// Split the labels from the training set.
arma::mat trainData = dataset.submat(0, 0, dataset.n_rows - 4,
    dataset.n_cols - 1);

// Split the data from the training set.
arma::mat trainLabelsTemp = dataset.submat(dataset.n_rows - 3, 0,
    dataset.n_rows - 1, dataset.n_cols - 1);

// Initialize the network.
FFN<> model;
model.Add<Linear<> >(trainData.n_rows, 8);
model.Add<SigmoidLayer<> >();
model.Add<Linear<> >(8, 3);
model.Add<LogSoftMax<> >();

// Train the model.
model.Train(trainData, trainLabels);

// Use the Predict method to get the assignments.
arma::mat assignments;
model.Predict(trainData, assignments);
```

Now, the matrix assignments holds the classification of each point in the dataset.

In the next example, we create simple noisy sine sequences, which are trained later on, using the RNN class in the `RNNModel()` method.

```
void GenerateNoisySines(arma::mat& data,
    arma::mat& labels,
    const size_t points,
    const size_t sequences,
    const double noise = 0.3)
{
    arma::colvec x = arma::linspace<arma::Col<double>>(0,
        points - 1, points) / points * 20.0;
    arma::colvec y1 = arma::sin(x + arma::as_scalar(arma::randu(1)) * 3.0);
    arma::colvec y2 = arma::sin(x / 2.0 + arma::as_scalar(arma::randu(1)) * 3.0);

    data = arma::zeros(points, sequences * 2);
    labels = arma::zeros(2, sequences * 2);

    for (size_t seq = 0; seq < sequences; seq++)
    {
        data.col(seq) = arma::randu(points) * noise + y1 +
            arma::as_scalar(arma::randu(1) - 0.5) * noise;
        labels(0, seq) = 1;

        data.col(sequences + seq) = arma::randu(points) * noise + y2 +
            arma::as_scalar(arma::randu(1) - 0.5) * noise;
        labels(1, sequences + seq) = 1;
    }
}

void RNNModel()
{
    const size_t rho = 10;

    // Generate 12 (2 * 6) noisy sines. A single sine contains rho
    // points/features.
    arma::mat input, labelsTemp;
    GenerateNoisySines(input, labelsTemp, rho, 6);

    arma::mat labels = arma::zeros<arma::mat>(rho, labelsTemp.n_cols);
    for (size_t i = 0; i < labelsTemp.n_cols; ++i)
    {
```

```

    const int value = arma::as_scalar(arma::find(
        arma::max(labelsTemp.col(i)) == labelsTemp.col(i), 1)) + 1;
    labels.col(i).fill(value);
}

Add<> add(4);
Linear<> lookup(1, 4);
SigmoidLayer<> sigmoidLayer;
Linear<> linear(4, 4);
Recurrent<> recurrent(add, lookup, linear, sigmoidLayer, rho);

RNN<> model(rho);
model.Add<IdentityLayer<> >();
model.Add(recurrent);
model.Add<Linear<> >(4, 10);
model.Add<LogSoftMax<> >();

StandardSGD opt(0.1, 1, input.n_cols /* 1 epoch */, -100);
model.Train(input, labels, opt);
}

```

For further examples on the usage of the ann classes, see `mlpack models`.

17.4 Layer API

In order to facilitate consistent implementations, we have defined a `LayerType` API that describes all the methods that a `layer` may implement. `mlpack` offers a few variations of this API, each designed to cover some of the model characteristics mentioned in the previous section. Any `layer` requires the implementation of a `Forward()` method. The interface looks like:

```

template<typename eT>
void Forward(const arma::Mat<eT>&& input, arma::Mat<eT>&& output);

```

The method should calculate the output of the layer given the input matrix and store the result in the given output matrix. Next, any `layer` must implement the `Backward()` method, which uses certain computations obtained during the forward pass and should calculate the function $f(x)$ by propagating x backward through f :

```

template<typename eT>
void Backward(const arma::Mat<eT>&& input,
              arma::Mat<eT>&& gy,
              arma::Mat<eT>&& g);

```

Finally, if the layer is differentiable, the layer must also implement a `Gradient()` method:

```

template<typename eT>
void Gradient(const arma::Mat<eT>&& input,
              arma::Mat<eT>&& error,
              arma::Mat<eT>&& gradient);

```

The `Gradient` function should calculate the gradient with respect to the input activations `input` and calculated errors `error` and place the results into the gradient matrix object `gradient` that is passed as an argument.

Note

Note that each method accepts a template parameter `InputType`, `OutputType` or `GradientType`, which may be `arma::mat` (dense Armadillo matrix) or `arma::sp_mat` (sparse Armadillo matrix). This allows support for both sparse-supporting and non-sparse-supporting `layer` without explicitly passing the type.

In addition, each layer must implement the `Parameters()`, `InputParameter()`, `OutputParameter()`, `Delta()` methods, differentiable layer should also provide access to the gradient by implementing the `Gradient()`, `Parameters()` member function. Note each function is a single line that looks like:

```
OutputDataType const& Parameters() const { return weights; }
```

Below is an example that shows each function with some additional boilerplate code.

Note

Note this is not an actual layer but instead an example that exists to show and document all the functions that `mlpack::layer` must implement. For a better overview of the various layers, see `mlpack::ann` (p. 262). Also be aware that the implementations of each of the methods in this example are entirely fake and do not work; this example exists for its API, not its implementation.

Note that layer sometimes have different properties. These properties are known at compile-time through the `mlpack::ann::LayerTraits` (p. 769) class, and some properties may imply the existence (or non-existence) of certain functions. Refer to the `LayerTraits` `LayerTraits` for more documentation on that.

The two template parameters below must be template parameters to the layer, in the order given below. More template parameters are fine, but they must come after the first two.

- `InputDataType`: this defines the internally used input type for example to store the parameter matrix. Note, a layer could be built on a dense matrix or a sparse matrix. All `mlpack` trees should be able to support any Armadillo-compatible matrix type. When the layer is written it should be assumed that `MatType` has the same functionality as `arma::mat`. Note that
- `OutputDataType`: this defines the internally used input type for example to store the parameter matrix. Note, a layer could be built on a dense matrix or a sparse matrix. All `mlpack` trees should be able to support any Armadillo-compatible matrix type. When the layer is written it should be assumed that `MatType` has the same functionality as `arma::mat`.

```
template<typename InputDataType = arma::mat,
        typename OutputDataType = arma::mat>
class ExampleLayer
{
public:
    ExampleLayer(const size_t inSize, const size_t outSize) :
        inputSize(inSize), outputSize(outSize)
    {
        /* Nothing to do here */
    }
}
```

The constructor for `ExampleLayer` will build the layer given the input and output size. Note that, if the input or output size information isn't used internally it's not necessary to provide a specific constructor. Also, one could add additional or other information that are necessary for the layer construction. One example could be:

```
ExampleLayer(const double ratio = 0.5) : ratio(ratio) { /* Nothing to do here*/ }
```

When this constructor is finished, the entire layer will be built and is ready to be used. Next, as pointed out above, each layer has to follow the `LayerType` API, so we must implement some additional functions.

```
template<typename InputType, typename OutputType>
void Forward(const InputType&& input, OutputType&& output)
{
    output = arma::ones(input.n_rows, input.n_cols);
}

template<typename InputType, typename ErrorType, typename GradientType>
void Backward(const InputType&& input, ErrorType&& gy, GradientType&& g)
{
    g = arma::zeros(gy.n_rows, gy.n_cols) + gy;
}

template<typename InputType, typename ErrorType, typename GradientType>
void Gradient(const InputType&& input,
              ErrorType&& error,
              GradientType&& gradient)
{
    gradient = arma::zeros(input.n_rows, input.n_cols) * error;
}
```

The three functions `Forward()`, `Backward()` and `Gradient()` (which is needed for a differentiable layer) contain the main logic of the layer. The following functions are just to access and manipulate the different layer parameters.

```
OutputDataType& Parameters() { return weights; }
InputDataType& InputParameter() { return inputParameter; }
OutputDataType& OutputParameter() { return outputParameter; }
OutputDataType& Delta() { return delta; }
OutputDataType& Gradient() { return gradient; }
```

Since some of these methods return internal class members we have to define them.

```
private:
    size_t inSize, outSize;
    OutputDataType weights, delta, gradient, outputParameter;
    InputDataType inputParameter;
```

Note some members are just here so `ExampleLayer` compiles without warning. For instance, `inSize` is not required to be a member of every type of layer.

There is one last method that is especially interesting for a layer that shares parameter. Since the layer weights are set once the complete model is defined, it's not possible to split the weights during the construction time. To solve this issue, a layer can implement the `Reset()` method which is called once the layer parameter is set.

17.5 Model Setup & Training

Once the base container is selected (FNN or RNN), the `Add` method can be used to add layers to the model. The code below adds two linear layers to the model—the first takes 512 units as input and gives 256 output units, and the second takes 256 units as input and gives 128 output units.

```
FFN<> model;
model.Add<Linear<> >(512, 256);
model.Add<Linear<> >(256, 128);
```

The model is trained on Armadillo matrices. For training a model, you will typically use the `Train()` function:

```
arma::mat trainingSet, trainingLabels;
model.Train(trainingSet, trainingLabels);
```

You can use mlpack's `Load()` (p. 379) function to load a dataset like this:

```
arma::mat trainingSet;
data::Load("dataset.csv", dataset, true);
```

```
$ cat dataset.csv
0, 1, 4
1, 0, 5
1, 1, 1
2, 0, 2
```

The type does not necessarily need to be a CSV; it can be any supported storage format, assuming that it is a coordinate-format file in the format specified above. For more information on mlpack file formats, see the documentation for `mlpack::data::Load()` (p. 379).

Note

It's often a good idea to normalize or standardize your data, for example using:

```
for (size_t i = 0; i < dataset.n_cols; ++i)
  dataset.col(i) /= norm(dataset.col(i), 2);
```

Also, it is possible to retrain a model with new parameters or with a new reference set. This is functionally equivalent to creating a new model.

17.6 Saving & Loading

Using `boost::serialization` (p. 251) (for more information about the internals see `Serialization - Boost C++ Libraries`), mlpack is able to load and save machine learning models with ease. To save a trained neural network to disk. The example below builds a model on the `thyroid` dataset and then saves the model to the file `model.xml` for later use.

```
// Load the training set.
arma::mat dataset;
data::Load("thyroid_train.csv", dataset, true);

// Split the labels from the training set.
arma::mat trainData = dataset.submat(0, 0, dataset.n_rows - 4,
  dataset.n_cols - 1);

// Split the data from the training set.
arma::mat trainLabelsTemp = dataset.submat(dataset.n_rows - 3, 0,
  dataset.n_rows - 1, dataset.n_cols - 1);

// Initialize the network.
```

```
FFN<> model;
model.Add<Linear<> >(trainData.n_rows, 3);
model.Add<SigmoidLayer<> >();
model.Add<LogSoftMax<> >();

// Train the model.
model.Train(trainData, trainLabels);

// Use the Predict method to get the assignments.
arma::mat assignments;
model.Predict(trainData, assignments);

data::Save("model.xml", "model", model, false);
```

After this, the file `model.xml` will be available in the current working directory.

Now, we can look at the output model file, `model.xml` :

```
$ cat model.xml
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<!DOCTYPE boost_serialization>
<boost_serialization signature="serialization::archive" version="15">
<model class_id="0" tracking_level="0" version="0">
  <parameter class_id="1" tracking_level="1" version="0" object_id="_0">
    <n_rows>66</n_rows>
    <n_cols>1</n_cols>
    <n_elem>66</n_elem>
    <vec_state>0</vec_state>
    <item>-7.55971528334903642e+00</item>
    <item>-9.95435955058058930e+00</item>
    <item>9.31133928948225353e+00</item>
    <item>-5.36784434861701953e+00</item>
    ...
  </parameter>
  <width>0</width>
  <height>0</height>
  <currentInput object_id="_1">
    <n_rows>0</n_rows>
    <n_cols>0</n_cols>
    <n_elem>0</n_elem>
    <vec_state>0</vec_state>
  </currentInput>
  <network class_id="2" tracking_level="0" version="0">
    <count>3</count>
    <item_version>0</item_version>
    <item class_id="3" tracking_level="0" version="0">
      <which>18</which>
      <value class_id="4" tracking_level="1" version="0" object_id="_2">
        <inSize>21</inSize>
        <outSize>3</outSize>
      </value>
    </item>
    <item>
      <which>2</which>
      <value class_id="5" tracking_level="1" version="0" object_id="_3"></value>
    </item>
    <item>
      <which>20</which>
      <value class_id="6" tracking_level="1" version="0" object_id="_4"></value>
    </item>
  </network>
</model>
</boost_serialization>
```

As you can see, the `<parameter>` section of `model.xml` contains the trained network weights. We can see that this section also contains the network input size, which is 66 rows and 1 column. Note that in this example, we used three different layers, as can be seen by looking at the `<network>` section. Each node has a unique id that is used to reconstruct the model when loading.

The models can also be saved as `.bin` or `.txt`; the `.xml` format provides a human-inspectable format (though the models tend to be quite complex and may be difficult to read). These models can then be re-used to be used for classification or other tasks.

So, instead of saving or training a network, `mlpack` can also load a pre-trained model. For instance, the example below will load the model from `model.xml` and then generate the class predictions for the `thyroid` test dataset.

```
data::Load("thyroid_test.csv", dataset, true);  
arma::mat testData = dataset.submat(0, 0, dataset.n_rows - 4,  
    dataset.n_cols - 1);  
  
data::Load("model.xml", "model", model);  
  
arma::mat predictions;  
model.Predict(testData, predictions);
```

This enables the possibility to distribute a model without having to train it first or simply to save a model for later use. Note that loading will also work on different machines.

17.7 Extracting Parameters

To access the weights from the neural network layers, you can call the following function on any initialized network:

```
model.Parameters();
```

which will return the complete model parameters as an armadillo matrix object; however often it is useful to not only have the parameters for the complete network, but the parameters of a specific layer. Another method, `Model()`, makes this easily possible:

```
model.Model()[1].Parameters();
```

In the example above, we get the weights of the second layer.

17.8 Further documentation

For further documentation on the ann classes, consult the **complete API documentation** (p. 262).

Chapter 18

Approximate furthest neighbor search (mlpack_approx_kfn) tutorial

18.1 Introduction

mlpack implements multiple strategies for approximate furthest neighbor search in its `mlpack_approx_kfn` and `mlpack_kfn` programs (each program corresponds to different techniques). This tutorial discusses what problems these algorithms solve and how to use each of the techniques that **mlpack** implements.

mlpack implements five approximate furthest neighbor search algorithms:

- brute-force search (in `mlpack_kfn`)
- single-tree search (in `mlpack_kfn`)
- dual-tree search (in `mlpack_kfn`)
- query-dependent approximate furthest neighbor (QDAFN) (in `mlpack_approx_kfn`)
- DrusillaSelect (in `mlpack_approx_kfn`)

These methods are described in the following papers:

```
@inproceedings{curtin2013tree,

  publisher={Elsevier}
}
```

The problem of furthest neighbor search is simple, and is the opposite of the much-more-studied nearest neighbor search problem. Given a set of reference points R (the set in which we are searching), and a set of query points Q (the set of points for which we want the furthest neighbor), our goal is to return the k furthest neighbors for each query point in Q :

$$k\text{-argmax}_{p_r \in R} d(p_q, p_r).$$

In order to solve this problem, **mlpack** provides a number of interfaces.

- two **simple command-line executables** (p. 90) to calculate approximate furthest neighbors
- a simple **C++ class for QDAFN** (p. 98)
- a simple **C++ class for DrusillaSelect** (p. 96)
- a simple C++ class for tree-based and brute-force search

 - Searching in brute-force mode (p. 102)
- **Further documentation** (p. 102)

18.3 Which algorithm should be used?

There are three algorithms for furthest neighbor search that **mlpack** implements, and each is suited to a different setting. Below is some basic guidance on what should be used. Note that the question of "which algorithm should be used" is a very difficult question to answer, so the guidance below is just that—guidance—and may not be right for a particular problem.

- `DrusillaSelect` is very fast and will perform extremely well for datasets with outliers or datasets with structure (like low-dimensional datasets embedded in high dimensions)
- `QDAFN` is a random approach and therefore should be well-suited for datasets with little to no structure
- The tree-based approaches (the `KFN` class and the `mlpack_kfn` program) is best suited for low-dimensional datasets, and is most effective when very small levels of approximation are desired, or when exact results are desired.
- Dual-tree search is most useful when the query set is large and structured (like for all-furthest-neighbor search).
- Single-tree search is more useful when the query set is small.

18.4 Command-line 'mlpack_approx_kfn' and 'mlpack_kfn'

mlpack provides two command-line programs to solve approximate furthest neighbor search:

- `mlpack_approx_kfn`, for the QDAFN and DrusillaSelect approaches
- `mlpack_kfn`, for exact and approximate tree-based approaches

These two programs allow a large number of algorithms to be used to find approximate furthest neighbors. Note that the `mlpack_kfn` program is also documented by the **Command-Line 'mlpack_knn'** (p. 152) section of the **Neighbor↔ Search tutorial (k-nearest-neighbors)** (p. 151) page, as it shares options with the `mlpack_knn` program.

Below are several examples of how the `mlpack_approx_kfn` and `mlpack_kfn` programs might be used. The first examples focus on the `mlpack_approx_kfn` program, and the last few show how `mlpack_kfn` can be used to produce approximate results.

18.4.1 Calculate 5 furthest neighbors with default options

Here we have a query dataset `queries.csv` and a reference dataset `refs.csv` and we wish to find the 5 furthest neighbors of every query point in the reference dataset. We may do that with the `mlpack_approx_kfn` algorithm, using the default of the DrusillaSelect algorithm with default parameters.

```
$ mlpack_approx_kfn -q queries.csv -r refs.csv -v -k 5 -n n.csv -d d.csv
[INFO ] Loading 'refs.csv' as CSV data. Size is 3 x 1000.
[INFO ] Building DrusillaSelect model...
[INFO ] Model built.
[INFO ] Loading 'queries.csv' as CSV data. Size is 3 x 1000.
[INFO ] Searching for 5 furthest neighbors with DrusillaSelect...
[INFO ] Search complete.
[INFO ] Saving CSV data to 'n.csv'.
[INFO ] Saving CSV data to 'd.csv'.
[INFO ]
[INFO ] Execution parameters:
[INFO ]   algorithm: ds
[INFO ]   calculate_error: false
[INFO ]   distances_file: d.csv
[INFO ]   exact_distances_file: ""
[INFO ]   help: false
[INFO ]   info: ""
[INFO ]   input_model_file: ""
[INFO ]   k: 5
[INFO ]   neighbors_file: n.csv
[INFO ]   num_projections: 5
[INFO ]   num_tables: 5
[INFO ]   output_model_file: ""
[INFO ]   query_file: queries.csv
[INFO ]   reference_file: refs.csv
[INFO ]   verbose: true
[INFO ]   version: false
[INFO ]
[INFO ] Program timers:
[INFO ]   drusilla_select_construct: 0.000342s
[INFO ]   drusilla_select_search: 0.000780s
[INFO ]   loading_data: 0.010689s
[INFO ]   saving_data: 0.005585s
[INFO ]   total_time: 0.018592s
```

Convenient timers for parts of the program operation are printed. The results, saved in `n.csv` and `d.csv`, indicate the furthest neighbors and distances for each query point. The row of the output file indicates the query point that the results are for. The neighbors are listed from furthest to nearest; so, the 4th element in the 3rd row of `d.csv` indicates the distance between the 3rd query point in `queries.csv` and its approximate 4th furthest neighbor. Similarly, the same element in `n.csv` indicates the index of the approximate 4th furthest neighbor (with respect to `refs.csv`).

18.4.2 Specifying algorithm parameters for DrusillaSelect

The `-p` (`-num_projections`) and `-t` (`-num_tables`) parameters affect the running of the `DrusillaSelect` algorithm and the `QDAFN` algorithm. Specifically, larger values for each of these parameters will search more possible candidate furthest neighbors and produce better results (at the cost of runtime). More details on how each of these parameters works is available in the original papers, the `mlpack` source, or the documentation given by `-help`.

In the example below, we run `DrusillaSelect` to find 4 furthest neighbors using 10 tables and 2 points in each table. In this case we have chosen to omit the `-n n.csv` option, meaning that only the output candidate distances will be written to `d.csv`.

```
$ mlpack_approx_kfn -q queries.csv -r refs.csv -v -k 4 -n n.csv -d d.csv -t 10 -p 2
[INFO ] Loading 'refs.csv' as CSV data. Size is 3 x 1000.

[INFO ]   saving_data: 0.003734s
[INFO ]   total_time: 0.014019s
```

18.4.3 Using QDAFN instead of DrusillaSelect

The algorithm to be used for approximate furthest neighbor search can be specified with the `-algorithm` (`-a`) option to the `mlpack_approx_kfn` program. Below, we use the `QDAFN` algorithm instead of the default. We leave the `-p` and `-t` options at their defaults—even though `QDAFN` often requires more tables and points to get the same quality of results.

```
$ mlpack_approx_kfn -q queries.csv -r refs.csv -v -k 3 -n n.csv -d d.csv -a qdafn
[INFO ] Loading 'refs.csv' as CSV data. Size is 3 x 1000.
[INFO ] Building QDAFN model...
[INFO ] Model built.

[INFO ]   loading_data: 0.008380s
[INFO ]   qdafn_construct: 0.003399s
[INFO ]   qdafn_search: 0.000886s
[INFO ]   saving_data: 0.002253s
[INFO ]   total_time: 0.015465s
```

18.4.4 Printing results quality with exact distances

The `mlpack_approx_kfn` program can calculate the quality of the results if the `-calculate_error` (`-e`) flag is specified. Below we use the program with its default parameters and calculate the error, which is displayed in the output. The error is only calculated for the furthest neighbor, not all `k`; therefore, in this example we have set `-k` to 1.

```
$ mlpack_approx_kfn -q queries.csv -r refs.csv -v -k 1 -e -q -n n.csv
[INFO ] Loading 'refs.csv' as CSV data. Size is 3 x 1000.
[INFO ] Building DrusillaSelect model...
[INFO ] Model built.
[INFO ] Loading 'queries.csv' as CSV data. Size is 3 x 1000.

[INFO ]   total_time: 0.011670s
[INFO ]   tree_building: 0.000202s
```

Note that the output includes three lines indicating the error:

```
[INFO ] Average error: 1.08417.
[INFO ] Maximum error: 1.28712.
[INFO ] Minimum error: 1.
```

In this case, a minimum error of 1 indicates an exact result, and over the entire query set the algorithm has returned a furthest neighbor candidate with maximum error 1.28712.

18.4.5 Using cached exact distances for quality results

However, for large datasets, calculating the error may take a long time, because the exact furthest neighbors must be calculated. Therefore, if the exact furthest neighbor distances are already known, they may be passed in with the `-exact_distances_file` (`-x`) option in order to avoid the calculation. In the example below, we assume `exact.csv` contains the exact furthest neighbor distances. We run the `qdafn` algorithm in this example.

Note that the `-e` option must be specified for the `-x` option have any effect.

```
$ mlpack_approx_kfn -q queries.csv -r refs.csv -k 1 -e -x exact.csv -n n.csv -v -a qdafn

18.4.6 Using tree-based approximation with `mlpack_kfn`

The `mlpack_kfn` algorithm allows specifying a desired approximation level with the `-epsilon` (`-e`) option. The parameter must be greater than or equal to 0 and less than 1. A setting of 0 indicates exact search.

The example below runs dual-tree furthest neighbor search (the default algorithm) with the approximation parameter set to 0.5.

```
$ mlpack_kfn -q queries.csv -r refs.csv -v -k 3 -e 0.5 -n n.csv -d d.csv
[INFO ] Loading 'refs.csv' as CSV data. Size is 3 x 1000.

[INFO ]   total_time: 0.012667s
[INFO ]   tree_building: 0.000251s
```

Note that the format of the output files `d.csv` and `n.csv` are the same as for `mlpack_approx_kfn`.

18.4.7 Different algorithms with 'mlpack_kfn'

The `mlpack_kfn` program offers a large number of different algorithms that can be used. The `-algorithm (-a)` may be used to specify three main different algorithm types: `naive` (brute-force search), `single_tree` (single-tree search), `dual_tree` (dual-tree search, the default), and `greedy` ("defeatist" greedy search, which goes to one leaf node of the tree then terminates). The example below uses single-tree search to find approximate neighbors with epsilon set to 0.1.

```
mlpack_kfn -q queries.csv -r refs.csv -v -k 3 -e 0.1 -n n.csv -d d.csv -a single_tree
[INFO ] Loading 'refs.csv' as CSV data. Size is 3 x 1000.
[INFO ] Loaded reference data from 'refs.csv' (3x1000).
[INFO ] Building reference tree...
[INFO ] Tree built.
[INFO ] Loading 'queries.csv' as CSV data. Size is 3 x 1000.

[INFO ]   total_time: 0.013084s
[INFO ]   tree_building: 0.000250s
```

18.4.8 Saving a model for later use

The `mlpack_approx_kfn` and `mlpack_kfn` programs both allow models to be saved and loaded for future use. The `-output_model_file` (`-M`) option allows specifying where to save a model, and the `-input_model_file` (`-m`) option allows a model to be loaded instead of trained. So, if you specify `-input_model_file` then you do not need to specify `-reference_file` (`-r`), `-num_projections` (`-p`), or `-num_tables` (`-t`).

The example below saves a model with 10 projections and 5 tables. Note that neither `-query_file` (`-q`) nor `-k` are specified; this run only builds the model and saves it to `model.bin`.

```
$ mlpack_approx_kfn -r refs.csv -t 5 -p 10 -v -M model.bin
[INFO ] Loading 'refs.csv' as CSV data. Size is 3 x 1000.
[INFO ] Building DrusillaSelect model...
[INFO ] Model built.
[INFO ]
[INFO ] Execution parameters:
[INFO ]   algorithm: ds
[INFO ]   calculate_error: false
[INFO ]   distances_file: ""
[INFO ]   exact_distances_file: ""
[INFO ]   help: false
[INFO ]   info: ""
[INFO ]   input_model_file: ""
[INFO ]   k: 0
[INFO ]   neighbors_file: ""
[INFO ]   num_projections: 10
[INFO ]   num_tables: 5
[INFO ]   output_model_file: model.bin
[INFO ]   query_file: ""
[INFO ]   reference_file: refs.csv
[INFO ]   verbose: true
[INFO ]   version: false
[INFO ]
[INFO ] Program timers:
[INFO ]   drusilla_select_construct: 0.000321s
[INFO ]   loading_data: 0.004700s
[INFO ]   total_time: 0.007320s
```

Now, with the model saved, we can run approximate furthest neighbor search on a query set using the saved model:

```
$ mlpack_approx_kfn -m model.bin -q queries.csv -k 3 -d d.csv -n n.csv -v
[INFO ] Loading 'queries.csv' as CSV data. Size is 3 x 1000.
[INFO ] Searching for 3 furthest neighbors with DrusillaSelect...
[INFO ] Search complete.
[INFO ] Saving CSV data to 'n.csv'.
[INFO ] Saving CSV data to 'd.csv'.
[INFO ]
[INFO ] Execution parameters:
[INFO ]   algorithm: ds
[INFO ]   calculate_error: false
[INFO ]   distances_file: d.csv
[INFO ]   exact_distances_file: ""
[INFO ]   help: false
[INFO ]   info: ""
[INFO ]   input_model_file: model.bin
[INFO ]   k: 3
[INFO ]   neighbors_file: n.csv
[INFO ]   num_projections: 5
[INFO ]   num_tables: 5
[INFO ]   output_model_file: ""
[INFO ]   query_file: queries.csv
[INFO ]   reference_file: ""
[INFO ]   verbose: true
[INFO ]   version: false
[INFO ]
[INFO ] Program timers:
[INFO ]   drusilla_select_search: 0.000878s
[INFO ]   loading_data: 0.004599s
[INFO ]   saving_data: 0.003006s
[INFO ]   total_time: 0.009234s
```

These options work in the same way for both the `mlpack_approx_kfn` and `mlpack_kfn` programs.

18.4.9 Final command-line program notes

Both the `mlpack_kfn` and `mlpack_approx_kfn` programs contain numerous options not fully documented in these short examples. You can run each program with the `-help` (`-h`) option for more information.

18.5 DrusillaSelect C++ class

mlpack provides a simple `DrusillaSelect` C++ class that can be used inside of C++ programs to perform approximate furthest neighbor search. The class has only one template parameter—`MatType`—which specifies the type of matrix to be used. That means the class can be used with either dense data (of type `arma::mat`) or sparse data (of type `arma::sp_mat`).

The following examples show simple usage of this class.

18.5.1 Approximate furthest neighbors with defaults

The code below builds a `DrusillaSelect` model with default options on the `matrix` dataset, then queries for the approximate furthest neighbor of every point in the `queries` matrix.

```
#include <mlpack/methods/approx_kfn/drusilla_select.hpp>

using namespace mlpack::neighbor;

// The reference dataset.
extern arma::mat dataset;
// The query set.
extern arma::mat queries;

// Construct the model with defaults.
DrusillaSelect<> ds(dataset);

// Query the model, putting output into the following two matrices.
arma::mat distances;
arma::Mat<size_t> neighbors;
ds.Search(queries, 1, neighbors, distances);
```

At the end of this code, both the `distances` and `neighbors` matrices will have number of columns equal to the number of columns in the `queries` matrix. So, each column of the `distances` and `neighbors` matrices are the distances or neighbors of the corresponding column in the `queries` matrix.

18.5.2 Custom numbers of tables and projections

The following example constructs a `DrusillaSelect` model with 10 tables and 5 projections. Once that is done it performs the same task as the previous example.

```
#include <mlpack/methods/approx_kfn/drusilla_select.hpp>

using namespace mlpack::neighbor;

// The reference dataset.
extern arma::mat dataset;
// The query set.
extern arma::mat queries;

// Construct the model with custom parameters.
DrusillaSelect<> ds(dataset, 10, 5);

// Query the model, putting output into the following two matrices.
arma::mat distances;
arma::Mat<size_t> neighbors;
ds.Search(queries, 1, neighbors, distances);
```

18.5.3 Accessing the candidate set

The `DrusillaSelect` algorithm merely scans the reference set and extracts a number of points that will be queried in a brute-force fashion when the `Search()` method is called. We can access this set with the `CandidateSet()` method. The code below prints the fifth point of the candidate set.

```
#include <mlpack/methods/approx_kfn/drusilla_select.hpp>

using namespace mlpack::neighbor;

// The reference dataset.
extern arma::mat dataset;

// Construct the model with custom parameters.
DrusillaSelect<> ds(dataset, 10, 5);

// Print the fifth point of the candidate set.
std::cout << ds.CandidateSet().col(4).t();
```

18.5.4 Retraining on a new reference set

It is possible to retrain a `DrusillaSelect` model with new parameters or with a new reference set. This is functionally equivalent to creating a new model. The example code below creates a first `DrusillaSelect` model using 3 tables and 10 projections, and then retrains this with the same reference set using 10 tables and 3 projections.

```
#include <mlpack/methods/approx_kfn/drusilla_select.hpp>

using namespace mlpack::neighbor;

// The reference dataset.
extern arma::mat dataset;

// Construct the model with initial parameters.
DrusillaSelect<> ds(dataset, 3, 10);

// Now retrain with different parameters.
ds.Train(dataset, 10, 3);
```

18.5.5 Running on sparse data

We can set the template parameter for `DrusillaSelect` to `arma::sp_mat` in order to perform furthest neighbor search on sparse data. This code below creates a `DrusillaSelect` model using 4 tables and 6 projections with sparse input data, then searches for 3 approximate furthest neighbors.

```
#include <mlpack/methods/approx_kfn/drusilla_select.hpp>

using namespace mlpack::neighbor;

// The reference dataset.
extern arma::sp_mat dataset;
// The query dataset.
extern arma::sp_mat querySet;

// Construct the model on sparse data.
DrusillaSelect<arma::sp_mat> ds(dataset, 4, 6);

// Search on query data.
arma::Mat<size_t> neighbors;
arma::mat distances;
ds.Search(querySet, 3, neighbors, distances);
```

18.6 QDAFN C++ class

mlpack also provides a standalone simple `QDAFN` class for furthest neighbor search. The API for this class is virtually identical to the `DrusillaSelect` class, and also has one template parameter to specify the type of matrix to be used (dense or sparse or other).

The following subsections demonstrate usage of the `QDAFN` class in the same way as the previous section's examples for `DrusillaSelect`.

18.6.1 Approximate furthest neighbors with defaults

The code below builds a QDAFN model with default options on the matrix dataset, then queries for the approximate furthest neighbor of every point in the queries matrix.

```
#include <mlpack/methods/approx_kfn/qdafn.hpp>

using namespace mlpack::neighbor;

// The reference dataset.
extern arma::mat dataset;
// The query set.
extern arma::mat queries;

// Construct the model with defaults.
QDAFN<> qd(dataset);

// Query the model, putting output into the following two matrices.
arma::mat distances;
arma::Mat<size_t> neighbors;
qd.Search(queries, 1, neighbors, distances);
```

At the end of this code, both the distances and neighbors matrices will have number of columns equal to the number of columns in the queries matrix. So, each column of the distances and neighbors matrices are the distances or neighbors of the corresponding column in the queries matrix.

18.6.2 Custom numbers of tables and projections

The following example constructs a QDAFN model with 15 tables and 30 projections. Once that is done it performs the same task as the previous example.

```
#include <mlpack/methods/approx_kfn/qdafn.hpp>

using namespace mlpack::neighbor;

// The reference dataset.
extern arma::mat dataset;
// The query set.
extern arma::mat queries;

// Construct the model with custom parameters.
QDAFN<> qdafn(dataset, 15, 30);

// Query the model, putting output into the following two matrices.
arma::mat distances;
arma::Mat<size_t> neighbors;
qdafn.Search(queries, 1, neighbors, distances);
```

18.6.3 Accessing the candidate set

The QDAFN algorithm scans the reference set, extracting points that have been projected onto random directions. Each random direction corresponds to a single table. The QDAFN class stores these points as a vector of matrices, which can be accessed with the CandidateSet() method. The code below prints the fifth point of the candidate set of the third table.

```
#include <mlpack/methods/approx_kfn/qdafn.hpp>

using namespace mlpack::neighbor;

// The reference dataset.
extern arma::mat dataset;

// Construct the model with custom parameters.
QDAFN<> qdafn(dataset, 10, 5);

// Print the fifth point of the candidate set.
std::cout << ds.CandidateSet(2).col(4).t();
```

18.6.4 Retraining on a new reference set

It is possible to retrain a QDAFN model with new parameters or with a new reference set. This is functionally equivalent to creating a new model. The example code below creates a first QDAFN model using 10 tables and 40 projections, and then retrains this with the same reference set using 15 tables and 25 projections.

```
#include <mlpack/methods/approx_kfn/qdafn.hpp>

using namespace mlpack::neighbor;

// The reference dataset.
extern arma::mat dataset;

// Construct the model with initial parameters.
QDAFN<> qdafn(dataset, 3, 10);

// Now retrain with different parameters.
qdafn.Train(dataset, 10, 3);
```

18.6.5 Running on sparse data

We can set the template parameter for QDAFN to `arma::sp_mat` in order to perform furthest neighbor search on sparse data. This code below creates a QDAFN model using 20 tables and 60 projections with sparse input data, then searches for 3 approximate furthest neighbors.

```
#include <mlpack/methods/approx_kfn/qdafn.hpp>

using namespace mlpack::neighbor;

// The reference dataset.
extern arma::sp_mat dataset;
// The query dataset.
extern arma::sp_mat querySet;

// Construct the model on sparse data.
QDAFN<arma::sp_mat> qdafn(dataset, 20, 60);

// Search on query data.
arma::Mat<size_t> neighbors;
arma::mat distances;
qdafn.Search(querySet, 3, neighbors, distances);
```

18.7 KFN C++ class

The extensive `NeighborSearch` class also provides a way to search for approximate furthest neighbors using a different, tree-based technique. For full documentation on this class, see the [NeighborSearch tutorial](#) (p. 151). The KFN class is a convenient typedef of the `NeighborSearch` class that can be used to perform the furthest neighbors task with kd-trees.

In the following subsections, the KFN class is used in short code examples.

18.7.1 Simple furthest neighbors example

The KFN class has construction semantics similar to `DrusillaSelect` and `QDAFN`. The example below constructs a KFN object (which will build the tree on the reference set), but note that the third parameter to the constructor allows us to specify our desired level of approximation. In this example we choose $\epsilon = 0.05$. Then, the code searches for 3 approximate furthest neighbors.

```
#include <mlpack/methods/neighbor_search/neighbor_search.hpp>

using namespace mlpack::neighbor;

// The reference dataset.
extern arma::mat dataset;
// The query set.
extern arma::mat querySet;

// Construct the object, performing the default dual-tree search with
// approximation level epsilon = 0.05.
KFN kfn(dataset, KFN::DUAL_TREE_MODE, 0.05);

// Search for approximate furthest neighbors.
arma::Mat<size_t> neighbors;
arma::mat distances;
kfn.Search(querySet, 3, neighbors, distances);
```

18.7.2 Retraining on a new reference set

Like the `QDAFN` and `DrusillaSelect` classes, the KFN class is capable of retraining on a new reference set. The code below demonstrates this.

```
#include <mlpack/methods/neighbor_search/neighbor_search.hpp>

using namespace mlpack::neighbor;

// The original reference set we train on.
extern arma::mat dataset;
// The new reference set we retrain on.
extern arma::mat newDataset;

// Construct the object with approximation level 0.1.
KFN kfn(dataset, DUAL_TREE_MODE, 0.1);

// Retrain on the new reference set.
kfn.Train(newDataset);
```

18.7.3 Searching in single-tree mode

The particular mode to be used in search can be specified in the constructor. In this example, we use single-tree search (as opposed to the default of dual-tree search).

```
#include <mlpack/methods/neighbor_search/neighbor_search.hpp>

using namespace mlpack::neighbor;

// The reference set.
extern arma::mat dataset;
// The query set.
extern arma::mat querySet;

// Construct the object with approximation level 0.25 and in single tree search
// mode.
KFN kfn(dataset, SINGLE_TREE_MODE, 0.25);

// Search for 5 approximate furthest neighbors.
arma::Mat<size_t> neighbors;
arma::mat distances;
kfn.Search(querySet, 5, neighbors, distances);
```

18.7.4 Searching in brute-force mode

If desired, brute-force search ("naive search") can be used to find the furthest neighbors; however, the result will not be approximate—it will be exact (since every possibility will be considered). The code below performs exact furthest neighbor search by using the `KFN` class in brute-force mode.

```
#include <mlpack/methods/neighbor_search/neighbor_search.hpp>

using namespace mlpack::neighbor;

// The reference set.
extern arma::mat dataset;
// The query set.
extern arma::mat querySet;

// Construct the object in brute-force mode. We can leave the approximation
// parameter to its default (0) since brute-force will provide exact results.
KFN kfn(dataset, NAIVE_MODE);

// Perform the search for 2 furthest neighbors.
arma::Mat<size_t> neighbors;
arma::mat distances;
kfn.Search(querySet, 2, neighbors, distances);
```

18.8 Further documentation

For further documentation on the approximate furthest neighbor facilities offered by **mlpack**, consult the following documentation:

- **NeighborSearch tutorial (k-nearest-neighbors)** (p. 151)
- **QDAFN class documentation** (p. 1666)
- **DrusillaSelect class documentation** (p. 1597)
- **NeighborSearch class documentation** (p. 1627)

Chapter 19

Collaborative filtering tutorial

19.1 Introduction

Collaborative filtering is an increasingly popular approach for recommender systems. A typical formulation of the problem is as follows: there are n users and m items, and each user has rated some of the items. We want to provide each user with a recommendation for an item they have not rated yet, which they are likely to rate highly. In another formulation, we may want to predict a user's rating of an item. This type of problem has been considered extensively, especially in the context of the Netflix prize. The winning approach for the Netflix prize was a collaborative filtering approach which utilized matrix decomposition. More information on their approach can be found in the following paper:

```
@article{koren2009matrix,
  title={Matrix factorization techniques for recommender systems},
  author={Koren, Yehuda and Bell, Robert and Volinsky, Chris},
  journal={Computer},
  number={8},
  pages={30--37},
  year={2009},
  publisher={IEEE}
}
```

The key to this approach is that the data is represented as an incomplete matrix $V \in \Re^{n \times m}$, where V_{ij} represents user i 's rating of item j , if that rating exists. The task, then, is to complete the entries of the matrix.

In the matrix factorization framework, the matrix V is assumed to be low-rank and decomposed into components as $V \approx WH$ according to some heuristic.

In order to solve problems of this form, **mlpack** provides:

- a **simple command-line interface** (p. 104) to perform collaborative filtering
- a **simple C++ interface** (p. 107) to perform collaborative filtering
- an **extensible C++ interface** (p. 109) for implementing new collaborative filtering techniques

19.3 The 'mlpack_cf' program

mlpack provides a command-line program, `mlpack_cf`, which is used to perform collaborative filtering on a given dataset. It can provide neighborhood-based recommendations for users. The algorithm used for matrix factorization is configurable, and the parameters of each algorithm are also configurable.

The following examples detail usage of the `mlpack_cf` program. Note that you can get documentation on all the possible parameters by typing:

```
$ mlpack_cf --help
```

19.3.1 Input format for mlpack_cf

The input file for the `mlpack_cf` program is specified with the `-training_file` or `-t` option. This file is a coordinate-format sparse matrix, similar to the Matrix Market (MM) format. The first coordinate is the user id; the second coordinate is the item id; and the third coordinate is the rating. So, for instance, a dataset with 3 users and 2 items, and ratings between 1 and 5, might look like the following:

```
$ cat dataset.csv
0, 1, 4
1, 0, 5
1, 1, 1
2, 0, 2
```

This dataset has four ratings: user 0 has rated item 1 with a rating of 4; user 1 has rated item 0 with a rating of 5; user 1 has rated item 1 with a rating of 1; and user 2 has rated item 0 with a rating of 2. Note that the user and item indices start from 0, and the identifiers must be numeric indices, and not names.

The type does not necessarily need to be a csv; it can be any supported storage format, assuming that it is a coordinate-format file in the format specified above. For more information on mlpack file formats, see the documentation for `mlpack::data::Load()` (p. 379).

19.3.2 mlpack_cf with default parameters

In this example, we have a dataset from MovieLens, and we want to use `mlpack_cf` with the default parameters, which will provide 5 recommendations for each user, and we wish to save the results in the file `recommendations.csv`. Assuming that our dataset is in the file `MovieLens-100k.csv` and it is in the correct format, we may use the `mlpack_cf` executable as below:

```
$ mlpack_cf -t MovieLens-100k.csv -v -o recommendations.csv
```

The `-v` option provides verbose output, and may be omitted if desired. Now, for each user, we have recommendations in `recommendations.csv`:

```
$ head recommendations.csv
317,422,482,356,495
116,120,180,6,327
312,49,116,99,236
312,116,99,236,285
55,190,317,194,63
171,209,180,175,95
208,0,94,87,57
99,97,0,203,172
257,99,180,287,0
171,203,172,209,88
```

So, for user 0, the top 5 recommended items that user 0 has not rated are items 317, 422, 482, 356, and 495. For user 5, the recommendations are on the sixth line: 171, 209, 180, 175, 95.

The `mlpack_cf` program can be built into a larger recommendation framework, with a preprocessing step that can turn user information and item information into numeric IDs, and a postprocessing step that can map these numeric IDs back to the original information.

19.3.3 Saving `mlpack_cf` models

The `mlpack_cf` program is able to save a particular model for later loading. Saving a model can be done with the `-output_model_file` or `-M` option. The example below builds a CF model on the `MovieLens-100k.csv` dataset, and then saves the model to the file `cf-model.xml` for later usage.

```
$ mlpack_cf -t MovieLens-100k.csv -M cf-model.xml -v
```

The models can also be saved as `.bin` or `.txt`; the `.xml` format provides a human-inspectable format (though the models tend to be quite complex and may be difficult to read). These models can then be re-used to provide specific recommendations for certain users, or other tasks.

19.3.4 Loading `mlpack_cf` models

Instead of training a model, the `mlpack_cf` model can also load a model to provide recommendations, using the `-input_model_file` or `-m` option. For instance, the example below will load the model from `cf-model.xml` and then generate 3 recommendations for each user in the dataset, saving the results to `recommendations.csv`.

```
$ mlpack_cf -m cf-model.xml -v -o recommendations.csv
```

19.3.5 Specifying rank of `mlpack_cf` decomposition

By default, the matrix factorizations in the `mlpack_cf` program decompose the data matrix into two matrices W and H with rank two. Often, this default parameter is not correct, and it makes sense to use a higher-rank decomposition. The rank can be specified with the `-rank` or `-R` parameter:

```
$ mlpack_cf -t MovieLens-100k.csv -R 10 -v
```

In the example above, the data matrix will be decomposed into two matrices of rank 10. In general, higher-rank decompositions will take longer, but will give more accurate predictions.

19.3.6 `mlpack_cf` with single-user recommendation

In the previous two examples, the output file `recommendations.csv` contains one line for each user in the input dataset. But often, recommendations may only be desired for a few users. In that case, we can assemble a file of query users, with one user per line:

```
$ cat query.csv
0
17
31
```

Now, if we run the `mlpack_cf` executable with this query file, we will obtain recommendations for users 0, 17, and 31:

```
$ mlpack_cf -i MovieLens-100k.csv -R 10 -q query.csv -o recommendations.csv
$ cat recommendations.csv
474,356,317,432,473
510,172,204,483,182
0,120,236,257,126
```

19.3.7 `mlpack_cf` with non-default factorizer

The `-algorithm` (or `-a`) parameter controls the factorizer that is used. Several options are available:

- `'NMF'`: non-negative matrix factorization; see `mlpack::amf::AMF<>`
- `'SVDBatch'`: SVD batch factorization
- `'SVDIncompleteIncremental'`: incomplete incremental SVD
- `'SVDCompleteIncremental'`: complete incremental SVD
- `'RegSVD'`: regularized SVD; see `mlpack::svd::RegularizedSVD` (p. 1943)

The default factorizer is `'NMF'`. The example below uses the `'RegSVD'` factorizer:

```
$ mlpack_cf -i MovieLens-100k.csv -R 10 -q query.csv -a RegSVD -o recommendations.csv
```

19.3.8 `mlpack_cf` with non-default neighborhood size

The `mlpack_cf` program produces recommendations using a neighborhood: similar users in the query user's neighborhood will be averaged to produce predictions. The size of this neighborhood is controlled with the `-neighborhood` (or `-n`) option. An example using a neighborhood with 10 similar users is below:

```
$ mlpack_cf -i MovieLens-100k.csv -R 10 -q query.csv -a RegSVD -n 10
```

19.4 The 'CF' class

The `CF` class in **mlpack** offers a simple, flexible API for performing collaborative filtering for recommender systems within C++ applications. In the constructor, the `CF` class takes a coordinate-list dataset and decomposes the matrix according to the specified `FactorizerType` template parameter.

Then, the `GetRecommendations()` function may be called to obtain recommendations for certain users (or all users), and the `W()` and `H()` matrices may be accessed to perform other computations.

The data which the `CF` constructor takes should be an Armadillo matrix (`arma::mat`) with three rows. The first row corresponds to users; the second row corresponds to items; the third column corresponds to the rating. This is a coordinate list format, like the format the `cf` executable takes. The `data::Load()` (p. 379) function can be used to load data.

The following examples detail a few ways that the `CF` class can be used.

19.4.1 CF with default parameters

This example constructs the CF object with default parameters and obtains recommendations for each user, storing the output in the `recommendations` matrix.

```
#include <mlpack/methods/cf/cf.hpp>

using namespace mlpack::cf;

// The coordinate list of ratings that we have.
extern arma::mat data;
// The size of the neighborhood to use to get recommendations.
extern size_t neighborhood;
// The rank of the decomposition.
extern size_t rank;

// Build the CF object and perform the decomposition.
// The constructor takes a default-constructed factorizer, which, by default,
// is of type amf::NMFALSFactorizer.
CF cf(data, amf::NMFALSFactorizer(), neighborhood, rank);

// Store the results in this object.
arma::Mat<size_t> recommendations;

// Get 5 recommendations for all users.
cf.GetRecommendations(5, recommendations);
```

19.4.2 CF with other factorizers

mlpack provides a number of existing factorizers which can be used in place of the default `mlpack::amf::NMFA↔LSFactorizer` (p. 259) (which is non-negative matrix factorization with alternating least squares update rules). These include:

- `mlpack::amf::SVDBatchFactorizer` (p. 259)
- `mlpack::amf::SVDCompleteIncrementalFactorizer` (p. 260)
- `mlpack::amf::SVDIncompleteIncrementalFactorizer` (p. 260)
- `mlpack::amf::NMFALSFactorizer` (p. 259)
- `mlpack::svd::RegularizedSVD` (p. 1943)
- `mlpack::svd::QUIC_SVD` (p. 1932)

The `amf::AMF<>` class has many other possibilities than those listed here; it is a framework for alternating matrix factorization techniques. See the class documentation or **tutorial on AMF** (p. 73) for more information.

The use of another factorizer is straightforward; the example from the previous section is adapted below to use `svd::↔RegularizedSVD`:

```
#include <mlpack/methods/cf/cf.hpp>
#include <mlpack/methods/regularized_svd/regularized_svd.hpp>

using namespace mlpack::cf;

// The coordinate list of ratings that we have.
extern arma::mat data;
// The size of the neighborhood to use to get recommendations.
extern size_t neighborhood;
// The rank of the decomposition.
extern size_t rank;

// Build the CF object and perform the decomposition.
CF cf(data, svd::RegularizedSVD(), neighborhood, rank);

// Store the results in this object.
arma::Mat<size_t> recommendations;

// Get 5 recommendations for all users.
cf.GetRecommendations(5, recommendations);
```

19.4.3 Predicting individual user/item ratings

The `Predict()` method can be used to predict the rating of an item by a certain user, using the same neighborhood-based approach as the `GetRecommendations()` function or the `cf` executable. Below is an example of the use of that function.

The example below will obtain the predicted rating for item 50 by user 12.

```
#include <mlpack/methods/cf/cf.hpp>

using namespace mlpack::cf;

// The coordinate list of ratings that we have.
extern arma::mat data;
// The size of the neighborhood to use to get recommendations.
extern size_t neighborhood;
// The rank of the decomposition.
extern size_t rank;

// Build the CF object and perform the decomposition.
// The constructor takes a default-constructed factorizer, which, by default,
// is of type amf::NMFALSFactorizer.
CF cf(data, amf::NMFALSFactorizer(), neighborhood, rank);

const double prediction = cf.Predict(12, 50); // User 12, item 50.
```

19.4.4 Other operations with the W and H matrices

Sometimes, the raw decomposed W and H matrices can be useful. The example below obtains these matrices, and multiplies them against each other to obtain a reconstructed data matrix with no missing values.

```
#include <mlpack/methods/cf/cf.hpp>

using namespace mlpack::cf;

// The coordinate list of ratings that we have.
extern arma::mat data;
// The size of the neighborhood to use to get recommendations.
extern size_t neighborhood;
// The rank of the decomposition.
extern size_t rank;

// Build the CF object and perform the decomposition.
// The constructor takes a default-constructed factorizer, which, by default,
// is of type amf::NMFALSFactorizer.
CF cf(data, amf::NMFALSFactorizer(), neighborhood, rank);

// References to W and H matrices.
const arma::mat& W = cf.W();
const arma::mat& H = cf.H();

// Multiply the matrices together.
arma::mat reconstructed = W * H;
```

19.5 Template parameters for the 'CF' class

The CF class takes the `FactorizerType` as a template parameter to some of its constructors and to the `Train()` function. The `FactorizerType` class defines the algorithm used for matrix factorization. There are a number of existing factorizers that can be used in **mlpack**; these were detailed in the **'other factorizers' example** (p. 108) of the previous section.

The `FactorizerType` class must implement one of the two following methods:

- `Apply(arma::mat& data, const size_t rank, arma::mat& W, arma::mat& H);`
- `Apply(arma::sp_mat& data, const size_t rank, arma::mat& W, arma::mat& H);`

The difference between these two methods is whether `arma::mat` or `arma::sp_mat` is used as input. If `arma::mat` is used, then the data matrix is a coordinate list with three columns, as in the constructor to the `CF` class. If `arma::sp_mat` is used, then a sparse matrix is passed with the number of rows equal to the number of items and the number of columns equal to the number of users, and each nonzero element in the matrix corresponds to a non-missing rating.

The method that the factorizer implements is specified via the `FactorizerTraits` class, which is a template metaprogramming traits class:

```
template<typename FactorizerType>
struct FactorizerTraits
{
    static const bool UsesCoordinateList = false;
};
```

If `FactorizerTraits<MyFactorizer>::UsesCoordinateList` is `true`, then `CF` will try to call `Apply()` with an `arma::mat` object. Otherwise, `CF` will try to call `Apply()` with an `arma::sp_mat` object. Specifying the value of `UsesCoordinateList` is straightforward; provide this specialization of the `FactorizerTraits` class:

```
template<>
struct FactorizerTraits<MyFactorizer>
{
    static const bool UsesCoordinateList = true; // Set your value here.
};
```

The `Apply()` function also takes a reference to the matrices `W` and `H`. When the `Apply()` function returns, the input data matrix should be decomposed into these two matrices. `W` should have number of rows equal to the number of items and number of columns equal to the `rank` parameter, and `H` should have number of rows equal to the `rank` parameter, and number of columns equal to the number of users.

The `amf::AMF<>` class (p. 499) can be used as a base for factorizers that alternate between updating `W` and updating `H`. A useful reference is the **AMF tutorial** (p. 73).

19.6 Further documentation

Further documentation for the `CF` class may be found in the complete API documentation. In addition, more information on the `AMF` class of factorizers may be found in its **complete API documentation** (p. 499).

Chapter 20

Density Estimation Tree (DET) tutorial

20.1 Introduction

DETs perform the unsupervised task of density estimation using decision trees. Using a trained density estimation tree (DET), the density at any particular point can be estimated very quickly ($O(\log n)$ time, where n is the number of points the tree is built on).

The details of this work is presented in the following paper:

```
@inproceedings{ram2011density,
  title={Density estimation trees},
  author={Ram, P. and Gray, A.G.},
  booktitle={Proceedings of the 17th ACM SIGKDD International Conference on
    Knowledge Discovery and Data Mining},
  pages={627--635},
  year={2011},
  organization={ACM}
}
```

mlpack provides:

- a **simple command-line executable** (p. 112) to perform density estimation and related analyses using DETs
- a **generic C++ class (DTree)** (p. 114) which provides various functionality for the DETs
- a set of functions in the namespace **mlpack::det** (p. 115) to perform cross-validation for the task of density estimation with DETs

20.2 Table of Contents

A list of all the sections this tutorial contains.

 - **Utility Functions** (p. 116)
- **Further Documentation** (p. 116)

20.3 Command-Line `mlpack_det`

The command line arguments of this program can be viewed using the `-h` option:

```
$ mlpack_det -h
Density Estimation With Density Estimation Trees

This program performs a number of functions related to Density Estimation
Trees. The optimal Density Estimation Tree (DET) can be trained on a set of
data (specified by --training_file or -t) using cross-validation (with number
of folds specified by --folds). This trained density estimation tree may then
be saved to a model file with the --output_model_file (-M) option.

The variable importances of each dimension may be saved with the --vi_file
(-i) option, and the density estimates on each training point may be saved to
the file specified with the --training_set_estimates_file (-e) option.

This program also can provide density estimates for a set of test points,
specified in the --test_file (-T) file. The density estimation tree used for
this task will be the tree that was trained on the given training points, or a
tree stored in the file given with the --input_model_file (-m) parameter. The
density estimates for the test points may be saved into the file specified
with the --test_set_estimates_file (-E) option.
```

Options:

```
--folds (-f) [int]          The number of folds of cross-validation to
                             perform for the estimation (0 is LOOCV) Default
                             value 10.
--help (-h)                Default help info.
--info [string]             Get help on a specific module or option.
                             Default value ''.
--input_model_file (-m) [string]
                             File containing already trained density
                             estimation tree. Default value ''.
--max_leaf_size (-L) [int]  The maximum size of a leaf in the unpruned,
                             fully grown DET. Default value 10.
--min_leaf_size (-l) [int]  The minimum size of a leaf in the unpruned,
                             fully grown DET. Default value 5.
--output_model_file (-M) [string]
                             File to save trained density estimation tree to.
                             Default value ''.
--test_file (-T) [string]   A set of test points to estimate the density of.
                             Default value ''.
--test_set_estimates_file (-E) [string]
                             The file in which to output the estimates on the
                             test set from the final optimally pruned tree.
                             Default value ''.
```

```

--training_file (-t) [string]
    The data set on which to build a density
    estimation tree. Default value ''.
--training_set_estimates_file (-e) [string]
    The file in which to output the density
    estimates on the training set from the final
    optimally pruned tree. Default value ''.
--verbose (-v)
    Display informational messages and the full list
    of parameters and timers at the end of
    execution.
--version (-V)
    Display the version of mlpack.
--vi_file (-i) [string]
    The file to output the variable importance
    values for each feature. Default value ''.

```

For further information, including relevant papers, citations, and theory, consult the documentation found at <http://www.mlpack.org> or included with your distribution of **mlpack**.

20.3.1 Plain-vanilla density estimation

We can just train a DET on the provided data set *S*. Like all datasets **mlpack** uses, the data should be row-major (**mlpack** transposes data when it is loaded; internally, the data is column-major – see [this page](#) (p. 57) for more information).

```
$ mlpack_det -t dataset.csv -v
```

By default, `mlpack_det` performs 10-fold cross-validation (using the α -pruning regularization for decision trees). To perform LOOCV (leave-one-out cross-validation), which can provide better results but will take longer, use the following command:

```
$ mlpack_det -t dataset.csv -f 0 -v
```

To perform k-fold crossvalidation, use `-f k` (or `-folds k`). There are certain other options available for training. For example, in the construction of the initial tree, you can specify the maximum and minimum leaf sizes. By default, they are 10 and 5 respectively; you can set them using the `-M` (`-max_leaf_size`) and the `-N` (`-min_leaf_size`) options.

```
$ mlpack_det -t dataset.csv -M 20 -N 10
```

In case you want to output the density estimates at the points in the training set, use the `-e` (`-training_set_↔estimates_file`) option to specify the output file to which the estimates will be saved. The first line in `density_↔estimates.txt` will correspond to the density at the first point in the training set. Note that the logarithm of the density estimates are given, which allows smaller estimates to be saved.

```
$ mlpack_det -t dataset.csv -e density_estimates.txt -v
```

20.3.2 Estimation on a test set

Often, it is useful to train a density estimation tree on a training set and then obtain density estimates from the learned estimator for a separate set of test points. The `-T` (`-test_file`) option allows specification of a set of test points, and the `-E` (`-test_set_estimates_file`) option allows specification of the file into which the test set estimates are saved. Note that the logarithm of the density estimates are saved; this allows smaller values to be saved.

```
$ mlpack_det -t dataset.csv -T test_points.csv -E test_density_estimates.txt -v
```

20.3.3 Computing the variable importance

The variable importance (with respect to density estimation) of the different features in the data set can be obtained by using the `-i (-vi_file)` option. This outputs the absolute (as opposed to relative) variable importance of the all the features into the specified file.

```
$ mlpack_det -t dataset.csv -i variable_importance.txt -v
```

20.3.4 Saving trained DETs

The `mlpack_det` program is capable of saving a trained DET to a file for later usage. The `-output_model_file` or `-M` option allows specification of the file to save to. In the example below, a DET trained on `dataset.csv` is saved to the file `det.xml`.

```
$ mlpack_det -t dataset.csv -M det.xml -v
```

20.3.5 Loading trained DETs

A saved DET can be used to perform any of the functionality in the examples above. A saved DET is loaded with the `-input_model_file` or `-m` option. The example below loads a saved DET from `det.xml` and outputs density estimates on the dataset `test_dataset.csv` into the file `estimates.csv`.

```
$ mlpack_det -m det.xml -T test_dataset.csv -E estimates.csv -v
```

20.4 The 'DTree' class

This class implements density estimation trees. Below is a simple example which initializes a density estimation tree.

```
#include <mlpack/methods/det/dtree.hpp>

using namespace mlpack::det;

// The dataset matrix, on which to learn the density estimation tree.
extern arma::Mat<float> data;

// Initialize the tree. This function also creates and saves the bounding box
// of the data. Note that it does not actually build the tree.
DTree<> det(data);
```

20.4.1 Public Functions

The function `Grow()` greedily grows the tree, adding new points to the tree. Note that the points in the dataset will be reordered. This should only be run on a tree which has not already been built. In general, it is more useful to use the **`Trainer()`** (p. 392) function found in 'namespace mlpack::det' (p. 115).

```
// This keeps track of the data during the shuffle that occurs while growing the
// tree.
arma::Col<size_t> oldFromNew(data.n_cols);
for (size_t i = 0; i < data.n_cols; i++)
  oldFromNew[i] = i;

// This function grows the tree down to the leaves. It returns the current
// minimum value of the regularization parameter alpha.
size_t maxLeafSize = 10;
size_t minLeafSize = 5;

double alpha = det.Grow(data, oldFromNew, false, maxLeafSize, minLeafSize);
```

Note that the alternate volume regularization should not be used (see ticket #238).

To estimate the density at a given query point, use the following code. Note that the logarithm of the density is returned.

```
// For a given query, you can obtain the density estimate.
extern arma::Col<float> query;
extern DTree* det;
double estimate = det->ComputeValue(&query);
```

Computing the **variable importance** of each feature for the given DET.

```
// The data matrix and density estimation tree.
extern arma::mat data;
extern DTree* det;

// The variable importances will be saved into this vector.
arma::Col<double> varImps;

// You can obtain the variable importance from the current tree.
det->ComputeVariableImportance(varImps);
```

20.5 'namespace mlpack::det'

The functions in this namespace allows the user to perform tasks with the 'DTree' class. Most importantly, the **`Trainer()`** (p. 392) method allows the full training of a density estimation tree with cross-validation. There are also utility functions which allow printing of leaf membership and variable importance.

20.5.1 Utility Functions

The code below details how to train a density estimation tree with cross-validation.

```
#include <mlpack/methods/det/dt_utils.hpp>

using namespace mlpack::det;

// The dataset matrix, on which to learn the density estimation tree.
extern arma::Mat<float> data;

// The number of folds for cross-validation.
const size_t folds = 10; // Set folds = 0 for LOOCV.

const size_t maxLeafSize = 10;
const size_t minLeafSize = 5;

// Train the density estimation tree with cross-validation.
DTree<>* dtree_opt = Trainer(data, folds, false, maxLeafSize, minLeafSize);
```

Note that the alternate volume regularization should be set to false because it has known bugs (see #238).

To print the class membership of leaves in the tree into a file, see the following code.

```
extern arma::Mat<size_t> labels;
extern DTree* det;
const size_t numClasses = 3; // The number of classes must be known.

extern string leafClassMembershipFile;

PrintLeafMembership(det, data, labels, numClasses, leafClassMembershipFile);
```

Note that you can find the number of classes with `max(labels) + 1`. The variable importance can also be printed to a file in a similar manner.

```
extern DTree* det;

extern string variableImportanceFile;
const size_t numFeatures = data.n_rows;

PrintVariableImportance(det, numFeatures, variableImportanceFile);
```

20.6 Further Documentation

For further documentation on the DTree class, consult the **complete API documentation** (p. 1207).

Chapter 21

EMST Tutorial

21.1 Introduction

The Euclidean Minimum Spanning Tree problem is widely used in machine learning and data mining applications. Given a set S of points in \mathbf{R}^d , our task is to compute lowest weight spanning tree in the complete graph on S with edge weights given by the Euclidean distance between points.

Among other applications, the EMST can be used to compute hierarchical clusterings of data. A *single-linkage clustering* can be obtained from the EMST by deleting all edges longer than a given cluster length. This technique is also referred to as a *Friends-of-Friends* clustering in the astronomy literature.

mlpack includes an implementation of **Dual-Tree Boruvka** which uses *kd*-trees by default; this is the empirically and theoretically fastest EMST algorithm. In addition, the implementation supports the use of different trees via templates. For more details, see the following paper:

```
@inproceedings{march2010fast,
  title={Fast {E}uclidean minimum spanning tree: algorithm, analysis, and
  applications},
  author={March, William B. and Ram, Parikshit and Gray, Alexander G.},
  booktitle={Proceedings of the 16th ACM SIGKDD International Conference on
  Knowledge Discovery and Data Mining (KDD '10)},
  pages={603--612},
  year={2010},
  organization={ACM}
}
```

mlpack provides:

- a **simple command-line executable** (p. 118) to compute the EMST of a given data set
- a **simple C++ interface** (p. 119) to compute the EMST

21.2 Table of Contents

A list of all the sections this tutorial contains.

- **Further documentation** (p. 119)

21.3 Command-Line 'EMST'

The `mlpack_emst` executable in **mlpack** will compute the EMST of a given set of points and store the resulting edge list to a file.

The output file contains an edge list representation of the MST in an $n-1 \times 3$ matrix, where the first and second columns are labels of points and the third column is the edge weight. The edges are sorted in order of increasing weight.

Below are several examples of simple usage (and the resultant output). The `-v` option is used so that verbose output is given. Further documentation on each individual option can be found by typing

```
$ mlpack_emst --help

$ mlpack_emst --input_file=dataset.csv --output_file=edge_list.csv -v
[INFO ] Reading in data.
[INFO ] Loading 'dataset.csv' as CSV data.
[INFO ] Data read, building tree.
[INFO ] Tree built, running algorithm.
[INFO ] 4 edges found so far.
[INFO ] 5 edges found so far.
[INFO ] Total spanning tree length: 1002.45
[INFO ] Saving CSV data to 'edge_list.csv'.
[INFO ]
[INFO ] Execution parameters:
[INFO ]   help: false
[INFO ]   info: ""
[INFO ]   input_file: dataset.csv
[INFO ]   leaf_size: 1
[INFO ]   naive: false
[INFO ]   output_file: edge_list.csv
[INFO ]   verbose: true
[INFO ]
[INFO ] Program timers:
[INFO ]   emst/mst_computation: 0.000179s
[INFO ]   emst/tree_building: 0.000061s
[INFO ]   total_time: 0.052641s
```

The code performs at most $\log N$ iterations for N data points. It will print an update on the number of MST edges found after each iteration. Convenient program timers are given for different parts of the calculation at the bottom of the output, as well as the parameters the simulation was run with.

```
$ cat dataset.csv
0, 0
1, 1
3, 3
0.5, 0
1000, 0
1001, 0

$ cat edge_list.csv
0.0000000000e+00,3.0000000000e+00,5.0000000000e-01
4.0000000000e+00,5.0000000000e+00,1.0000000000e+00
1.0000000000e+00,3.0000000000e+00,1.1180339887e+00
1.0000000000e+00,2.0000000000e+00,2.8284271247e+00
2.0000000000e+00,4.0000000000e+00,9.9700451353e+02
```

The input points are labeled 0-5. The output tells us that the MST connects point 0 to point 3, point 4 to point 5, point 1 to point 3, point 1 to point 2, and point 2 to point 4, with the corresponding edge weights given in the third column. The total length of the MST is also given in the verbose output.

Note that it is also possible to compute the EMST using a naive ($O(N^2)$) algorithm for timing and comparison purposes, using the `-naive` option.

21.4 The 'DualTreeBoruvka' class

The 'DualTreeBoruvka' class contains our implementation of the Dual-Tree Boruvka algorithm.

The class has two constructors: the first takes the data set, constructs the tree (where the type of tree constructed is the `TreeType` template parameter), and computes the MST. The second takes data set and an already constructed tree.

The class provides one method that performs the MST computation:

```
void ComputeMST(const arma::mat& results);
```

This method stores the computed MST in the matrix results in the format given above.

21.5 Further documentation

For further documentation on the DualTreeBoruvka class, consult the **complete API documentation** (p. 1272).

Chapter 22

Fast max-kernel search tutorial (fastmks)

22.1 Introduction

The FastMKS algorithm (fast exact max-kernel search) is a recent algorithm proposed in the following papers:

```
@inproceedings{curtin2013fast,
  title={Fast Exact Max-Kernel Search},
  author={Curtin, Ryan R. and Ram, Parikshit and Gray, Alexander G.},
  booktitle={Proceedings of the 2013 SIAM International Conference on Data
    Mining (SDM '13)},
  year={2013},
  pages={1--9}
}

@article{curtin2014dual,
  author = {Curtin, Ryan R. and Ram, Parikshit},
  title = {Dual-tree fast exact max-kernel search},
  journal = {Statistical Analysis and Data Mining},
  volume = {7},
  number = {4},
  publisher = {Wiley Subscription Services, Inc., A Wiley Company},
  issn = {1932-1872},
  url = {http://dx.doi.org/10.1002/sam.11218},
  doi = {10.1002/sam.11218},
  pages = {229--253},
  year = {2014},
}
```

Given a set of query points Q and a set of reference points R , the FastMKS algorithm is a fast dual-tree (or single-tree) algorithm which finds

$$\arg \max_{p_r \in R} K(p_q, p_r)$$

for all points $p_q \in Q$ and for some Mercer kernel $K(\cdot, \cdot)$. A Mercer kernel is a kernel that is positive semidefinite; these are the classes of kernels that can be used with the kernel trick. In short, the positive semidefiniteness of a Mercer kernel means that any kernel matrix (or Gram matrix) created on a dataset must be positive semidefinite.

The FastMKS algorithm builds trees on the datasets Q and R in such a way that explicit representation of the points in the kernel space is unnecessary, by using cover trees (**mlpack::tree::CoverTree** (p. 2040)). This allows the algorithm to be run, for instance, on string kernels, where there is no sensible explicit representation. The **mlpack** implementation allows any type of tree that does not require an explicit representation to be used. For more details, see the paper.

At the time of this writing there is no other fast algorithm for exact max-kernel search. **mlpack** implements both single-tree and dual-tree fast max-kernel search.

mlpack provides:

- a **simple command-line executable** (p. 122) to run FastMKS
- a **C++ interface** (p. 125) to run FastMKS

22.2 Table of Contents

22.3 Command-line FastMKS (mlpack_fastmks)

mlpack provides a command-line program, `mlpack_fastmks`, which is used to perform FastMKS on a given query and reference dataset. It supports numerous different types of kernels:

- **linear kernel** (p. 1446)
- **polynomial kernel** (p. 1451)
- **cosine distance** (p. 1416)
- **Gaussian kernel** (p. 1424)

- **Epanechnikov kernel** (p. 1417)
- **triangular kernel** (p. 1461)
- **hyperbolic tangent kernel** (p. 1430)

Note that when a shift-invariant kernel is used, the results will be the same as nearest neighbor search, so **KNN** (p. 151) may be a better option. A shift-invariant kernel is a kernel that depends only on the distance between the two input points. The **Gaussian kernel** (p. 1424), **Epanechnikov kernel** (p. 1417), and **triangular kernel** (p. 1461) are instances of shift-invariant kernels. The paper contains more details on this situation. The `mlpack_fastmks` executable still provides these kernels as options, though.

The following examples detail usage of the `mlpack_fastmks` program. Note that you can get documentation on all the possible parameters by typing:

```
$ mlpack_fastmks --help
```

22.3.1 FastMKS with a linear kernel on one dataset

If only one dataset is specified (with `-r` or `-reference_file`), the reference dataset is taken to be both the query and reference datasets. The example below finds the 4 maximum kernels of each point in `dataset.csv`, using the default linear kernel.

```
$ mlpack_fastmks -r dataset.csv -k 4 -v -p products.csv -i indices.csv
```

When the operation completes, the values of the kernels are saved in `products.csv` and the indices of the points which give the maximum kernels are saved in `indices.csv`.

```
$ head indices.csv
762,910,863,890
762,910,426,568
910,762,863,426
762,910,863,426
863,910,614,762
762,863,910,614
762,910,488,568
762,910,863,426
910,762,863,426
863,762,910,614
```

```
$ head products.csv
1.6221652894e+00,1.5998743443e+00,1.5898890769e+00,1.5406789753e+00
1.3387953449e+00,1.3317349486e+00,1.2966613184e+00,1.2774493620e+00
1.6386110476e+00,1.6332029753e+00,1.5952629124e+00,1.5887195330e+00
1.0917545803e+00,1.0820878726e+00,1.0668992636e+00,1.0419838050e+00
1.2272441028e+00,1.2169643942e+00,1.2104597963e+00,1.2067780154e+00
1.5720962456e+00,1.5618504956e+00,1.5609069923e+00,1.5235605095e+00
1.3655478674e+00,1.3548593212e+00,1.3311547298e+00,1.3250728881e+00
2.0119149744e+00,2.0043668067e+00,1.9847289214e+00,1.9298280046e+00
1.1586923205e+00,1.1494586097e+00,1.1274872962e+00,1.1248172766e+00
4.4789820372e-01,4.4618539778e-01,4.4200024852e-01,4.3989721792e-01
```

We can see in this example that for point 0, the point with maximum kernel value is point 762, with a kernel value of 1.622165. For point 3, the point with third largest kernel value is point 863, with a kernel value of 1.0669.

22.3.2 FastMKS on a reference and query dataset

The query points may be different than the reference points. To specify a different query set, the `-q` (or `-query_file`) option is used, as in the example below.

```
$ mlpack_fastmks -q query_set.csv -r reference_set.csv -k 5 -i indices.csv \
> -p products.csv
```

22.3.3 FastMKS with a different kernel

The `mlpack_fastmks` program offers more than just the linear kernel. Valid options are 'linear', 'polynomial', 'cosine', 'gaussian', 'epanechnikov', 'triangular' and 'hyptan' (the hyperbolic tangent kernel). Note that the hyperbolic tangent kernel is provably not a Mercer kernel but is positive semidefinite on most datasets and is commonly used as a kernel. Note also that the Gaussian kernel and other shift-invariant kernels give the same results as nearest neighbor search (see **NeighborSearch tutorial (k-nearest-neighbors)** (p. 151)).

The kernel to use is specified with the `-K` (or `-kernel`) option. The example below uses the cosine similarity as a kernel.

```
$ mlpack_fastmks -r dataset.csv -k 5 -K cosine -i indices.csv -p products.csv -v
```

22.3.4 Using single-tree search or naive search

In some cases, it may be useful to not use the dual-tree FastMKS algorithm. Instead you can specify the `-single` option, indicating that a tree should be built only on the reference set, and then the queries should be processed in a linear scan (instead of in a tree). Alternately, the `-N` (or `-naive`) option makes the program not build trees at all and instead use brute-force search to find the solutions.

The example below uses single-tree search on two datasets with the linear kernel.

```
$ mlpack_fastmks -q query_set.csv -r reference_set.csv --single -k 5 \
> -p products.csv -i indices.csv -K linear
```

The example below uses naive search on one dataset.

```
$ mlpack_fastmks -r reference_set.csv -k 5 -N -p products.csv -i indices.csv
```

22.3.5 Parameters for alternate kernels

Many of the alternate kernel choices have parameters which can be chosen; these are detailed in this section.

- `-w` (`-bandwidth`): this sets the bandwidth of the kernel, and is applicable to the 'gaussian', 'epanechnikov', and 'triangular' kernels. This is the "spread" of the kernel.
- `-d` (`-degree`): this sets the degree of the polynomial kernel (the power to which the result is raised). It is only applicable to the 'polynomial' kernel.
- `-o` (`-offset`): this sets the offset of the kernel, for the 'polynomial' and 'hyptan' kernel. See the **polynomial kernel documentation** (p. 1451) and the **hyperbolic tangent kernel documentation** (p. 1430) for more information.
- `-s` (`-scale`): this sets the scale of the kernel, and is only applicable to the 'hyptan' kernel. See the **hyperbolic tangent kernel documentation** (p. 1430) for more information.

22.3.6 Saving a FastMKS model/tree

The `mlpack_fastmks` program also supports saving a model built on a reference dataset (this model includes the tree, the kernel, and the search parameters). The `-output_model_file` or `-M` option allows one to save these parameters to disk for later usage. An example is below:

```
$ mlpack_fastmks -r reference_set.csv -K cosine -M fastmks_model.xml
```

This example builds a tree on the dataset in `reference_set.csv` using the cosine similarity kernel, and saves the resulting model to `fastmks_model.xml`. This model may then be used in later calls to the `mlpack_fastmks` program.

22.3.7 Loading a FastMKS model for further searches

Supposing that a FastMKS model has been saved with the `-output_model_file` or `-M` parameter, that model can then be later loaded in subsequent calls to the `mlpack_fastmks` program, using the `-input_model_file` or `-m` option. For instance, with a model saved in `fastmks_model.xml` and a query set in `query_set.csv`, we can find 3 max-kernel candidates, saving to `indices.csv` and `kernels.csv`:

```
$ mlpack_fastmks -m fastmks_model.xml -k 3 -i indices.csv -p kernels.csv
```

Loading a model as opposed to building a model is advantageous because the reference tree is already built. So, among other situations, this could be useful in the setting where many different query sets (or many different values of k) will be used.

Note that the kernel cannot be changed in a saved model without rebuilding the model entirely.

22.4 The 'FastMKS' class

The `FastMKS<>` class offers a simple API for use within C++ applications, and allows further flexibility in kernel choice and tree type choice. However, `FastMKS<>` has no default template parameter for the kernel type – that must be manually specified. Choices that `mlpack` provides include:

- `mlpack::kernel::LinearKernel` (p. 1446)
- `mlpack::kernel::PolynomialKernel` (p. 1451)
- `mlpack::kernel::CosineDistance` (p. 1416)
- `mlpack::kernel::GaussianKernel` (p. 1424)
- `mlpack::kernel::EpanechnikovKernel` (p. 1417)
- `mlpack::kernel::TriangularKernel` (p. 1461)
- `mlpack::kernel::HyperbolicTangentKernel` (p. 1430)
- `mlpack::kernel::LaplacianKernel` (p. 1442)
- `mlpack::kernel::PSpectrumStringKernel` (p. 1454)

The following examples use kernels from that list. Writing your own kernel is detailed in **the next section** (p. 128). Remember that when you are using the C++ interface, the data matrices must be column-major. See **Matrices in `mlpack`** (p. 57) for more information.

22.4.1 FastMKS on one dataset

Given only a reference dataset, the following code will run FastMKS with k set to 5.

```
#include <mlpack/methods/fastmks/fastmks.hpp>
#include <mlpack/core/kernels/linear_kernel.hpp>

using namespace mlpack::fastmks;

// The reference dataset, which is column-major.
extern arma::mat data;

// This will initialize the FastMKS object with the linear kernel with default
// options:  $K(x, y) = x^T y$ . The tree is built in the constructor.
FastMKS<LinearKernel> f(data);

// The results will be stored in these matrices.
arma::Mat<size_t> indices;
arma::mat products;

// Run FastMKS.
f.Search(5, indices, products);
```

22.4.2 FastMKS with a query and reference dataset

In this setting we have both a query and reference dataset. We search for 10 maximum kernels.

```
#include <mlpack/methods/fastmks/fastmks.hpp>
#include <mlpack/core/kernels/triangular_kernel.hpp>

using namespace mlpack::fastmks;
using namespace mlpack::kernel;

// The reference and query datasets, which are column-major.
extern arma::mat referenceData;
extern arma::mat queryData;

// This will initialize the FastMKS object with the triangular kernel with
// default options (bandwidth of 1). The reference tree is built in the
// constructor.
FastMKS<TriangularKernel> f(referenceData);

// The results will be stored in these matrices.
arma::Mat<size_t> indices;
arma::mat products;

// Run FastMKS. The query tree is built during the call to Search().
f.Search(queryData, 10, indices, products);
```

22.4.3 FastMKS with an initialized kernel

Often, kernels have parameters which need to be specified. FastMKS<> has constructors which take initialized kernels. Note that temporary kernels cannot be passed as an argument. The example below initializes a PolynomialKernel object and then runs FastMKS with a query and reference dataset.

```
#include <mlpack/methods/fastmks/fastmks.hpp>
#include <mlpack/core/kernels/polynomial_kernel.hpp>

using namespace mlpack::fastmks;
using namespace mlpack::kernel;

// The reference and query datasets, which are column-major.
extern arma::mat referenceData;
extern arma::mat queryData;
```

```
// Initialize the polynomial kernel with degree of 3 and offset of 2.5.
PolynomialKernel pk(3.0, 2.5);

// Create the FastMKS object with the initialized kernel.
FastMKS<PolynomialKernel> f(referenceData, pk);

// The results will be stored in these matrices.
arma::Mat<size_t> indices;
arma::mat products;

// Run FastMKS.
f.Search(queryData, 10, indices, products);
```

The syntax for running FastMKS with one dataset and an initialized kernel is very similar:

```
f.Search(10, indices, products);
```

22.4.4 FastMKS with an already-created tree

By default, `FastMKS<>` uses the cover tree datastructure (see `mlpack::tree::CoverTree` (p. 2040)). Sometimes, it is useful to modify the parameters of the cover tree. In this scenario, a tree must be built outside of the constructor, and then passed to the appropriate `FastMKS<>` constructor. An example on just a reference dataset is shown below, where the base of the cover tree is modified.

We also use an instantiated kernel, but because we are building our own tree, we must use `IPMetric` (p. 1565) so that our tree is built on the metric induced by our kernel function.

```
#include <mlpack/methods/fastmks/fastmks.hpp>
#include <mlpack/core/kernels/polynomial_kernel.hpp>

// The reference dataset, which is column-major.
extern arma::mat data;

// Initialize the polynomial kernel with a degree of 4 and offset of 2.0.
PolynomialKernel pk(4.0, 2.0);

// Create the metric induced by this kernel (because a kernel is not a metric
// and we can't build a tree on a kernel alone).
IPMetric<PolynomialKernel> metric(pk);

// Now build a tree on the reference dataset using the instantiated metric and
// the custom base of 1.5 (default is 1.3). We have to be sure to use the right
// type here -- FastMKS needs the FastMKSStat object as the tree's
// StatisticType.
typedef tree::CoverTree<IPMetric<PolynomialKernel>, tree::FirstPointIsRoot,
    FastMKSStat> TreeType; // Convenience typedef.
TreeType* tree = new TreeType(data, metric, 1.5);

// Now initialize FastMKS with that statistic. We don't need to specify the
// TreeType template parameter since we are still using the default. We don't
// need to pass the kernel because that is contained in the tree.
FastMKS<PolynomialKernel> f(tree);

// The results will be stored in these matrices.
arma::Mat<size_t> indices;
arma::mat products;

// Run FastMKS.
f.Search(10, indices, products);
```

The syntax is similar for the case where different query and reference datasets are given; but trees for both need to be built in the manner specified above. Be sure to build both trees using the same metric (or at least a metric with the exact same parameters).

```
f.Search(queryTree, 10, indices, products);
```

22.5 Writing a custom kernel for FastMKS

While **mlpack** provides some number of kernels in the **mlpack::kernel** (p. 401) namespace, it is easy to create a custom kernel. To satisfy the **KernelType** policy, a class must implement the following methods:

```
// Empty constructor is required.
KernelType();

// Evaluate the kernel between two points.
template<typename VecType>
double Evaluate(const VecType& a, const VecType& b);
```

The template parameter **VecType** is helpful (but not necessary) so that the kernel can be used with both sparse and dense matrices (**arma::sp_mat** and **arma::mat**).

22.6 Using other tree types for FastMKS

The use of the cover tree (see **CoverTree** (p. 2040)) is not necessary for FastMKS, although it is the default tree type. A different type of tree can be specified with the **TreeType** template parameter. However, the tree type is required to have **FastMKSStat** (p. 1303) as the **StatisticType**, and for FastMKS to work, the tree must be built only on kernel evaluations (or distance evaluations in the kernel space via **IPMetric::Evaluate()** (p. 1565)).

Below is an example where a custom tree class, **CustomTree**, is used as the tree type for FastMKS. In this example FastMKS is only run on one dataset.

```
#include <mlpack/methods/fastmks/fastmks.hpp>
#include "custom_tree.hpp"

using namespace mlpack::fastmks;
using namespace mlpack::tree;

// The dataset that FastMKS will be run on.
extern arma::mat data;

// The custom tree type. We'll assume that the first template parameter is the
// statistic type.
typedef CustomTree<FastMKSStat> TreeType;

// The FastMKS constructor will create the tree.
FastMKS<LinearKernel, arma::mat, TreeType> f(data);

// These will hold the results.
arma::Mat<size_t> indices;
arma::mat products;

// Run FastMKS.
f.Search(5, indices, products);
```

22.7 Running FastMKS on objects

FastMKS has a lot of utility on objects which are not representable in some sort of metric space. These objects might be strings, graphs, models, or other objects. For these types of objects, questions based on distance don't really make sense. One good example is with strings. The question "how far is 'dog' from 'Taki Inoue'?" simply doesn't make sense. We can't have a centroid of the terms 'Fritz', 'E28', and 'popsicle'.

However, what we can do is define some sort of kernel on these objects. These kernels generally correspond to some similarity measure, with one example being the p-spectrum string kernel (see `mlpack::kernel::PSpectrumStringKernel` (p. 1454)). Using that, we can say "how similar is 'dog' to 'Taki Inoue'?" and get an actual numerical result by evaluating `K('dog', 'Taki Inoue')` (where `K` is our p-spectrum string kernel).

The only requirement on these kernels is that they are positive definite kernels (or Mercer kernels). For more information on those details, refer to the FastMKS paper.

Remember that FastMKS is a tree-based method. But trees like the binary space tree require centroids – and as we said earlier, centroids often don't make sense with these types of objects. Therefore, we need a type of tree which is built **exclusively** on points in the dataset – those are points which we can evaluate our kernel function on. The cover tree is one example of a type of tree satisfying this condition; its construction will only call the kernel function on two points that are in the dataset.

But, we have one more problem. The `CoverTree` class is built on `arma::mat` objects (dense matrices). Our objects, however, are not necessarily representable in a column of a matrix. To use the example we have been using, strings cannot be represented easily in a matrix because they may all have different lengths.

The way to work around this problem is to create a "fake" data matrix which simply holds indices to objects. A good example of how to do this is detailed in the documentation for the `PSpectrumStringKernel` (p. 1454).

In short, the trick is to make each data matrix one-dimensional and containing linear indices:

```
arma::mat data = "0 1 2 3 4 5 6 7 8";
```

Then, when `Evaluate()` is called on the kernel function, the parameters will be two one-dimensional vectors that simply contain indices to objects. The example below details the process a little better:

```
// This function evaluates the kernel on two Objects (in this example, its
// implementation is not important; the only important thing is that the
// function exists).
double ObjectKernel::Evaluate(const Object& a, const Object& b) const;

template<typename VecType>
double ObjectKernel::Evaluate(const VecType& a, const VecType& b) const
{
    // Extract the indices from the vectors.
    const size_t indexA = size_t(a[0]);
    const size_t indexB = size_t(b[0]);

    // Assume that 'objects' is an array (or std::vector or other container)
    // holding Objects.
    const Object& objectA = objects[indexA];
    const Object& objectB = objects[indexB];

    // Now call the function that does the actual evaluation on the objects and
    // return its result.
    return Evaluate(objectA, objectB);
}
```

As written earlier, the documentation for `PSpectrumStringKernel` (p. 1454) is a good place to consult for further reference on this. That kernel uses two dimensional indices; one dimension represents the index of the string, and the other represents whether it is referring to the query set or the reference set. If your kernel is meant to work on separate query and reference sets, that strategy should be considered.

22.8 Further documentation

For further documentation on the FastMKS class, consult the **complete API documentation** (p. 1280).

Chapter 23

K-Means tutorial (kmeans)

23.1 Introduction

The popular k-means algorithm for clustering has been around since the late 1950s, and the standard algorithm was proposed by Stuart Lloyd in 1957. Given a set of points X , k-means clustering aims to partition each point x_i into a cluster c_j (where $j \leq k$ and k , the number of clusters, is a parameter). The partitioning is done to minimize the objective function

$$\sum_{j=1}^k \sum_{x_i \in c_j} \|x_i - \mu_j\|^2$$

where μ_j is the centroid of cluster c_j . The standard algorithm is a two-step algorithm:

- **Assignment step.** Each point x_i in X is assigned to the cluster whose centroid it is closest to.
- **Update step.** Using the new cluster assignments, the centroids of each cluster are recalculated.

The algorithm has converged when no more assignment changes are happening with each iteration. However, this algorithm can get stuck in local minima of the objective function and is particularly sensitive to the initial cluster assignments. Also, situations can arise where the algorithm will never converge but reaches steady state – for instance, one point may be changing between two cluster assignments.

There is vast literature on the k-means algorithm and its uses, as well as strategies for choosing initial points effectively and keeping the algorithm from converging in local minima. **mlpack** does implement some of these, notably the Bradley-Fayyad algorithm (see the reference below) for choosing refined initial points. Importantly, the C++ `KMeans` class makes it very easy to improve the k-means algorithm in a modular way.

```
@inproceedings{bradley1998refining,
  title={Refining initial points for k-means clustering},
  author={Bradley, Paul S. and Fayyad, Usama M.},
  booktitle={Proceedings of the Fifteenth International Conference on Machine
    Learning (ICML 1998)},
  volume={66},
  year={1998}
}
```

mlpack provides:

- a **simple command-line executable** (p. 132) to run k-means
- a **simple C++ interface** (p. 135) to run k-means
- a **generic, extensible, and powerful C++ class** (p. 138) for complex usage

23.2 Table of Contents

A list of all the sections this tutorial contains.

23.3 Command-Line 'kmeans'

mlpack provides a command-line executable, `mlpack_kmeans`, to allow easy execution of the k-means algorithm on data. Complete documentation of the executable can be found by typing

```
$ mlpack_kmeans --help
```

As of October 2014, support for overclustering has been removed due to bugs and lack of usage. If this is support you were using, or are interested, please file a bug or get in touch with the **mlpack** developers in some way so that the support can be re-implemented.

Below are several examples demonstrating simple use of the `mlpack_kmeans` executable.

23.3.1 Simple k-means clustering

We want to find 5 clusters using the points in the file `dataset.csv`. By default, if any of the clusters end up empty, that cluster will be reinitialized to contain the point furthest from the cluster with maximum variance. The cluster assignments of each point will be stored in `assignments.csv`. Each row in `assignments.csv` will correspond to the row in `dataset.csv`.

```
$ mlpack_kmeans -c 5 -i dataset.csv -v -o assignments.csv
```

23.3.2 Saving the resulting centroids

Sometimes it is useful to save the centroids of the clusters found by k-means; one example might be for plotting the points. The `-C` (`-centroid_file`) option allows specification of a file into which the centroids will be saved (one centroid per line, if it is a CSV or other text format).

```
$ mlpack_kmeans -c 5 -i dataset.csv -v -o assignments.csv -C centroids.csv
```

23.3.3 Allowing empty clusters

If you would like to allow empty clusters to exist, instead of reinitializing them, simply specify the `-e` (`-allow_empty_clusters`) option. Note that when you save your clusters, even empty clusters will still have centroids. The centroids of the empty cluster will be the same as what they were on the last iteration when the cluster was not empty.

```
$ mlpack_kmeans -c 5 -i dataset.csv -v -e -o assignments.csv -C centroids.csv
```

23.3.4 Allowing empty clusters

If you would like to kill empty clusters, instead of reinitializing them, simply specify the `-E` (`-kill_empty_clusters`) option. Note that when you save your clusters, all the empty clusters will be removed and the final result may contain less than specified number of clusters.

```
$ mlpack_kmeans -c 5 -i dataset.csv -v -E -o assignments.csv -C centroids.csv
```

23.3.5 Limiting the maximum number of iterations

As mentioned earlier, the k-means algorithm can often fail to converge. In such a situation, it may be useful to stop the algorithm by way of limiting the maximum number of iterations. This can be done with the `-m` (`-max_iterations`) parameter, which is set to 1000 by default. If the maximum number of iterations is 0, the algorithm will run until convergence – or potentially forever. The example below sets a maximum of 250 iterations.

```
$ mlpack_kmeans -c 5 -i dataset.csv -v -o assignments.csv -m 250
```

23.3.6 Using Bradley-Fayyad "refined start"

The method proposed by Bradley and Fayyad in their paper "Refining initial points for k-means clustering" is implemented in **mlpack**. This strategy samples points from the dataset and runs k-means clustering on those points multiple times, saving the resulting clusters. Then, k-means clustering is run on those clusters, yielding the original number of clusters. The centroids of those resulting clusters are used as initial centroids for k-means clustering on the entire dataset.

This technique generally gives better initial points than the default random partitioning, but depending on the parameters, it can take much longer. This initialization technique is enabled with the `-r` (`-refined_start`) option. The `-S` (`-samplings`) parameter controls how many samplings of the dataset are performed, and the `-p` (`-percentage`) parameter controls how much of the dataset is randomly sampled for each sampling (it must be between 0.0 and 1.0). For more information on the refined start technique, see the paper referenced in the introduction of this tutorial.

The example below performs k-means clustering, giving 5 clusters, using the refined start technique, sampling 10% of the dataset 25 times to produce the initial centroids.

```
$ mlpack_kmeans -c 5 -i dataset.csv -v -o assignments.csv -r -S 25 -p 0.2
```

23.3.7 Using different k-means algorithms

The `mlpack_kmeans` program implements six different strategies for clustering; each of these gives the exact same results, but will have different runtimes. The particular algorithm to use can be specified with the `-a` or `-algorithm` option. The choices are:

- `naive`: the standard Lloyd iteration; takes $O(kN)$ time per iteration.
- `pelleg-moore`: the 'blacklist' algorithm, which builds a kd-tree on the data. This can be fast when k is small and the dimensionality is reasonably low.
- `elkan`: Elkan's algorithm for k-means, which maintains upper and lower distance bounds between each point and each centroid. This can be very fast, but it does not scale well to the case of large N or k , and uses a lot of memory.
- `hamerly`: Hamerly's algorithm is a variant of Elkan's algorithm that handles memory usage much better and thus can operate with much larger datasets than Elkan's algorithm.
- `dualtree`: The dual-tree algorithm for k-means builds a kd-tree on both the centroids and the points in order to prune away as much work as possible. This algorithm is most effective when both N and k are large.
- `dualtree-covertree`: This is the dual-tree algorithm using cover trees instead of kd-trees. It satisfies the runtime guarantees specified in the dual-tree k-means paper.

In general, the `naive` algorithm will be much slower than the others on datasets that are larger than tiny.

The example below uses the `dualtree` algorithm to perform k-means clustering with 5 clusters on the dataset in `dataset.csv`, using the initial centroids in `initial_centroids.csv`, saving the resulting cluster assignments to `assignments.csv`:

```
$ mlpack_kmeans -i dataset.csv -c 5 -v -I initial_centroids.csv -a dualtree \
> -o assignments.csv
```

23.4 The 'KMeans' class

The `KMeans<>` class (with default template parameters) provides a simple way to run k-means clustering using **mlpack** in C++. The default template parameters for `KMeans<>` will initialize cluster assignments randomly and disallow empty clusters. When an empty cluster is encountered, the point furthest from the cluster with maximum variance is set to the centroid of the empty cluster.

23.4.1 Running k-means and getting cluster assignments

The simplest way to use the `KMeans<>` class is to pass in a dataset and a number of clusters, and receive the cluster assignments in return. Note that the dataset must be column-major – that is, one column corresponds to one point. See **the matrices guide** (p. 57) for more information.

```
#include <mlpack/methods/kmeans/kmeans.hpp>

using namespace mlpack::kmeans;

// The dataset we are clustering.
extern arma::mat data;
// The number of clusters we are getting.
extern size_t clusters;

// The assignments will be stored in this vector.
arma::Row<size_t> assignments;

// Initialize with the default arguments.
KMeans<> k;
k.Cluster(data, clusters, assignments);
```

Now, the vector `assignments` holds the cluster assignments of each point in the dataset.

23.4.2 Running k-means and getting centroids of clusters

Often it is useful to not only have the cluster assignments, but the centroids of each cluster. Another overload of `Cluster()` makes this easily possible:

```
#include <mlpack/methods/kmeans/kmeans.hpp>

using namespace mlpack::kmeans;

// The dataset we are clustering.
extern arma::mat data;
// The number of clusters we are getting.
extern size_t clusters;

// The assignments will be stored in this vector.
arma::Row<size_t> assignments;
// The centroids will be stored in this matrix.
arma::mat centroids;

// Initialize with the default arguments.
KMeans<> k;
k.Cluster(data, clusters, assignments, centroids);
```

Note that the centroids matrix has columns equal to the number of clusters and rows equal to the dimensionality of the dataset. Each column represents the centroid of the according cluster – `centroids.col(0)` represents the centroid of the first cluster.

23.4.3 Limiting the maximum number of iterations

The first argument to the constructor allows specification of the maximum number of iterations. This is useful because often, the k-means algorithm does not converge, and is terminated after a number of iterations. Setting this parameter to 0 indicates that the algorithm will run until convergence – note that in some cases, convergence may never happen. The default maximum number of iterations is 1000.

```
// The first argument is the maximum number of iterations. Here we set it to
// 500 iterations.
KMeans<> k(500);
```

Then you can run `Cluster()` as normal.

23.4.4 Setting initial cluster assignments

If you have an initial guess for the cluster assignments for each point, you can fill the assignments vector with the guess and then pass an extra boolean (`initialAssignmentGuess`) as true to the `Cluster()` method. Below are examples for either overload of `Cluster()`.

```
#include <mlpack/methods/kmeans/kmeans.hpp>

using namespace mlpack::kmeans;

// The dataset we are clustering on.
extern arma::mat dataset;
// The number of clusters we are obtaining.
extern size_t clusters;

// A vector pre-filled with initial assignment guesses.
extern arma::Row<size_t> assignments;

KMeans<> k;

// The boolean set to true indicates that our assignments vector is filled with
// initial guesses.
k.Cluster(dataset, clusters, assignments, true);
```

```
#include <mlpack/methods/kmeans/kmeans.hpp>

using namespace mlpack::kmeans;

// The dataset we are clustering on.
extern arma::mat dataset;
// The number of clusters we are obtaining.
extern size_t clusters;

// A vector pre-filled with initial assignment guesses.
extern arma::Row<size_t> assignments;

// This will hold the centroids of the finished clusters.
arma::mat centroids;

KMeans<> k;

// The boolean set to true indicates that our assignments vector is filled with
// initial guesses.
k.Cluster(dataset, clusters, assignments, centroids, true);
```

Note

If you have a heuristic or algorithm which makes initial guesses, a more elegant solution is to create a new class fulfilling the InitialPartitionPolicy template policy. See **the section about changing the initial partitioning strategy** (p. 139) for more details.

Note

If you set the InitialPartitionPolicy parameter to something other than the default but give an initial cluster assignment guess, the InitialPartitionPolicy will not be used to initialize the algorithm. See **the section about changing the initial partitioning strategy** (p. 139) for more details.

23.4.5 Setting initial cluster centroids

An equally important option to being able to make initial cluster assignment guesses is to make initial cluster centroid guesses without having to assign each point in the dataset to an initial cluster. This is similar to the previous section, but now you must pass two extra booleans – the first (initialAssignmentGuess) as false, indicating that there are not initial cluster assignment guesses, and the second (initialCentroidGuess) as true, indicating that the centroids matrix is filled with initial centroid guesses.

This, of course, only works with the overload of `Cluster()` that takes a matrix to put the resulting centroids in. Below is an example.

```
#include <mlpack/methods/kmeans/kmeans.hpp>

using namespace mlpack::kmeans;

// The dataset we are clustering on.
extern arma::mat dataset;
// The number of clusters we are obtaining.
extern size_t clusters;

// A matrix pre-filled with guesses for the initial cluster centroids.
extern arma::mat centroids;

// This will be filled with the final cluster assignments for each point.
arma::Row<size_t> assignments;

KMeans<> k;

// Remember, the first boolean indicates that we are not giving initial
// assignment guesses, and the second boolean indicates that we are giving
// initial centroid guesses.
k.Cluster(dataset, clusters, assignments, centroids, false, true);
```

Note

If you have a heuristic or algorithm which makes initial guesses, a more elegant solution is to create a new class fulfilling the InitialPartitionPolicy template policy. See **the section about changing the initial partitioning strategy** (p. 139) for more details.

Note

If you set the InitialPartitionPolicy parameter to something other than the default but give an initial cluster centroid guess, the InitialPartitionPolicy will not be used to initialize the algorithm. See **the section about changing the initial partitioning strategy** (p. 139) for more details.

23.4.6 Running sparse k-means

The `Cluster()` function can work on both sparse and dense matrices, so all of the above examples can be used with sparse matrices instead, if the fifth template parameter is modified. Below is a simple example. Note that the centroids are returned as a dense matrix, because the centroids of collections of sparse points are not generally sparse.

```
// The sparse dataset.
extern arma::sp_mat sparseDataset;
// The number of clusters.
extern size_t clusters;

// The assignments will be stored in this vector.
arma::Row<size_t> assignments;
// The centroids of each cluster will be stored in this sparse matrix.
arma::sp_mat sparseCentroids;

// We must change the fifth (and last) template parameter.
KMeans<metric::EuclideanDistance, SampleInitialization, MaxVarianceNewCluster,
      NaiveKMeans, arma::sp_mat> k;
k.Cluster(sparseDataset, clusters, assignments, sparseCentroids);
```

23.5 Template parameters for the 'KMeans' class

The `KMeans<>` class also takes three template parameters, which can be modified to change the behavior of the k-means algorithm. There are three template parameters:

- **MetricType**: controls the distance metric used for clustering (by default, the squared Euclidean distance is used)
- **InitialPartitionPolicy**: the method by which initial clusters are set; by default, **SampleInitialization** (p. 1506) is used
- **EmptyClusterPolicy**: the action taken when an empty cluster is encountered; by default, **MaxVarianceNewCluster** (p. 1489) is used
- **LloydStepType**: this defines the strategy used to make a single Lloyd iteration; by default this is the typical Lloyd iteration specified in **NaiveKMeans** (p. 1491)
- **MatType**: type of data matrix to use for clustering

The class is defined like below:

```
template<
  typename DistanceMetric = mlpack::metric::SquaredEuclideanDistance,
  typename InitialPartitionPolicy = SampleInitialization,
  typename EmptyClusterPolicy = MaxVarianceNewCluster,
  template<class, class> class LloydStepType = NaiveKMeans,
  typename MatType = arma::mat
>
class KMeans;
```

In the following sections, each policy is described further, with examples of how to modify them.

23.5.1 Changing the distance metric used for k-means

Most machine learning algorithms in **mlpack** support modifying the distance metric, and **KMeans<>** is no exception. Similar to **NeighborSearch** (p. 1627) (see [the section in the NeighborSearch tutorial](#) (p. 156)), any class in **mlpack::metric** (p. 426) can be given as an argument. The **mlpack::metric::LMetric** (p. 1569) class is a good example implementation.

A class fulfilling the **MetricType** policy must provide the following two functions:

```
// Empty constructor is required.
MetricType();

// Computer the distance between two points.
template<typename VecType>
double Evaluate(const VecType& a, const VecType& b);
```

Most of the standard metrics that could be used are stateless and therefore the **Evaluate()** method is implemented statically. However, there are metrics, such as the Mahalanobis distance (**mlpack::metric::MahalanobisDistance** (p. 1572)), that store state. To this end, an instantiated **MetricType** object is stored within the **KMeans** class. The example below shows how to pass an instantiated **MahalanobisDistance** in the constructor.

```
// The initialized Mahalanobis distance.
extern mlpack::metric::MahalanobisDistance distance;

// We keep the default arguments for the maximum number of iterations, but pass
// our instantiated metric.
KMeans<mlpack::metric::MahalanobisDistance> k(1000, distance);
```

Note

While the **MetricType** policy only requires two methods, one of which is an empty constructor, more can always be added. **mlpack::metric::MahalanobisDistance** (p. 1572) also has constructors with parameters, because it is a stateful metric.

23.5.2 Changing the initial partitioning strategy used for k-means

There have been many initial cluster strategies for k-means proposed in the literature. Fortunately, the **KMeans<>** class makes it very easy to implement one of these methods and plug it in without needing to modify the existing algorithm code at all.

By default, the **KMeans<>** class uses **mlpack::kmeans::SampleInitialization** (p. 1506), which randomly samples points as initial centroids. However, writing a new policy is simple; it needs to only implement the following functions:

```
// Empty constructor is required.
InitialPartitionPolicy();

// Only *one* of the following two functions is required! You should implement
// whichever you find more convenient to implement.

// This function is called to initialize the clusters and returns centroids.
template<typename MatType>
void Cluster(MatType& data,
            const size_t clusters,
            arma::mat& centroids);

// This function is called to initialize the clusters and returns individual
// point assignments. The centroids will then be calculated from the given
// assignments.
template<typename MatType>
void Cluster(MatType& data,
            const size_t clusters,
            arma::Row<size_t> assignments);
```

The templatization of the `Cluster()` function allows both dense and sparse matrices to be passed in. If the desired policy does not work with sparse (or dense) matrices, then the method can be written specifically for one type of matrix – however, be warned that if you try to use `KMeans` with that policy and the wrong type of matrix, you will get many ugly compilation errors!

```
// The Cluster() function specialized for dense matrices.
void Cluster(arma::mat& data,
             const size_t clusters,
             arma::Row<size_t> assignments);
```

Note that only one of the two possible `Cluster()` functions are required. This is because sometimes it is easier to express an initial partitioning policy as something that returns point assignments, and sometimes it is easier to express the policy as something that returns centroids. The `KMeans<>` class will use whichever of these two functions is given; if both are given, the overload that returns centroids will be preferred.

One alternate to the default `SampleInitialization` policy is the `RefinedStart` policy, which is an implementation of the Bradley and Fayyad approach for finding initial points detailed in "Refined initial points for k-means clustering" and other places in this document. Another option is the `RandomPartition` class, which randomly assigns points to clusters, but this may not work very well for most settings. See the documentation for `mlpack::kmeans::RefinedStart` (p. 1502) and `mlpack::kmeans::RandomPartition` (p. 1500) for more information.

If the `Cluster()` method returns point assignments instead of centroids, then valid initial assignments must be returned for every point in the dataset.

As with the `MetricType` template parameter, an initialized `InitialPartitionPolicy` can be passed to the constructor of `KMeans` as a fourth argument.

23.5.3 Changing the action taken when an empty cluster is encountered

Sometimes, during clustering, a situation will arise where a cluster has no points in it. The `KMeans` class allows easy customization of the action to be taken when this occurs. By default, the point furthest from the centroid of the cluster with maximum variance is taken as the centroid of the empty cluster; this is implemented in the `mlpack::kmeans::MaxVarianceNewCluster` (p. 1489) class. Another alternate choice is the `mlpack::kmeans::AllowEmptyClusters` (p. 1464) class, which simply allows empty clusters to persist.

A custom policy can be written and it must implement the following methods:

```
// Empty constructor is required.
EmptyClusterPolicy();

// This function is called when an empty cluster is encountered. emptyCluster
// indicates the cluster which is empty, and then the clusterCounts and
// assignments are meant to be modified by the function. The function should
// return the number of modified points.
template<typename MatType>
size_t EmptyCluster(const MatType& data,
                   const size_t emptyCluster,
                   const MatType& centroids,
                   arma::Col<size_t>& clusterCounts,
                   arma::Row<size_t>& assignments);
```

The `EmptyCluster()` function is called for each cluster that is empty at each iteration of the algorithm. As with `InitialPartitionPolicy`, the `EmptyCluster()` function does not need to be generalized to support both dense and sparse matrices – but usage with the wrong type of matrix will cause compilation errors.

Like the other template parameters to `KMeans`, `EmptyClusterPolicy` implementations that have state can be passed to the constructor of `KMeans` as a fifth argument. See the `kmeans::KMeans` documentation for further details.

23.5.4 The LloydStepType template parameter

The internal algorithm used for a single step of the k-means algorithm can easily be changed; **mlpack** implements several existing classes that satisfy the `LloydStepType` policy:

- `mlpack::kmeans::NaiveKMeans` (p. 1491)
- `mlpack::kmeans::ElkanKMeans` (p. 1478)
- `mlpack::kmeans::HamerlyKMeans` (p. 1479)
- `mlpack::kmeans::PellegMooreKMeans` (p. 1493)
- `mlpack::kmeans::DualTreeKMeans` (p. 1466)

Note that the `LloydStepType` policy is itself a template template parameter, and must accept two template parameters of its own:

- `MetricType`: the type of metric to use
- `MatType`: the type of data matrix to use

The `LloydStepType` policy also mandates three functions:

- a constructor: `LloydStepType(const MatType& dataset, MetricType& metric);`
- an `Iterate()` function:

```
double Iterate(const arma::mat& centroids,
               arma::mat& newCentroids,
               arma::Col<size_t>& counts);
```

- a function to get the number of distance calculations:

```
size_t DistanceCalculations() const { return distanceCalculations; }
```

Note that `Iterate()` does not need to return valid centroids if the cluster is empty. This is because `EmptyClusterPolicy` will handle the empty centroid. This behavior can be used to avoid small amounts of computation.

For examples, see the five aforementioned implementations of classes that satisfy the `LloydStepType` policy.

23.6 Further documentation

For further documentation on the `KMeans` class, consult the **complete API documentation** (p. 1483).

Chapter 24

Linear/ridge regression tutorial (mlpack_linear_regression)

24.1 Introduction

Linear regression and ridge regression are simple machine learning techniques that aim to estimate the parameters of a linear model. Assuming we have n **predictor** points \mathbf{x}_i , $0 \leq i < n$ of dimensionality d and n responses y_i , $0 \leq i < n$, we are trying to estimate the best fit for β_i , $0 \leq i \leq d$ in the linear model

$$y_i = \beta_0 + \sum_{j=1}^d \beta_j x_{ij}$$

for each predictor \mathbf{x}_i and response y_i . If we take each predictor \mathbf{x}_i as a row in the matrix \mathbf{X} and each response y_i as an entry of the vector \mathbf{y} , we can represent the model in vector form:

$$\mathbf{y} = \mathbf{X}\boldsymbol{\beta} + \beta_0$$

The result of this method is the vector $\boldsymbol{\beta}$, including the offset term (or intercept term) β_0 .

mlpack provides:

- a **simple command-line executable** (p. 144) to perform linear regression or ridge regression
- a **simple C++ interface** (p. 148) to perform linear regression or ridge regression

24.2 Table of Contents

A list of all the sections this tutorial contains.

- **Introduction** (p. 143)

 - **Prediction** (p. 149)
 - **Setting lambda for ridge regression** (p. 149)
- **Further documentation** (p. 149)

24.3 Command-Line 'mlpack_linear_regression'

The simplest way to perform linear regression or ridge regression in **mlpack** is to use the `mlpack_linear_regression` executable. This program will perform linear regression and place the resultant coefficients into one file.

The output file holds a vector of coefficients in increasing order of dimension; that is, the offset term (β_0), the coefficient for dimension 1 (β_1), then dimension 2 (β_2) and so forth, as well as the intercept. This executable can also predict the y values of a second dataset based on the computed coefficients.

Below are several examples of simple usage (and the resultant output). The `option` is used so that verbose output is given. Further documentation on each individual option can be found by typing

```
$ mlpack_linear_regression --help
```

24.3.1 One file, generating the function coefficients

```
$ mlpack_linear_regression --training_file dataset.csv -v -M lr.xml
[INFO ] Loading 'dataset.csv' as CSV data. Size is 2 x 5.
[INFO ]
[INFO ] Execution parameters:
[INFO ]   help: false
[INFO ]   info: ""
[INFO ]   input_model_file: ""
[INFO ]   lambda: 0
[INFO ]   output_model_file: lr.xml
[INFO ]   output_predictions: predictions.csv
[INFO ]   test_file: ""
[INFO ]   training_file: dataset.csv
[INFO ]   training_responses: ""
[INFO ]   verbose: true
[INFO ]   version: false
[INFO ]
[INFO ] Program timers:
[INFO ]   load_regressors: 0.000263s
[INFO ]   loading_data: 0.000220s
[INFO ]   regression: 0.000392s
[INFO ]   total_time: 0.001920s
```

Convenient program timers are given for different parts of the calculation at the bottom of the output, as well as the parameters the simulation was run with. Now, if we look at the output model file, which is `lr.xml`,

```
$ cat dataset.csv
0,0
1,1
2,2
3,3
4,4

$ cat lr.xml
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
<!DOCTYPE boost_serialization>
<boost_serialization signature="serialization::archive" version="12">
<linearRegressionModel class_id="0" tracking_level="0" version="0">
  <parameters class_id="1" tracking_level="0" version="0">
    <n_rows>2</n_rows>
    <n_cols>1</n_cols>
    <n_elem>2</n_elem>
    <vec_state>1</vec_state>
    <item>-3.97205464519563669e-16</item>
    <item>1.00000000000000022e+00</item>
  </parameters>
  <lambda>0.0000000000000000e+00</lambda>
  <intercept>1</intercept>
</linearRegressionModel>
</boost_serialization>
```

As you can see, the function for this input is $f(y) = 0 + 1x_1$. We can see that the model we have trained catches this; in the `<parameters>` section of `lr.xml`, we can see that there are two elements, which are (approximately) 0 and 1. The first element corresponds to the intercept 0, and the second column corresponds to the coefficient 1 for the variable x_1 . Note that in this example, the regressors for the dataset are the second column. That is, the dataset is one dimensional, and the last column has the y values, or responses, for each row. You can specify these responses in a separate file if you want, using the `-input_responses`, or `-r`, option.

24.3.2 Compute model and predict at the same time

```
$ mlpack_linear_regression --training_file dataset.csv --test_file predict.csv \
> -v
[INFO ] Loading 'dataset.csv' as CSV data. Size is 2 x 5.
[INFO ] Loading 'predict.csv' as raw ASCII formatted data. Size is 1 x 3.
[INFO ] Saving CSV data to 'predictions.csv'.
```

```
[INFO ]
[INFO ] Execution parameters:
[INFO ]   help: false
[INFO ]   info: ""
[INFO ]   input_model_file: ""
[INFO ]   lambda: 0
[INFO ]   output_model_file: ""
[INFO ]   output_predictions: predictions.csv
[INFO ]   test_file: predict.csv
[INFO ]   training_file: dataset.csv
[INFO ]   training_responses: ""
[INFO ]   verbose: true
[INFO ]   version: false
[INFO ]
[INFO ] Program timers:
[INFO ]   load_regressors: 0.000371s
[INFO ]   load_test_points: 0.000229s
[INFO ]   loading_data: 0.000491s
[INFO ]   prediction: 0.000075s
[INFO ]   regression: 0.000449s
[INFO ]   saving_data: 0.000186s
[INFO ]   total_time: 0.002731s
```

```
$ cat dataset.csv
```

```
0,0
1,1
2,2
3,3
4,4
```

```
$ cat predict.csv
```

```
2
3
4
```

```
$ cat predictions.csv
```

```
2.000000000000e+00
3.000000000000e+00
4.000000000000e+00
```

We used the same dataset, so we got the same parameters. The key thing to note about the `predict.csv` dataset is that it has the same dimensionality as the dataset used to create the model, one. If the model generating dataset has d dimensions, so must the dataset we want to predict for.

24.3.3 Prediction using a precomputed model

```
$ mlpack_linear_regression --input_model_file lr.xml --test_file predict.csv -v
```

```
[INFO ] Loading 'predict.csv' as raw ASCII formatted data. Size is 1 x 3.
```

```
[INFO ] Saving CSV data to 'predictions.csv'.
```

```
[INFO ]
```

```
[INFO ] Execution parameters:
```

```
[INFO ]   help: false
```

```
[INFO ]   info: ""
```

```
[INFO ]   input_model_file: lr.xml
```

```
[INFO ]   lambda: 0
```

```
[INFO ]   output_model_file: ""
```

```
[INFO ]   output_predictions: predictions.csv
```

```
[INFO ]   test_file: predict.csv
```

```
[INFO ]   training_file: ""
```

```
[INFO ]   training_responses: ""
```

```
[INFO ]   verbose: true
```

```
[INFO ]   version: false
```

```
[INFO ]
```

```
[INFO ] Program timers:
```

```
[INFO ]   load_model: 0.000264s
```

```
[INFO ]   load_test_points: 0.000186s
```

```
[INFO ]   loading_data: 0.000157s
```

```
[INFO ]   prediction: 0.000098s
```

```
[INFO ]   saving_data: 0.000157s
```

```
[INFO ]   total_time: 0.001688s
```

```
$ cat lr.xml
```

```
<?xml version="1.0" encoding="UTF-8" standalone="yes" ?>
```

```

<!DOCTYPE boost_serialization>
<boost_serialization signature="serialization::archive" version="12">
<linearRegressionModel class_id="0" tracking_level="0" version="0">
  <parameters class_id="1" tracking_level="0" version="0">
    <n_rows>2</n_rows>
    <n_cols>1</n_cols>
    <n_elem>2</n_elem>
    <vec_state>1</vec_state>
    <item>-3.97205464519563669e-16</item>
    <item>1.00000000000000022e+00</item>
  </parameters>
  <lambda>0.00000000000000000e+00</lambda>
  <intercept>1</intercept>
</linearRegressionModel>
</boost_serialization>

$ cat predict.csv
2
3
4

$ cat predictions.csv
2.0000000000e+00
3.0000000000e+00
4.0000000000e+00

```

24.3.4 Using ridge regression

Sometimes, the input matrix of predictors has a covariance matrix that is not invertible, or the system is overdetermined. In this case, ridge regression is useful: it adds a normalization term to the covariance matrix to make it invertible. Ridge regression is a standard technique and documentation for the mathematics behind it can be found anywhere on the Internet. In short, the covariance matrix

$$\mathbf{X}'\mathbf{X}$$

is replaced with

$$\mathbf{X}'\mathbf{X} + \lambda \mathbf{I}$$

where \mathbf{I} is the identity matrix. So, a λ parameter greater than zero should be specified to perform ridge regression, using the `-lambda` (or `-l`) option. An example is given below.

```

$ mlpack_linear_regression --training_file dataset.csv -v --lambda 0.5 -M lr.xml
[INFO ] Loading 'dataset.csv' as CSV data. Size is 2 x 5.
[INFO ]
[INFO ] Execution parameters:
[INFO ]   help: false
[INFO ]   info: ""
[INFO ]   input_model_file: ""
[INFO ]   lambda: 0.5
[INFO ]   output_model_file: lr.xml
[INFO ]   output_predictions: predictions.csv
[INFO ]   test_file: ""
[INFO ]   training_file: dataset.csv
[INFO ]   training_responses: ""
[INFO ]   verbose: true
[INFO ]   version: false
[INFO ]
[INFO ] Program timers:
[INFO ]   load_regressors: 0.000210s
[INFO ]   loading_data: 0.000170s
[INFO ]   regression: 0.000332s
[INFO ]   total_time: 0.001835s

```

Further documentation on options should be found by using the `-help` option.

24.4 The 'LinearRegression' class

The 'LinearRegression' class is a simple implementation of linear regression.

Using the LinearRegression class is very simple. It has two available constructors; one for generating a model from a matrix of predictors and a vector of responses, and one for loading an already computed model from a given file.

The class provides one method that performs computation:

```
void Predict(const arma::mat& points, arma::vec& predictions);
```

Once you have generated or loaded a model, you can call this method and pass it a matrix of data points to predict values for using the model. The second parameter, predictions, will be modified to contain the predicted values corresponding to each row of the points matrix.

24.4.1 Generating a model

```
#include <mlpack/methods/linear_regression/linear_regression.hpp>

using namespace mlpack::regression;

arma::mat data; // The dataset itself.
arma::vec responses; // The responses, one row for each row in data.

// Regress.
LinearRegression lr(data, responses);

// Get the parameters, or coefficients.
arma::vec parameters = lr.Parameters();
```

24.4.2 Setting a model

Assuming you already have a model and do not need to create one, this is how you would set the parameters for a LinearRegression instance.

```
arma::vec parameters; // Your model.

LinearRegression lr; // Create a new LinearRegression instance or reuse one.
lr.Parameters() = parameters; // Set the model.
```

24.4.3 Load a model from a file

If you have a generated model in a file somewhere you would like to load and use, you can use `data::Load()` (p. 379) to load it.

```
std::string filename; // The path and name of your file.

LinearRegression lr;
data::Load(filename, "lr_model", lr);
```

24.4.4 Prediction

Once you have generated or loaded a model using one of the aforementioned methods, you can predict values for a dataset.

```
LinearRegression lr();  
// Load or generate your model.  
  
// The dataset we want to predict on; each row is a data point.  
arma::mat points;  
// This will store the predictions; one row for each point.  
arma::vec predictions;  
  
lr.Predict(points, predictions); // Predict.  
  
// Now, the vector 'predictions' will contain the predicted values.
```

24.4.5 Setting lambda for ridge regression

As discussed in **Using ridge regression** (p. 147), ridge regression is useful when the covariance of the predictors is not invertible. The standard constructor can be used to set a value of lambda:

```
#include <mlpack/methods/linear_regression/linear_regression.hpp>  
  
using namespace mlpack::regression;  
  
arma::mat data; // The dataset itself.  
arma::vec responses; // The responses, one row for each row in data.  
  
// Regress, with a lambda of 0.5.  
LinearRegression lr(data, responses, 0.5);  
  
// Get the parameters, or coefficients.  
arma::vec parameters = lr.Parameters();
```

In addition, the `Lambda()` function can be used to get or modify the lambda value:

```
LinearRegression lr;  
lr.Lambda() = 0.5;  
Log::Info << "Lambda is " << lr.Lambda() << "." << std::endl;
```

24.5 Further documentation

For further documentation on the `LinearRegression` class, consult the **complete API documentation** (p. 1789).

Chapter 25

NeighborSearch tutorial (k-nearest-neighbors)

25.1 Introduction

Nearest-neighbors search is a common machine learning task. In this setting, we have a **query** and a **reference** dataset. For each point in the **query** dataset, we wish to know the k points in the **reference** dataset which are closest to the given query point.

Alternately, if the query and reference datasets are the same, the problem can be stated more simply: for each point in the dataset, we wish to know the k nearest points to that point.

mlpack provides:

- a **simple command-line executable** (p. 152) to run nearest-neighbors search (and furthest-neighbors search)
- a **simple C++ interface** (p. 154) to perform nearest-neighbors search (and furthest-neighbors search)
- a **generic, extensible, and powerful C++ class (NeighborSearch)** (p. 156) for complex usage

25.2 Table of Contents

A list of all the sections this tutorial contains.

 - **One dataset, 5 nearest neighbors** (p. 152)
 - **Query and reference dataset, 10 nearest neighbors** (p. 153)
 - **One dataset, 3 nearest neighbors, leaf size of 15 points** (p. 154)
- **The 'KNN' class** (p. 154)

- 5 nearest neighbors on a single dataset (p. 155)
- 10 nearest neighbors on a query and reference dataset (p. 155)
- Naive (exhaustive) search for 6 nearest neighbors on one dataset (p. 155)
- The extensible 'NeighborSearch' class (p. 156)
 - SortPolicy policy class (p. 156)
 - MetricType policy class (p. 156)
 - MatType policy class (p. 157)
 - TreeType policy class (p. 157)
 - TraverserType policy class (p. 157)
- Further documentation (p. 157)

25.3 Command-Line 'mlpack_knn'

The simplest way to perform nearest-neighbors search in **mlpack** is to use the `mlpack_knn` executable. This program will perform nearest-neighbors search and place the resultant neighbors into one file and the resultant distances into another. The output files are organized such that the first row corresponds to the nearest neighbors of the first query point, with the first column corresponding to the nearest neighbor, and so forth.

Below are several examples of simple usage (and the resultant output). The `-v` option is used so that output is given. Further documentation on each individual option can be found by typing

```
$ mlpack_knn --help
```

25.3.1 One dataset, 5 nearest neighbors

```
$ mlpack_knn -r dataset.csv -n neighbors_out.csv -d distances_out.csv -k 5 -v
[INFO ] Loading 'dataset.csv' as CSV data. Size is 3 x 1000.
[INFO ] Loaded reference data from 'dataset.csv' (3 x 1000).
[INFO ] Building reference tree...
[INFO ] Tree built.
[INFO ] Searching for 5 nearest neighbors with dual-tree kd-tree search...
[INFO ] 18412 node combinations were scored.
[INFO ] 54543 base cases were calculated.
[INFO ] Search complete.
[INFO ] Saving CSV data to 'neighbors_out.csv'.
[INFO ] Saving CSV data to 'distances_out.csv'.
[INFO ]
[INFO ] Execution parameters:
[INFO ]   distances_file: distances_out.csv
[INFO ]   help: false
[INFO ]   info: ""
[INFO ]   input_model_file: ""
[INFO ]   k: 5
[INFO ]   leaf_size: 20
[INFO ]   naive: false
[INFO ]   neighbors_file: neighbors_out.csv
[INFO ]   output_model_file: ""
[INFO ]   query_file: ""
[INFO ]   random_basis: false
[INFO ]   reference_file: dataset.csv
[INFO ]   seed: 0
[INFO ]   single_mode: false
[INFO ]   tree_type: kd
[INFO ]   verbose: true
[INFO ]   version: false
[INFO ]
[INFO ] Program timers:
[INFO ]   computing_neighbors: 0.108968s
[INFO ]   loading_data: 0.006495s

```

Further documentation on options should be found by using the `--help` option.

25.4 The 'KNN' class

The 'KNN' class is, specifically, a typedef of the more extensible NeighborSearch class, querying for nearest neighbors using the Euclidean distance.

```
typedef NeighborSearch<NearestNeighborSort, metric::EuclideanDistance>
    KNN;
```

Using the KNN class is particularly simple; first, the object must be constructed and given a dataset. Then, the method is run, and two matrices are returned: one which holds the indices of the nearest neighbors, and one which holds the distances of the nearest neighbors. These are of the same structure as the output `--neighbors_file` and `--distances_file` for the CLI interface (see above). A handful of examples of simple usage of the KNN class are given below.

25.4.1 5 nearest neighbors on a single dataset

```
#include <mlpack/methods/neighbor_search/neighbor_search.hpp>

using namespace mlpack::neighbor;

// Our dataset matrix, which is column-major.
extern arma::mat data;

KNN a(data);

// The matrices we will store output in.
arma::Mat<size_t> resultingNeighbors;
arma::mat resultingDistances;

a.Search(5, resultingNeighbors, resultingDistances);
```

The output of the search is stored in `resultingNeighbors` and `resultingDistances`.

25.4.2 10 nearest neighbors on a query and reference dataset

```
#include <mlpack/methods/neighbor_search/neighbor_search.hpp>

using namespace mlpack::neighbor;

// Our dataset matrices, which are column-major.
extern arma::mat queryData, referenceData;

KNN a(referenceData);

// The matrices we will store output in.
arma::Mat<size_t> resultingNeighbors;
arma::mat resultingDistances;

a.Search(queryData, 10, resultingNeighbors, resultingDistances);
```

25.4.3 Naive (exhaustive) search for 6 nearest neighbors on one dataset

This example uses the $O(n^2)$ naive search (not the tree-based search).

```
#include <mlpack/methods/neighbor_search/neighbor_search.hpp>

using namespace mlpack::neighbor;

// Our dataset matrix, which is column-major.
extern arma::mat dataset;

KNN a(dataset, true);

// The matrices we will store output in.
arma::Mat<size_t> resultingNeighbors;
arma::mat resultingDistances;

a.Search(6, resultingNeighbors, resultingDistances);
```

Needless to say, naive search can be very slow...

25.5 The extensible 'NeighborSearch' class

The NeighborSearch class is very extensible, having the following template arguments:

```
template<
    typename SortPolicy = NearestNeighborSort,
    typename MetricType = mlpack::metric::EuclideanDistance,
    typename MatType = arma::mat,
    template<typename> TreeMetricType,
    typename TreeStatType,
    typename TreeMatType> class TreeType = tree::KDTree,
    template<typename> RuleType> class TraversalType =
        TreeType<MetricType, NeighborSearchStat<SortPolicy>,
            MatType>::template DualTreeTraverser>
>
class NeighborSearch;
```

By choosing different components for each of these template classes, a very arbitrary neighbor searching object can be constructed. Note that each of these template parameters have defaults, so it is not necessary to specify each one.

25.5.1 SortPolicy policy class

The SortPolicy template parameter allows specification of how the NeighborSearch object will decide which points are to be searched for. The `mlpack::neighbor::NearestNeighborSort` (p. 433) class is a well-documented example. A custom SortPolicy class must implement the same methods which NearestNeighborSort does:

```
static size_t SortDistance(const arma::vec& list, double newDistance);

static bool IsBetter(const double value, const double ref);

template<typename TreeType>
static double BestNodeToNodeDistance(const TreeType* queryNode,
                                     const TreeType* referenceNode);

template<typename TreeType>
static double BestPointToNodeDistance(const arma::vec& queryPoint,
                                     const TreeType* referenceNode);

static const double WorstDistance();

static const double BestDistance();
```

The `mlpack::neighbor::FurthestNeighborSort` (p. 431) class is another implementation, which is used to create the 'KFN' typedef class, which finds the furthest neighbors, as opposed to the nearest neighbors.

25.5.2 MetricType policy class

The MetricType policy class allows the neighbor search to take place in any arbitrary metric space. The `mlpack::metric::LMetric` (p. 1569) class is a good example implementation. A MetricType class must provide the following functions:

```
// Empty constructor is required.
MetricType();

// Compute the distance between two points.
template<typename VecType>
double Evaluate(const VecType& a, const VecType& b);
```

Internally, the NeighborSearch class keeps an instantiated MetricType class (which can be given in the constructor). This is useful for a metric like the Mahalanobis distance (`mlpack::metric::MahalanobisDistance` (p. 1572)), which must store state (the covariance matrix). Therefore, you can write a non-static MetricType class and use it seamlessly with NeighborSearch.

For more information on the MetricType policy, see the documentation [here](#) (p. 177).

25.5.3 MatType policy class

The MatType template parameter specifies the type of data matrix used. This type must implement the same operations as an Armadillo matrix, and so standard choices are `arma::mat` and `arma::sp_mat`.

25.5.4 TreeType policy class

The NeighborSearch class allows great extensibility in the selection of the type of tree used for search. This type must follow the typical mlpack TreeType policy, documented [here](#) (p. 179).

Typical choices might include `mlpack::tree::KDTree` (p. 453), `mlpack::tree::BallTree` (p. 451), `mlpack::tree::↔StandardCoverTree` (p. 460), `mlpack::tree::RTree` (p. 459), or `mlpack::tree::RStarTree` (p. 459). It is easily possible to make your own tree type for use with NeighborSearch; consult the [TreeType documentation](#) (p. 179) for more details.

An example of using the NeighborSearch class with a ball tree is given below.

```
// Construct a NeighborSearch object with ball bounds.
NeighborSearch<
    NearestNeighborSort,
    metric::EuclideanDistance,
    arma::mat,
    tree::BallTree
> neighborSearch(dataset);
```

25.5.5 TraverserType policy class

The last template parameter the NeighborSearch class offers is the TraverserType class. The TraverserType class holds the strategy used to traverse the trees in either single-tree or dual-tree search mode. By default, it is set to use the default traverser of the given TreeType (which is the member `TreeType::DualTreeTraverser`).

This class must implement the following two methods:

```
// Instantiate with a given RuleType.
TraverserType(RuleType& rule);

// Traverse with two trees.
void Traverse(TreeType& queryNode, TreeType& referenceNode);
```

The RuleType class provides the following functions for use in the traverser:

```
// Evaluate the base case between two points.
double BaseCase(const size_t queryIndex, const size_t referenceIndex);

// Score the two nodes to see if they can be pruned, returning DBL_MAX if they
// can be pruned.
double Score(TreeType& queryNode, TreeType& referenceNode);
```

Note also that any traverser given must satisfy the definition of a pruning dual-tree traversal given in the paper "Tree-independent dual-tree algorithms".

25.6 Further documentation

For further documentation on the NeighborSearch class, consult the [complete API documentation](#) (p. 1627).

Chapter 26

RangeSearch tutorial (mlpack_range_search)

26.1 Introduction

Range search is a simple machine learning task which aims to find all the neighbors of a point that fall into a certain range of distances. In this setting, we have a **query** and a **reference** dataset. Given a certain range, for each point in the **query** dataset, we wish to know all points in the **reference** dataset which have distances within that given range to the given query point.

Alternately, if the query and reference datasets are the same, the problem can be stated more simply: for each point in the dataset, we wish to know all points which have distance in the given range to that point.

mlpack provides:

- a **simple command-line executable** (p. 160) to run range search
- a **simple C++ interface** (p. 162) to perform range search
- a **generic, extensible, and powerful C++ class (RangeSearch)** (p. 164) for complex usage

26.2 Table of Contents

A list of all the sections this tutorial contains.

- **Introduction** (p. 159)
- **Table of Contents** (p. 159)
- **The 'mlpack_range_search' command-line executable** (p. 160)
 - **One dataset, points with distance ≤ 0.01** (p. 160)
 - **Query and reference dataset, range [1.0, 1.5]** (p. 161)
 - **One dataset, range [0.7 0.8], leaf size of 15 points** (p. 162)
- **The 'RangeSearch' class** (p. 162)

- Distance less than 2.0 on a single dataset (p. 163)
- Range [3.0, 4.0] on a query and reference dataset (p. 163)
- Naive (exhaustive) search for distance greater than 5.0 on one dataset (p. 163)
- The extensible 'RangeSearch' class (p. 164)
 - MetricType policy class (p. 164)
 - MatType policy class (p. 164)
 - TreeType policy class (p. 164)
- Further documentation (p. 165)

26.3 The 'mlpack_range_search' command-line executable

mlpack provides an executable, `mlpack_range_search`, which can be used to perform range searches quickly and simply from the command-line. This program will perform the range search and place the resulting neighbor index list into one file and their corresponding distances into another file. These files are organized such that the first row corresponds to the neighbors (or distances) of the first query point, and the second row corresponds to the neighbors (or distances) of the second query point, and so forth. The neighbors of a specific point are not arranged in any specific order.

Because a range search may return different numbers of points (including zero), the output file is technically not a valid CSV and may not be loadable by other programs. Therefore, if you need the results in a certain format, it may be better to use the **C++ interface** (p. 162) to manually export the data in the preferred format.

Below are several examples of simple usage (and the resultant output). The '-v' option is used so that output is given. Further documentation on each individual option can be found by typing

```
$ mlpack_range_search --help
```

26.3.1 One dataset, points with distance ≤ 0.01

```
$ mlpack_range_search -r dataset.csv -n neighbors_out.csv -d distances_out.csv \
> -U 0.076 -v
[INFO ] Loading 'dataset.csv' as CSV data. Size is 3 x 1000.
[INFO ] Loaded reference data from 'dataset.csv' (3x1000).
[INFO ] Building reference tree...
[INFO ] Tree built.
[INFO ] Search for points in the range [0, 0.076] with dual-tree kd-tree
search...
[INFO ] Search complete.
[INFO ]
[INFO ] Execution parameters:
[INFO ]   distances_file: distances_out.csv
[INFO ]   help: false
[INFO ]   info: ""
[INFO ]   input_model_file: ""
[INFO ]   leaf_size: 20
[INFO ]   max: 0.01
[INFO ]   min: 0
[INFO ]   naive: false
[INFO ]   neighbors_file: neighbors_out.csv
[INFO ]   output_model_file: ""
[INFO ]   query_file: ""
[INFO ]   random_basis: false
[INFO ]   reference_file: dataset.csv
[INFO ]   seed: 0
[INFO ]   single_mode: false
```

```
[INFO ] tree_type: kd
[INFO ] verbose: true
[INFO ] version: false
[INFO ]
[INFO ] Program timers:
[INFO ]   loading_data: 0.005201s
[INFO ]   range_search/computing_neighbors: 0.017110s
[INFO ]   total_time: 0.033313s
[INFO ]   tree_building: 0.002500s
```

Convenient program timers are given for different parts of the calculation at the bottom of the output, as well as the parameters the simulation was run with. Now, if we look at the output files:

```
$ head neighbors_out.csv
862
703

397, 277, 319
840
732

361
547, 695
113, 982, 689

$ head distances_out.csv
0.0598608
0.0753264

0.0207941, 0.0759762, 0.0471072
0.0708221
0.0568806

0.0700532
0.0529565, 0.0550988
0.0447142, 0.0399286, 0.0734605
```

We can see that only point 862 is within distance 0.076 of point 0. We can also see that point 2 has no points within a distance of 0.076 – that line is empty.

26.3.2 Query and reference dataset, range [1.0, 1.5]

```
$ mlpack_range_search -q query_dataset.csv -r reference_dataset.csv -n \
> neighbors_out.csv -d distances_out.csv -L 1.0 -U 1.5 -v

[INFO ]   total_time: 0.045403s
[INFO ]   tree_building: 0.003979s
```

26.3.3 One dataset, range [0.7 0.8], leaf size of 15 points

The **mlpack** implementation of range search is a dual-tree algorithm; when *kd*-trees are used, the leaf size of the tree can be changed. Depending on the characteristics of the dataset, a larger or smaller leaf size can provide faster computation. The leaf size is modifiable through the command-line interface, as shown below.

```
$ mlpack_range_search -r dataset.csv -n neighbors_out.csv -d distances_out.csv \
> -L 0.7 -U 0.8 -l 15 -v
[INFO ] Loading 'dataset.csv' as CSV data. Size is 3 x 1000.
[INFO ] Loaded reference data from 'dataset.csv' (3x1000).
[INFO ] Building reference tree...
[INFO ] Tree built.
[INFO ] Search for points in the range [0.7, 0.8] with dual-tree kd-tree
search...
[INFO ] Search complete.
[INFO ]
[INFO ] Execution parameters:
[INFO ]   distances_file: distances_out.csv
[INFO ]   help: false
[INFO ]   info: ""
[INFO ]   input_model_file: ""
[INFO ]   leaf_size: 15
[INFO ]   max: 0.8
[INFO ]   min: 0.7
[INFO ]   naive: false
[INFO ]   neighbors_file: neighbors_out.csv
[INFO ]   output_model_file: ""
[INFO ]   query_file: ""
[INFO ]   random_basis: false
[INFO ]   reference_file: dataset.csv
[INFO ]   seed: 0
[INFO ]   single_mode: false
[INFO ]   tree_type: kd
[INFO ]   verbose: true
[INFO ]   version: false
[INFO ]
[INFO ] Program timers:
[INFO ]   loading_data: 0.006298s
[INFO ]   range_search/computing_neighbors: 0.411041s
[INFO ]   total_time: 0.539931s
[INFO ]   tree_building: 0.004695s
```

Further documentation on options should be found by using the `--help` option.

26.4 The 'RangeSearch' class

The 'RangeSearch' class is an extensible template class which allows a high level of flexibility. However, all of the template arguments have default parameters, allowing a user to simply use 'RangeSearch<>' for simple usage without worrying about the exact necessary template parameters.

The class bears many similarities to the **NeighborSearch** (p. 151) class; usage generally consists of calling the constructor with one or two datasets, and then calling the 'Search()' method to perform the actual range search.

The 'Search()' method stores the results in two vector-of-vector objects. This is necessary because each query point may have a different number of neighbors in the specified distance range. The structure of those two objects is very similar to the output files `--neighbors_file` and `--distances_file` for the CLI interface (see above). A handful of examples of simple usage of the RangeSearch class are given below.

26.4.1 Distance less than 2.0 on a single dataset

```
#include <mlpack/methods/range_search/range_search.hpp>

using namespace mlpack::range;

// Our dataset matrix, which is column-major.
extern arma::mat data;

RangeSearch<> a(data);

// The vector-of-vector objects we will store output in.
std::vector<std::vector<size_t> > resultingNeighbors;
std::vector<std::vector<double> > resultingDistances;

// The range we will use.
math::Range r(0.0, 2.0); // [0.0, 2.0].

a.Search(r, resultingNeighbors, resultingDistances);
```

The output of the search is stored in `resultingNeighbors` and `resultingDistances`.

26.4.2 Range [3.0, 4.0] on a query and reference dataset

```
#include <mlpack/methods/range_search/range_search.hpp>

using namespace mlpack::range;

// Our dataset matrices, which are column-major.
extern arma::mat queryData, referenceData;

RangeSearch<> a(referenceData);

// The vector-of-vector objects we will store output in.
std::vector<std::vector<size_t> > resultingNeighbors;
std::vector<std::vector<double> > resultingDistances;

// The range we will use.
math::Range r(3.0, 4.0); // [3.0, 4.0].

a.Search(queryData, r, resultingNeighbors, resultingDistances);
```

26.4.3 Naive (exhaustive) search for distance greater than 5.0 on one dataset

This example uses the $O(n^2)$ naive search (not the tree-based search).

```
#include <mlpack/methods/range_search/range_search.hpp>

using namespace mlpack::range;

// Our dataset matrix, which is column-major.
extern arma::mat dataset;

// The 'true' option indicates that we will use naive calculation.
RangeSearch<> a(dataset, true);

// The vector-of-vector objects we will store output in.
std::vector<std::vector<size_t> > resultingNeighbors;
std::vector<std::vector<double> > resultingDistances;

// The range we will use. The upper bound is DBL_MAX.
math::Range r(5.0, DBL_MAX); // [5.0, inf).

a.Search(r, resultingNeighbors, resultingDistances);
```

Needless to say, naive search can be very slow...

26.5 The extensible 'RangeSearch' class

Similar to the **NeighborSearch** class (p. 151), the **RangeSearch** class is very extensible, having the following template arguments:

```
template<typename MetricType = metric::EuclideanDistance,
        typename MatType = arma::mat,
        template<typename TreeMetricType,
                typename TreeStatType,
                typename TreeMatType> class TreeType = tree::KDTree>
class RangeSearch;
```

By choosing different components for each of these template classes, a very arbitrary range searching object can be constructed.

26.5.1 MetricType policy class

The **MetricType** policy class allows the range search to take place in any arbitrary metric space. The **mlpack::metric::LMetric** (p. 1569) class is a good example implementation. A **MetricType** class must provide the following functions:

```
// Empty constructor is required.
MetricType();

// Compute the distance between two points.
template<typename VecType>
double Evaluate(const VecType& a, const VecType& b);
```

Internally, the **RangeSearch** class keeps an instantiated **MetricType** class (which can be given in the constructor). This is useful for a metric like the Mahalanobis distance (**mlpack::metric::MahalanobisDistance** (p. 1572)), which must store state (the covariance matrix). Therefore, you can write a non-static **MetricType** class and use it seamlessly with **RangeSearch**.

26.5.2 MatType policy class

The **MatType** template parameter specifies the type of data matrix used. This type must implement the same operations as an Armadillo matrix, and so standard choices are **arma::mat** and **arma::sp_mat**.

26.5.3 TreeType policy class

The **RangeSearch** class also allows a custom tree to be used. The **TreeType** policy is also used elsewhere in **mlpack** and is documented more thoroughly [here](#) (p. 179).

Typical choices might include **mlpack::tree::KDTree** (p. 453) (the default), **mlpack::tree::BallTree** (p. 451), **mlpack::tree::RTree** (p. 459), **mlpack::tree::RStarTree** (p. 459), or **mlpack::tree::StandardCoverTree** (p. 460). Below is an example that uses the **RangeSearch** class with an R-tree:

```
// Construct a RangeSearch object with ball bounds.
RangeSearch<
    metric::EuclideanDistance,
    arma::mat,
    tree::RTree
> rangeSearch(dataset);
```

For further information on trees, including how to write your own tree for use with **RangeSearch** and other **mlpack** methods, see the **TreeType policy documentation** (p. 179).

26.6 Further documentation

For further documentation on the RangeSearch class, consult the **complete API documentation** (p. 1754).

Chapter 27

Tutorials

27.1 Quickstart Tutorials

These tutorials give very quick "getting started" examples that you can use to get started with mlpack in different languages.

- **mlpack in Python quickstart guide** (p. 59)
- **mlpack command-line quickstart guide** (p. 31)

27.2 Introductory Tutorials

These tutorials introduce the basic concepts of working with mlpack, aimed at developers who want to use and contribute to mlpack but are not sure where to start.

- **Building mlpack From Source** (p. 21)
- **Building mlpack From Source on Windows** (p. 27)
- **File formats and loading data in mlpack** (p. 43)
- **Matrices in mlpack** (p. 57)
- **Writing an mlpack binding** (p. 53)
- **mlpack Timers** (p. 69)
- **Simple Sample mlpack Programs** (p. 63)
- **Sample C++ ML App for Windows** (p. 65)

27.3 Method-specific Tutorials

These tutorials introduce the various methods mlpack offers, aimed at users who want to get started quickly. These tutorials start with simple examples and progress to complex, extensible uses.

- **NeighborSearch tutorial (k-nearest-neighbors)** (p. 151)
- **Linear/ridge regression tutorial (mlpack_linear_regression)** (p. 143)
- **RangeSearch tutorial (mlpack_range_search)** (p. 159)

- **EMST Tutorial** (p. 117)
- **Alternating Matrix Factorization tutorial** (p. 73)
- **Collaborative filtering tutorial** (p. 103)
- **Approximate furthest neighbor search (mlpack_approx_kfn) tutorial** (p. 87)
- **Neural Network tutorial** (p. 77)

27.4 Advanced Tutorials

These tutorials discuss some of the more advanced functionality contained in mlpack.

- **mlpack automatic bindings to other languages** (p. 3)
- **Cross-Validation** (p. 35)
- **Hyper-Parameter Tuning** (p. 49)

27.5 Policy Class Documentation

mlpack uses templates to achieve its genericity and flexibility. Some of the template types used by mlpack are common across multiple machine learning algorithms. The links below provide documentation for some of these common types.

- **The MetricType policy in mlpack** (p. 177)
- **The KernelType policy in mlpack** (p. 173)
- **The TreeType policy in mlpack** (p. 179)

Chapter 28

The ElemType policy in mlpack

28.1 Overview

mlpack algorithms should be as generic as possible. Often this means allowing arbitrary metrics or kernels to be used, but this also means allowing any type of data point to be used. This means that **mlpack** classes should support `float`, `double`, and other observation types. Some algorithms support this through the use of a `MatType` template parameter; others will have their own template parameter, `ElemType`.

The `ElemType` template parameter can take any value that can be used by Armadillo (or, specifically, classes like `arma::Mat<>` and others); this encompasses the types

- `double`
- `float`
- `int`
- `unsigned int`
- `std::complex<double>`
- `std::complex<float>`

and other primitive numeric types. Note that Armadillo does not support some integer types for functionality such as matrix decompositions or other more advanced linear algebra. This means that when these integer types are used, some algorithms may fail with Armadillo error messages indicating that those types cannot be used.

28.2 note for developers

If the class has a `MatType` template parameter, `ElemType` can be easily defined as below:

```
typedef typename MatType::elem_type ElemType;
```

and otherwise a template parameter with the name `ElemType` can be used. It is generally a good idea to expose the element type somehow for use by other classes.

Chapter 29

The FunctionType policy in mlpack

29.1 Overview

To represent the various types of loss functions encountered in machine learning problems, mlpack provides the `FunctionType` template parameter in the optimizer interface. The various optimizers available in the core library rely on this policy to gain the necessary information required by the optimizing algorithm.

The `FunctionType` template parameter required by the `Optimizer` class can have additional requirements imposed on it, depending on the type of optimizer used.

29.2 Interface requirements

The most basic requirements for the `FunctionType` parameter are the implementations of two public member functions, with the following interface and semantics

```
// Evaluate the loss function at the given coordinates.
double Evaluate(const arma::mat& coordinates);

// Evaluate the gradient at the given coordinates, where 'gradient' is an
// output parameter for the required gradient.
void Gradient(const arma::mat& coordinates, arma::mat& gradient);
```

Optimizers like SGD and RMSProp require a `DecomposableFunctionType` having the following requirements

```
// Return the number of functions. In a data-dependent function, this would
// return the number of points in the dataset.
size_t NumFunctions();

// Evaluate the 'i' th loss function. For example, for a data-dependent
// function, Evaluate(coordinates, 0) should evaluate the loss function at the
// first point in the dataset.
double Evaluate(const arma::mat& coordinates, const size_t i);
```

```
// Evaluate the gradient of the 'i' th loss function at the given coordinates,
// where 'gradient' is an output parameter for the required gradient.
void Gradient(const arma::mat& coordinates, const size_t i, arma::mat& gradient);
```

ParallelSGD optimizer requires a SparseFunctionType interface. SparseFunctionType requires the gradient to be in a sparse matrix (arma::sp_mat), as ParallelSGD, implemented with the HOGWILD! scheme of unsynchronised updates, is expected to be relevant only in situations where the individual gradients are sparse. So, the interface requires function with the following signatures

```
// Return the number of functions. In a data-dependent function, this would
// return the number of points in the dataset.
size_t NumFunctions();
```

```
// Evaluate the loss function at the given coordinates.
double Evaluate(const arma::mat& coordinates);
```

```
// Evaluate the (sparse) gradient of the 'i' th loss function at the given
// coordinates, where 'gradient' is an output parameter for the required
// gradient.
void Gradient(const arma::mat& coordinates, const size_t i, arma::sp_mat& gradient);
```

The SCD optimizer requires a ResolvableFunctionType interface, to calculate partial gradients with respect to individual features. The optimizer requires the decision variable to be arranged in a particular fashion to allow for disjoint updates. The features should be arranged columnwise in the decision variable. For example, in Softmax←RegressionFunction the decision variable has size numClasses x featureSize (+ 1 if an intercept also needs to be fit). Similarly, for LogisticRegression, the decision variable is a row vector, with the number of columns determined by the dimensionality of the dataset.

The interface expects the following member functions from the function class

```
// Return the number of features in the decision variable.
size_t NumFeatures();
```

```
// Evaluate the loss function at the given coordinates.
double Evaluate(const arma::mat& coordinates);
```

```
// Evaluate the partial gradient of the loss function with respect to the 'j' th
// coordinate at the given coordinates, where 'gradient' is an output parameter
// for the required gradient. The 'gradient' matrix is supposed to be non-zero
// in the jth column, which contains the relevant partial gradient.
void PartialGradient(const arma::mat& coordinates, const size_t j, arma::sp_mat& gradient);
```

Chapter 30

The KernelType policy in mlpack

30.1 Table of Contents

- **Introduction to the KernelType policy** (p. 173)
- **The KernelTraits trait class** (p. 175)
- **List of kernels and classes that use a KernelType** (p. 175)

30.2 Introduction to the KernelType policy

'Kernel methods' make up a large class of machine learning techniques. Each of these methods is characterized by its dependence on a **kernel function**. In rough terms, a kernel function is a general notion of similarity between two points, with its value large when objects are similar and its value small when objects are dissimilar (note that this is not the only interpretation of what a kernel is).

A kernel (or 'Mercer kernel') $\mathcal{K}(\cdot, \cdot)$ takes two objects as input and returns some sort of similarity value. The specific details and properties of kernels are outside the scope of this documentation; for a better introduction to kernels and kernel methods, there are numerous better resources available, including <http://www.eric-kim.net/eric-kim-net/posts/1/kernel-trick.html> "Eric Kim's tutorial".

mlpack implements a number of kernel methods and, accordingly, each of these methods allows arbitrary kernels to be used via the `KernelType` template parameter. Like the **MetricType policy** (p. 177), the requirements are quite simple: a class implementing the `KernelType` policy must have

- an `Evaluate()` function
- a default constructor

The signature of the `Evaluate()` function is straightforward:

```
template<typename VecTypeA, typename VecTypeB>
double Evaluate(const VecTypeA& a, const VecTypeB& b);
```

The function takes two vector arguments, a and b , and returns a `double` that is the evaluation of the kernel between the two arguments. So, for a particular kernel $\mathcal{K}(\cdot, \cdot)$, the `Evaluate()` function should return $\mathcal{K}(a, b)$.

The arguments a and b , of types `VecTypeA` and `VecTypeB`, respectively, will be an Armadillo-like vector type (usually `arma::vec`, `arma::sp_vec`, or similar). In general it should be valid to assume that `VecTypeA` is a class with the same API as `arma::vec`.

Note that for kernels that do not hold any state, the `Evaluate()` method can be marked as `static`.

Overall, the `KernelType` template policy is quite simple (much like the **MetricType** policy (p.177)). Below is an example kernel class, which outputs 1 if the vectors are close and 0 otherwise.

```
class ExampleKernel
{
    // Default constructor is required.
    ExampleKernel() { }

    // The example kernel holds no state, so we can mark Evaluate() as static.
    template<typename VecTypeA, typename VecTypeB>
    static double Evaluate(const VecTypeA& a, const VecTypeB& b)
    {
        // Get how far apart the vectors are (using the Euclidean distance).
        const double distance = arma::norm(a - b);

        if (distance < 0.05) // Less than 0.05 distance is "close".
            return 1;
        else
            return 0;
    }
};
```

Then, this kernel may be easily used inside of mlpack algorithms. For instance, the code below runs kernel PCA (**mlpack::kpca::KernelPCA** (p.1507)) on a random dataset using the `ExampleKernel`. The results are saved to a file called `results.csv`. (Note that this is simply an example to demonstrate usage, and this example kernel isn't actually likely to be useful in practice.)

```
#include <mlpack/core.hpp>
#include <mlpack/methods/kernel_pca/kernel_pca.hpp>
#include "example_kernel.hpp" // Contains the ExampleKernel class.

using namespace mlpack;
using namespace mlpack::kpca;
using namespace arma;

int main()
{
    // Generate the random dataset; 10 dimensions, 5000 points.
    mat dataset = randu<mat>(10, 5000);

    // Instantiate the KernelPCA object with the ExampleKernel kernel type.
    KernelPCA<ExampleKernel> kpca;

    // The dataset will be transformed using kernel PCA with the example kernel to
    // contain only 2 dimensions.
    kpca.Apply(dataset, 2);

    // Save the results to 'results.csv'.
    data::Save(dataset, "results.csv");
}
```

30.3 The KernelTraits trait class

Some algorithms that use kernels can specialize if the kernel fulfills some certain conditions. An example of a condition might be that the kernel is shift-invariant or that the kernel is normalized. In the case of fast max-kernel search (`mlpack::fastmks::FastMKS` (p. 1280)), the computation can be accelerated if the kernel is normalized. For this reason, the `KernelTraits` trait class exists. This allows a kernel to specify via a `const static bool` when these types of conditions are satisfied. **Note that a `KernelTraits` class is not required**, but may be helpful.

The `KernelTraits` trait class is a template class that takes a `KernelType` as a parameter, and exposes `const static bool` values that depend on the kernel. Setting these values is achieved by specialization. The code below provides an example, specializing `KernelTraits` for the `ExampleKernel` from earlier:

```
template<>
class KernelTraits<ExampleKernel>
{
public:
    const static bool IsNormalized = true;
};
```

At this time, there is only one kernel trait that is used in `mlpack` code:

- `IsNormalized` (defaults to `false`): if $K(x, x) = 1 \forall x$, then the kernel is normalized and this should be set to `true`.

30.4 List of kernels and classes that use a `KernelType`

`mlpack` comes with a number of pre-written kernels that satisfy the `KernelType` policy:

- `mlpack::kernel::LinearKernel` (p. 1446)
- `mlpack::kernel::ExampleKernel` (p. 1421) – an example kernel with more documentation
- `mlpack::kernel::GaussianKernel` (p. 1424)
- `mlpack::kernel::HyperbolicTangentKernel` (p. 1430)
- `mlpack::kernel::EpanechnikovKernel` (p. 1417)
- `mlpack::kernel::CosineDistance` (p. 1416)
- `mlpack::kernel::LaplacianKernel` (p. 1442)
- `mlpack::kernel::PolynomialKernel` (p. 1451)
- `mlpack::kernel::TriangularKernel` (p. 1461)
- `mlpack::kernel::SphericalKernel` (p. 1458)
- `mlpack::kernel::PSpectrumStringKernel` (p. 1454) – operates on strings, not vectors

These kernels (or a custom kernel) may be used in a variety of `mlpack` methods:

- `mlpack::kpca::KernelPCA` (p. 1507) - kernel principal components analysis
- `mlpack::fastmks::FastMKS` (p. 1280) - fast max-kernel search
- `mlpack::kernel::NystroemMethod` (p. 1448) - the Nystroem method for sampling
- `mlpack::metric::IPMetric` (p. 1565) - a metric built on a kernel

Chapter 31

The MetricType policy in mlpack

Many machine learning methods operate with some sort of metric, and often, this metric can be any arbitrary metric. For instance, consider the problem of nearest neighbor search; one can find the nearest neighbor of a point with respect to the standard Euclidean distance, or the Manhattan (city-block) distance. The actual search techniques, though, remain the same. And this is true of many machine learning methods: the specific metric that is used can be any valid metric.

mlpack algorithms, when possible, allow the use of an arbitrary metric via the use of the `MetricType` template parameter. Any metric passed as a `MetricType` template parameter will need to have

- an `Evaluate` function
- a default constructor.

The signature of the `Evaluate` function is straightforward:

```
template<typename VecTypeA, typename VecTypeB>
double Evaluate(const VecTypeA& a, const VecTypeB& b);
```

The function takes two vector arguments, `a` and `b`, and returns a `double` that is the evaluation of the metric between the two arguments. So, for a particular metric $d(\cdot, \cdot)$, the `Evaluate()` function should return $d(a, b)$.

The arguments `a` and `b`, of types `VecTypeA` and `VecTypeB`, respectively, will be an Armadillo-like vector type (usually `arma::vec`, `arma::sp_vec`, or similar). In general it should be valid to assume that `VecTypeA` is a class with the same API as `arma::vec`.

Note that for metrics that do not hold any state, the `Evaluate()` method can be marked as `static`.

Overall, the `MetricType` template policy is quite simple (much like the **The KernelType policy in mlpack** (p. 173) `KernelType` policy). Below is an example metric class, which implements the L2 distance:

```
class ExampleMetric
{
    // Default constructor is required.
    ExampleMetric() {}

    // The example metric holds no state, so we can mark Evaluate() as static.
    template<typename VecTypeA, typename VecTypeB>
    static double Evaluate(const VecTypeA& a, const VecTypeB& b)
    {
        // Return the L2 norm of the difference between the points, which is the
        // same as the L2 distance.
        return arma::norm(a - b);
    }
};
```

Then, this metric can easily be used inside of other mlpack algorithms. For example, the code below runs range search on a random dataset with the `ExampleKernel`, by instantiating a `mlpack::range::RangeSearch` (p. 1754) object that uses the `ExampleKernel`. Then, the number of results are printed. The `RangeSearch` class takes three template parameters: `MetricType`, `MatType`, and `TreeType`. (All three have defaults, so we will just leave `MatType` and `TreeType` to their defaults.)

```
#include <mlpack/core.hpp>
#include <mlpack/methods/range_search/range_search.hpp>
#include "example_metric.hpp" // A file that contains ExampleKernel.

using namespace mlpack;
using namespace mlpack::range;
using namespace std;

int main()
{
  // Create a random dataset with 10 dimensions and 5000 points.
  arma::mat data = arma::randu<arma::mat>(10, 5000);

  // Instantiate the RangeSearch object with the ExampleKernel.
  RangeSearch<ExampleKernel> rs(data);

  // These vectors will store the results.
  vector<vector<size_t>> neighbors;
  vector<vector<double>> distances;

  // Create a random 10-dimensional query point.
  arma::vec query = arma::randu<arma::vec>(10);

  // Find those points with distance (according to ExampleMetric) between 1 and
  // 2 from the query point.
  rs.Search(query, math::Range(1.0, 2.0), neighbors, distances);

  // Now, print the number of points inside the desired range. We know that
  // neighbors and distances will have length 1, since there was only one query
  // point.
  cout << neighbors[0].size() << " points within the range [1.0, 2.0] of the "
       << "query point!" << endl;
}
```

mlpack comes with a number of pre-written metrics that satisfy the `MetricType` policy:

- `mlpack::metric::ManhattanDistance` (p. 427)
- `mlpack::metric::EuclideanDistance` (p. 427)
- `mlpack::metric::ChebyshevDistance` (p. 427)
- `mlpack::metric::MahalanobisDistance` (p. 1572)
- `mlpack::metric::LMetric` (p. 1569) (for arbitrary L-metrics)
- `mlpack::metric::IPMetric` (p. 1565) (requires a `KernelType` (p. 173) parameter)

Chapter 32

The TreeType policy in mlpack

32.1 Introduction

Trees are an important data structure in mlpack and are used in a number of the machine learning algorithms that mlpack implements. Often, the use of trees can allow significant acceleration of an algorithm; this is generally done by pruning away large parts of the tree during computation.

Most mlpack algorithms that use trees are not tied to a specific tree but instead allow the user to choose a tree via the `TreeType` template parameter. Any tree passed as a `TreeType` template parameter will need to implement a certain set of functions. In addition, a tree may optionally specify some traits about itself with the `TreeTraits` trait class.

This document aims to clarify the abstractions underlying mlpack trees, list and describe the required functionality of the `TreeType` policy, and point users towards existing types of trees. A table of contents is below:

- **Introduction** (p. 179)
- **What is a tree?** (p. 180)
- **Template parameters required by the TreeType policy** (p. 181)
- **The TreeType API** (p. 182)
- **Rigorous API documentation** (p. 184)
 - **Template parameters** (p. 185)
 - **Constructors and destructors** (p. 186)
 - **Basic tree functionality** (p. 187)
 - **Complex tree functionality and bounds** (p. 188)
 - **Serialization** (p. 190)
- **The TreeTraits trait class** (p. 190)
- **A list of trees in mlpack and more information** (p. 191)

Although this document is long, there may still be errors and unclear areas. If you are having trouble understanding anything, please get in touch on Github or on the mailing list and someone will help you (and possibly update the documentation afterwards).

32.2 What is a tree?

In `mlpack`, we assume that we have some sort of data matrix, which might be sparse or dense (that is, it could be of type `arma::mat` or `arma::sp_mat`, or any variant that implements the Armadillo API). This data matrix corresponds to a collection of points in some space (usually a Euclidean space). A tree is a way of organizing this data matrix in a hierarchical manner—so, points that are nearby should lie in similar nodes.

We can rigorously define what a tree is, using the definition of **space tree** introduced in the following paper:

R.R. Curtin, W.B. March, P. Ram, D.V. Anderson, A.G. Gray, and C.L. Isbell Jr., "Tree-independent dual-tree algorithms," in Proceedings of the 30th International Conference on Machine Learning (ICML '13), pp. 1435–1443, 2013.

The definition is:

A **space tree** on a dataset $S \in \mathcal{R}^{N \times d}$ is an undirected, connected, acyclic, rooted simple graph with the following properties:

- Each node (or vertex) holds a number of points (possibly zero) and is connected to one parent node and a number of child nodes (possibly zero).
- There is one node in every space tree with no parent; this is the root node of the tree.
- Each point in S is contained in at least one node.
- Each node corresponds to some subset of \mathcal{R}^d that contains each point in the node and also the subsets that correspond to each child of the node.

This is really a quite straightforward definition: a tree is hierarchical, and each node corresponds to some region of the input space. Each node may have some number of children, and may hold some number of points. However, there is an important terminology distinction to make: the term **points held by a node** has a different meaning than the term **descendant points held by a node**. The points held in a node are just that—points held only in the node. The descendant points of a node are the combination of the points held in a node with the points held in the node's children and the points held in the node's children's children (and so forth). For the purposes of clarity in all discussions about trees, care is taken to differentiate the terms "descendant point" and "point".

Now, it's also important to note that a point does not *need* to hold any children, and that a node *can* hold the same points as its children (or its parent). Some types of trees do this. For instance, each node in the cover tree holds only one point, and may have a child that holds the same point. As another example, the k *d*-tree holds its points only in the leaves (at the bottom of the tree). More information on space trees can be found in either the "Tree-independent dual-tree algorithms" paper or any of the related literature.

So there is a huge amount of possible variety in the types of trees that can fall into the class of *space trees*. Therefore, it's important to treat them abstractly, and the `TreeType` policy allows us to do just that. All we need to remember is that a node in a tree can be represented as the combination of some points held in the node, some child nodes, and some geometric structure that represents the space that all of the descendant points fall into (this is a restatement of the fourth part of the definition).

32.3 Template parameters required by the TreeType policy

Most everything in mlpack is decomposed into a series of configurable template parameters, and trees are no exception. In order to ease usage of high-level mlpack algorithms, each `TreeType` itself must be a template class taking three parameters:

- `MetricType` – the underlying metric that the tree will be built on (see [the MetricType policy documentation](#) (p. 177))
- `StatisticType` – holds any auxiliary information that individual algorithms may need
- `MatType` – the type of the matrix used to represent the data

The reason that these three template parameters are necessary is so that each `TreeType` can be used as a template template parameter, which can radically simplify the required syntax for instantiating mlpack algorithms. By using template template parameters, a user needs only to write

```
// The RangeSearch class takes a MetricType and a TreeType template parameter.

// This code instantiates RangeSearch with the ManhattanDistance and a
// QuadTree. Note that the QuadTree itself is a template, and takes a
// MetricType, StatisticType, and MatType, just like the policy requires.

// This example ignores the constructor parameters, for the sake of simplicity.
RangeSearch<ManhattanDistance, QuadTree> rs(...);
```

as opposed to the far more complicated alternative, where the user must specify the values of each template parameter of the tree type:

```
// This is a much worse alternative, where the user must specify the template
// arguments of their tree.
RangeSearch<ManhattanDistance,
            QuadTree<ManhattanDistance, EmptyStatistic, arma::mat>> rs(...);
```

Unfortunately, the price to pay for this user convenience is that *every* `TreeType` must have three template parameters, and they must be in exactly that order. Fortunately, there is an additional benefit: we are guaranteed that the tree is built using the same metric as the method (that is, a user can't specify different metric types to the algorithm and to the tree, which they can without template template parameters).

There are two important notes about this:

- Not every possible input of `MetricType`, `StatisticType`, and/or `MatType` necessarily need to be valid or work correctly for each type of tree. For instance, the `QuadTree` is limited to Euclidean metrics and will not work otherwise. Either compile-time static checks or detailed documentation can help keep users from using invalid combinations of template arguments.
- Some types of trees have more template parameters than just these three. One example is the generalized binary space tree, where the bounding shape of each node is easily made into a fourth template parameter (the `BinarySpaceTree` class calls this the `BoundType` parameter), and the procedure used to split a node is easily made into a fifth template parameter (the `BinarySpaceTree` class calls this the `SplitType` parameter). However, the syntax of template template parameters *requires* that the class only has the correct number of template parameters—no more, no less. Fortunately, C++11 allows template typedefs, which can be used to provide partial specialization of template classes:

```
// This is the definition of the BinarySpaceTree class, which has five template
// parameters.
template<typename MetricType,
        typename StatisticType,
        typename MatType,
        typename BoundType,
        typename SplitType>
class BinarySpaceTree;

// The 'using' keyword gives us a template typedef, so we can define the
// MeanSplitKDTree template class, which has three parameters and is a valid
// TreeType policy class.
template<typename MetricType, typename StatisticType, typename MatType>
using MeanSplitKDTree = BinarySpaceTree<MetricType,
                                       StatisticType,
                                       MatType,
                                       HRectBound<MetricType>
                                       MeanSplit<BoundType, MetricType>>;
```

Now, the MeanSplitKDTree class has only three template parameters and can be used as a TreeType policy class in various mlpack algorithms. Many types of trees in mlpack have more than three template parameters and rely on template typedefs to provide simplified TreeType interfaces.

32.4 The TreeType API

As a result of the definition of *space tree* in the previous section, a simplified API presents itself quite easily. However, more complex functionality is often necessary in mlpack, so this leads to more functions being necessary for a class to satisfy the TreeType policy. Combining this with the template parameters required for trees given in the previous section gives us the complete API required for a class implementing the TreeType policy. Below is the minimal set of functions required with minor documentation for each function. (More extensive documentation and explanation is given afterwards.)

```
// The three template parameters will be supplied by the user, and are detailed
// in the previous section.
template<typename MetricType,
        typename StatisticType,
        typename MatType>
class ExampleTree
{
public:

    // This batch constructor does not modify the dataset, and builds the entire
    // tree using a default-constructed MetricType.
    ExampleTree(const MatType& data);

    // This batch constructor does not modify the dataset, and builds the entire
    // tree using the given MetricType.
    ExampleTree(const MatType& data, MetricType& metric);

    // Initialize the tree from a given boost::serialization archive. SFINAE (the
    // second argument) is necessary to ensure that the archive is loading, not
    // saving.
    template<typename Archive>
    ExampleTree(
        Archive& ar,
        const typename boost::enable_if<typename Archive::is_loading>::type* = 0);

    // Release any resources held by the tree.
    ~ExampleTree();

    // ////////////////////////////////// //
    // // Basic functionality // //
    // ////////////////////////////////// //

    // Get the dataset that the tree is built on.
    const MatType& Dataset();

    // Get the metric that the tree is built with.
```

```

MetricType& Metric();

// Get/modify the StatisticType for this node.
StatisticType& Stat();

// Return the parent of the node, or NULL if this is the root.
ExampleTree* Parent();

// Return the number of children held by the node.
size_t NumChildren();
// Return the i'th child held by the node.
ExampleTree& Child(const size_t i);

// Return the number of points held in the node.
size_t NumPoints();
// Return the index of the i'th point held in the node.
size_t Point(const size_t i);

// Return the number of descendant nodes of this node.
size_t NumDescendantNodes();
// Return the i'th descendant node of this node.
ExampleTree& DescendantNode(const size_t i);

// Return the number of descendant points of this node.
size_t NumDescendants();
// Return the index of the i'th descendant point of this node.
size_t Descendant(const size_t i);

// Store the center of the bounding region of the node in the given vector.
void Center(arma::vec& center);

// //////////////////////////////////////// //
// // More complex distance-related functionality // //
// //////////////////////////////////////// //

// Return the distance between the center of this node and the center of
// its parent.
double ParentDistance();

// Return an upper bound on the furthest possible distance between the
// center of the node and any point held in the node.
double FurthestPointDistance();

// Return an upper bound on the furthest possible distance between the
// center of the node and any descendant point of the node.
double FurthestDescendantDistance();

// Return a lower bound on the minimum distance between the center and any
// edge of the node's bounding shape.
double MinimumBoundDistance();

// Return a lower bound on the minimum distance between the given point and
// the node.
template<typename VecType>
double MinDistance(VecType& point);

// Return a lower bound on the minimum distance between the given node and
// this node.
double MinDistance(ExampleTree& otherNode);

// Return an upper bound on the maximum distance between the given point and
// the node.
template<typename VecType>
double MaxDistance(VecType& point);

// Return an upper bound on the maximum distance between the given node and
// this node.
double MaxDistance(ExampleTree& otherNode);

// Return the combined results of MinDistance() and MaxDistance().
template<typename VecType>
math::Range RangedDistance(VecType& point);

// Return the combined results of MinDistance() and MaxDistance().
math::Range RangeDistance(ExampleTree& otherNode);

// //////////////////////////////////////// //
// // Serialization (loading/saving) // //
// //////////////////////////////////////// //

// Return a string representation of the tree.

```

```

std::string ToString() const;

// Serialize the tree (load from the given archive / save to the given
// archive, depending on its type).
template<typename Archive>
void Serialize(Archive& ar, const unsigned int version);

protected:
// A default constructor; only meant to be used by boost::serialization. This
// must be protected so that boost::serialization will work; it does not need
// to return a valid tree.
ExampleTree();

// Friend access must be given for the default constructor.
friend class boost::serialization::access;
};

```

Although this is significantly more complex than the four-item definition of `space tree*` might suggest, it turns out many of these methods are not difficult to implement for most reasonable tree types. It is also important to realize that this is a *minimum* API; you may implement more complex tree types at your leisure (and you may include more template parameters too, though you will have to use template typedefs to provide versions with three parameters; see **the previous section** (p. 181)).

Before diving into the detailed documentation for each function, let us consider a few important points about the implications of this API:

- **Trees are not default-constructible** and should not (in general) provide a default constructor. This helps prevent invalid trees. In general, any instantiated mlpack object should be valid and ready to use—and a tree built on no points is not valid or ready to use.
- **Trees only need to provide batch constructors.** Although many tree types do have algorithms for incremental insertions, in mlpack this is not required because the tree-based algorithms that mlpack implements generally assume fully-built, non-modifiable trees. For this purpose, batch construction is perfectly sufficient. (It's also worth pointing out that for some types of trees, like kd-trees, the cost of a handful of insertions often outweighs the cost of completely rebuilding the tree.)
- **Trees must provide a number of distance bounding functions.** The utility of trees generally stems from the ability to place quick bounds on distance-related quantities. For instance, if all the descendant points of a node are bounded by a ball of radius λ and the center of the node is a point c , then the minimum distance between some point p and any descendant point of the node is equal to the distance between p and c minus the radius λ : $d(p, c) - \lambda$. This is a fast calculation, and (usually) provides a decent bound on the minimum distance between p and any descendant point of the node.
- **Trees need to be able to be serialized.** mlpack uses the `boost::serialization` (p. 251) library for saving and loading objects. Trees—which can be a part of machine learning models—therefore must have the ability to be saved and loaded. Making this all work requires a protected constructor (part of the API) and generally makes it impossible to hold references instead of pointers internally, because if a tree is loaded from a file then it must own the dataset it is built on and the metric it uses (this also means that a destructor must exist for freeing these resources).

Now, we can consider each part of the API more rigorously.

32.5 Rigorous API documentation

This section is divided into five parts:

- **Template parameters** (p. 185)
- **Constructors and destructors** (p. 186)
- **Basic tree functionality** (p. 187)
- **Complex tree functionality and bounds** (p. 188)
- **Serialization** (p. 190)

32.5.1 Template parameters

An earlier section discussed the three different template parameters that are required by the `TreeType` policy.

The **MetricType** policy (p. 177) provides one method that will be useful for tree building and other operations:

```
// This function is required by the MetricType policy.
// Evaluate the metric between two points (which may be of different types).
template<typename VecTypeA, typename VecTypeB>
double Evaluate(const VecTypeA& a, const VecTypeB& b);
```

Note that this method is not necessarily static, so a `MetricType` object should be held internally and its `Evaluate()` method should be called whenever the distance between two points is required. **It is generally a bad idea to hardcode any distance calculation in your tree.** This will make the tree unable to generalize to arbitrary metrics. If your tree must depend on certain assumptions holding about the metric (i.e. the metric is a Euclidean metric), then make that clear in the documentation of the tree, so users do not try to use the tree with an inappropriate metric.

The second template parameter, `StatisticType`, is for auxiliary information that is required by certain algorithms. For instance, consider an algorithm which repeatedly uses the variance of the descendant points of a node. It might be tempting to add a `Variance()` method to the required `TreeType` API, but this quickly leads to code bloat (after all, the API already has quite enough functions as it is). Instead, it is better to create a `StatisticType` class which provides the `Variance()` method, and then call `Stat().Variance()` when the variance is required. This also holds true for cached data members.

Each node should have its own instance of a `StatisticType` class. The `StatisticType` must provide the following constructors:

```
// Default constructor required by the StatisticType policy.
StatisticType();

// This constructor is required by the StatisticType policy.
template<typename TreeType>
StatisticType(TreeType& node);
```

This constructor should be called with `(*this)` after the node is constructed (usually, this ends up being the last line in the constructor of a node).

The last template parameter is the `MatType` parameter. This is generally `arma::mat` or `arma::sp_mat`, but could be any Armadillo type, including matrices that hold data points of different precisions (such as `float` or even `int`). It generally suffices to write `MatType` assuming that `arma::mat` will be used, since the vast majority of the time this will be what is used.

32.5.2 Constructors and destructors

The `TreeType` API requires at least three constructors. Technically, it does not *require* a destructor, but almost certainly your tree class will be doing some memory management internally and should have one (though not always).

The first two constructors are variations of the same idea:

```
// This batch constructor does not modify the dataset, and builds the entire
// tree using a default-constructed MetricType.
ExampleTree(const MatType& data);

// This batch constructor does not modify the dataset, and builds the entire
// tree using the given MetricType.
ExampleTree(const MatType& data, MetricType& metric);
```

All that is required here is that a constructor is available that takes a dataset and optionally an instantiated metric. If no metric is provided, then it should be assumed that the `MetricType` class has a default constructor and a default-constructed metric should be used. The constructor *must* return a valid, fully-constructed, ready-to-use tree that satisfies the definition of *space tree* that was **given earlier** (p. 180).

It is possible to implement both these constructors as one by using `boost::optional`.

The third constructor requires the tree to be initializable from a `boost::serialization` (p. 251) archive:

```
// Initialize the tree from a given boost::serialization archive. SFINAE (the
// second argument) is necessary to ensure that the archive is loading, not
// saving.
template<typename Archive>
ExampleTree(
    Archive& ar,
    const typename boost::enable_if<typename Archive::is_loading>::type* = 0);
```

This has implications on how the tree must be stored. In this case, the dataset is *not yet loaded* and therefore the tree **may be required to have ownership of the data matrix**. This means that realistically the most reasonable way to represent the data matrix internally in a tree class is not with a reference but instead with a pointer. If this is true, then a destructor will be required:

```
// Release any resources held by the tree.
~ExampleTree();
```

and, if the data matrix is represented internally with a pointer, this destructor will need to release the memory for the data matrix (in the case that the tree was created via `boost::serialization` (p. 251)).

Note that these constructors are not necessarily the only constructors that a `TreeType` implementation can provide. One important example of when more constructors are useful is when the tree rearranges points internally; this might be desired for the sake of speed or memory optimization. But to do this with the required constructors would necessarily incur a copy of the data matrix, because the user will pass a `"const MatType&"`. One alternate solution is to provide a constructor which takes an rvalue reference to a `MatType`:

```
template<typename Archive>
ExampleTree(MatType&& data);
```

(and another overload that takes an instantiated metric), and then the user can use `std::move()` to build the tree without copying the data matrix, although the data matrix will be modified:

```
ExampleTree exTree(std::move(dataset));
```

It is, of course, possible to add even more constructors if desired.

32.5.3 Basic tree functionality

The basic functionality of a class implementing the `TreeType` API is quite straightforward and intuitive.

```
// Get the dataset that the tree is built on.
const MatType& Dataset();
```

This should return a `const` reference to the dataset the tree is built on. The fact that this function is required essentially means that each node in the tree must store a pointer to the dataset (this is not the only option, but it is the most obvious option).

```
// Get the metric that the tree is built with.
MetricType& Metric();
```

Each node must also store an instantiated metric or a pointer to one (note that this is required even for metrics that have no state and have a `static Evaluate()` function).

```
// Get/modify the StatisticType for this node.
StatisticType& Stat();
```

As discussed earlier, each node must hold a `StatisticType`; this is accessible through the `Stat()` function.

```
// Return the parent of the node, or NULL if this is the root.
ExampleTree* Parent();

// Return the number of children held by the node.
size_t NumChildren();
// Return the i'th child held by the node.
ExampleTree& Child(const size_t i);

// Return the number of points held in the node.
size_t NumPoints();
// Return the index of the i'th point held in the node.
size_t Point(const size_t i);

// Return the number of descendant nodes of this node.
size_t NumDescendantNodes();
// Return the i'th descendant node of this node.
ExampleTree& DescendantNode(const size_t i);

// Return the number of descendant points of this node.
size_t NumDescendants();
// Return the index of the i'th descendant point of this node.
size_t Descendant(const size_t i);
```

These functions are all fairly self-explanatory. Most algorithms will use the `Parent()`, `Children()`, `NumChildren()`, `Point()`, and `NumPoints()` functions, so care should be taken when implementing those functions to ensure they will be efficient. Note that `Point()` and `Descendant()` should return indices of points, so the actual points can be accessed by calling `"Dataset().col(Point(i))"` for some index `i` (or something similar).

An important note about the `Descendant()` function is that each descendant point should be unique. So if a node holds the point with index 6 and it has one child that holds the points with indices 6 and 7, then `NumDescendants()` should return 2, not 3. The ordering in which the descendants are returned can be arbitrary; so, `Descendant(0)` can return 6 or 7, and `Descendant(1)` should return the other index.

```
// Store the center of the bounding region of the node in the given vector.
void Center(arma::vec& center);
```

The last function, **Center()** (p. 410), should calculate the center of the bounding shape and store it in the given vector. So, for instance, if the tree is a ball tree, then the center is simply the center of the ball. Algorithm writers would be wise to try and avoid the use of **Center()** (p. 410) if possible, since it will necessarily cost a copy of a vector.

32.5.4 Complex tree functionality and bounds

A node in a tree should also be able to calculate various distance-related bounds; these are particularly useful in tree-based algorithms. Note that any of these bounds does not necessarily need to be maximally tight; generally it is more important that each bound can be easily calculated.

Details on each bounding function that the `TreeType` API requires are given below.

```
// Return the distance between the center of this node and the center of
// its parent.
double ParentDistance();
```

Remember that each node corresponds to some region in the space that the dataset lies in. For most tree types this shape is often something geometrically simple: a ball, a cone, a hyperrectangle, a slice, or something similar. The `ParentDistance()` function should return the distance between the center of this node's region and the center of the parent node's region.

In practice this bound is often used in dual-tree (or single-tree) algorithms to place an easy `MinDistance()` (or `MaxDistance()`) bound for a child node; the parent's `MinDistance()` (or `MaxDistance()`) function is called and then adjusted with `ParentDistance()` to provide a possibly loose but efficient bound on what the result of `MinDistance()` (or `MaxDistance()`) would be with the child.

```
// Return an upper bound on the furthest possible distance between the
// center of the node and any point held in the node.
double FurthestPointDistance();

// Return an upper bound on the furthest possible distance between the
// center of the node and any descendant point of the node.
double FurthestDescendantDistance();
```

It is often very useful to be able to bound the radius of a node, which is effectively what `FurthestDescendantDistance()` does. Often it is easiest to simply calculate and cache the furthest descendant distance at tree construction time. Some trees, such as the cover tree, are able to give guarantees that the points held in the node will necessarily be closer than the descendant points; therefore, the `FurthestPointDistance()` function is also useful.

It is permissible to simply have `FurthestPointDistance()` return the result of `FurthestDescendantDistance()`, and that will still be a valid bound, but depending on the type of tree it may be possible to have `FurthestPointDistance()` return a tighter bound.

```
// Return a lower bound on the minimum distance between the center and any
// edge of the node's bounding shape.
double MinimumBoundDistance();
```

This is, admittedly, a somewhat complex and weird quantity. It is one of the less important bounding functions, so it is valid to simply return 0...

The bound is a bound on the minimum distance between the center of the node and any edge of the shape that bounds all of the descendants of the node. So, if the bounding shape is a ball (as in a ball tree or a cover tree), then `MinimumBoundDistance()` should just return the radius of the ball. If the bounding shape is a hypercube (as in a generalized octree), then `MinimumBoundDistance()` should return the side length divided by two. If the bounding shape is a hyperrectangle (as in a kd-tree or a spill tree), then `MinimumBoundDistance()` should return half the side length of the hyperrectangle's smallest side.

```

// Return a lower bound on the minimum distance between the given point and
// the node.
template<typename VecType>
double MinDistance(VecType& point);

// Return a lower bound on the minimum distance between the given node and
// this node.
double MinDistance(ExampleTree& otherNode);

// Return an upper bound on the maximum distance between the given point and
// the node.
template<typename VecType>
double MaxDistance(VecType& point);

// Return an upper bound on the maximum distance between the given node and
// this node.
double MaxDistance(ExampleTree& otherNode);

// Return the combined results of MinDistance() and MaxDistance().
template<typename VecType>
math::Range RangeDistance(VecType& point);

// Return the combined results of MinDistance() and MaxDistance().
math::Range RangeDistance(ExampleTree& otherNode);

```

These six functions are almost without a doubt the most important functionality of a tree. Therefore, it is preferable that these methods be implemented as efficiently as possible, as they may potentially be called many millions of times in a tree-based algorithm. It is also preferable that these bounds be as tight as possible. In tree-based algorithms, these are used for pruning away work, and tighter bounds mean that more pruning is possible.

Of these six functions, there are only really two bounds that are desired here: the *minimum distance* between a node and an object, and the *maximum distance* between a node and an object. The object may be either a vector (usually `arma::vec`) or another tree node.

Consider the first case, where the object is a vector. The result of `MinDistance()` needs to be less than or equal to the true minimum distance, which could be calculated as below:

```

// We assume that we have a vector 'vec', and a tree node 'node'.
double trueMinDist = DBL_MAX;
for (size_t i = 0; i < node.NumDescendants(); ++i)
{
    const double dist = node.Metric().Evaluate(vec,
        node.Dataset().col(node.Descendant(i)));
    if (dist < trueMinDist)
        trueMinDist = dist;
}
// At the end of the loop, trueMinDist will hold the true minimum distance
// between 'vec' and any descendant point of 'node'.

```

Often the bounding shape of a node will allow a quick calculation that will make a reasonable bound. For instance, if the node's bounding shape is a ball with radius r and center ctr , the calculation is simply `"(node.Metric().Evaluate(vec, ctr) - r)".` Usually a good `MinDistance()` or `MaxDistance()` function will make only one call to the `Evaluate()` function of the metric.

The `RangeDistance()` function allows a way for both bounds to be calculated at once. It is possible to implement this as a call to `MinDistance()` followed by a call to `MaxDistance()`, but this may incur more metric `Evaluate()` calls than necessary. Often calculating both bounds at once can be more efficient and can be done with fewer `Evaluate()` calls than calling both `MinDistance()` and `MaxDistance()`.

32.5.5 Serialization

The last two public functions that the `TreeType` API requires are related to serialization and printing.

```
// Return a string representation of the tree.
std::string ToString() const;
```

There are few restrictions on the precise way that the `ToString()` function should operate, but generally it should behave similarly to the `ToString()` function in other mlpack methods. Generally, a user will call `ToString()` when they want to inspect the object and see what it looks like. For a tree, printing the entire tree may be way more information than the user was expecting, so it may be a better option to print either only the node itself or the node plus one or two levels of children.

```
// Serialize the tree (load from the given archive / save to the given
// archive, depending on its type).
template<typename Archive>
void Serialize(Archive& ar, const unsigned int version);

protected:
// A default constructor; only meant to be used by boost::serialization. This
// must be protected so that boost::serialization will work; it does not need
// to return a valid tree.
ExampleTree();

// Friend access must be given for the default constructor.
friend class boost::serialization::access;
```

On the other hand, the specifics of the functionality required for the `Serialize()` function are somewhat more difficult. The `Serialize()` function will be called either when a tree is being saved to disk or loaded from disk. The **boost::serialization** (p.251) documentation is fairly comprehensive, but when writing a `Serialize()` method for mlpack trees you should use `data::CreateNVP()` instead of `BOOST_SERIALIZATION_NVP()`. This is because mlpack classes implement `Serialize()` instead of `serialize()` in order to conform to the mlpack style guidelines, and making this work requires some interesting shim code, which is hidden inside of `data::CreateNVP()`. It may be useful to look at other `Serialize()` methods contained in other mlpack classes as an example.

An important note is that it is very difficult to use references with **boost::serialization** (p.251), because `Serialize()` may be called at any time during the object's lifetime, and references cannot be re-seated. In general this will require the use of pointers, which then require manual memory management. Therefore, be careful that `Serialize()` (and the tree's destructor) properly handle memory management!

32.6 The TreeTraits trait class

Some tree-based algorithms can specialize if the tree fulfills certain conditions. For instance, if the regions represented by two sibling nodes cannot overlap, an algorithm may be able to perform a simpler computation. Based on this reasoning, the `TreeTraits` trait class (much like the **mlpack::kernel::KernelTraits** (p.1433) class) exists in order to allow a tree to specify (via a `const static bool`) when these types of conditions are satisfied. **Note that a `TreeTraits` class is not required**, but may be helpful.

The `TreeTraits` trait class is a template class that takes a `TreeType` as a parameter, and exposes `const static bool` values that depend on the tree. Setting these values is achieved by specialization. The code below shows the default `TreeTraits` values (these are the values that will be used if no specialization is provided for a given `TreeType`).

```
template<typename TreeType>
class TreeTraits
{
public:
    // This is true if the subspaces represented by the children of a node can
    // overlap.
    static const bool HasOverlappingChildren = true;

    // This is true if Point(0) is the centroid of the node.
    static const bool FirstPointIsCentroid = false;

    // This is true if the points contained in the first child of a node
    // (Child(0)) are also contained in that node.
    static const bool HasSelfChildren = false;

    // This is true if the tree rearranges points in the dataset when it is built.
    static const bool RearrangesDataset = false;

    // This is true if the tree always has only two children.
    static const bool BinaryTree = false;
};
```

An example specialization for the `mlpack::tree::KDTree` (p. 453) class is given below. Note that `mlpack::tree::KDTree` (p. 453) is itself a template class (like every class satisfying the `TreeType` policy), so we are specializing to a template parameter.

```
template<typename MetricType,
        typename StatisticType,
        typename MatType>
template<>
class TreeTraits<KDTree<MetricType, StatisticType, MatType>>
{
public:
    // The regions represented by the two children of a node may not overlap.
    static const bool HasOverlappingChildren = false;

    // There is no guarantee that the first point of a node is the centroid.
    static const bool FirstPointIsCentroid = false;

    // Points are not contained at multiple levels (only at the leaves).
    static const bool HasSelfChildren = false;

    // Points are rearranged during the building of the tree.
    static const bool RearrangesDataset = true;

    // The tree is always binary.
    static const bool BinaryTree = true;
};
```

Currently, the traits available are each of the five detailed above. For more information, see the `mlpack::tree::TreeTraits` (p. 2302) documentation.

32.7 A list of trees in mlpack and more information

mlpack contains several ready-to-use implementations of trees that satisfy the `TreeType` policy API:

- `mlpack::tree::KDTree` (p. 453)
- `mlpack::tree::MeanSplitKDTree` (p. 455)
- `mlpack::tree::BallTree` (p. 451)
- `mlpack::tree::MeanSplitBallTree` (p. 455)

- **mlpack::tree::RTree** (p. 459)
- **mlpack::tree::RStarTree** (p. 459)
- **mlpack::tree::StandardCoverTree** (p. 460)

Often, these are template typedefs of more flexible tree classes:

- **mlpack::tree::BinarySpaceTree** (p. 1998) – binary trees, such as the KD-tree and ball tree
- **mlpack::tree::RectangleTree** (p. 2207) – the R tree and variants
- **mlpack::tree::CoverTree** (p. 2040) – the cover tree and variants

Member PARAM_ROW_IN (p. 2720) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member PARAM_ROW_OUT (p. 2721) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the

`PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member **PARAM_STRING_IN** (p. 2721) (ID, DESC, ALIAS, DEF)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member **PARAM_STRING_IN_REQ** (p. 2722) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member **PARAM_STRING_OUT** (p. 2723) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member **PARAM_TMATRIX_IN** (p. 2723) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member **PARAM_TMATRIX_IN_REQ** (p. 2724) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member **PARAM_TMATRIX_OUT** (p. 2725) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member **PARAM_UCOL_IN** (p. 2726) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member **PARAM_UCOL_OUT** (p. 2726) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member **PARAM_UMATRIX_IN** (p. 2727) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member PARAM_UMATRIX_IN_REQ (p. 2728) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member PARAM_UMATRIX_OUT (p. 2729) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member PARAM_UROW_IN (p. 2730) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member PARAM_UROW_OUT (p. 2731) (ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member PARAM_VECTOR_IN (p. 2731) (T, ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member PARAM_VECTOR_IN_REQ (p. 2732) (T, ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member PARAM_VECTOR_OUT (p. 2733) (T, ID, DESC, ALIAS)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Member TUPLE_TYPE (p. 2735)

The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Chapter 34

Namespace Index

34.1 Namespace List

Here is a list of all namespaces with brief descriptions:

boost	
Set the serialization version of the adaboost class	251
boost::serialization	251
ens	252
mlpack	
.hpp	252
mlpack::adaboost	257
mlpack::amf	
Alternating Matrix Factorization	257
mlpack::ann	
Artificial Neural Network	262
mlpack::ann::augmented	274
mlpack::ann::augmented::scorers	274
mlpack::ann::augmented::tasks	276
mlpack::bindings	276
mlpack::bindings::cli	276
mlpack::bindings::markdown	311
mlpack::bindings::python	324
mlpack::bindings::tests	357
mlpack::bound	364
mlpack::bound::addr	365
mlpack::bound::meta	
Metaprogramming utilities	368
mlpack::cf	
Collaborative filtering	368
mlpack::cv	371
mlpack::data	
Functions to load and save matrices and models	373
mlpack::dbscan	390
mlpack::decision_stump	390
mlpack::det	
Density Estimation Trees	390

mlpack::distribution	
Probability distributions	392
mlpack::emst	
Euclidean Minimum Spanning Trees	393
mlpack::fastmks	
Fast max-kernel search	394
mlpack::gmm	
Gaussian Mixture Models	394
mlpack::hmm	
Hidden Markov Models	395
mlpack::hpt	397
mlpack::kde	
Kernel Density Estimation	399
mlpack::kernel	
Kernel functions	401
mlpack::kmeans	
K-Means clustering	402
mlpack::kpca	405
mlpack::lcc	406
mlpack::lmnn	
Large Margin Nearest Neighbor	406
mlpack::math	
Miscellaneous math routines	406
mlpack::matrix_completion	426
mlpack::meanshift	
Mean shift clustering	426
mlpack::metric	426
mlpack::naive_bayes	
The Naive Bayes Classifier	428
mlpack::nca	
Neighborhood Components Analysis	428
mlpack::neighbor	429
mlpack::nn	435
mlpack::pca	437
mlpack::perceptron	438
mlpack::radical	438
mlpack::range	
Range-search routines	439
mlpack::regression	
Regression methods	440
mlpack::rl	440
mlpack::sfinae	443
mlpack::sparse_coding	443
mlpack::svd	444
mlpack::svm	444
mlpack::tree	
Trees and tree-building procedures	444
mlpack::tree::enumerate	464
mlpack::tree::split	465
mlpack::util	466
std	476

Chapter 35

Hierarchical Index

35.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

AdaBoost< mlpack::decision_stump::DecisionStump<> >	488
AdaBoost< mlpack::perceptron::Perceptron<> >	488
version< mlpack::adaboost::AdaBoost< WeakLearnerType, MatType > >	477
version< mlpack::ann::BRNN< OutputLayerType, MergeLayerType, MergeOutputType, InitializationRuleType, CustomLayer... > >	478
version< mlpack::ann::FFN< OutputLayerType, InitializationRuleType, CustomLayer... > >	478
version< mlpack::ann::RNN< OutputLayerType, InitializationRuleType, CustomLayer... > >	479

Chapter 36

Class Index

36.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

version< mlpack::adaboost::AdaBoost< WeakLearnerType, MatType > >	477
version< mlpack::ann::BRNN< OutputLayerType, MergeLayerType, MergeOutputType, InitializationRuleType, CustomLayer... > >	478
version< mlpack::ann::FFN< OutputLayerType, InitializationRuleType, CustomLayer... > >	478
version< mlpack::ann::RNN< OutputLayerType, InitializationRuleType, CustomLayer... > >	479
InitHMMModel	480
IsVector< VecType > If value == true, then VecType is some sort of Armadillo vector or subview	482
IsVector< arma::Col< eT > >	483
IsVector< arma::Row< eT > >	484
IsVector< arma::SpCol< eT > >	485
IsVector< arma::SpRow< eT > >	485
IsVector< arma::SpSubview< eT > >	486
IsVector< arma::subview_col< eT > >	487
IsVector< arma::subview_row< eT > >	487
AdaBoost< WeakLearnerType, MatType > The AdaBoost (p. 488) class	488
AdaBoostModel The model to save to disk	494
AMF< TerminationPolicyType, InitializationRuleType, UpdateRuleType > This class implements AMF (p. 499) (alternating matrix factorization) on the given matrix V	499
AverageInitialization This initialization rule initializes matrix W and H to root of the average of V, perturbed with uniform noise	502
CompleteIncrementalTermination< TerminationPolicy > This class acts as a wrapper for basic termination policies to be used by SVDCompleteIncrementalLearning (p. 542)	504
GivenInitialization This initialization rule for AMF (p. 499) simply fills the W and H matrices with the matrices given to the constructor of this object	508

IncompleteIncrementalTermination < TerminationPolicy >	
This class acts as a wrapper for basic termination policies to be used by SVDIncompleteIncrementalLearning (p. 547)	510
MaxIterationTermination	
This termination policy only terminates when the maximum number of iterations has been reached	513
NMFALSUpdate	
This class implements a method titled 'Alternating Least Squares' described in the following paper:	516
NMFMultiplicativeDistanceUpdate	
The multiplicative distance update rules for matrices W and H	519
NMFMultiplicativeDivergenceUpdate	
This follows a method described in the paper 'Algorithms for Non-negative	523
RandomAcolInitialization < columnsToAverage >	
This class initializes the W matrix of the AMF (p. 499) algorithm by averaging p randomly chosen columns of V	526
RandomInitialization	
This initialization rule for AMF (p. 499) simply fills the W and H matrices with uniform random noise in [0, 1]	528
SimpleResidueTermination	
This class implements a simple residue-based termination policy	529
SimpleToleranceTermination < MatType >	
This class implements residue tolerance termination policy	535
SVDBatchLearning	
This class implements SVD batch learning with momentum	539
SVDCompleteIncrementalLearning < MatType >	
This class computes SVD using complete incremental batch learning, as described in the following paper:	542
SVDCompleteIncrementalLearning < arma::sp_mat >	
TODO : Merge this template specialized function for sparse matrix using common row_col_iterator	544
SVDIncompleteIncrementalLearning	
This class computes SVD using incomplete incremental batch learning, as described in the following paper:	547
ValidationRMSETermination < MatType >	
This class implements validation termination policy based on RMSE index	549
Add < InputDataType , OutputDataType >	
Implementation of the Add (p. 553) module class	553
AddMerge < InputDataType , OutputDataType , CustomLayers >	
Implementation of the AddMerge (p. 558) module class	558
AddVisitor < CustomLayers >	
AddVisitor (p. 565) exposes the Add() method of the given module	565
AlphaDropout < InputDataType , OutputDataType >	
The alpha - dropout layer is a regularizer that randomly with probability 'ratio' sets input values to alphaDash	567
AtrousConvolution < ForwardConvolutionRule , BackwardConvolutionRule , GradientConvolutionRule , InputDataType , OutputDataType >	
Implementation of the Atrous Convolution (p. 643) class	572
AddTask	
Generator of instances of the binary addition task	580
CopyTask	
Generator of instances of the binary sequence copy task	582
SortTask	
Generator of instances of the sequence sort task	584
BackwardVisitor	
BackwardVisitor (p. 587) executes the Backward() function given the input, error and delta parameter	587

BaseLayer < ActivationFunction , InputDataType , OutputDataType > Implementation of the base layer	588
BatchNorm < InputDataType , OutputDataType > Declaration of the Batch Normalization layer class	592
BernoulliDistribution < DataType > Multiple independent Bernoulli distributions	599
BilinearInterpolation < InputDataType , OutputDataType > Definition and Implementation of the Bilinear Interpolation Layer	605
BinaryRBM For more information, see the following paper:	609
BRNN < OutputLayerType , MergeLayerType , MergeOutputType , InitializationRuleType , CustomLayers > Implementation of a standard bidirectional recurrent neural network container	610
Concat < InputDataType , OutputDataType , CustomLayers > Implementation of the Concat (p. 621) class	621
Concatenate < InputDataType , OutputDataType > Implementation of the Concatenate (p. 630) module class	630
ConcatPerformance < OutputLayerType , InputDataType , OutputDataType > Implementation of the concat performance class	634
Constant < InputDataType , OutputDataType > Implementation of the constant layer	638
ConstInitialization This class is used to initialize weight matrix with constant values	641
Convolution < ForwardConvolutionRule , BackwardConvolutionRule , GradientConvolutionRule , InputDataType , OutputDataType > Implementation of the Convolution (p. 643) class	643
CopyVisitor < CustomLayers > This visitor is to support copy constructor for neural network module	651
CReLU < InputDataType , OutputDataType > A concatenated ReLU has two outputs, one ReLU and one negative ReLU, concatenated together	652
CrossEntropyError < InputDataType , OutputDataType > The cross-entropy performance function measures the network's performance according to the cross-entropy between the input and target distributions	656
DeleteVisitor DeleteVisitor (p. 659) executes the destructor of the instantiated object	659
DeltaVisitor DeltaVisitor (p. 660) exposes the delta parameter of the given module	660
DeterministicSetVisitor DeterministicSetVisitor (p. 661) set the deterministic parameter given the deterministic value	661
DiceLoss < InputDataType , OutputDataType > The dice loss performance function measures the network's performance according to the dice coefficient between the input and target distributions	662
DropConnect < InputDataType , OutputDataType > The DropConnect (p. 666) layer is a regularizer that randomly with probability ratio sets the connection values to zero and scales the remaining elements by factor 1 / (1 - ratio)	666
Dropout < InputDataType , OutputDataType > The dropout layer is a regularizer that randomly with probability 'ratio' sets input values to zero and scales the remaining elements by factor 1 / (1 - ratio) rather than during test time so as to keep the expected sum same	673
EarthMoverDistance < InputDataType , OutputDataType > The earth mover distance function measures the network's performance according to the Kantorovich-Rubinstein duality approximation	677
ELU < InputDataType , OutputDataType > The ELU (p. 680) activation function, defined by	680

FastLSTM < InputDataType , OutputDataType >	
An implementation of a faster version of the Fast LSTM (p. 801) network layer	685
FFN < OutputLayerType , InitializationRuleType , CustomLayers >	
Implementation of a standard feed forward network	692
FFTConvolution < BorderMode , padLastDim >	
Computes the two-dimensional convolution through fft	705
FlexibleReLU < InputDataType , OutputDataType >	
The FlexibleReLU (p. 707) activation function, defined by	707
ForwardVisitor	
ForwardVisitor (p. 713) executes the Forward() function given the input and output parameter	713
FullConvolution	714
GaussianInitialization	
This class is used to initialize weight matrix with a gaussian	715
Glimpse < InputDataType , OutputDataType >	
The glimpse layer returns a retina-like representation (down-scaled cropped images) of increasing scale around a given location in a given image	717
GlorotInitializationType < Uniform >	
This class is used to initialize the weight matrix with the Glorot Initialization method	723
GradientSetVisitor	
GradientSetVisitor (p. 725) update the gradient parameter given the gradient set	725
GradientUpdateVisitor	
GradientUpdateVisitor (p. 727) update the gradient parameter given the gradient set	727
GradientVisitor	
SearchModeVisitor executes the Gradient() method of the given module using the input and delta parameter	728
GradientZeroVisitor	730
GRU < InputDataType , OutputDataType >	
An implementation of a gru network layer	731
HardSigmoidFunction	
The hard sigmoid function, defined by	737
HardTanH < InputDataType , OutputDataType >	
The Hard Tanh activation function, defined by	740
HeInitialization	
This class is used to initialize weight matrix with the He initialization rule given by He et	744
IdentityFunction	
The identity function, defined by	746
InitTraits < InitRuleType >	
This is a template class that can provide information about various initialization methods	750
InitTraits < KathirvalavakumarSubavathiInitialization >	
Initialization traits of the kathirvalavakumar subavath initialization rule	751
InitTraits < NguyenWidrowInitialization >	
Initialization traits of the Nguyen-Widrow initialization rule	752
Join < InputDataType , OutputDataType >	
Implementation of the Join (p. 753) module class	753
KathirvalavakumarSubavathiInitialization	
This class is used to initialize the weight matrix with the method proposed by T	756
KLDivergence < InputDataType , OutputDataType >	
The Kullback–Leibler divergence is often used for continuous distributions (direct regression)	759
LayerNorm < InputDataType , OutputDataType >	
Declaration of the Layer Normalization class	762
LayerTraits < LayerType >	
This is a template class that can provide information about various layers	769
LeakyReLU < InputDataType , OutputDataType >	
The LeakyReLU (p. 771) activation function, defined by	771

LecunNormalInitialization	
This class is used to initialize weight matrix with the Lecun Normalization initialization rule	774
Linear< InputDataType, OutputDataType >	
Implementation of the Linear (p. 776) layer class	776
LinearNoBias< InputDataType, OutputDataType >	
Implementation of the LinearNoBias (p. 782) class	782
LoadOutputParameterVisitor	
LoadOutputParameterVisitor (p. 788) restores the output parameter using the given parameter set	788
LogisticFunction	
The logistic function, defined by	789
LogSoftMax< InputDataType, OutputDataType >	
Implementation of the log softmax layer	792
Lookup< InputDataType, OutputDataType >	
Implementation of the Lookup (p. 795) class	795
LossVisitor	
LossVisitor (p. 800) exposes the Loss() method of the given module	800
LSTM< InputDataType, OutputDataType >	
Implementation of the LSTM (p. 801) module class	801
MaxPooling< InputDataType, OutputDataType >	
Implementation of the MaxPooling (p. 808) layer	808
MaxPoolingRule	814
MeanPooling< InputDataType, OutputDataType >	
Implementation of the MeanPooling (p. 814)	814
MeanPoolingRule	822
MeanSquaredError< InputDataType, OutputDataType >	
The mean squared error performance function measures the network's performance according to the mean of squared errors	823
MultiplyConstant< InputDataType, OutputDataType >	
Implementation of the multiply constant layer	825
MultiplyMerge< InputDataType, OutputDataType, CustomLayers >	
Implementation of the MultiplyMerge (p. 829) module class	829
NaiveConvolution< BorderMode >	
Computes the two-dimensional convolution	834
NegativeLogLikelihood< InputDataType, OutputDataType >	
Implementation of the negative log likelihood layer	837
NetworkInitialization< InitializationRuleType, CustomLayers >	
This class is used to initialize the network with the given initialization rule	841
NguyenWidrowInitialization	
This class is used to initialize the weight matrix with the Nguyen-Widrow method	842
OivsInitialization< ActivationFunction >	
This class is used to initialize the weight matrix with the oivs method	844
OrthogonalInitialization	
This class is used to initialize the weight matrix with the orthogonal matrix initialization	848
OutputHeightVisitor	
OutputHeightVisitor (p. 850) exposes the OutputHeight() method of the given module	850
OutputParameterVisitor	
OutputParameterVisitor (p. 851) exposes the output parameter of the given module	851
OutputWidthVisitor	
OutputWidthVisitor (p. 852) exposes the OutputWidth() method of the given module	852
ParametersSetVisitor	
ParametersSetVisitor (p. 853) update the parameters set using the given matrix	853
ParametersVisitor	
ParametersVisitor (p. 854) exposes the parameters set of the given module and stores the parameters set into the given matrix	854

PReLU < InputDataType , OutputDataType >	
The PReLU (p. 855) activation function, defined by (where alpha is trainable)	855
RandomInitialization	
This class is used to initialize randomly the weight matrix	861
RBM < InitializationRuleType , DataType , PolicyType >	
The implementation of the RBM (p. 864) module	864
ReconstructionLoss < InputDataType , OutputDataType , DistType >	
The reconstruction loss performance function measures the network's performance equal to the negative log probability of the target with the input distribution	880
RectifierFunction	
The rectifier function, defined by	883
Recurrent < InputDataType , OutputDataType , CustomLayers >	
Implementation of the RecurrentLayer class	886
RecurrentAttention < InputDataType , OutputDataType >	
This class implements the Recurrent (p. 886) Model for Visual Attention, using a variety of possible layer implementations	892
ReinforceNormal < InputDataType , OutputDataType >	
Implementation of the reinforce normal layer	898
Reparametrization < InputDataType , OutputDataType >	
Implementation of the Reparametrization (p. 903) layer class	903
ResetCellVisitor	
ResetCellVisitor (p. 907) executes the ResetCell() function	907
ResetVisitor	
ResetVisitor (p. 909) executes the Reset() function	909
RewardSetVisitor	
RewardSetVisitor (p. 910) set the reward parameter given the reward value	910
RNN < OutputLayerType , InitializationRuleType , CustomLayers >	
Implementation of a standard recurrent neural network container	911
RunSetVisitor	
RunSetVisitor (p. 921) set the run parameter given the run value	921
SaveOutputParameterVisitor	
SaveOutputParameterVisitor (p. 923) saves the output parameter into the given parameter set	923
Select < InputDataType , OutputDataType >	
The select module selects the specified column from a given input matrix	924
Sequential < InputDataType , OutputDataType , Residual , CustomLayers >	
Implementation of the Sequential (p. 927) class	927
SetInputHeightVisitor	
SetInputHeightVisitor (p. 934) updates the input height parameter with the given input height	934
SetInputWidthVisitor	
SetInputWidthVisitor (p. 935) updates the input width parameter with the given input width	935
SigmoidCrossEntropyError < InputDataType , OutputDataType >	
The SigmoidCrossEntropyError (p. 937) performance function measures the network's performance according to the cross-entropy function between the input and target distributions	937
SoftplusFunction	
The softplus function, defined by	940
SoftsignFunction	
The softsign function, defined by	943
SpikeSlabRBM	
For more information, see the following paper:	947
Subview < InputDataType , OutputDataType >	
Implementation of the subview layer	947
SVDConvolution < BorderMode >	
Computes the two-dimensional convolution using singular value decomposition	950

SwishFunction	
The swish function, defined by	953
TanhFunction	
The tanh function, defined by	955
TransposedConvolution < ForwardConvolutionRule , BackwardConvolutionRule , GradientConvolutionRule , InputDataType , OutputDataType >	
Implementation of the Transposed Convolution (p. 643) class	959
ValidConvolution	967
VRCClassReward < InputDataType , OutputDataType >	
Implementation of the variance reduced classification reinforcement layer	967
WeightSetVisitor	
WeightSetVisitor (p. 972) update the module parameters given the parameters set	972
WeightSizeVisitor	
WeightSizeVisitor (p. 973) returns the number of weights of the given module	973
Backtrace	
Provides a backtrace	974
CLIOption < N >	
A static object whose constructor registers a parameter with the CLI (p. 1117) class	975
ParameterType < T >	
Utility struct to return the type that boost::program_options should accept for a given input type	977
ParameterType < arma::Col < eT > >	
For vector types, boost::program_options will accept a std::string, not an arma::Col<eT> (since it is not clear how to specify a vector on the command-line)	978
ParameterType < arma::Mat < eT > >	
For matrix types, boost::program_options will accept a std::string, not an arma::mat (since it is not clear how to specify a matrix on the command-line)	978
ParameterType < arma::Row < eT > >	
For row vector types, boost::program_options will accept a std::string, not an arma::Row<eT> (since it is not clear how to specify a vector on the command-line)	979
ParameterType < std::tuple < mlpack::data::DatasetMapper < PolicyType , std::string >, arma::Mat < eT > > >	
For matrix+dataset info types, we should accept a std::string	980
ParameterTypeDeducer < HasSerialize , T >	981
ParameterTypeDeducer < true , T >	981
ProgramDoc	
A static object whose constructor registers program documentation with the CLI (p. 1117) class	982
BindingInfo	
Used by the Markdown documentation generator to store multiple ProgramDoc objects, indexed by both the binding name (i.e.	984
MDOption < T >	
The Markdown option class	985
ProgramDocWrapper	986
PyOption < T >	
The Python option class	987
ProgramDoc	
A static object whose constructor registers program documentation with the CLI (p. 1117) class	988
TestOption < N >	
A static object whose constructor registers a parameter with the CLI (p. 1117) class	990
BallBound < MetricType , VecType >	
Ball bound encloses a set of points at a specific distance (radius) from a specific point (center)	991
BoundTraits < BoundType >	
A class to obtain compile-time traits about BoundType classes	1002
BoundTraits < BallBound < MetricType , VecType > >	
A specialization of BoundTraits (p. 1002) for this bound type	1003

BoundTraits < CellBound < MetricType , ElemType > >	1003
BoundTraits < HollowBallBound < MetricType , ElemType > > A specialization of BoundTraits (p. 1002) for this bound type	1004
BoundTraits < HRectBound < MetricType , ElemType > >	1005
CellBound < MetricType , ElemType > The CellBound (p. 1006) class describes a bound that consists of a number of hyperrectangles	1006
HollowBallBound < TMetricType , ElemType > Hollow ball bound encloses a set of points at a specific distance (radius) from a specific point (center) except points at a specific distance from another point (the center of the hole)	1006
HRectBound < MetricType , ElemType > Hyper-rectangle bound for an L-metric	1018
IsLMetric < MetricType > Utility struct where Value is true if and only if the argument is of type LMetric	1028
IsLMetric < metric::LMetric < Power , TakeRoot > > Specialization for IsLMetric (p. 1028) when the argument is of type LMetric	1029
AverageInterpolation This class performs average interpolation to generate interpolation weights for neighborhood-based collaborative filtering	1030
BatchSVDPolicy Implementation of the Batch SVD policy to act as a wrapper when accessing Batch SVD from within CFTYPE (p. 1045)	1032
BiasSVDPolicy Implementation of the Bias SVD policy to act as a wrapper when accessing Bias SVD from within CFTYPE (p. 1045)	1035
CFModel The model to save to disk	1042
CFTYPE < DecompositionPolicy , NormalizationType > This class implements Collaborative Filtering (CF)	1045
CombinedNormalization < NormalizationTypes > This normalization class performs a sequence of normalization methods on raw ratings	1053
CosineSearch Nearest neighbor search with cosine distance	1056
DeleteVisitor DeleteVisitor (p. 1058) deletes the CFTYPE <> object which is pointed to by the variable cf in class CFModel (p. 1042)	1058
DummyClass This class acts as a dummy class for passing as template parameter	1059
GetValueVisitor GetValueVisitor (p. 1060) returns the pointer which points to the CFTYPE (p. 1045) object	1060
ItemMeanNormalization This normalization class performs item mean normalization on raw ratings	1061
LMetricSearch < TPower > Nearest neighbor search with L _p distance	1064
NMFPolicy Implementation of the NMF policy to act as a wrapper when accessing NMF from within CFTYPE (p. 1045)	1066
NoNormalization This normalization class doesn't perform any normalization	1070
OverallMeanNormalization This normalization class performs overall mean normalization on raw ratings	1072
PearsonSearch Nearest neighbor search with pearson distance (or furthest neighbor search with pearson correlation)	1075

PredictVisitor< NeighborSearchPolicy, InterpolationPolicy >	
PredictVisitor (p. 1077) uses the CFTYPE (p. 1045) object to make predictions on the given combinations of users and items	1077
RandomizedSVDPolicy	
Implementation of the Randomized SVD policy to act as a wrapper when accessing Randomized SVD from within CFTYPE (p. 1045)	1078
RecommendationVisitor< NeighborSearchPolicy, InterpolationPolicy >	
RecommendationVisitor (p. 1084) uses the CFTYPE (p. 1045) object to get recommendations for the given users	1084
RegressionInterpolation	
Implementation of regression-based interpolation method	1085
RegSVDPolicy	
Implementation of the Regularized SVD policy to act as a wrapper when accessing Regularized SVD from within CFTYPE (p. 1045)	1088
SimilarityInterpolation	
With SimilarityInterpolation (p. 1092), interpolation weights are based on similarities between query user and its neighbors	1092
SVDCompletePolicy	
Implementation of the SVD complete incremental policy to act as a wrapper when accessing SVD complete decomposition from within CFTYPE (p. 1045)	1094
SVDIncompletePolicy	
Implementation of the SVD incomplete incremental to act as a wrapper when accessing SVD incomplete incremental from within CFTYPE (p. 1045)	1098
SVDPlusPlusPolicy	
Implementation of the SVDPlusPlus policy to act as a wrapper when accessing SVDPlusPlus from within CFTYPE (p. 1045)	1102
SVDWrapper< Factorizer >	
This class acts as the wrapper for all SVD factorizers which are incompatible with CF module	1108
UserMeanNormalization	
This normalization class performs user mean normalization on raw ratings	1111
ZScoreNormalization	
This normalization class performs z-score normalization on raw ratings	1114
CLI	
Parses the command line for parameters and holds user-specified parameters	1117
Accuracy	
The Accuracy (p. 1127) is a metric of performance for classification algorithms that is equal to a proportion of correctly labeled test items among all ones for given test items	1127
CVBase< MLAlgorithm, MatType, PredictionsType, WeightsType >	
An auxiliary class for cross-validation	1129
F1< AS, PositiveClass >	
F1 (p. 1132) is a metric of performance for classification algorithms that for binary classification is equal to $2 * precision * recall / (precision + recall)$	1132
KFoldCV< MLAlgorithm, Metric, MatType, PredictionsType, WeightsType >	
The class KFoldCV (p. 1134) implements k-fold cross-validation for regression and classification algorithms	1134
MetaInfoExtractor< MLAlgorithm, MT, PT, WT >	
MetaInfoExtractor (p. 1140) is a tool for extracting meta information about a given machine learning algorithm	1140
MSE	
The MeanSquaredError is a metric of performance for regression algorithms that is equal to the mean squared error between predicted values and ground truth (correct) values for given test items	1143
NotFoundMethodForm	1144

Precision < AS, PositiveClass >	
Precision (p. 1145) is a metric of performance for classification algorithms that for binary classification is equal to $tp/(tp + fp)$, where tp and fp are the numbers of true positives and false positives respectively	1145
Recall < AS, PositiveClass >	
Recall (p. 1147) is a metric of performance for classification algorithms that for binary classification is equal to $tp/(tp + fn)$, where tp and fn are the numbers of true positives and false negatives respectively	1147
SelectMethodForm < MLAlgorithm, HMFs >	
A type function that selects a right method form	1148
SelectMethodForm < MLAlgorithm >	1149
SelectMethodForm < MLAlgorithm >::From< Forms >	1149
SelectMethodForm < MLAlgorithm, HasMethodForm, HMFs... >	1150
SelectMethodForm < MLAlgorithm, HasMethodForm, HMFs... >::From< Forms >	1151
SimpleCV < MLAlgorithm, Metric, MatType, PredictionsType, WeightsType >	
SimpleCV (p. 1151) splits data into two sets - training and validation sets - and then runs training on the training set and evaluates performance on the validation set	1151
TrainForm < MatType, PredictionsType, WeightsType, DatasetInfo, NumClasses >	
A wrapper struct for holding a Train form	1157
TrainForm < MT, PT, void, false, false >	1158
TrainForm < MT, PT, void, false, true >	1159
TrainForm < MT, PT, void, true, false >	1160
TrainForm < MT, PT, void, true, true >	1160
TrainForm < MT, PT, WT, false, false >	1161
TrainForm < MT, PT, WT, false, true >	1162
TrainForm < MT, PT, WT, true, false >	1162
TrainForm < MT, PT, WT, true, true >	1163
TrainFormBase4 < PT, WT, T1, T2 >	1164
TrainFormBase5 < PT, WT, T1, T2, T3 >	1165
TrainFormBase6 < PT, WT, T1, T2, T3, T4 >	1167
TrainFormBase7 < PT, WT, T1, T2, T3, T4, T5 >	1169
CustomImputation < T >	
A simple custom imputation class	1170
DatasetMapper < PolicyType, InputType >	
Auxiliary information for a dataset, including mappings to/from strings (or other types) and the datatype of each dimension	1172
HasSerialize < T >	1178
HasSerialize < T >::check< U, V, W >	1180
HasSerializeFunction < T >	1180
Imputer < T, MapperType, StrategyType >	
Given a dataset of a particular datatype, replace user-specified missing value with a variable dependent on the StrategyType and MapperType	1182
IncrementPolicy	
IncrementPolicy (p. 1184) is used as a helper class for DatasetMapper (p. 1172)	1184
ListwiseDeletion < T >	
A complete-case analysis to remove the values containing mappedValue	1187
LoadCSV	
Load the csv file. This class use boost::spirit to implement the parser, please refer to following link http://theboostcpplibaries.com/boost.spirit for quick review	1188
MeanImputation < T >	
A simple mean imputation class	1191
MedianImputation < T >	
This is a class implementation of simple median imputation	1192

MissingPolicy	
MissingPolicy (p. 1193) is used as a helper class for DatasetMapper (p. 1172)	1193
DBSCAN< RangeSearchType, PointSelectionPolicy >	
DBSCAN (p. 1197) (Density-Based Spatial Clustering of Applications with Noise) is a clustering technique described in the following paper:	1197
OrderedPointSelection	
This class can be used to sequentially select the next point to use for DBSCAN (p. 1197)	1200
RandomPointSelection	
This class can be used to randomly select the next point to use for DBSCAN (p. 1197)	1201
DecisionStump< MatType >	
This class implements a decision stump	1202
DTree< MatType, TagType >	
A density estimation tree is similar to both a decision tree and a space partitioning tree (like a kd-tree)	1207
PathCacher	
This class is responsible for caching the path to each node of the tree	1221
DiagonalGaussianDistribution	
A single multivariate Gaussian distribution with diagonal covariance	1226
DiscreteDistribution	
A discrete distribution where the only observations are discrete observations	1232
GammaDistribution	
This class represents the Gamma distribution	1238
GaussianDistribution	
A single multivariate Gaussian distribution	1246
LaplaceDistribution	
The multivariate Laplace distribution centered at 0 has pdf	1251
RegressionDistribution	
A class that represents a univariate conditionally Gaussian distribution	1257
DTBRules< MetricType, TreeType >	1264
DTBStat	
A statistic for use with mlpac trees, which stores the upper bound on distance to nearest neighbors and the component which this node belongs to	1269
DualTreeBoruvka< MetricType, MatType, TreeType >	
Performs the MST calculation using the Dual-Tree Boruvka algorithm, using any type of tree	1272
EdgePair	
An edge pair is simply two indices and a distance	1275
UnionFind	
A Union-Find data structure	1278
FastMKS< KernelType, MatType, TreeType >	
An implementation of fast exact max-kernel search	1280
FastMKSMModel	
A utility struct to contain all the possible FastMKS (p. 1280) models, for use by the mlpac_fastmks program	1291
FastMKSRules< KernelType, TreeType >	
The FastMKSRules (p. 1298) class is a template helper class used by FastMKS (p. 1280) class when performing exact max-kernel search	1298
FastMKStat	
The statistic used in trees with FastMKS (p. 1280)	1303
DiagonalConstraint	
Force a covariance matrix to be diagonal	1306
DiagonalGMM	
A Diagonal Gaussian Mixture Model	1308
EigenvalueRatioConstraint	
Given a vector of eigenvalue ratios, ensure that the covariance matrix always has those eigenvalue ratios	1317

EMFit < InitialClusteringType , CovarianceConstraintPolicy , Distribution >	
This class contains methods which can fit a GMM (p. 1323) to observations using the EM algorithm	1318
GMM	
A Gaussian Mixture Model (GMM (p. 1323))	1323
NoConstraint	
This class enforces no constraint on the covariance matrix	1332
PositiveDefiniteConstraint	
Given a covariance matrix, force the matrix to be positive definite	1334
HMM < Distribution >	
A class that represents a Hidden Markov Model with an arbitrary type of emission distribution	1335
HMMModel	
A serializable HMM (p. 1335) model that also stores the type	1350
HMMRegression	
A class that represents a Hidden Markov Model Regression (HMMR)	1354
CVFunction < CVType , MLAlgorithm , TotalArgs , BoundArgs >	
This wrapper serves for adapting the interface of the cross-validation classes to the one that can be utilized by the mlpack optimizers	1361
DeduceHyperParameterTypes < Args >	
A type function for deducing types of hyper-parameters from types of arguments in the Optimize method in HyperParameterTuner (p. 1375)	1365
DeduceHyperParameterTypes < Args >:: ResultHolder < HPTypes >	1366
DeduceHyperParameterTypes < PreFixedArg < T >, Args... >	
Defining DeduceHyperParameterTypes (p. 1365) for the case when not all argument types have been processed, and the next one is the type of an argument that should be fixed	1366
DeduceHyperParameterTypes < PreFixedArg < T >, Args... >:: ResultHolder < HPTypes >	1367
DeduceHyperParameterTypes < T , Args... >	
Defining DeduceHyperParameterTypes (p. 1365) for the case when not all argument types have been processed, and the next one (T) is a collection type or an arithmetic type	1368
DeduceHyperParameterTypes < T , Args... >:: IsCollectionType < Type >	
A type function to check whether Type is a collection type (for that it should define value_type)	1369
DeduceHyperParameterTypes < T , Args... >:: ResultHolder < HPTypes >	1371
DeduceHyperParameterTypes < T , Args... >:: ResultHPType < ArgumentType , IsArithmetic >	
A type function to deduce the result hyper-parameter type for ArgumentType	1372
DeduceHyperParameterTypes < T , Args... >:: ResultHPType < ArithmeticType , true >	1372
DeduceHyperParameterTypes < T , Args... >:: ResultHPType < CollectionType , false >	1373
FixedArg < T , I >	
A struct for storing information about a fixed argument	1373
HyperParameterTuner < MLAlgorithm , Metric , CV , OptimizerType , MatType , PredictionsType , WeightsType >	
The class HyperParameterTuner (p. 1375) for the given MLAlgorithm utilizes the provided Optimizer to find the values of hyper-parameters that optimize the value of the given Metric	1375
IsPreFixedArg < T >	
A type function for checking whether the given type is PreFixedArg (p. 1381)	1380
PreFixedArg < T >	
A struct for marking arguments as ones that should be fixed (it can be useful for the Optimize method of HyperParameterTuner (p. 1375))	1381
PreFixedArg < T & >	
The specialization of the template for references	1382
DeleteVisitor	1383
DualBiKDE	
DualBiKDE (p. 1384) computes a Kernel Density Estimation on the given KDEType	1384
DualMonoKDE	
DualMonoKDE (p. 1386) computes a Kernel Density Estimation on the given KDEType	1386

KDE < KernelType , MetricType , MatType , TreeType , DualTreeTraversalType , SingleTreeTraversalType >	
The KDE (p. 1387) class is a template class for performing Kernel Density Estimations	1387
KDEModel	1397
KDERules < MetricType , KernelType , TreeType >	
A dual-tree traversal Rules class for kernel density estimation	1404
KDEStat	
Extra data for each node in the tree for the task of kernel density estimation	1408
KernelNormalizer	
KernelNormalizer (p. 1410) holds a set of methods to normalize estimations applying in each case the appropriate kernel normalizer function	1410
ModeVisitor	
ModeVisitor (p. 1412) exposes the Mode() method of the KDEType	1412
TrainVisitor	
TrainVisitor (p. 1413) trains a given KDEType using a reference set	1413
CauchyKernel	
The Cauchy kernel	1414
CosineDistance	
The cosine distance (or cosine similarity)	1416
EpanechnikovKernel	
The Epanechnikov kernel, defined as	1417
ExampleKernel	
An example kernel function	1421
GaussianKernel	
The standard Gaussian kernel	1424
HyperbolicTangentKernel	
Hyperbolic tangent kernel	1430
KernelTraits < KernelType >	
This is a template class that can provide information about various kernels	1433
KernelTraits < CauchyKernel >	
Kernel traits for the Cauchy kernel	1434
KernelTraits < CosineDistance >	
Kernel traits for the cosine distance	1435
KernelTraits < EpanechnikovKernel >	
Kernel traits for the Epanechnikov kernel	1436
KernelTraits < GaussianKernel >	
Kernel traits for the Gaussian kernel	1437
KernelTraits < LaplacianKernel >	
Kernel traits of the Laplacian kernel	1438
KernelTraits < SphericalKernel >	
Kernel traits for the spherical kernel	1439
KernelTraits < TriangularKernel >	
Kernel traits for the triangular kernel	1440
KMeansSelection < ClusteringType , maxIterations >	
Implementation of the kmeans sampling scheme	1441
LaplacianKernel	
The standard Laplacian kernel	1442
LinearKernel	
The simple linear kernel (dot product)	1446
NystroemMethod < KernelType , PointSelectionPolicy >	
.	1448
OrderedSelection	1450
PolynomialKernel	
The simple polynomial kernel	1451

PSpectrumStringKernel	
The p-spectrum string kernel	1454
RandomSelection	1457
SphericalKernel	
The spherical kernel, which is 1 when the distance between the two argument points is less than or equal to the bandwidth, or 0 otherwise	1458
TriangularKernel	
The trivially simple triangular kernel, defined by	1461
AllowEmptyClusters	
Policy which allows K-Means to create empty clusters without any error being reported	1464
DualTreeKMeans< MetricType, MatType, TreeType >	
An algorithm for an exact Lloyd iteration which simply uses dual-tree nearest-neighbor search to find the nearest centroid for each point in the dataset	1466
DualTreeKMeansRules< MetricType, TreeType >	1469
DualTreeKMeansStatistic	1473
ElkanKMeans< MetricType, MatType >	1478
HamerlyKMeans< MetricType, MatType >	1479
KillEmptyClusters	
Policy which allows K-Means to "kill" empty clusters without any error being reported	1481
KMeans< MetricType, InitialPartitionPolicy, EmptyClusterPolicy, LloydStepType, MatType >	
This class implements K-Means clustering, using a variety of possible implementations of Lloyd's algorithm	1483
MaxVarianceNewCluster	
When an empty cluster is detected, this class takes the point furthest from the centroid of the cluster with maximum variance as a new cluster	1489
NaiveKMeans< MetricType, MatType >	
This is an implementation of a single iteration of Lloyd's algorithm for k-means	1491
PellegMooreKMeans< MetricType, MatType >	
An implementation of Pelleg-Moore's 'blacklist' algorithm for k-means clustering	1493
PellegMooreKMeansRules< MetricType, TreeType >	
The rules class for the single-tree Pelleg-Moore kd-tree traversal for k-means clustering	1495
PellegMooreKMeansStatistic	
A statistic for trees which holds the blacklist for Pelleg-Moore k-means clustering (which represents the clusters that cannot possibly own any points in a node)	1498
RandomPartition	
A very simple partitioner which partitions the data randomly into the number of desired clusters	1500
RefinedStart	
A refined approach for choosing initial points for k-means clustering	1502
SampleInitialization	1506
KernelPCA< KernelType, KernelRule >	
This class performs kernel principal components analysis (Kernel PCA), for a given kernel	1507
NaiveKernelRule< KernelType >	1511
NystroemKernelRule< KernelType, PointSelectionPolicy >	1512
LocalCoordinateCoding	
An implementation of Local Coordinate Coding (LCC) that codes data which approximately lives on a manifold using a variation of l1-norm regularized sparse coding; in LCC, the penalty on the absolute value of each point's coefficient for each atom is weighted by the squared distance of that point to that atom	1513
Constraints< MetricType >	
Interface for generating distance based constraints on a given dataset, provided corresponding true labels and a quantity parameter (k) are specified	1520
LMNN< MetricType, OptimizerType >	
An implementation of Large Margin nearest neighbor metric learning technique	1526

LMNNFunction < MetricType >	
The Large Margin Nearest Neighbors function	1531
Log	
Provides a convenient way to give formatted output	1538
ColumnsToBlocks	
Transform the columns of the given matrix into a block format	1541
RangeType < T >	
Simple real-valued range	1549
MatrixCompletion	
This class implements the popular nuclear norm minimization heuristic for matrix completion problems	1558
MeanShift < UseKernel , KernelType , MatType >	
This class implements mean shift clustering	1561
IPMetric < KernelType >	
The inner product metric, IPMetric (p. 1565), takes a given Mercer kernel (KernelType), and when Evaluate() (p. 1567) is called, returns the distance between the two points in kernel space:	1565
LMetric < TPower , TTakeRoot >	
The L _p metric for arbitrary integer p, with an option to take the root	1569
MahalanobisDistance < TakeRoot >	
The Mahalanobis distance, which is essentially a stretched Euclidean distance	1572
NaiveBayesClassifier < ModelMatType >	
The simple Naive Bayes classifier	1576
NCA < MetricType , OptimizerType >	
An implementation of Neighborhood Components Analysis, both a linear dimensionality reduction technique and a distance learning technique	1583
SoftmaxErrorFunction < MetricType >	
The "softmax" stochastic neighbor assignment probability function	1586
AlphaVisitor	
Exposes the Alpha() method of the given RAType	1590
BiSearchVisitor < SortPolicy >	
BiSearchVisitor (p. 1591) executes a bichromatic neighbor search on the given NSType	1591
DeleteVisitor	
DeleteVisitor (p. 1595) deletes the given NSType instance	1595
DrusillaSelect < MatType >	1597
EpsilonVisitor	
EpsilonVisitor (p. 1600) exposes the Epsilon method of the given NSType	1600
FirstLeafExactVisitor	
Exposes the FirstLeafExact() method of the given RAType	1601
FurthestNS	
This class implements the necessary methods for the SortPolicy template parameter of the NeighborSearch (p. 1627) class	1602
LSHSearch < SortPolicy >	
The LSHSearch (p. 1609) class; this class builds a hash on the reference set and uses this hash to compute the distance-approximate nearest-neighbors of the given queries	1609
MonoSearchVisitor	
MonoSearchVisitor (p. 1618) executes a monochromatic neighbor search on the given NSType	1618
NaiveVisitor	
NaiveVisitor (p. 1620) exposes the Naive() method of the given RAType	1620
NearestNS	
This class implements the necessary methods for the SortPolicy template parameter of the NeighborSearch (p. 1627) class	1621

NeighborSearch < SortPolicy , MetricType , MatType , TreeType , DualTreeTraversalType , SingleTreeTraversalType >	
The NeighborSearch (p. 1627) class is a template class for performing distance-based neighbor searches	1627
NeighborSearchRules < SortPolicy , MetricType , TreeType >	
The NeighborSearchRules (p. 1640) class is a template helper class used by NeighborSearch (p. 1627) class when performing distance-based neighbor searches	1640
NeighborSearchRules < SortPolicy , MetricType , TreeType >:: CandidateCmp	
Compare two candidates based on the distance	1652
NeighborSearchStat < SortPolicy >	
Extra data for each node in the tree	1653
NSModel < SortPolicy >	
The NSModel (p. 1657) class provides an easy way to serialize a model, abstracts away the different types of trees, and also reflects the NeighborSearch (p. 1627) API	1657
QDAFN < MatType >	1666
RAModel < SortPolicy >	
The RAModel (p. 1669) class provides an abstraction for the RASearch (p. 1681) class, abstracting away the TreeType parameter and allowing it to be specified at runtime in this class	1669
RAQueryStat < SortPolicy >	
Extra data for each node in the tree	1678
RASearch < SortPolicy , MetricType , MatType , TreeType >	
The RASearch (p. 1681) class: This class provides a generic manner to perform rank-approximate search via random-sampling	1681
RASearchRules < SortPolicy , MetricType , TreeType >	
The RASearchRules (p. 1692) class is a template helper class used by RASearch (p. 1681) class when performing rank-approximate search via random-sampling	1692
RAUtil	1699
ReferenceSetVisitor	
ReferenceSetVisitor (p. 1701) exposes the referenceSet of the given NSType	1701
SampleAtLeavesVisitor	
Exposes the SampleAtLeaves() method of the given RAType	1702
SearchModeVisitor	
SearchModeVisitor (p. 1703) exposes the SearchMode() method of the given NSType	1703
SingleModeVisitor	
Exposes the SingleMode() method of the given RAType	1704
SingleSampleLimitVisitor	
Exposes the SingleSampleLimit() method of the given RAType	1705
TauVisitor	
Exposes the Tau() method of the given RAType	1706
TrainVisitor < SortPolicy >	
TrainVisitor (p. 1707) sets the reference set to a new reference set on the given NSType	1707
SparseAutoencoder	
A sparse autoencoder is a neural network whose aim to learn compressed representations of the data, typically for dimensionality reduction, with a constraint on the activity of the neurons in the network	1711
SparseAutoencoderFunction	
This is a class for the sparse autoencoder objective function	1717
ExactSVDPolicy	
Implementation of the exact SVD policy	1722
PCA < DecompositionPolicy >	
This class implements principal components analysis (PCA (p. 1723))	1723
QUICSVDPolicy	
Implementation of the QUIC-SVD policy	1727

RandomizedBlockKrylovSVDPolicy	
Implementation of the randomized block krylov SVD policy	1730
RandomizedSVDPolicy	
Implementation of the randomized SVD policy	1732
Perceptron< LearnPolicy, WeightInitializationPolicy, MatType >	
This class implements a simple perceptron (i.e., a single layer neural network)	1735
RandomInitialization	
This class is used to initialize weights for the weightVectors matrix in a random manner	1740
SimpleWeightUpdate	1741
ZeroInitialization	
This class is used to initialize the matrix weightVectors to zero	1742
Radical	
An implementation of RADICAL, an algorithm for independent component analysis (ICA)	1744
BiSearchVisitor	
BiSearchVisitor (p. 1748) executes a bichromatic range search on the given RSType	1748
DeleteVisitor	
DeleteVisitor (p. 1751) deletes the given RSType instance	1751
MonoSearchVisitor	
MonoSearchVisitor (p. 1752) executes a monochromatic range search on the given RSType	1752
NaiveVisitor	
NaiveVisitor (p. 1753) exposes the Naive() method of the given RSType	1753
RangeSearch< MetricType, MatType, TreeType >	
The RangeSearch (p. 1754) class is a template class for performing range searches	1754
RangeSearchRules< MetricType, TreeType >	
The RangeSearchRules (p. 1764) class is a template helper class used by RangeSearch (p. 1754) class when performing range searches	1764
RangeSearchStat	
Statistic class for RangeSearch (p. 1754), to be set to the StatisticType of the tree type that range search is being performed with	1768
ReferenceSetVisitor	
ReferenceSetVisitor (p. 1771) exposes the referenceSet of the given RSType	1771
RSModel	1772
SingleModeVisitor	
SingleModeVisitor (p. 1779) exposes the SingleMode() method of the given RSType	1779
TrainVisitor	
TrainVisitor (p. 1780) sets the reference set to a new reference set on the given RSType	1780
LARS	
An implementation of LARS (p. 1783), a stage-wise homotopy-based algorithm for l1-regularized linear regression (LASSO) and l1+l2 regularized linear regression (Elastic Net)	1783
LinearRegression	
A simple linear regression algorithm using ordinary least squares	1789
LogisticRegression< MatType >	
The LogisticRegression (p. 1795) class implements an L2-regularized logistic regression model, and supports training with multiple optimizers and classification	1795
LogisticRegressionFunction< MatType >	
The log-likelihood function for the logistic regression objective function	1803
SoftmaxRegression	
Softmax Regression is a classifier which can be used for classification when the data available can take two or more class values	1811
SoftmaxRegressionFunction	1818
Acrobot	
Implementation of Acrobot (p. 1825) game	1825
Acrobot::State	1831
AggregatedPolicy< PolicyType >	1835

AsyncLearning < WorkerType , EnvironmentType , NetworkType , UpdaterType , PolicyType >	
Wrapper of various asynchronous learning algorithms, e.g	1837
CartPole	
Implementation of Cart Pole task	1842
CartPole::State	
Implementation of the state of Cart Pole	1846
ContinuousMountainCar	
Implementation of Continuous Mountain Car task	1850
ContinuousMountainCar::Action	
Implementation of action of Continuous Mountain Car	1854
ContinuousMountainCar::State	
Implementation of state of Continuous Mountain Car	1855
GreedyPolicy < EnvironmentType >	
Implementation for epsilon greedy policy	1858
MountainCar	
Implementation of Mountain Car task	1861
MountainCar::State	
Implementation of state of Mountain Car	1865
NStepQLearningWorker < EnvironmentType , NetworkType , UpdaterType , PolicyType >	
Forward declaration of NStepQLearningWorker (p. 1868)	1868
OneStepQLearningWorker < EnvironmentType , NetworkType , UpdaterType , PolicyType >	
Forward declaration of OneStepQLearningWorker (p. 1871)	1871
OneStepSarsaWorker < EnvironmentType , NetworkType , UpdaterType , PolicyType >	
Forward declaration of OneStepSarsaWorker (p. 1875)	1875
Pendulum	
Implementation of Pendulum (p. 1878) task	1878
Pendulum::Action	
Implementation of action of Pendulum (p. 1878)	1881
Pendulum::State	
Implementation of state of Pendulum (p. 1878)	1882
QLearning < EnvironmentType , NetworkType , UpdaterType , PolicyType , ReplayType >	
Implementation of various Q-Learning algorithms, such as DQN, double DQN	1885
RandomReplay < EnvironmentType >	
Implementation of random experience replay	1890
RewardClipping < EnvironmentType >	
Interface for clipping the reward to some value between the specified maximum and minimum value	
(Clipping here is implemented as $g_{clipped} = \max(g_{min}, \min(g_{min}, g))$.)	1894
TrainingConfig	1901
MethodFormDetector < Class , MethodForm , AdditionalArgsCount >	1907
MethodFormDetector < Class , MethodForm , 0 >	1907
MethodFormDetector < Class , MethodForm , 1 >	1908
MethodFormDetector < Class , MethodForm , 2 >	1908
MethodFormDetector < Class , MethodForm , 3 >	1909
MethodFormDetector < Class , MethodForm , 4 >	1910
MethodFormDetector < Class , MethodForm , 5 >	1910
MethodFormDetector < Class , MethodForm , 6 >	1911
MethodFormDetector < Class , MethodForm , 7 >	1912
SigCheck < U , U >	
Utility struct for checking signatures	1912
DataDependentRandomInitializer	
A data-dependent random dictionary initializer for SparseCoding (p. 1916)	1913
NothingInitializer	
A DictionaryInitializer for SparseCoding (p. 1916) which does not initialize anything; it is useful for when the dictionary is already known and will be set with SparseCoding::Dictionary() (p. 1920)	1914

RandomInitializer	
A DictionaryInitializer for use with the SparseCoding (p. 1916) class	1915
SparseCoding	
An implementation of Sparse Coding with Dictionary Learning that achieves sparsity via an l1-norm regularizer on the codes (LASSO) or an (l1+l2)-norm regularizer on the codes (the Elastic Net)	1916
BiasSVD< OptimizerType >	
Bias SVD is an improvement on Regularized SVD which is a matrix factorization techniques	1925
BiasSVDFunction< MatType >	
This class contains methods which are used to calculate the cost of BiasSVD (p. 1925)'s objective function, to calculate gradient of parameters with respect to the objective function, etc	1926
QUIC_SVD	
QUIC-SVD is a matrix factorization technique, which operates in a subspace such that A's approximation in that subspace has minimum error(A being the data matrix)	1932
RandomizedBlockKrylovSVD	
Randomized block krylov SVD is a matrix factorization that is based on randomized matrix approximation techniques, developed in in "Randomized Block Krylov Methods for Stronger and Faster Approximate Singular Value Decomposition"	1934
RandomizedSVD	
Randomized SVD is a matrix factorization that is based on randomized matrix approximation techniques, developed in in "Finding structure with randomness: Probabilistic algorithms for constructing approximate matrix decompositions"	1937
RegularizedSVD< OptimizerType >	
Regularized SVD is a matrix factorization technique that seeks to reduce the error on the training set, that is on the examples for which the ratings have been provided by the users	1943
RegularizedSVDFunction< MatType >	
The data is stored in a matrix of type MatType, so that this class can be used with both dense and sparse matrix types	1945
SVDPlusPlus< OptimizerType >	
SVD++ is a matrix decomposition technique used in collaborative filtering	1951
SVDPlusPlusFunction< MatType >	
This class contains methods which are used to calculate the cost of SVD++'s objective function, to calculate gradient of parameters with respect to the objective function, etc	1954
LinearSVM< MatType >	
The LinearSVM (p. 1959) class implements an L2-regularized support vector machine model, and supports training with multiple optimizers and classification	1959
LinearSVMFunction< MatType >	
The hinge loss function for the linear SVM objective function	1967
Timer	
The timer class provides a way for mpack methods to be timed	1975
Timers	1977
AllCategoricalSplit< FitnessFunction >	
The AllCategoricalSplit (p. 1981) is a splitting function that will split categorical features into many children: one child for each category	1981
AllCategoricalSplit< FitnessFunction >::AuxiliarySplitInfo< ElemType >	1984
AllDimensionSelect	
This dimension selection policy allows any dimension to be selected for splitting	1984
AxisParallelProjVector	
AxisParallelProjVector (p. 1986) defines an axis-parallel projection vector	1986
BestBinaryNumericSplit< FitnessFunction >	
The BestBinaryNumericSplit (p. 1989) is a splitting function for decision trees that will exhaustively search a numeric dimension for the best binary split	1989
BestBinaryNumericSplit< FitnessFunction >::AuxiliarySplitInfo< ElemType >	1991

BinaryNumericSplit < FitnessFunction , ObservationType >	
The BinaryNumericSplit (p. 1992) class implements the numeric feature splitting strategy devised by Gama, Rocha, and Medas in the following paper:	1992
BinaryNumericSplitInfo < ObservationType >	1996
BinarySpaceTree < MetricType , StatisticType , MatType , BoundType , SplitType >	
A binary space partitioning tree, such as a KD-tree or a ball tree	1998
BinarySpaceTree < MetricType , StatisticType , MatType , BoundType , SplitType >:: BreadthFirstDualTreeTraverser < RuleType >	2019
BinarySpaceTree < MetricType , StatisticType , MatType , BoundType , SplitType >:: DualTreeTraverser < RuleType >	
A dual-tree traverser for binary space trees; see <code>dual_tree_traverser.hpp</code>	2022
BinarySpaceTree < MetricType , StatisticType , MatType , BoundType , SplitType >:: SingleTreeTraverser < RuleType >	
A single-tree traverser for binary space trees; see <code>single_tree_traverser.hpp</code> for implementation	2026
CategoricalSplitInfo	2028
CompareCosineNode	2029
CosineTree	2030
CoverTree < MetricType , StatisticType , MatType , RootPointPolicy >	
A cover tree is a tree specifically designed to speed up nearest-neighbor computation in high-dimensional spaces	2040
CoverTree < MetricType , StatisticType , MatType , RootPointPolicy >:: DualTreeTraverser < RuleType >	
A dual-tree cover tree traverser; see <code>dual_tree_traverser.hpp</code>	2060
CoverTree < MetricType , StatisticType , MatType , RootPointPolicy >:: SingleTreeTraverser < RuleType >	
A single-tree cover tree traverser; see <code>single_tree_traverser.hpp</code> for implementation	2063
DecisionTree < FitnessFunction , NumericSplitType , CategoricalSplitType , DimensionSelectionType , ElemType , NoRecursion >	
This class implements a generic decision tree learner	2065
DiscreteHilbertValue < TreeElemType >	
The DiscreteHilbertValue (p. 2079) class stores Hilbert values for all of the points in a Rectangle < Tree (p. 2207) node, and calculates Hilbert values for new points	2079
EmptyStatistic	
Empty statistic if you are not interested in storing statistics in your tree	2080
ExampleTree < MetricType , StatisticType , MatType >	
This is not an actual space tree but instead an example tree that exists to show and document all the functions that mlpack trees must implement	2081
FirstPointIsRoot	
This class is meant to be used as a choice for the policy class RootPointPolicy of the CoverTree (p. 2040) class	2089
GiniGain	
The Gini gain, a measure of set purity usable as a fitness function (FitnessFunction) for decision tree	2090
GiniImpurity	2092
GreedySingleTreeTraverser < TreeType , RuleType >	2093
HilbertRTreeAuxiliaryInformation < TreeType , HilbertValueType >	2095
HilbertRTreeDescentHeuristic	
This class chooses the best child of a node in a Hilbert R tree when inserting a new point	2101
HilbertRTreeSplit < splitOrder >	
The splitting procedure for the Hilbert R tree	2102
HoeffdingCategoricalSplit < FitnessFunction >	
This is the standard Hoeffding-bound categorical feature proposed in the paper below:	2104
HoeffdingNumericSplit < FitnessFunction , ObservationType >	
The HoeffdingNumericSplit (p. 2108) class implements the numeric feature splitting strategy al- luded to by Domingos and Hulten in the following paper:	2108

HoeffdingTree < FitnessFunction , NumericSplitType , CategoricalSplitType >	
The HoeffdingTree (p.2113) object represents all of the necessary information for a Hoeffding-bound-based decision tree	2113
HoeffdingTreeModel	
This class is a serializable Hoeffding tree model that can hold four different types of Hoeffding trees	2126
HyperplaneBase < BoundT , ProjVectorT >	
HyperplaneBase (p.2133) defines a splitting hyperplane based on a projection vector and projection value	2133
InformationGain	
The standard information gain criterion, used for calculating gain in decision trees	2138
IsSpillTree < TreeType >	2140
IsSpillTree < tree::SpillTree < MetricType , StatisticType , MatType , HyperplaneType , SplitType > >	2141
MeanSpaceSplit < MetricType , MatType >	2141
MeanSplit < BoundType , MatType >	
A binary space partitioning tree node is split into its left and right child	2142
MeanSplit < BoundType , MatType >:: SplitInfo	
An information about the partition	2145
MidpointSpaceSplit < MetricType , MatType >	2146
MidpointSplit < BoundType , MatType >	
A binary space partitioning tree node is split into its left and right child	2147
MidpointSplit < BoundType , MatType >:: SplitInfo	
A struct that contains an information about the split	2150
MinimalCoverageSweep < SplitPolicy >	
The MinimalCoverageSweep (p.2151) class finds a partition along which we can split a node according to the coverage of two resulting nodes	2151
MinimalCoverageSweep < SplitPolicy >:: SweepCost < TreeType >	
A struct that provides the type of the sweep cost	2154
MinimalSplitsNumberSweep < SplitPolicy >	
The MinimalSplitsNumberSweep (p.2155) class finds a partition along which we can split a node according to the number of required splits of the node	2155
MinimalSplitsNumberSweep < SplitPolicy >:: SweepCost < typename >	
A struct that provides the type of the sweep cost	2157
MultipleRandomDimensionSelect	
This dimension selection policy allows the selection from a few random dimensions	2158
NoAuxiliaryInformation < TreeType >	2160
NumericSplitInfo < ObservationType >	2165
Octree < MetricType , StatisticType , MatType >	2167
Octree < MetricType , StatisticType , MatType >:: DualTreeTraverser < MetricType , StatisticType , MatType >	
A dual-tree traverser; see <code>dual_tree_traverser.hpp</code>	2184
Octree < MetricType , StatisticType , MatType >:: SingleTreeTraverser < RuleType >	
A single-tree traverser; see <code>single_tree_traverser.hpp</code>	2187
Octree < MetricType , StatisticType , MatType >:: SplitType::SplitInfo	2189
ProjVector	
ProjVector (p.2190) defines a general projection vector (not necessarily axis-parallel)	2190
QueueFrame < TreeType , TraversallInfoType >	2193
RandomDimensionSelect	
This dimension selection policy only selects one single random dimension	2194
RandomForest < FitnessFunction , DimensionSelectionType , NumericSplitType , CategoricalSplitType , ElemType >	2196
RectangleTree < MetricType , StatisticType , MatType , SplitType , DescentType , AuxiliaryInformationType >	
A rectangle type tree tree, such as an R-tree or X-tree	2207

RectangleTree < MetricType , StatisticType , MatType , SplitType , DescentType , AuxiliaryInformation < Type >:: DualTreeTraverser < MetricType , StatisticType , MatType , SplitType , DescentType , AuxiliaryInformationType >	
A dual tree traverser for rectangle type trees	2234
RectangleTree < MetricType , StatisticType , MatType , SplitType , DescentType , AuxiliaryInformation < Type >:: SingleTreeTraverser < RuleType >	
A single traverser for rectangle type trees	2237
RPlusPlusTreeAuxiliaryInformation < TreeType >	2239
RPlusPlusTreeDescentHeuristic	2246
RPlusPlusTreeSplitPolicy	
The RPlusPlusTreeSplitPolicy (p. 2247) helps to determine the subtree into which we should insert a child of an intermediate node that is being split	2247
RPlusTreeDescentHeuristic	2250
RPlusTreeSplit < SplitPolicyType , SweepType >	
The RPlusTreeSplit (p. 2251) class performs the split process of a node on overflow	2251
RPlusTreeSplitPolicy	
The RPlusPlusTreeSplitPolicy (p. 2247) helps to determine the subtree into which we should insert a child of an intermediate node that is being split	2253
RPTreeMaxSplit < BoundType , MatType >	
This class splits a node by a random hyperplane	2255
RPTreeMaxSplit < BoundType , MatType >:: SplitInfo	
An information about the partition	2260
RPTreeMeanSplit < BoundType , MatType >	
This class splits a binary space tree	2261
RPTreeMeanSplit < BoundType , MatType >:: SplitInfo	
An information about the partition	2264
RStarTreeDescentHeuristic	
When descending a RectangleTree (p. 2207) to insert a point, we need to have a way to choose a child node when the point isn't enclosed by any of them	2266
RStarTreeSplit	
A Rectangle Tree has new points inserted at the bottom	2267
RTreeDescentHeuristic	
When descending a RectangleTree (p. 2207) to insert a point, we need to have a way to choose a child node when the point isn't enclosed by any of them	2269
RTreeSplit	
A Rectangle Tree has new points inserted at the bottom	2271
SpaceSplit < MetricType , MatType >	2272
SpillTree < MetricType , StatisticType , MatType , HyperplaneType , SplitType >	
A hybrid spill tree is a variant of binary space trees in which the children of a node can "spill over" each other, and contain shared datapoints	2274
SpillTree < MetricType , StatisticType , MatType , HyperplaneType , SplitType >:: SpillDualTree < Traverser < MetricType , StatisticType , MatType , HyperplaneType , SplitType >	
A generic dual-tree traverser for hybrid spill trees; see spill_dual_tree_traverser.hpp (p. 2683) for implementation	2293
SpillTree < MetricType , StatisticType , MatType , HyperplaneType , SplitType >:: SpillSingleTree < Traverser < MetricType , StatisticType , MatType , HyperplaneType , SplitType >	
A generic single-tree traverser for hybrid spill trees; see spill_single_tree_traverser.hpp (p. 2684) for implementation	2297
TraversalInfo < TreeType >	
The TraversalInfo (p. 2299) class holds traversal information which is used in dual-tree (and single- tree) traversals	2299
TreeTraits < TreeType >	
The TreeTraits (p. 2302) class provides compile-time information on the characteristics of a given tree type	2302

TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, bound::BallBound, SplitType > >	
This is a specialization of the TreeType class to the BallTree tree type	2305
TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, bound::CellBound, SplitType > >	
This is a specialization of the TreeType class to the UBTREE tree type	2307
TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, bound::HollowBallBound, SplitType > >	
This is a specialization of the TreeType class to an arbitrary tree with HollowBallBound (currently only the vantage point tree is supported)	2309
TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, RPTreeMaxSplit > >	
This is a specialization of the TreeType class to the max-split random projection tree	2311
TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, RPTreeMeanSplit > >	
This is a specialization of the TreeType class to the mean-split random projection tree	2313
TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > >	
This is a specialization of the TreeTraits (p. 2302) class to the BinarySpaceTree (p. 1998) tree type	2316
TreeTraits< CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > >	
The specialization of the TreeTraits (p. 2302) class for the CoverTree (p. 2040) tree type	2318
TreeTraits< Octree< MetricType, StatisticType, MatType > >	
This is a specialization of the TreeTraits (p. 2302) class to the Octree (p. 2167) tree type	2321
TreeTraits< RectangleTree< MetricType, StatisticType, MatType, RPlusTreeSplit< SplitPolicyType, SweepType >, DescentType, AuxiliaryInformationType > >	
Since the R+/R++ tree can not have overlapping children, we should define traits for the R+/R++ tree	2323
TreeTraits< RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType > >	
This is a specialization of the TreeType class to the RectangleTree (p. 2207) tree type	2326
TreeTraits< SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType > >	
This is a specialization of the TreeType class to the SpillTree (p. 2274) tree type	2328
UBTreeSplit< BoundType, MatType >	
Split a node into two parts according to the median address of points contained in the node	2331
VantagePointSplit< BoundType, MatType, MaxNumSamples >	
The class splits a binary space partitioning tree node according to the median distance to the vantage point	2331
VantagePointSplit< BoundType, MatType, MaxNumSamples >::SplitInfo	
A struct that contains an information about the split	2336
XTreeAuxiliaryInformation< TreeType >	
The XTreeAuxiliaryInformation (p. 2338) class provides information specific to X trees for each node in a RectangleTree (p. 2207)	2338
XTreeAuxiliaryInformation< TreeType >::SplitHistoryStruct	
The X tree requires that the tree records it's "split history"	2345
XTreeSplit	
A Rectangle Tree has new points inserted at the bottom	2347
IsStdVector< T >	
Metaprogramming structure for vector detection	2349
IsStdVector< std::vector< T, A > >	
Metaprogramming structure for vector detection	2349
NullOutputStream	
Used for Log::Debug (p. 1540) when not compiled with debugging symbols	2350
ParamData	
This structure holds all of the information about a single parameter, including its value (which is set when ParseCommandLine() (p. 302) is called)	2356
PrefixedOutputStream	
Allows us to output to an ostream with a prefix at the beginning of each line, in the same way we would output to cout or cerr	2361

ProgramDoc

A static object whose constructor registers program documentation with the **CLI** (p. 1117) class . . . 2368

TrainHMMModel 2371

Chapter 38

Namespace Documentation

38.1 boost Namespace Reference

Set the serialization version of the adaboost class.

Namespaces

- **serialization**

38.1.1 Detailed Description

Set the serialization version of the adaboost class.

Set the serialization version of the RNN class.

Set the serialization version of the FFN class.

Set the serialization version of the BRNN class.

Multiple template arguments makes this ugly...

38.2 boost::serialization Namespace Reference

Classes

- struct **version**< **mlpack::adaboost::AdaBoost**< **WeakLearnerType**, **MatType** > >

Trees and tree-building procedures.

- **util**

Classes

- class **Backtrace**

Provides a backtrace.

- class **CLI**

Parses the command line for parameters and holds user-specified parameters.

- class **Log**

Provides a convenient way to give formatted output.

- class **Timer**

The timer class provides a way for mlpack methods to be timed.

- class **Timers**

Functions

- void **CheckMatrices** (const arma::mat &x, const arma::mat &xmlX, const arma::mat &textX, const arma::mat &binaryX)
- void **CheckMatrices** (const arma::Mat< size_t > &x, const arma::Mat< size_t > &xmlX, const arma::Mat< size_t > &textX, const arma::Mat< size_t > &binaryX)

`void TestArmadilloSerialization (MatType &x)`

38.4.1 Detailed Description

.hpp

This class is used to update the weightVectors matrix according to the simple update rule as discussed by Rosenblatt:

Linear algebra utility functions, generally performed on matrices or vectors.

Author

Ryan Curtin

Simple utilities for **boost::serialization** (p. 251).

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

if a vector x has been incorrectly classified by a weight w , then $w = w - x$ and $w' = w' + x$

where w' is the weight vector which correctly classifies x .

38.4.2 Function Documentation

38.4.2.1 CheckMatrices() [1/3]

```
void mlpack::CheckMatrices (
    const arma::mat & x,
    const arma::mat & xmlX,
    const arma::mat & textX,
    const arma::mat & binaryX )
```

Referenced by `SerializePointerObjectAll()`.

38.4.2.2 CheckMatrices() [2/3]

```
void mlpack::CheckMatrices (
    const arma::Mat< size_t > & x,
    const arma::Mat< size_t > & xmlX,
    const arma::Mat< size_t > & textX,
    const arma::Mat< size_t > & binaryX )
```

38.4.2.3 CheckMatrices() [3/3]

```
void mlpack::CheckMatrices (
    const arma::cube & x,
    const arma::cube & xmlX,
    const arma::cube & textX,
    const arma::cube & binaryX )
```

38.4.2.4 SerializeObject()

```
void mlpack::SerializeObject (
    T & t,
    T & newT )
```

Definition at line 193 of file `serialization.hpp`.

References `mlpack::data::binary`, and `FilterFileName()`.

Referenced by `SerializeObjectAll()`.

38.4.2.5 SerializeObjectAll()

```
void mlpack::SerializeObjectAll (
    T & t,
    T & xmlT,
    T & textT,
    T & binaryT )
```

Definition at line 240 of file `serialization.hpp`.

References `SerializeObject()`.

38.4.2.6 SerializePointerObject()

```
void mlpack::SerializePointerObject (
    T * t,
    T *& newT )
```

Definition at line 252 of file `serialization.hpp`.

38.5 mlpack::adaboost Namespace Reference

Classes

- class **AdaBoost**
*The **AdaBoost** (p. 488) class.*
- class **AdaBoostModel**
The model to save to disk.

38.6 mlpack::amf Namespace Reference

Alternating Matrix Factorization.

Classes

- class **AMF**
*This class implements **AMF** (p. 499) (alternating matrix factorization) on the given matrix V .*
- class **AveragelInitialization**
This initialization rule initializes matrix W and H to root of the average of V , perturbed with uniform noise.
- class **CompleteIncrementalTermination**
*This class acts as a wrapper for basic termination policies to be used by **SVDCompleteIncrementalLearning** (p. 542).*
- class **GivenInitialization**
*This initialization rule for **AMF** (p. 499) simply fills the W and H matrices with the matrices given to the constructor of this object.*
- class **IncompleteIncrementalTermination**
*This class acts as a wrapper for basic termination policies to be used by **SVDIncompleteIncrementalLearning** (p. 547).*
- class **MaxIterationTermination**
This termination policy only terminates when the maximum number of iterations has been reached.
- class **NMFALSUpdate**
This class implements a method titled 'Alternating Least Squares' described in the following paper:
- class **NMFMultiplicativeDistanceUpdate**
The multiplicative distance update rules for matrices W and H .
- class **NMFMultiplicativeDivergenceUpdate**
This follows a method described in the paper 'Algorithms for Non-negative.
- class **RandomAcolInitialization**
*This class initializes the W matrix of the **AMF** (p. 499) algorithm by averaging p randomly chosen columns of V .*
- class **RandomInitialization**
*This initialization rule for **AMF** (p. 499) simply fills the W and H matrices with uniform random noise in $[0, 1]$.*
- class **SimpleResidueTermination**
This class implements a simple residue-based termination policy.
- class **SimpleToleranceTermination**
This class implements residue tolerance termination policy.
- class **SVDBatchLearning**
This class implements SVD batch learning with momentum.
- class **SVDCompleteIncrementalLearning**
This class computes SVD using complete incremental batch learning, as described in the following paper:
- class **SVDCompleteIncrementalLearning**< arma::sp_mat >
TODO : Merge this template specialized function for sparse matrix using common row_col_iterator.
- class **SVDIncompleteIncrementalLearning**
This class computes SVD using incomplete incremental batch learning, as described in the following paper:
- class **ValidationRMSETermination**
This class implements validation termination policy based on RMSE index.

Typedefs

- typedef **amf::AMF**< **amf::SimpleResidueTermination**, **amf::RandomAcolInitialization**<>, **amf::NMFA**< **LSUpdate** > **NMFALSFactorizer**
- template<typename MatType = arma::mat>
using **SVDBatchFactorizer** = **amf::AMF**< **amf::SimpleResidueTermination**, **amf::RandomAcol**< **Initialization**<>, **amf::SVDBatchLearning** >

Convenience typedefs.

- `template<class MatType = arma::mat>`
`using SVDCompleteIncrementalFactorizer = amf::AMF< amf::SimpleResidueTermination, amf::RandomAcolInitialization<>, amf::SVDCompleteIncrementalLearning< MatType > >`
SVDCompleteIncrementalFactorizer factorizes given matrix V into two matrices W and H by complete incremental gradient descent.
- `template<class MatType = arma::mat>`
`using SVDIncompleteIncrementalFactorizer = amf::AMF< amf::SimpleResidueTermination, amf::RandomAcolInitialization<>, amf::SVDIncompleteIncrementalLearning >`
SVDIncompleteIncrementalFactorizer factorizes given matrix V into two matrices W and H by incomplete incremental gradient descent.

Functions

- `template<>`
`void SVDBatchLearning::HUpdate< arma::sp_mat > (const arma::sp_mat &V, const arma::mat &W, arma::mat &H)`
- `template<>`
`void SVDBatchLearning::WUpdate< arma::sp_mat > (const arma::sp_mat &V, arma::mat &W, const arma::mat &H)`
TODO : Merge this template specialized function for sparse matrix using common row_col_iterator.
- `template<>`
`void SVDIncompleteIncrementalLearning::HUpdate< arma::sp_mat > (const arma::sp_mat &V, const arma::mat &W, arma::mat &H)`
- `template<>`
`void SVDIncompleteIncrementalLearning::WUpdate< arma::sp_mat > (const arma::sp_mat &V, arma::mat &W, const arma::mat &H)`
TODO : Merge this template specialized function for sparse matrix using common row_col_iterator.

38.6.1 Detailed Description

Alternating Matrix Factorization.

38.6.2 Typedef Documentation

38.6.2.1 NMFALSFactorizer

```
typedef amf::AMF< amf::SimpleResidueTermination, amf::RandomAcolInitialization<>, amf::NMFALSUpdate> NMFALSFactorizer
```

Definition at line 143 of file amf.hpp.

38.6.2.2 SVDBatchFactorizer

```
using SVDBatchFactorizer = amf::AMF< amf::SimpleResidueTermination, amf::RandomAcolInitialization<>,
amf::SVDBatchLearning>
```

Convenience typedefs.

SVDBatchFactorizer factorizes given matrix V into two matrices W and H by gradient descent. SVD batch learning is described in paper 'A Guide to singular Value Decomposition' by Chih-Chao Ma.

See also

SVDBatchLearning (p. 539)

Definition at line 158 of file amf.hpp.

38.6.2.3 SVDCompleteIncrementalFactorizer

```
using SVDCompleteIncrementalFactorizer = amf::AMF< amf::SimpleResidueTermination, amf::↵
RandomAcolInitialization<>, amf::SVDCompleteIncrementalLearning<MatType> >
```

SVDCompleteIncrementalFactorizer factorizes given matrix V into two matrices W and H by complete incremental gradient descent.

SVD complete incremental learning is described in paper 'A Guide to singular Value Decomposition' by Chih-Chao Ma.

See also

SVDCompleteIncrementalLearning (p. 542)

Definition at line 185 of file amf.hpp.

38.6.2.4 SVDIncompleteIncrementalFactorizer

```
using SVDIncompleteIncrementalFactorizer = amf::AMF< amf::SimpleResidueTermination, amf::↵
RandomAcolInitialization<>, amf::SVDIncompleteIncrementalLearning>
```

SVDIncompleteIncrementalFactorizer factorizes given matrix V into two matrices W and H by incomplete incremental gradient descent.

SVD incomplete incremental learning is described in paper 'A Guide to singular Value Decomposition' by Chih-Chao Ma.

See also

SVDIncompleteIncrementalLearning (p. 547)

Definition at line 172 of file amf.hpp.

38.6.3 Function Documentation

38.6.3.1 SVDBatchLearning::HUpdate< arma::sp_mat >()

```
void mlpack::amf::SVDBatchLearning::HUpdate< arma::sp_mat > (
    const arma::sp_mat & V,
    const arma::mat & W,
    arma::mat & H ) [inline]
```

Definition at line 230 of file svd_batch_learning.hpp.

38.6.3.2 SVDBatchLearning::WUpdate< arma::sp_mat >()

```
void mlpack::amf::SVDBatchLearning::WUpdate< arma::sp_mat > (
    const arma::sp_mat & V,
    arma::mat & W,
    const arma::mat & H ) [inline]
```

TODO : Merge this template specialized function for sparse matrix using common row_col_iterator.

WUpdate function specialization for sparse matrix

Definition at line 202 of file svd_batch_learning.hpp.

38.6.3.3 SVDIncompleteIncrementalLearning::HUpdate< arma::sp_mat >()

```
void mlpack::amf::SVDIncompleteIncrementalLearning::HUpdate< arma::sp_mat > (
    const arma::sp_mat & V,
    const arma::mat & W,
    arma::mat & H ) [inline]
```

Definition at line 185 of file svd_incomplete_incremental_learning.hpp.

38.6.3.4 SVDIncompleteIncrementalLearning::WUpdate< arma::sp_mat >()

```
void mlpack::amf::SVDIncompleteIncrementalLearning::WUpdate< arma::sp_mat > (
    const arma::sp_mat & V,
    arma::mat & W,
    const arma::mat & H ) [inline]
```

TODO : Merge this template specialized function for sparse matrix using common row_col_iterator.

template specialized functions for sparse matrices

Definition at line 166 of file svd_incomplete_incremental_learning.hpp.

38.7 mlpack::ann Namespace Reference

Artificial Neural Network.

Namespaces

- **augmented**

Classes

- class **Add**
*Implementation of the **Add** (p. 553) module class.*
- class **AddMerge**
*Implementation of the **AddMerge** (p. 558) module class.*
- class **AddVisitor**
***AddVisitor** (p. 565) exposes the Add() method of the given module.*
- class **AlphaDropout**
The alpha - dropout layer is a regularizer that randomly with probability 'ratio' sets input values to alphaDash.
- class **AtrousConvolution**
*Implementation of the Atrous **Convolution** (p. 643) class.*
- class **BackwardVisitor**
***BackwardVisitor** (p. 587) executes the Backward() function given the input, error and delta parameter.*
- class **BaseLayer**
Implementation of the base layer.
- class **BatchNorm**
Declaration of the Batch Normalization layer class.
- class **BernoulliDistribution**
Multiple independent Bernoulli distributions.
- class **BilinearInterpolation**
Definition and Implementation of the Bilinear Interpolation Layer.
- class **BinaryRBM**
For more information, see the following paper:
- class **BRNN**
Implementation of a standard bidirectional recurrent neural network container.
- class **Concat**
*Implementation of the **Concat** (p. 621) class.*
- class **Concatenate**
*Implementation of the **Concatenate** (p. 630) module class.*
- class **ConcatPerformance**
Implementation of the concat performance class.
- class **Constant**
Implementation of the constant layer.
- class **ConstInitialization**
This class is used to initialize weight matrix with constant values.
- class **Convolution**

Implementation of the **Convolution** (p. 643) class.

- class **CopyVisitor**

This visitor is to support copy constructor for neural network module.

- class **CReLU**

A concatenated ReLU has two outputs, one ReLU and one negative ReLU, concatenated together.

- class **CrossEntropyError**

The cross-entropy performance function measures the network's performance according to the cross-entropy between the input and target distributions.

- class **DeleteVisitor**

DeleteVisitor (p. 659) executes the destructor of the instantiated object.

- class **DeltaVisitor**

DeltaVisitor (p. 660) exposes the delta parameter of the given module.

- class **DeterministicSetVisitor**

DeterministicSetVisitor (p. 661) set the deterministic parameter given the deterministic value.

- class **DiceLoss**

The dice loss performance function measures the network's performance according to the dice coefficient between the input and target distributions.

- class **DropConnect**

The DropConnect (p. 666) layer is a regularizer that randomly with probability ratio sets the connection values to zero and scales the remaining elements by factor $1 / (1 - \text{ratio})$.

- class **Dropout**

The dropout layer is a regularizer that randomly with probability 'ratio' sets input values to zero and scales the remaining elements by factor $1 / (1 - \text{ratio})$ rather than during test time so as to keep the expected sum same.

- class **EarthMoverDistance**

The earth mover distance function measures the network's performance according to the Kantorovich-Rubinstein duality approximation.

- class **ELU**

The ELU (p. 680) activation function, defined by.

- class **FastLSTM**

An implementation of a faster version of the Fast LSTM (p. 801) network layer.

- class **FFN**

Implementation of a standard feed forward network.

- class **FFTConvolution**

Computes the two-dimensional convolution through fft.

- class **FlexibleReLU**

The FlexibleReLU (p. 707) activation function, defined by.

- class **ForwardVisitor**

ForwardVisitor (p. 713) executes the Forward() function given the input and output parameter.

- class **FullConvolution**

- class **GaussianInitialization**

This class is used to initialize weight matrix with a gaussian.

- class **Glimpse**

The glimpse layer returns a retina-like representation (down-scaled cropped images) of increasing scale around a given location in a given image.

- class **GlorotInitializationType**

This class is used to initialize the weight matrix with the Glorot Initialization method.

- class **GradientSetVisitor**

GradientSetVisitor (p. 725) update the gradient parameter given the gradient set.

- class **GradientUpdateVisitor**
GradientUpdateVisitor (p. 727) update the gradient parameter given the gradient set.
- class **GradientVisitor**
SearchModeVisitor executes the *Gradient()* method of the given module using the input and delta parameter.
- class **GradientZeroVisitor**
- class **GRU**
An implementation of a gru network layer.
- class **HardSigmoidFunction**
The hard sigmoid function, defined by.
- class **HardTanH**
The Hard Tanh activation function, defined by.
- class **HeInitialization**
This class is used to initialize weight matrix with the He initialization rule given by He et.
- class **IdentityFunction**
The identity function, defined by.
- class **InitTraits**
This is a template class that can provide information about various initialization methods.
- class **InitTraits< KathirvalavakumarSubavathilInitialization >**
Initialization traits of the kathirvalavakumar subavath initialization rule.
- class **InitTraits< NguyenWidrowInitialization >**
Initialization traits of the Nguyen-Widrow initialization rule.
- class **Join**
*Implementation of the **Join** (p. 753) module class.*
- class **KathirvalavakumarSubavathilInitialization**
This class is used to initialize the weight matrix with the method proposed by T.
- class **KLDivergence**
The Kullback–Leibler divergence is often used for continuous distributions (direct regression).
- class **LayerNorm**
Declaration of the Layer Normalization class.
- class **LayerTraits**
This is a template class that can provide information about various layers.
- class **LeakyReLU**
*The **LeakyReLU** (p. 771) activation function, defined by.*
- class **LecunNormalInitialization**
This class is used to initialize weight matrix with the Lecun Normalization initialization rule.
- class **Linear**
*Implementation of the **Linear** (p. 776) layer class.*
- class **LinearNoBias**
*Implementation of the **LinearNoBias** (p. 782) class.*
- class **LoadOutputParameterVisitor**
LoadOutputParameterVisitor (p. 788) restores the output parameter using the given parameter set.
- class **LogisticFunction**
The logistic function, defined by.
- class **LogSoftMax**
Implementation of the log softmax layer.
- class **Lookup**
*Implementation of the **Lookup** (p. 795) class.*

- class **LossVisitor**
***LossVisitor** (p. 800) exposes the `Loss()` method of the given module.*
- class **LSTM**
*Implementation of the **LSTM** (p. 801) module class.*
- class **MaxPooling**
*Implementation of the **MaxPooling** (p. 808) layer.*
- class **MaxPoolingRule**
- class **MeanPooling**
*Implementation of the **MeanPooling** (p. 814).*
- class **MeanPoolingRule**
- class **MeanSquaredError**
The mean squared error performance function measures the network's performance according to the mean of squared errors.
- class **MultiplyConstant**
Implementation of the multiply constant layer.
- class **MultiplyMerge**
*Implementation of the **MultiplyMerge** (p. 829) module class.*
- class **NaiveConvolution**
Computes the two-dimensional convolution.
- class **NegativeLogLikelihood**
Implementation of the negative log likelihood layer.
- class **NetworkInitialization**
This class is used to initialize the network with the given initialization rule.
- class **NguyenWidrowInitialization**
This class is used to initialize the weight matrix with the Nguyen-Widrow method.
- class **OivsInitialization**
This class is used to initialize the weight matrix with the oivs method.
- class **OrthogonalInitialization**
This class is used to initialize the weight matrix with the orthogonal matrix initialization.
- class **OutputHeightVisitor**
***OutputHeightVisitor** (p. 850) exposes the `OutputHeight()` method of the given module.*
- class **OutputParameterVisitor**
***OutputParameterVisitor** (p. 851) exposes the output parameter of the given module.*
- class **OutputWidthVisitor**
***OutputWidthVisitor** (p. 852) exposes the `OutputWidth()` method of the given module.*
- class **ParametersSetVisitor**
***ParametersSetVisitor** (p. 853) update the parameters set using the given matrix.*
- class **ParametersVisitor**
***ParametersVisitor** (p. 854) exposes the parameters set of the given module and stores the parameters set into the given matrix.*
- class **PReLU**
*The **PReLU** (p. 855) activation function, defined by (where α is trainable)*
- class **RandomInitialization**
This class is used to initialize randomly the weight matrix.
- class **RBM**
*The implementation of the **RBM** (p. 864) module.*
- class **ReconstructionLoss**

The reconstruction loss performance function measures the network's performance equal to the negative log probability of the target with the input distribution.

- class **RectifierFunction**

The rectifier function, defined by.

- class **Recurrent**

Implementation of the *RecurrentLayer* class.

- class **RecurrentAttention**

This class implements the **Recurrent** (p. 886) Model for Visual Attention, using a variety of possible layer implementations.

- class **ReinforceNormal**

Implementation of the reinforce normal layer.

- class **Reparametrization**

Implementation of the **Reparametrization** (p. 903) layer class.

- class **ResetCellVisitor**

ResetCellVisitor (p. 907) executes the *ResetCell()* function.

- class **ResetVisitor**

ResetVisitor (p. 909) executes the *Reset()* function.

- class **RewardSetVisitor**

RewardSetVisitor (p. 910) set the reward parameter given the reward value.

- class **RNN**

Implementation of a standard recurrent neural network container.

- class **RunSetVisitor**

RunSetVisitor (p. 921) set the run parameter given the run value.

- class **SaveOutputParameterVisitor**

SaveOutputParameterVisitor (p. 923) saves the output parameter into the given parameter set.

- class **Select**

The select module selects the specified column from a given input matrix.

- class **Sequential**

Implementation of the **Sequential** (p. 927) class.

- class **SetInputHeightVisitor**

SetInputHeightVisitor (p. 934) updates the input height parameter with the given input height.

- class **SetInputWidthVisitor**

SetInputWidthVisitor (p. 935) updates the input width parameter with the given input width.

- class **SigmoidCrossEntropyError**

The **SigmoidCrossEntropyError** (p. 937) performance function measures the network's performance according to the cross-entropy function between the input and target distributions.

- class **SoftplusFunction**

The softplus function, defined by.

- class **SoftsignFunction**

The softsign function, defined by.

- class **SpikeSlabRBM**

For more information, see the following paper:

- class **Subview**

Implementation of the subview layer.

- class **SVDConvolution**

Computes the two-dimensional convolution using singular value decomposition.

- class **SwishFunction**

The swish function, defined by.

- class **TanhFunction**
The tanh function, defined by.
- class **TransposedConvolution**
*Implementation of the Transposed **Convolution** (p. 643) class.*
- class **ValidConvolution**
- class **VRClassReward**
Implementation of the variance reduced classification reinforcement layer.
- class **WeightSetVisitor**
***WeightSetVisitor** (p. 972) update the module parameters given the parameters set.*
- class **WeightSizeVisitor**
***WeightSizeVisitor** (p. 973) returns the number of weights of the given module.*

Typedefs

- template<class ActivationFunction = LogisticFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
using **CustomLayer** = **BaseLayer**< ActivationFunction, InputDataType, OutputDataType >
Standard Sigmoid layer.
- template<typename MatType = arma::mat>
using **Embedding** = **Lookup**< MatType, MatType >
- using **GlorotInitialization** = **GlorotInitializationType**< false >
GlorotInitialization uses uniform distribution.
- template<class ActivationFunction = HardSigmoidFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
using **HardSigmoidLayer** = **BaseLayer**< ActivationFunction, InputDataType, OutputDataType >
Standard HardSigmoid-Layer using the HardSigmoid activation function.
- template<class ActivationFunction = IdentityFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
using **IdentityLayer** = **BaseLayer**< ActivationFunction, InputDataType, OutputDataType >
Standard Identity-Layer using the identity activation function.
- template<typename... CustomLayers>
using **LayerTypes** = boost::variant< **Add**< arma::mat, arma::mat > *, **AddMerge**< arma::mat, arma::mat > *, **AtrousConvolution**< **NaiveConvolution**< **ValidConvolution** >, **NaiveConvolution**< **FullConvolution** >, **NaiveConvolution**< **ValidConvolution** >, arma::mat, arma::mat > *, **BaseLayer**< **LogisticFunction**, arma::mat, arma::mat > *, **BaseLayer**< **IdentityFunction**, arma::mat, arma::mat > *, **BaseLayer**< **TanhFunction**, arma::mat, arma::mat > *, **BaseLayer**< **RectifierFunction**, arma::mat, arma::mat > *, **BaseLayer**< **SoftplusFunction**, arma::mat, arma::mat > *, **BatchNorm**< arma::mat, arma::mat > *, **BilinearInterpolation**< arma::mat, arma::mat > *, **Concat**< arma::mat, arma::mat > *, **Concatenate**< arma::mat, arma::mat > *, **ConcatPerformance**< **NegativeLogLikelihood**< arma::mat, arma::mat >, arma::mat, arma::mat > *, **Constant**< arma::mat, arma::mat > *, **Convolution**< **NaiveConvolution**< **ValidConvolution** >, **NaiveConvolution**< **FullConvolution** >, **NaiveConvolution**< **ValidConvolution** >, arma::mat, arma::mat > *, **TransposedConvolution**< **NaiveConvolution**< **ValidConvolution** >, **NaiveConvolution**< **FullConvolution** >, **NaiveConvolution**< **ValidConvolution** >, arma::mat, arma::mat > *, **DropConnect**< arma::mat, arma::mat > *, **Dropout**< arma::mat, arma::mat > *, **AlphaDropout**< arma::mat, arma::mat > *, **ELU**< arma::mat, arma::mat > *, **FlexibleReLU**< arma::mat, arma::mat > *, **Glimpse**< arma::mat, arma::mat > *, **HardTanH**< arma::mat, arma::mat > *, **Join**< arma::mat, arma::mat > *, **LayerNorm**< arma::mat, arma::mat > *, **LeakyReLU**< arma::mat, arma::mat > *, **CReLU**< arma::mat, arma::mat > *, **Linear**< arma::mat, arma::mat > *, **LinearNoBias**< arma::mat, arma::mat > *, **LogSoftMax**< arma::mat, arma::mat > *, **Lookup**< arma::mat, arma::mat > *, **LSTM**< arma::mat, arma::mat > *, **GRU**< arma::mat, arma::mat > *, **FastLSTM**< arma::mat, arma::mat > *, **MaxPooling**< arma::mat, arma::mat > *, **MeanPooling**< arma::mat, arma::mat > *, **MultiplyConstant**< arma::mat, arma::mat > *, **MultiplyMerge**< arma::mat, arma::mat > *, **NegativeLogLikelihood**< arma::mat, arma::mat > *, **PReLU**< arma::mat, arma::mat > *, **Recurrent**< arma::mat, arma::mat > *, **RecurrentAttention**< arma::mat, arma::mat > *, **ReinforceNormal**< arma::mat,

```
arma::mat > *, Reparametrization< arma::mat, arma::mat > *, Select< arma::mat, arma::mat > *, Sequential< arma::mat, arma::mat, false > *, Sequential< arma::mat, arma::mat, true > *, Subview< arma::mat, arma::mat > *, VRClassReward< arma::mat, arma::mat > *, CustomLayers *... >
```

- `template<class ActivationFunction = RectifierFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat> using ReLULayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType >`

Standard rectified linear unit non-linearity layer.

- `template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat, typename... CustomLayers> using Residual = Sequential< InputDataType, OutputDataType, true, CustomLayers... >`
- `using SELU = ELU< arma::mat, arma::mat >`
- `template<class ActivationFunction = LogisticFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat> using SigmoidLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType >`

Standard Sigmoid-Layer using the logistic activation function.

- `template<class ActivationFunction = SoftplusFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat> using SoftPlusLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType >`

Standard Softplus-Layer using the Softplus activation function.

- `template<class ActivationFunction = TanhFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat> using TanHLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType >`

Standard hyperbolic tangent layer.

- `using XavierInitialization = GlorotInitializationType< true >`

XavierInitialization is the popular name for this method.

38.7.1 Detailed Description

Artificial Neural Network.

38.7.2 Typedef Documentation

38.7.2.1 CustomLayer

```
using CustomLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType>
```

Standard Sigmoid layer.

Definition at line 31 of file custom_layer.hpp.

38.7.2.2 Embedding

```
using Embedding = Lookup<MatType, MatType>
```

Definition at line 131 of file lookup.hpp.

38.7.2.3 GlorotInitialization

```
using GlorotInitialization = GlorotInitializationType<false>
```

GlorotInitialization uses uniform distribution.

Definition at line 148 of file glorot_init.hpp.

38.7.2.4 HardSigmoidLayer

```
using HardSigmoidLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType>
```

Standard HardSigmoid-Layer using the HardSigmoid activation function.

Definition at line 185 of file base_layer.hpp.

38.7.2.5 IdentityLayer

```
using IdentityLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType>
```

Standard Identity-Layer using the identity activation function.

Definition at line 141 of file base_layer.hpp.

38.7.2.6 LayerTypes

```
using LayerTypes = boost::variant< Add<arma::mat, arma::mat>*, AddMerge<arma::mat, arma::mat>*,
AtrousConvolution< NaiveConvolution< ValidConvolution>, NaiveConvolution< FullConvolution>,
NaiveConvolution< ValidConvolution>, arma::mat, arma::mat>*, BaseLayer< LogisticFunction,
arma::mat, arma::mat>*, BaseLayer< IdentityFunction, arma::mat, arma::mat>*, BaseLayer< TanhFunction,
arma::mat, arma::mat>*, BaseLayer< RectifierFunction, arma::mat, arma::mat>*, BaseLayer< SoftplusFunction,
arma::mat, arma::mat>*, BatchNorm<arma::mat, arma::mat>*, BilinearInterpolation<arma::mat, arma::mat>*,
Concat<arma::mat, arma::mat>*, Concatenate<arma::mat, arma::mat>*, ConcatPerformance< NegativeLogLikelihood<arma::mat, arma::mat>, arma::mat,

```

Definition at line 203 of file layer_types.hpp.

38.7.2.7 ReLULayer

```
using ReLULayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType>
```

Standard rectified linear unit non-linearity layer.

Definition at line 152 of file base_layer.hpp.

38.7.2.8 Residual

```
using Residual = Sequential< InputDataType, OutputDataType, true, CustomLayers*...>
```

Definition at line 241 of file sequential.hpp.

38.7.2.9 SELU

```
using SELU = ELU<arma::mat, arma::mat>
```

Definition at line 263 of file elu.hpp.

38.7.2.10 SigmoidLayer

```
using SigmoidLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType>
```

Standard Sigmoid-Layer using the logistic activation function.

Definition at line 130 of file base_layer.hpp.

38.7.2.11 SoftPlusLayer

```
using SoftPlusLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType>
```

Standard Softplus-Layer using the Softplus activation function.

Definition at line 174 of file base_layer.hpp.

38.7.2.12 TanHLayer

```
using TanHLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType>
```

Standard hyperbolic tangent layer.

Definition at line 163 of file base_layer.hpp.

38.7.2.13 XavierInitialization

```
using XavierInitialization = GlorotInitializationType<true>
```

XavierInitialization is the popular name for this method.

Definition at line 143 of file glorot_init.hpp.

38.7.3 Function Documentation

38.7.3.1 HAS_ANY_METHOD_FORM()

```
mlpack::ann::HAS_ANY_METHOD_FORM (
    Model ,
    HasModelCheck )
```

38.7.3.2 HAS_MEM_FUNC() [1/13]

```
mlpack::ann::HAS_MEM_FUNC (

```

38.8 mlpack::ann::augmented Namespace Reference**Namespaces**

- **scorers**
- **tasks**

38.9 mlpack::ann::augmented::scorers Namespace Reference**Functions**

- `template<typename MatType >`
`double SequencePrecision (arma::field< MatType > trueOutputs, arma::field< MatType > predOutputs, double tol=1e-4)`
Function that computes the sequences precision (number of correct sequences / number of sequences) of model's answer against ground truth answer.

38.9.1 Function Documentation

38.9.1.1 SequencePrecision()

```
double mlpack::ann::augmented::scorers::SequencePrecision (
    arma::field< MatType > trueOutputs,
    arma::field< MatType > predOutputs,
    double tol = 1e-4 )
```

Function that computes the sequences precision (number of correct sequences / number of sequences) of model's answer against ground truth answer.

Parameters

<i>trueOutputs</i>	Ground truth sequences.
<i>predOutputs</i>	Sequences predicted by model.
<i>tol</i>	Minimum absolute difference value which is considered as a model failure.

38.10 mlpack::ann::augmented::tasks Namespace Reference

Classes

- class **AddTask**
Generator of instances of the binary addition task.
- class **CopyTask**
Generator of instances of the binary sequence copy task.
- class **SortTask**
Generator of instances of the sequence sort task.

- **markdown**
- **python**
- **tests**

38.12 mlpack::bindings::cli Namespace Reference

Classes

- class **CLIOption**
*A static object whose constructor registers a parameter with the **CLI** (p. 1117) class.*
- struct **ParameterType**
Utility struct to return the type that boost::program_options should accept for a given input type.
- struct **ParameterType< arma::Col< eT > >**
For vector types, boost::program_options will accept a std::string, not an arma::Col<eT> (since it is not clear how to specify a vector on the command-line).
- struct **ParameterType< arma::Mat< eT > >**
For matrix types, boost::program_options will accept a std::string, not an arma::mat (since it is not clear how to specify a matrix on the command-line).
- struct **ParameterType< arma::Row< eT > >**

For row vector types, `boost::program_options` will accept a `std::string`, not an `arma::Row<eT>` (since it is not clear how to specify a vector on the command-line).

- struct **ParameterType**< `std::tuple< mlpack::data::DatasetMapper< PolicyType, std::string >, arma::Mat< eT > >` >

For matrix+dataset info types, we should accept a `std::string`.

- struct **ParameterTypeDeducer**
- struct **ParameterTypeDeducer**< `true`, `T` >
- class **ProgramDoc**

A static object whose constructor registers program documentation with the **CLI** (p. 1117) class.

Functions

- template<typename T >
void **AddToPO** (const `std::string` &boostName, const `std::string` &descr, `boost::program_options::options_↵` description &desc, const typename `boost::disable_if< util::IsStdVector< T >>::type` !=0, const typename `boost::disable_if< std::is_same< T, bool >>::type` !=0)

Add a non-vector option to `boost::program_options`.

- template<typename T >
void **AddToPO** (const `std::string` &boostName, const `std::string` &descr, `boost::program_options::options_↵` description &desc, const typename `boost::enable_if< util::IsStdVector< T >>::type` !=0, const typename `boost::disable_if< std::is_same< T, bool >>::type` !=0)

Add a vector option to `boost::program_options`.

- template<typename T >
void **AddToPO** (const `std::string` &boostName, const `std::string` &descr, `boost::program_options::options_↵` description &desc, const typename `boost::disable_if< util::IsStdVector< T >>::type` !=0, const typename `boost::enable_if< std::is_same< T, bool >>::type` !=0)

Add a boolean option to `boost::program_options`.

- template<typename T >
void **AddToPO** (const `util::ParamData` &d, const void *, void *output)

Add an option to `boost::program_options`.

- template<typename T >
void **DefaultParam** (const `util::ParamData` &data, const void *, void *output)

Return the default value of an option.

- template<typename T >
`std::string` **DefaultParamImpl** (const `util::ParamData` &data, const typename `boost::disable_if< arma::is_↵` `arma_type< T >>::type` !=0, const typename `boost::disable_if< util::IsStdVector< T >>::type` !=0, const typename `boost::disable_if< data::HasSerialize< T >>::type` !=0, const typename `boost::disable_if< std::is_↵` `_same< T, std::string >>::type` !=0, const typename `boost::disable_if< std::is_same< T, std::tuple< mlpack_↵` `::data::DatasetInfo, arma::mat >>>::type` !=0)

Return the default value of an option.

- template<typename T >
`std::string` **DefaultParamImpl** (const `util::ParamData` &data, const typename `boost::enable_if< util::IsStd_↵` `Vector< T >>::type` !=0)

Return the default value of a vector option.

- template<typename T >
`std::string` **DefaultParamImpl** (const `util::ParamData` &data, const typename `boost::enable_if< std::is_same< ↵` `T, std::string >>::type` !=0)

Return the default value of a string option.

- `template<typename T >`
`std::string DefaultParamImpl (const util::ParamData &data, const typename boost::enable_if_c< arma::is_↵`
`_arma_type< T >::value||std::is_same< T, std::tuple< mlpack::data::DatasetInfo, arma::mat >>::value >↵`
`::type ==0)`
Return the default value of a matrix option, a tuple option, a serializable option, or a string option (this returns the default filename, or " if the default is no file).
- `template<typename T >`
`std::string DefaultParamImpl (const util::ParamData &data, const typename boost::disable_if< arma::is_↵`
`arma_type< T >>::type ==0, const typename boost::enable_if< data::HasSerialize< T >>::type ==0)`
Return the default value of a model option (this returns the default filename, or " if the default is no file).
- `template<typename T >`
`void DeleteAllocatedMemory (const util::ParamData &d, const void *, void *)`
- `template<typename T >`
`void DeleteAllocatedMemoryImpl (const util::ParamData &, const typename boost::disable_if< data::Has_↵`
`Serialize< T >>::type ==0, const typename boost::disable_if< arma::is_arma_type< T >>::type ==0)`
- `template<typename T >`
`void DeleteAllocatedMemoryImpl (const util::ParamData &, const typename boost::enable_if< arma::is_↵`
`arma_type< T >>::type ==0)`
- `template<typename T >`
`void DeleteAllocatedMemoryImpl (const util::ParamData &d, const typename boost::disable_if< arma::is_↵`
`arma_type< T >>::type ==0, const typename boost::enable_if< data::HasSerialize< T >>::type ==0)`
- `void EndProgram ()`
Handle command-line program termination.
- `template<typename T >`
`void * GetAllocatedMemory (const util::ParamData &, const typename boost::disable_if< data::Has_↵`
`Serialize< T >>::type ==0, const typename boost::disable_if< arma::is_arma_type< T >>::type ==0)`
- `template<typename T >`
`void * GetAllocatedMemory (const util::ParamData &, const typename boost::enable_if< arma::is_arma_↵`
`type< T >>::type ==0)`
- `template<typename T >`
`void * GetAllocatedMemory (const util::ParamData &d, const typename boost::disable_if< arma::is_arma_↵`
`_type< T >>::type ==0, const typename boost::enable_if< data::HasSerialize< T >>::type ==0)`
- `template<typename T >`
`void GetAllocatedMemory (const util::ParamData &d, const void *, void *output)`
- `std::string GetBindingName (const std::string &bindingName)`
Given the name of a binding, print its command-line name (this returns "mlpack_<bindingName>".
- `template<typename T >`
`T & GetParam (util::ParamData &d, const typename boost::disable_if< arma::is_arma_type< T >>::type ==0,`
`const typename boost::disable_if< data::HasSerialize< T >>::type ==0, const typename boost::disable_if<`
`std::is_same< T, std::tuple< mlpack::data::DatasetInfo, arma::mat >>>::type ==0)`
This overload is called when nothing special needs to happen to the name of the parameter.
- `template<typename T >`
`T & GetParam (util::ParamData &d, const typename boost::enable_if< arma::is_arma_type< T >>::type ==0)`
Return a matrix parameter.
- `template<typename T >`
`T & GetParam (util::ParamData &d, const typename boost::enable_if< std::is_same< T, std::tuple< mlpack_↵`
`::data::DatasetInfo, arma::mat >>>::type ==0)`
Return a matrix/dataset info parameter.
- `template<typename T >`
`T *& GetParam (util::ParamData &d, const typename boost::disable_if< arma::is_arma_type< T >>::type`
`==0, const typename boost::enable_if< data::HasSerialize< T >>::type ==0)`

Return a serializable object.

- template<typename T >
void **GetParam** (const **util::ParamData** &d, const void *, void *output)

Return a parameter casted to the given type.

- template<typename T >
std::string **GetPrintableParam** (const **util::ParamData** &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< **util::IsStdVector**< T >>::type *=0, const typename boost::disable_if< **data::HasSerialize**< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< **data::DatasetInfo**, arma::mat >>>::type *=0)

Print an option.

- template<typename T >
std::string **GetPrintableParam** (const **util::ParamData** &data, const typename std::enable_if< **util::IsStdVector**< T >>::value >::type *=0)

Print a vector option, with spaces between it.

- template<typename T >
std::string **GetPrintableParam** (const **util::ParamData** &data, const typename std::enable_if< arma::is_arma_type< T >>::value||std::is_same< T, std::tuple< **data::DatasetInfo**, arma::mat >>>::value >::type *=0)

Print a matrix/tuple option (this just prints the filename).

- template<typename T >
std::string **GetPrintableParam** (const **util::ParamData** &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< **data::HasSerialize**< T >>::type *=0)

Print a model option (this just prints the filename).

- template<typename T >
void **GetPrintableParam** (const **util::ParamData** &data, const void *, void *output)

Print an option into a std::string.

- template<typename T >
std::string **GetPrintableParamName** (const **util::ParamData** &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< **data::HasSerialize**< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< **data::DatasetInfo**, arma::mat >>>::type *=0)

Get the parameter name for a type that has no special handling.

- template<typename T >
std::string **GetPrintableParamName** (const **util::ParamData** &data, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)

Get the parameter name for a matrix type (where the user has to pass the file that holds the matrix).

- template<typename T >
std::string **GetPrintableParamName** (const **util::ParamData** &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< **data::HasSerialize**< T >>::type *=0)

Get the parameter name for a serializable model type (where the user has to pass the file that holds the matrix).

- template<typename T >
std::string **GetPrintableParamName** (const **util::ParamData** &data, const typename boost::enable_if< std::is_same< T, std::tuple< **data::DatasetInfo**, arma::mat >>>::type *=0)

Get the parameter name for a mapped matrix type (where the user has to pass the file that holds the matrix).

- template<typename T >
void **GetPrintableParamName** (const **util::ParamData** &d, const void *, void *output)

Get the parameter's name as seen by the user.

- template<typename T >
std::string **GetPrintableParamValue** (const **util::ParamData** &data, const std::string &value, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< **data::HasSerialize**< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< **data::DatasetInfo**, arma::mat >>>::type *=0)

Get the parameter name for a type that has no special handling.

- template<typename T >
 std::string **GetPrintableParamValue** (const **util::ParamData** &data, const std::string &value, const typename boost::enable_if< arma::is_arma_type< T >>::type !=0)
Get the parameter name for a matrix type (where the user has to pass the file that holds the matrix).
- template<typename T >
 std::string **GetPrintableParamValue** (const **util::ParamData** &data, const std::string &value, const typename boost::disable_if< arma::is_arma_type< T >>::type !=0, const typename boost::enable_if< **data::HasSerialize**< T >>::type !=0)
Get the parameter name for a serializable model type (where the user has to pass the file that holds the matrix).
- template<typename T >
 std::string **GetPrintableParamValue** (const **util::ParamData** &data, const std::string &value, const typename boost::enable_if< std::is_same< T, std::tuple< **data::DatasetInfo**, arma::mat >>>::type !=0)
Get the parameter name for a mapped matrix type (where the user has to pass the file that holds the matrix).
- template<typename T >
 void **GetPrintableParamValue** (const **util::ParamData** &d, const void *input, void *output)
Get the parameter's name as seen by the user.
- template<typename T >
 std::string **GetPrintableType** (const **util::ParamData** &data, const typename boost::disable_if< arma::is_arma_type< T >>::type !=0, const typename boost::disable_if< **util::IsStdVector**< T >>::type !=0, const typename boost::disable_if< **data::HasSerialize**< T >>::type !=0, const typename boost::disable_if< std::is_same< T, std::tuple< **data::DatasetInfo**, arma::mat >>>::type !=0)
Return a string representing the command-line type of an option.
- template<typename T >
 std::string **GetPrintableType** (const **util::ParamData** &data, const typename std::enable_if< **util::IsStdVector**< T >::value >::type !=0)
Return a string representing the command-line type of a vector.
- template<typename T >
 std::string **GetPrintableType** (const **util::ParamData** &data, const typename std::enable_if< arma::is_arma_type< T >::value >::type !=0)
Return a string representing the command-line type of a matrix option.
- template<typename T >
 std::string **GetPrintableType** (const **util::ParamData** &data, const typename std::enable_if< std::is_same< T, std::tuple< **data::DatasetInfo**, arma::mat >>>::value >::type !=0)
Return a string representing the command-line type of a matrix tuple option.
- template<typename T >
 std::string **GetPrintableType** (const **util::ParamData** &data, const typename boost::disable_if< arma::is_arma_type< T >>::type !=0, const typename boost::enable_if< **data::HasSerialize**< T >>::type !=0)
Return a string representing the command-line type of a model.
- template<typename T >
 void **GetPrintableType** (const **util::ParamData** &data, const void *, void *output)
Print the command-line type of an option into a string.
- template<typename T >
 T & **GetRawParam** (**util::ParamData** &d, const typename boost::disable_if< arma::is_arma_type< T >>::type !=0, const typename boost::disable_if< **data::HasSerialize**< T >>::type !=0, const typename boost::disable_if< std::is_same< T, std::tuple< **mlpack::data::DatasetInfo**, arma::mat >>>::type !=0)
This overload is called when nothing special needs to happen to the name of the parameter.
- template<typename T >
 T & **GetRawParam** (**util::ParamData** &d, const typename boost::enable_if_c< arma::is_arma_type< T >::value || std::is_same< T, std::tuple< **mlpack::data::DatasetInfo**, arma::mat >>>::value >::type !=0)
Return a matrix parameter.

- `template<typename T >`
`T * & GetRawParam (util::ParamData &d, const typename boost::disable_if< arma::is_arma_type< T >>::type ==0, const typename boost::enable_if< data::HasSerialize< T >>::type ==0)`
Return the name of a model parameter.
- `template<typename T >`
`void GetRawParam (const util::ParamData &d, const void *, void *output)`
Return a parameter casted to the given type.
- `template<typename T >`
`bool IgnoreCheck (const T &)`
Return whether or not a runtime check on parameters should be ignored.
- `template<typename T >`
`std::string MapParameterName (const std::string &identifier, const typename boost::disable_if< arma::is_arma_type< T >>::type ==0, const typename boost::disable_if< data::HasSerialize< T >>::type ==0, const typename boost::disable_if< std::is_same< T, std::tuple< mlpack::data::DatasetInfo, arma::mat >>>::type ==0)`
If needed, map the parameter name to the name that is used by boost::program_options.
- `template<typename T >`
`std::string MapParameterName (const std::string &identifier, const typename boost::enable_if_c< arma::is_arma_type< T >::value || std::is_same< T, std::tuple< mlpack::data::DatasetInfo, arma::mat >>::value || data::HasSerialize< T >::value >::type ==0)`
Map the parameter name to the name that is used by boost::program_options.
- `template<typename T >`
`void MapParameterName (const util::ParamData &d, const void *, void *output)`
Map the parameter name to the name seen by boost::program_options.
- `template<typename T >`
`void OutputParam (const util::ParamData &data, const void *, void *)`
Output an option.
- `template<typename T >`
`void OutputParamImpl (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type ==0, const typename boost::disable_if< util::IsStdVector< T >>::type ==0, const typename boost::disable_if< data::HasSerialize< T >>::type ==0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type ==0)`
Output an option (print to stdout).
- `template<typename T >`
`void OutputParamImpl (const util::ParamData &data, const typename boost::enable_if< util::IsStdVector< T >>::type ==0)`
Output a vector option (print to stdout).
- `template<typename T >`
`void OutputParamImpl (const util::ParamData &data, const typename boost::enable_if< arma::is_arma_type< T >>::type ==0)`
Output a matrix option (this saves it to the given file).
- `template<typename T >`
`void OutputParamImpl (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type ==0, const typename boost::enable_if< data::HasSerialize< T >>::type ==0)`
Output a serializable class option (this saves it to the given file).
- `template<typename T >`
`void OutputParamImpl (const util::ParamData &data, const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type ==0)`
Output a mapped dataset.
- **PARAM_FLAG** ("help", "Default help info.", "h")

- **PARAM_FLAG** ("verbose", "Display informational messages and the full list of " "parameters and timers at the end of execution.", "v")
- **PARAM_FLAG** ("version", "Display the version of mlpack.", "V")
- **PARAM_STRING_IN** ("info", "Print help on a specific option.", "", "")
- `std::string` **ParamString** (const `std::string` ¶mName)
Print what a user would type to invoke the given option name.
- `void` **ParseCommandLine** (int argc, char **argv)
*Parse the command line, setting all of the options inside of the **CLI** (p. 1117) object to their appropriate given values.*
- `std::string` **PrintDataset** (const `std::string` &dataset)
Print a dataset type parameter (add .csv and return).
- `std::string` **PrintDefault** (const `std::string` ¶mName)
Given a parameter name, print its corresponding default value.
- `void` **PrintHelp** (const `std::string` ¶m="")
Print the help for the given parameter.
- `std::string` **PrintImport** (const `std::string` &bindingName)
*Print any imports for **CLI** (p. 1117) (there are none, so this returns an empty string).*
- `std::string` **PrintModel** (const `std::string` &model)
Print a model type parameter (add .bin and return).
- `std::string` **PrintOutputOptionInfo** ()
Print any special information about output options.
- `std::string` **PrintType** (const `util::ParamData` ¶m)
Print the type of a parameter that a user would specify from the command-line.
- `template<typename T >`
`std::string` **PrintTypeDoc** (const `util::ParamData` &data, const `typename` boost::disable_if< arma::is_arma_↵
type< T >>::type ==0, const `typename` boost::disable_if< `util::IsStdVector`< T >>::type ==0, const `typename`
boost::disable_if< `data::HasSerialize`< T >>::type ==0, const `typename` boost::disable_if< std::is_same< T,
std::tuple< `data::DatasetInfo`, arma::mat >>>::type ==0)
Return a string representing the command-line type of an option.
- `template<typename T >`
`std::string` **PrintTypeDoc** (const `util::ParamData` &data, const `typename` std::enable_if< `util::IsStdVector`< T
>::value >::type ==0)
Return a string representing the command-line type of a vector.
- `template<typename T >`
`std::string` **PrintTypeDoc** (const `util::ParamData` &data, const `typename` std::enable_if< arma::is_arma_type<
T >::value >::type ==0)
Return a string representing the command-line type of a matrix option.
- `template<typename T >`
`std::string` **PrintTypeDoc** (const `util::ParamData` &data, const `typename` std::enable_if< std::is_same< T, std::↵
::tuple< `data::DatasetInfo`, arma::mat >>::value >::type ==0)
Return a string representing the command-line type of a matrix tuple option.
- `template<typename T >`
`std::string` **PrintTypeDoc** (const `util::ParamData` &data, const `typename` boost::disable_if< arma::is_arma_↵
type< T >>::type ==0, const `typename` boost::enable_if< `data::HasSerialize`< T >>::type ==0)
Return a string representing the command-line type of a model.
- `template<typename T >`
`void` **PrintTypeDoc** (const `util::ParamData` &data, const `void` *, `void` *output)
Print the command-line type of an option into a string.
- `std::string` **PrintTypeDocs** ()
Print documentation for each of the types.

- `template<typename T >`
`std::string PrintValue (const T &value, bool quotes)`
Given a parameter type, print the corresponding value.
- `std::string ProcessOptions ()`
Base case for recursion.
- `template<typename T, typename... Args>`
`std::string ProcessOptions (const std::string ¶mName, const T &value, Args... args)`
Print an option for a command-line argument.
- `template<typename... Args>`
`std::string ProgramCall (const std::string &programName, Args... args)`
Given a program name and arguments for it, print what its invocation would be.
- `std::string ProgramCall (const std::string &programName)`
Given a program name, print a program call invocation assuming that all options are specified.
- `template<typename T >`
`void SetParam (util::ParamData &d, const boost::any &value, const typename boost::disable_if< arma::is_↵
arma_type< T >>::type !=0, const typename boost::disable_if< data::HasSerialize< T >>::type !=0, const
typename boost::disable_if< std::is_same< T, std::tuple< mlpack::data::DatasetInfo, arma::mat >>>::type
!=0, const typename boost::disable_if< std::is_same< T, bool >>::type !=0)`
This overload is called when nothing special needs to happen to the name of the parameter.
- `template<typename T >`
`void SetParam (util::ParamData &d, const boost::any &, const typename boost::enable_if< std::is_same< T,
bool >>::type !=0)`
This overload is called to set a boolean.
- `template<typename T >`
`void SetParam (util::ParamData &d, const boost::any &value, const typename std::enable_if< arma::is_arma↵
_type< T >::value||std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>::value >::type !=0)`
Set a matrix parameter, a matrix/dataset info parameter, or a serializable object.
- `template<typename T >`
`void SetParam (util::ParamData &d, const boost::any &value, const typename boost::disable_if< arma::is_↵
arma_type< T >>::type !=0, const typename boost::enable_if< data::HasSerialize< T >>::type !=0)`
Set a serializable object.
- `template<typename T >`
`void SetParam (const util::ParamData &d, const void *input, void *)`
Return a parameter casted to the given type.
- `template<typename T >`
`void StringTypeParam (const util::ParamData &, const void *, void *output)`
Return a string containing the type of a parameter.
- `template<>`
`void StringTypeParam< bool > (const util::ParamData &, const void *, void *output)`
Return "bool".
- `template<>`
`void StringTypeParam< double > (const util::ParamData &, const void *, void *output)`
Return "double".
- `template<>`
`void StringTypeParam< int > (const util::ParamData &, const void *, void *output)`
Return "int".
- `template<>`
`void StringTypeParam< std::string > (const util::ParamData &, const void *, void *output)`
Return "string".

- `template<>`
`void StringTypeParam< std::tuple< mlpack::data::DatasetInfo, arma::mat > > (const util::ParamData &, const void *, void *output)`
Return "string".
- `template<typename T >`
`std::string StringTypeParamImpl (const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0)`
Return a string containing the type of the parameter.
- `template<typename T >`
`std::string StringTypeParamImpl (const typename boost::enable_if< util::IsStdVector< T >>::type *=0)`
Return a string containing the type of the parameter, for vector options.
- `template<typename T >`
`std::string StringTypeParamImpl (const typename boost::enable_if< data::HasSerialize< T >>::type *=0)`
Return a string containing the type of the parameter,.

38.12.1 Function Documentation

38.12.1.1 AddToPO() [1/4]

```
void mlpack::bindings::cli::AddToPO (
    const std::string & boostName,
    const std::string & descr,
    boost::program_options::options_description & desc,
    const typename boost::disable_if< util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, bool >>::type * = 0 )
```

Add a non-vector option to boost::program_options.

Parameters

<i>boostName</i>	The name of the option to add to boost::program_options.
<i>descr</i>	Description string for parameter.
<i>desc</i>	Options description to add parameter to.

Definition at line 33 of file `add_to_po.hpp`.

38.12.1.2 AddToPO() [2/4]

```
void mlpack::bindings::cli::AddToPO (
    const std::string & boostName,
    const std::string & descr,
```

```
boost::program_options::options_description & desc,
const typename boost::enable_if< util::IsStdVector< T >>::type * = 0,
const typename boost::disable_if< std::is_same< T, bool >>::type * = 0 )
```

Add a vector option to boost::program_options.

This overload will use the multitoken() option.

Parameters

<i>boostName</i>	The name of the option to add to boost::program_options.
<i>descr</i>	Description string for parameter.
<i>desc</i>	Options description to add parameter to.

Definition at line 52 of file add_to_po.hpp.

38.12.1.3 AddToPO() [3/4]

```
void mlpack::bindings::cli::AddToPO (
    const std::string & boostName,
    const std::string & descr,
    boost::program_options::options_description & desc,
    const typename boost::disable_if< util::IsStdVector< T >>::type * = 0,
    const typename boost::enable_if< std::is_same< T, bool >>::type * = 0 )
```

Add a boolean option to boost::program_options.

Parameters

<i>boostName</i>	The name of the option to add to boost::program_options.
<i>descr</i>	Description string for parameter.
<i>desc</i>	Options description to add parameter to.

Definition at line 70 of file add_to_po.hpp.

38.12.1.4 AddToPO() [4/4]

```
void mlpack::bindings::cli::AddToPO (
    const util::ParamData & d,
    const void * ,
    void * output )
```

Add an option to boost::program_options.

This is the function meant to be used in the **CLI** (p. 1117) function map.

Parameters

<i>d</i>	Parameter data.
<i>input</i>	Unused void pointer.
<i>output</i>	Void pointer to options_description object.

Definition at line 88 of file `add_to_po.hpp`.

References `ParamData::alias`, `ParamData::desc`, and `ParamData::name`.

38.12.1.5 `DefaultParam()`

```
void mpack::bindings::cli::DefaultParam (
    const    util::ParamData & data,
    const void * ,
    void * output )
```

Return the default value of an option.

This is the function that will be placed into the **CLI** (p. 1117) `functionMap`.

Definition at line 80 of file `default_param.hpp`.

38.12.1.6 `DefaultParamImpl()` [1/5]

```
std::string mpack::bindings::cli::DefaultParamImpl (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if<    util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if<    data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::string >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple<    mpack::data::↵
DatasetInfo, arma::mat >>>::type * = 0 )
```

Return the default value of an option.

This is for regular types.

38.12.1.7 `DefaultParamImpl()` [2/5]

```
std::string mpack::bindings::cli::DefaultParamImpl (
    const    util::ParamData & data,
    const typename boost::enable_if<    util::IsStdVector< T >>::type * = 0 )
```

Return the default value of a vector option.

38.12.1.8 DefaultParamImpl() [3/5]

```
std::string mlpack::bindings::cli::DefaultParamImpl (
    const    util::ParamData & data,
    const typename boost::enable_if< std::is_same< T, std::string >>::type * = 0 )
```

Return the default value of a string option.

38.12.1.9 DefaultParamImpl() [4/5]

```
std::string mlpack::bindings::cli::DefaultParamImpl (
    const    util::ParamData & data,
    const typename boost::enable_if_c< arma::is_arma_type< T >::value||std::is_same< T,
std::tuple< mlpack::data::DatasetInfo, arma::mat >>::value >::type * = 0 )
```

Return the default value of a matrix option, a tuple option, a serializable option, or a string option (this returns the default filename, or "" if the default is no file).

38.12.1.10 DefaultParamImpl() [5/5]

```
std::string mlpack::bindings::cli::DefaultParamImpl (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Return the default value of a model option (this returns the default filename, or "" if the default is no file).

38.12.1.11 DeleteAllocatedMemory()

```
void mlpack::bindings::cli::DeleteAllocatedMemory (
    const    util::ParamData & d,
    const void * ,
    void * )
```

Definition at line 50 of file delete_allocated_memory.hpp.

38.12.1.12 DeleteAllocatedMemoryImpl() [1/3]

```
void mlpack::bindings::cli::DeleteAllocatedMemoryImpl (
    const util::ParamData & ,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0 )
```

Definition at line 22 of file delete_allocated_memory.hpp.

38.12.1.13 DeleteAllocatedMemoryImpl() [2/3]

```
void mlpack::bindings::cli::DeleteAllocatedMemoryImpl (
    const util::ParamData & ,
    const typename boost::enable_if< arma::is_arma_type< T >>::type * = 0 )
```

Definition at line 31 of file delete_allocated_memory.hpp.

38.12.1.14 DeleteAllocatedMemoryImpl() [3/3]

```
void mlpack::bindings::cli::DeleteAllocatedMemoryImpl (
    const util::ParamData & d,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Definition at line 39 of file delete_allocated_memory.hpp.

References `ParamData::value`.

38.12.1.15 EndProgram()

```
void mlpack::bindings::cli::EndProgram ( ) [inline]
```

Handle command-line program termination.

If `-help` or `-info` was passed, we won't make it here, so we don't have to write any contingencies for that.

Definition at line 26 of file end_program.hpp.

References `CLI::functionMap`, `Timers::GetAllTimers()`, `CLI::GetSingleton()`, `CLI::HasParam()`, `Log::Info`, `ParamData::input`, `CLI::Parameters()`, `Timers::PrintTimer()`, `Timers::StopAllTimers()`, `CLI::timer`, and `ParamData::tname`.

38.12.1.16 GetAllocatedMemory() [1/4]

```
void* mlpack::bindings::cli::GetAllocatedMemory (
    const    util::ParamData & ,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0 )
```

Definition at line 23 of file get_allocated_memory.hpp.

38.12.1.17 GetAllocatedMemory() [2/4]

```
void* mlpack::bindings::cli::GetAllocatedMemory (
    const    util::ParamData & ,
    const typename boost::enable_if< arma::is_arma_type< T >>::type * = 0 )
```

Definition at line 32 of file get_allocated_memory.hpp.

38.12.1.18 GetAllocatedMemory() [3/4]

```
void* mlpack::bindings::cli::GetAllocatedMemory (
    const    util::ParamData & d,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Definition at line 40 of file get_allocated_memory.hpp.

References ParamData::value.

38.12.1.19 GetAllocatedMemory() [4/4]

```
void mlpack::bindings::cli::GetAllocatedMemory (
    const    util::ParamData & d,
    const void * ,
    void * output )
```

Definition at line 52 of file get_allocated_memory.hpp.

38.12.1.20 GetBindingName()

```
std::string mlpack::bindings::cli::GetBindingName (
    const std::string & bindingName ) [inline]
```

Given the name of a binding, print its command-line name (this returns "mlpack_<bindingName>").

38.12.1.21 GetParam() [1/5]

```
T& mlpack::bindings::cli::GetParam (
    util::ParamData & d,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< mlpack::data::↵
DatasetInfo, arma::mat >>>::type * = 0 )
```

This overload is called when nothing special needs to happen to the name of the parameter.

Parameters

<i>d</i>	ParamData object to get parameter value from.
----------	---

Definition at line 29 of file get_param.hpp.

References ParamData::value.

38.12.1.22 GetParam() [2/5]

```
T& mlpack::bindings::cli::GetParam (
    util::ParamData & d,
    const typename boost::enable_if< arma::is_arma_type< T >>::type * = 0 )
```

Return a matrix parameter.

Parameters

<i>d</i>	ParamData object to get parameter value from.
----------	---

Definition at line 46 of file get_param.hpp.

References ParamData::input, mlpack::data::Load(), ParamData::loaded, ParamData::noTranspose, and ParamData↵
::value.

38.12.1.23 GetParam() [3/5]

```
T& mlpack::bindings::cli::GetParam (
    util::ParamData & d,
    const typename boost::enable_if< std::is_same< T, std::tuple< mlpack::data::↵
DatasetInfo, arma::mat >>>::type * = 0 )
```

Return a matrix/dataset info parameter.

Parameters

<i>d</i>	ParamData object to get parameter value from.
----------	---

Definition at line 77 of file get_param.hpp.

References ParamData::input, mlpack::data::Load(), ParamData::loaded, ParamData::noTranspose, and ParamData↵
::value.

38.12.1.24 GetParam() [4/5]

```
T*& mlpack::bindings::cli::GetParam (
    util::ParamData & d,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Return a serializable object.

Parameters

<i>d</i>	ParamData object to get parameter value from.
----------	---

Definition at line 103 of file get_param.hpp.

References ParamData::input, mlpack::data::Load(), ParamData::loaded, and ParamData::value.

38.12.1.25 GetParam() [5/5]

```
void mlpack::bindings::cli::GetParam (
    const util::ParamData & d,
    const void * ,
    void * output )
```

Return a parameter casted to the given type.

Type checking does not happen here!

Parameters

<i>d</i>	Parameter information.
<i>input</i>	Unused parameter.
<i>output</i>	Place to store pointer to value.

Definition at line 132 of file `get_param.hpp`.

38.12.1.26 `GetPrintableParam()` [1/5]

```
std::string mlpack::bindings::cli::GetPrintableParam (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if<    util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if<    data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple<    data::DatasetInfo,
arma::mat >>>::type * = 0 )
```

Print an option.

Print an option.

Definition at line 26 of file `get_printable_param.hpp`.

38.12.1.27 `GetPrintableParam()` [2/5]

```
std::string mlpack::bindings::cli::GetPrintableParam (
    const    util::ParamData & data,
    const typename std::enable_if<    util::IsStdVector< T >::value >::type * = 0 )
```

Print a vector option, with spaces between it.

38.12.1.28 `GetPrintableParam()` [3/5]

```
std::string mlpack::bindings::cli::GetPrintableParam (
    const    util::ParamData & data,
    const typename std::enable_if< arma::is_arma_type< T >::value||std::is_same< T, std::
::tuple<    data::DatasetInfo, arma::mat >>>::value >::type * = 0 )
```

Print a matrix/tuple option (this just prints the filename).

38.12.1.29 GetPrintableParam() [4/5]

```
std::string mlpack::bindings::cli::GetPrintableParam (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *   = 0,
    const typename boost::enable_if<    data::HasSerialize< T >>::type *   = 0 )
```

Print a model option (this just prints the filename).

Print a model option (this just prints the filename).

Definition at line 75 of file get_printable_param.hpp.

38.12.1.30 GetPrintableParam() [5/5]

```
void mlpack::bindings::cli::GetPrintableParam (
    const    util::ParamData & data,
    const void * ,
    void * output )
```

Print an option into a std::string.

This should print a short, one-line representation of the object. The string will be stored in the output pointer.

Definition at line 69 of file get_printable_param.hpp.

38.12.1.31 GetPrintableParamName() [1/5]

```
std::string mlpack::bindings::cli::GetPrintableParamName (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *   = 0,
    const typename boost::disable_if<    data::HasSerialize< T >>::type *   = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple<    data::DatasetInfo,
arma::mat >>>::type *   = 0 )
```

Get the parameter name for a type that has no special handling.

38.12.1.32 GetPrintableParamName() [2/5]

```
std::string mlpack::bindings::cli::GetPrintableParamName (
    const    util::ParamData & data,
    const typename boost::enable_if< arma::is_arma_type< T >>::type *   = 0 )
```

Get the parameter name for a matrix type (where the user has to pass the file that holds the matrix).

38.12.1.33 GetPrintableParamName() [3/5]

```
std::string mlpack::bindings::cli::GetPrintableParamName (
    const util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Get the parameter name for a serializable model type (where the user has to pass the file that holds the matrix).

38.12.1.34 GetPrintableParamName() [4/5]

```
std::string mlpack::bindings::cli::GetPrintableParamName (
    const util::ParamData & data,
    const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo,
    arma::mat >>>::type * = 0 )
```

Get the parameter name for a mapped matrix type (where the user has to pass the file that holds the matrix).

38.12.1.35 GetPrintableParamName() [5/5]

```
void mlpack::bindings::cli::GetPrintableParamName (
    const util::ParamData & d,
    const void * ,
    void * output )
```

Get the parameter's name as seen by the user.

Definition at line 67 of file get_printable_param_name.hpp.

38.12.1.36 GetPrintableParamValue() [1/5]

```
std::string mlpack::bindings::cli::GetPrintableParamValue (
    const util::ParamData & data,
    const std::string & value,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo,
    arma::mat >>>::type * = 0 )
```

Get the parameter name for a type that has no special handling.

38.12.1.37 GetPrintableParamValue() [2/5]

```
std::string mlpack::bindings::cli::GetPrintableParamValue (
    const util::ParamData & data,
    const std::string & value,
    const typename boost::enable_if< arma::is_arma_type< T >>::type * = 0 )
```

Get the parameter name for a matrix type (where the user has to pass the file that holds the matrix).

38.12.1.38 GetPrintableParamValue() [3/5]

```
std::string mlpack::bindings::cli::GetPrintableParamValue (
    const util::ParamData & data,
    const std::string & value,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Get the parameter name for a serializable model type (where the user has to pass the file that holds the matrix).

38.12.1.39 GetPrintableParamValue() [4/5]

```
std::string mlpack::bindings::cli::GetPrintableParamValue (
    const util::ParamData & data,
    const std::string & value,
    const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo,
    arma::mat >>>::type * = 0 )
```

Get the parameter name for a mapped matrix type (where the user has to pass the file that holds the matrix).

38.12.1.40 GetPrintableParamValue() [5/5]

```
void mlpack::bindings::cli::GetPrintableParamValue (
    const util::ParamData & d,
    const void * input,
    void * output )
```

Get the parameter's name as seen by the user.

Definition at line 71 of file `get_printable_param_value.hpp`.

38.12.1.41 GetPrintableType() [1/6]

```
std::string mlpack::bindings::cli::GetPrintableType (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if<    util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if<    data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple<    data::DatasetInfo,
arma::mat >>>::type * = 0 )
```

Return a string representing the command-line type of an option.

38.12.1.42 GetPrintableType() [2/6]

```
std::string mlpack::bindings::cli::GetPrintableType (
    const    util::ParamData & data,
    const typename std::enable_if<    util::IsStdVector< T >::value >::type * = 0 )
```

Return a string representing the command-line type of a vector.

38.12.1.43 GetPrintableType() [3/6]

```
std::string mlpack::bindings::cli::GetPrintableType (
    const    util::ParamData & data,
    const typename std::enable_if< arma::is_arma_type< T >::value >::type * = 0 )
```

Return a string representing the command-line type of a matrix option.

38.12.1.44 GetPrintableType() [4/6]

```
std::string mlpack::bindings::cli::GetPrintableType (
    const    util::ParamData & data,
    const typename std::enable_if< std::is_same< T, std::tuple<    data::DatasetInfo,
arma::mat >>>::value >::type * = 0 )
```

Return a string representing the command-line type of a matrix tuple option.

38.12.1.45 GetPrintableType() [5/6]

```
std::string mlpack::bindings::cli::GetPrintableType (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *   = 0,
    const typename boost::enable_if<    data::HasSerialize< T >>::type *   = 0 )
```

Return a string representing the command-line type of a model.

38.12.1.46 GetPrintableType() [6/6]

```
void mlpack::bindings::cli::GetPrintableType (
    const    util::ParamData & data,
    const void * ,
    void * output )
```

Print the command-line type of an option into a string.

Definition at line 70 of file `get_printable_type.hpp`.

38.12.1.47 GetRawParam() [1/4]

```
T& mlpack::bindings::cli::GetRawParam (
    util::ParamData & d,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *   = 0,
    const typename boost::disable_if<    data::HasSerialize< T >>::type *   = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< mlpack::data::↵
DatasetInfo, arma::mat >>>::type *   = 0 )
```

This overload is called when nothing special needs to happen to the name of the parameter.

Definition at line 28 of file `get_raw_param.hpp`.

References `ParamData::value`.

38.12.1.48 GetRawParam() [2/4]

```
T& mlpack::bindings::cli::GetRawParam (
    util::ParamData & d,
    const typename boost::enable_if_c< arma::is_arma_type< T >::value||std::is_same< T,
std::tuple< mlpack::data::DatasetInfo, arma::mat >>::value >::type *   = 0 )
```

Return a matrix parameter.

Definition at line 43 of file `get_raw_param.hpp`.

References `ParamData::value`.

38.12.1.49 GetRawParam() [3/4]

```
T*& mlpack::bindings::cli::GetRawParam (
    util::ParamData & d,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Return the name of a model parameter.

Definition at line 60 of file `get_raw_param.hpp`.

References `ParamData::value`.

38.12.1.50 GetRawParam() [4/4]

```
void mlpack::bindings::cli::GetRawParam (
    const util::ParamData & d,
    const void * ,
    void * output )
```

Return a parameter casted to the given type.

Type checking does not happen here!

Parameters

<i>d</i>	Parameter information.
<i>input</i>	Unused parameter.
<i>output</i>	Place to store pointer to value.

Definition at line 80 of file `get_raw_param.hpp`.

38.12.1.51 IgnoreCheck()

```
bool mlpack::bindings::cli::IgnoreCheck (
    const T & ) [inline]
```

Return whether or not a runtime check on parameters should be ignored.

We don't ignore any runtime checks for **CLI** (p. 1117) bindings, so this always returns false.

Definition at line 111 of file `print_doc_functions.hpp`.

38.12.1.52 MapParameterName() [1/3]

```
std::string mlpack::bindings::cli::MapParameterName (
    const std::string & identifier,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< mlpack::data::↵
DatasetInfo, arma::mat >>>::type * = 0 )
```

If needed, map the parameter name to the name that is used by boost::program_options.

This overload simply returns the same name, so it is used for primitive types.

Definition at line 28 of file map_parameter_name.hpp.

Referenced by CLIOption< N >::CLIOption().

38.12.1.53 MapParameterName() [2/3]

```
std::string mlpack::bindings::cli::MapParameterName (
    const std::string & identifier,
    const typename boost::enable_if_c< arma::is_arma_type< T >::value||std::is_same< T,
std::tuple< mlpack::data::DatasetInfo, arma::mat >>::value|| data::HasSerialize< T >::value >↵
::type * = 0 )
```

Map the parameter name to the name that is used by boost::program_options.

This overload addresses matrices and models, where the parameter name has "_file" appended to it (since a filename will be provided).

Definition at line 44 of file map_parameter_name.hpp.

38.12.1.54 MapParameterName() [3/3]

```
void mlpack::bindings::cli::MapParameterName (
    const util::ParamData & d,
    const void * ,
    void * output )
```

Map the parameter name to the name seen by boost::program_options.

Parameters

<i>d</i>	Parameter data.
<i>input</i>	Unused parameter.
<i>output</i>	Pointer to std::string that will hold the mapped name.

Definition at line 63 of file map_parameter_name.hpp.

References ParamData::name.

38.12.1.55 OutputParam()

```
void mlpack::bindings::cli::OutputParam (
    const    util::ParamData & data,
    const void * ,
    void * )
```

Output an option.

This is the function that will be called by the **CLI** (p. 1117) module.

Definition at line 74 of file output_param.hpp.

38.12.1.56 OutputParamImpl() [1/5]

```
void mlpack::bindings::cli::OutputParamImpl (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if<    util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if<    data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple<    data::DatasetInfo,
    arma::mat >>>::type * = 0 )
```

Output an option (print to stdout).

38.12.1.57 OutputParamImpl() [2/5]

```
void mlpack::bindings::cli::OutputParamImpl (
    const    util::ParamData & data,
    const typename boost::enable_if<    util::IsStdVector< T >>::type * = 0 )
```

Output a vector option (print to stdout).

38.12.1.58 OutputParamImpl() [3/5]

```
void mlpack::bindings::cli::OutputParamImpl (
    const util::ParamData & data,
    const typename boost::enable_if< arma::is_arma_type< T >>::type * = 0 )
```

Output a matrix option (this saves it to the given file).

38.12.1.59 OutputParamImpl() [4/5]

```
void mlpack::bindings::cli::OutputParamImpl (
    const util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Output a serializable class option (this saves it to the given file).

38.12.1.60 OutputParamImpl() [5/5]

```
void mlpack::bindings::cli::OutputParamImpl (
    const util::ParamData & data,
    const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo,
    arma::mat >>>::type * = 0 )
```

Output a mapped dataset.

38.12.1.61 PARAM_FLAG() [1/3]

```
mlpack::bindings::cli::PARAM_FLAG (
    "help" ,
    "Default help info." ,
    "h" )
```

38.12.1.62 PARAM_FLAG() [2/3]

```
mlpack::bindings::cli::PARAM_FLAG (
    "verbose" ,
    "Display informational messages and the full list of " "parameters and timers at the
end of execution." ,
    "v" )
```

38.12.1.63 PARAM_FLAG() [3/3]

```
mlpack::bindings::cli::PARAM_FLAG (
    "version" ,
    "Display the version of mlpack." ,
    "v" )
```

38.12.1.64 PARAM_STRING_IN()

```
mlpack::bindings::cli::PARAM_STRING_IN (
    "info" ,
    "Print help on a specific option." ,
    "" ,
    "" )
```

38.12.1.65 ParamString()

```
std::string mlpack::bindings::cli::ParamString (
    const std::string & paramName ) [inline]
```

Print what a user would type to invoke the given option name.

Note that the name *must* exist in the **CLI** (p. 1117) module. (Note that because of the way ProgramInfo is structured, this doesn't mean that all of the **PARAM_*()** declarataions need to come before the **PROGRAM_INFO()** (p. 2733) declaration.)

38.12.1.66 ParseCommandLine()

```
void mlpack::bindings::cli::ParseCommandLine (
    int argc,
    char ** argv )
```

Parse the command line, setting all of the options inside of the **CLI** (p. 1117) object to their appropriate given values.

Definition at line 35 of file parse_command_line.hpp.

References `Log::Debug`, `CLI::didParse`, `Log::Fatal`, `CLI::functionMap`, `CLI::GetSingleton()`, `mlpack::util::GetVersion()`, `CLI::HasParam()`, `PrefixedOutputStream::ignoreInput`, `Log::Info`, `ParamData::name`, `CLI::Parameters()`, `PrintHelp()`, `CLI::ProgramName()`, `ParamData::required`, `ParamData::tname`, `ParamData::value`, and `ParamData::wasPassed`.

38.12.1.67 PrintDataset()

```
std::string mpack::bindings::cli::PrintDataset (
    const std::string & dataset ) [inline]
```

Print a dataset type parameter (add .csv and return).

38.12.1.68 PrintDefault()

```
std::string mpack::bindings::cli::PrintDefault (
    const std::string & paramName ) [inline]
```

Given a parameter name, print its corresponding default value.

38.12.1.69 PrintHelp()

```
void mpack::bindings::cli::PrintHelp (
    const std::string & param = "" )
```

Print the help for the given parameter.

If no parameter is specified, then help will be printed for all parameters.

Parameters

<i>param</i>	Parameter name to print help for.
--------------	-----------------------------------

Referenced by ParseCommandLine().

38.12.1.70 PrintImport()

```
std::string mpack::bindings::cli::PrintImport (
    const std::string & bindingName ) [inline]
```

Print any imports for **CLI** (p. 1117) (there are none, so this returns an empty string).

38.12.1.71 PrintModel()

```
std::string mlpack::bindings::cli::PrintModel (
    const std::string & model ) [inline]
```

Print a model type parameter (add .bin and return).

38.12.1.72 PrintOutputOptionInfo()

```
std::string mlpack::bindings::cli::PrintOutputOptionInfo ( ) [inline]
```

Print any special information about output options.

38.12.1.73 PrintType()

```
std::string mlpack::bindings::cli::PrintType (
    const util::ParamData & param ) [inline]
```

Print the type of a parameter that a user would specify from the command-line.

38.12.1.74 PrintTypeDoc() [1/6]

```
std::string mlpack::bindings::cli::PrintTypeDoc (
    const util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo,
arma::mat >>>::type * = 0 )
```

Return a string representing the command-line type of an option.

38.12.1.75 PrintTypeDoc() [2/6]

```
std::string mlpack::bindings::cli::PrintTypeDoc (
    const util::ParamData & data,
    const typename std::enable_if< util::IsStdVector< T >::value >::type * = 0 )
```

Return a string representing the command-line type of a vector.

38.12.1.76 PrintTypeDoc() [3/6]

```
std::string mlpack::bindings::cli::PrintTypeDoc (
    const util::ParamData & data,
    const typename std::enable_if< arma::is_arma_type< T >::value >::type * = 0 )
```

Return a string representing the command-line type of a matrix option.

38.12.1.77 PrintTypeDoc() [4/6]

```
std::string mlpack::bindings::cli::PrintTypeDoc (
    const util::ParamData & data,
    const typename std::enable_if< std::is_same< T, std::tuple< data::DatasetInfo,
    arma::mat >>::value >::type * = 0 )
```

Return a string representing the command-line type of a matrix tuple option.

38.12.1.78 PrintTypeDoc() [5/6]

```
std::string mlpack::bindings::cli::PrintTypeDoc (
    const util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Return a string representing the command-line type of a model.

38.12.1.79 PrintTypeDoc() [6/6]

```
void mlpack::bindings::cli::PrintTypeDoc (
    const util::ParamData & data,
    const void * ,
    void * output )
```

Print the command-line type of an option into a string.

Definition at line 72 of file `print_type_doc.hpp`.

38.12.1.80 PrintTypeDocs()

```
std::string mlpack::bindings::cli::PrintTypeDocs ( ) [inline]
```

Print documentation for each of the types.

38.12.1.81 PrintValue()

```
std::string mlpack::bindings::cli::PrintValue (
    const T & value,
    bool quotes ) [inline]
```

Given a parameter type, print the corresponding value.

38.12.1.82 ProcessOptions() [1/2]

```
std::string mlpack::bindings::cli::ProcessOptions ( ) [inline]
```

Base case for recursion.

38.12.1.83 ProcessOptions() [2/2]

```
std::string mlpack::bindings::cli::ProcessOptions (
    const std::string & paramName,
    const T & value,
    Args... args )
```

Print an option for a command-line argument.

38.12.1.84 ProgramCall() [1/2]

```
std::string mlpack::bindings::cli::ProgramCall (
    const std::string & programName,
    Args... args )
```

Given a program name and arguments for it, print what its invocation would be.

38.12.1.85 ProgramCall() [2/2]

```
std::string mlpack::bindings::cli::ProgramCall (
    const std::string & programName ) [inline]
```

Given a program name, print a program call invocation assuming that all options are specified.

38.12.1.86 SetParam() [1/5]

```
void mlpack::bindings::cli::SetParam (
    util::ParamData & d,
    const boost::any & value,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< mlpack::data::↔
DatasetInfo, arma::mat >>>::type * = 0,
    const typename boost::disable_if< std::is_same< T, bool >>::type * = 0 )
```

This overload is called when nothing special needs to happen to the name of the parameter.

Definition at line 27 of file set_param.hpp.

References ParamData::value.

38.12.1.87 SetParam() [2/5]

```
void mlpack::bindings::cli::SetParam (
    util::ParamData & d,
    const boost::any & ,
    const typename boost::enable_if< std::is_same< T, bool >>::type * = 0 )
```

This overload is called to set a boolean.

Definition at line 44 of file set_param.hpp.

References ParamData::value, and ParamData::wasPassed.

38.12.1.88 SetParam() [3/5]

```
void mlpack::bindings::cli::SetParam (
    util::ParamData & d,
    const boost::any & value,
    const typename std::enable_if< arma::is_arma_type< T >::value||std::is_same< T, std::
::tuple< data::DatasetInfo, arma::mat >>::value >::type * = 0 )
```

Set a matrix parameter, a matrix/dataset info parameter, or a serializable object.

These set the filename referring to the parameter.

Definition at line 58 of file set_param.hpp.

References ParamData::value.

38.12.1.89 SetParam() [4/5]

```
void mlpack::bindings::cli::SetParam (
    util::ParamData & d,
    const boost::any & value,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Set a serializable object.

This sets the filename referring to the parameter.

Definition at line 76 of file set_param.hpp.

References ParamData::value.

38.12.1.90 SetParam() [5/5]

```
void mlpack::bindings::cli::SetParam (
    const util::ParamData & d,
    const void * input,
    void * )
```

Return a parameter casted to the given type.

Type checking does not happen here!

Parameters

<i>d</i>	Parameter information.
<i>input</i>	Unused parameter.
<i>output</i>	Place to store pointer to value.

Definition at line 97 of file set_param.hpp.

38.12.1.91 StringTypeParam()

```
void mlpack::bindings::cli::StringTypeParam (
    const    util::ParamData & ,
    const void * ,
    void * output )
```

Return a string containing the type of a parameter.

This overload is used if we don't have a primitive type.

Definition at line 51 of file string_type_param.hpp.

References StringTypeParam< bool >(), StringTypeParam< double >(), and StringTypeParam< int >().

38.12.1.92 StringTypeParam< bool >()

```
void mlpack::bindings::cli::StringTypeParam< bool > (
    const    util::ParamData & ,
    const void * ,
    void * output ) [inline]
```

Return "bool".

Referenced by StringTypeParam().

38.12.1.93 StringTypeParam< double >()

```
void mlpack::bindings::cli::StringTypeParam< double > (
    const    util::ParamData & ,
    const void * ,
    void * output ) [inline]
```

Return "double".

Referenced by StringTypeParam().

38.12.1.94 StringTypeParam< int >()

```
void mlpack::bindings::cli::StringTypeParam< int > (
    const util::ParamData & ,
    const void * ,
    void * output ) [inline]
```

Return "int".

Referenced by StringTypeParam().

38.12.1.95 StringTypeParam< std::string >()

```
void mlpack::bindings::cli::StringTypeParam< std::string > (
    const util::ParamData & ,
    const void * ,
    void * output ) [inline]
```

Return "string".

38.12.1.96 StringTypeParam< std::tuple< mlpack::data::DatasetInfo, arma::mat > >()

```
void mlpack::bindings::cli::StringTypeParam< std::tuple< mlpack::data::DatasetInfo, arma::mat > > (
    const util::ParamData & ,
    const void * ,
    void * output ) [inline]
```

Return "string";.

38.12.1.97 StringTypeParamImpl() [1/3]

```
std::string mlpack::bindings::cli::StringTypeParamImpl (
    const typename boost::disable_if< util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0 )
```

Return a string containing the type of the parameter.

38.12.1.98 StringTypeParamImpl() [2/3]

```
std::string mlpack::bindings::cli::StringTypeParamImpl (
    const typename boost::enable_if< util::IsStdVector< T >>::type * = 0 )
```

Return a string containing the type of the parameter, for vector options.

38.12.1.99 StringTypeParamImpl() [3/3]

```
std::string mlpack::bindings::cli::StringTypeParamImpl (
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Return a string containing the type of the parameter,.

38.13 mlpack::bindings::markdown Namespace Reference

Classes

- class **BindingInfo**
The **BindingInfo** (p. 984) class is used by the Markdown documentation generator to store multiple ProgramDoc objects, indexed by both the binding name (i.e.
- class **MDOption**
The Markdown option class.
- class **ProgramDocWrapper**

Functions

- template<typename T >
void **DefaultParam** (const util::ParamData &data, const void *, void *output)
Print the default value of a parameter into the output string.
- std::string **GetBindingName** (const std::string &bindingName)
Given the name of the binding, print the name for the current language (as given by **BindingInfo** (p. 984)).
- std::string **GetBindingName** (const std::string &language, const std::string &name)
Given a language name and a binding name, return the name of that binding for that language.
- template<typename T >
void **GetParam** (const util::ParamData &d, const void *, void *output)
All Markdown binding types are exactly what is held in the ParamData, so no special handling is necessary.
- template<typename T >
std::string **GetPrintableParam** (const util::ParamData &data, const typename boost::disable_if< arma::is_↵
arma_type< T >>::type *=0, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const
typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_↵
_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)
Print an option of a simple type.

- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::enable_if< util::IsStd↵`
`Vector< T >>::type !=0)`
Print a vector option, with spaces between it.
- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::enable_if< arma::is_↵`
`arma_type< T >>::type !=0)`
Print a matrix option (this prints its size).
- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::disable_if< arma::is_↵`
`arma_type< T >>::type !=0, const typename boost::enable_if< data::HasSerialize< T >>::type !=0)`
Print a serializable class option (this prints the class name).
- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::enable_if< std::is_same<`
`T, std::tuple< data::DatasetInfo, arma::mat >>>::type !=0)`
Print a combination DatasetInfo/matrix parameter.
- `template<typename T >`
`void GetPrintableParam (const util::ParamData &data, const void *, void *output)`
Print an option into a std::string.
- `template<typename T >`
`std::string GetPrintableParamName (const util::ParamData &data, const typename boost::disable_if< arma↵`
`::is_arma_type< T >>::type !=0, const typename boost::disable_if< data::HasSerialize< T >>::type !=0,`
`const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type !=0)`
Get the parameter name for a type that has no special handling.
- `template<typename T >`
`std::string GetPrintableParamName (const util::ParamData &data, const typename boost::enable_if< arma↵`
`::is_arma_type< T >>::type !=0)`
Get the parameter name for a matrix type (where the user has to pass the file that holds the matrix).
- `template<typename T >`
`std::string GetPrintableParamName (const util::ParamData &data, const typename boost::enable_if< arma↵`
`::is_arma_type< T >>::type !=0, const typename boost::enable_if< data::HasSerialize< T >>::type !=0)`
Get the parameter name for a serializable model type (where the user has to pass the file that holds the matrix).
- `template<typename T >`
`std::string GetPrintableParamName (const util::ParamData &data, const typename boost::enable_if< std↵`
`::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type !=0)`
Get the parameter name for a mapped matrix type (where the user has to pass the file that holds the matrix).
- `template<typename T >`
`void GetPrintableParamName (const util::ParamData &d, const void *, void *output)`
Get the parameter's name as seen by the user.
- `template<typename T >`
`std::string GetPrintableParamValue (const util::ParamData &data, const std::string &value, const typename`
`boost::disable_if< arma::is_arma_type< T >>::type !=0, const typename boost::disable_if< data::Has↵`
`Serialize< T >>::type !=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo,`
`arma::mat >>>::type !=0)`
Get the parameter name for a type that has no special handling.
- `template<typename T >`
`std::string GetPrintableParamValue (const util::ParamData &data, const std::string &value, const typename`
`boost::enable_if< arma::is_arma_type< T >>::type !=0)`
Get the parameter name for a matrix type (where the user has to pass the file that holds the matrix).

- `template<typename T >`
`std::string GetPrintableParamValue (const util::ParamData &data, const std::string &value, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)`
Get the parameter name for a serializable model type (where the user has to pass the file that holds the matrix).
- `template<typename T >`
`std::string GetPrintableParamValue (const util::ParamData &data, const std::string &value, const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`
Get the parameter name for a mapped matrix type (where the user has to pass the file that holds the matrix).
- `template<typename T >`
`void GetPrintableParamValue (const util::ParamData &d, const void *input, void *output)`
Get the parameter's name as seen by the user.
- `template<typename T >`
`void GetPrintableType (const util::ParamData &data, const void *, void *output)`
Print the type of a parameter into the output string.
- `template<typename T >`
`std::string GetPrintableType (const util::ParamData &data)`
Print the type of a parameter.
- `template<typename T >`
`bool IgnoreCheck (const T &t)`
Return whether or not a runtime check on parameters should be ignored.
- `template<typename T >`
`bool IsSerializable (const typename boost::disable_if< data::HasSerialize< T >>::type *=0)`
Return false, because the type is not serializable.
- `template<typename T >`
`bool IsSerializable (const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)`
Return false, because even though the type is serializable, it is an Armadillo type not an mlpack model.
- `template<typename T >`
`bool IsSerializable (const typename boost::enable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0)`
Return true, because the type is serializable.
- `template<typename T >`
`void IsSerializable (const util::ParamData &, const void *, void *output)`
Return whether or not the type is serializable.
- `std::string ParamString (const std::string ¶mName)`
Print what a user would type to invoke the given option name.
- `std::string ParamType (const util::ParamData &d)`
Print the user-encountered type of an option.
- `std::string PrintDataset (const std::string &dataset)`
Print a dataset type parameter (add .csv and return).
- `std::string PrintDefault (const std::string ¶mName)`
Print the default value of an option, unless it is required (in which case Markdown italicized '-' is printed).
- `std::string PrintImport (const std::string &bindingName)`
Print any imports that need to be done before using the binding.
- `std::string PrintLanguage (const std::string &language)`
Print the name of the given language.
- `std::string PrintModel (const std::string &model)`
Print a model type parameter (add .bin and return).
- `std::string PrintOutputOptionInfo (const std::string &language)`

Print any special information about output options.

- `template<typename T >`
`std::string PrintTypeDoc (const util::ParamData &data)`
Print the type of a parameter into the output string.
- `std::string PrintTypeDocs ()`
Print details about the different types for a language.
- `template<typename T >`
`std::string PrintValue (const T &value, bool quotes)`
Given a parameter type, print the corresponding value.
- `template<typename... Args>`
`std::string ProgramCall (const std::string &programName, Args... args)`
Given a program name and arguments for it, print what its invocation would be.
- `std::string ProgramCall (const std::string &programName)`
Given a program name, print a call assuming that all arguments are specified.

38.13.1 Function Documentation

38.13.1.1 DefaultParam()

```
void mlpack::bindings::markdown::DefaultParam (
    const util::ParamData & data,
    const void * ,
    void * output )
```

Print the default value of a parameter into the output string.

The type printed depends on the current setting of **BindingInfo::Language()** (p. 985).

Definition at line 31 of file `default_param.hpp`.

References **BindingInfo::Language()**.

38.13.1.2 GetBindingName() [1/2]

```
std::string mlpack::bindings::markdown::GetBindingName (
    const std::string & bindingName ) [inline]
```

Given the name of the binding, print the name for the current language (as given by **BindingInfo** (p. 984)).

38.13.1.3 GetBindingName() [2/2]

```
std::string mlpack::bindings::markdown::GetBindingName (
    const std::string & language,
    const std::string & name )
```

Given a language name and a binding name, return the name of that binding for that language.

Note that if a new language is added to the mlpack bindings, this method will need to be updated so that documentation can be successfully generated for that language.

38.13.1.4 GetParam()

```
void mlpack::bindings::markdown::GetParam (
    const util::ParamData & d,
    const void * ,
    void * output )
```

All Markdown binding types are exactly what is held in the ParamData, so no special handling is necessary.

Definition at line 26 of file `get_param.hpp`.

References `ParamData::value`.

38.13.1.5 GetPrintableParam() [1/6]

```
std::string mlpack::bindings::markdown::GetPrintableParam (
    const util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo,
    arma::mat >>>::type * = 0 )
```

Print an option of a simple type.

Print an option.

Definition at line 26 of file `get_printable_param.hpp`.

38.13.1.6 GetPrintableParam() [2/6]

```
std::string mlpack::bindings::markdown::GetPrintableParam (
    const util::ParamData & data,
    const typename boost::enable_if< util::IsStdVector< T >>::type * = 0 )
```

Print a vector option, with spaces between it.

Definition at line 43 of file `get_printable_param.hpp`.

38.13.1.7 GetPrintableParam() [3/6]

```
std::string mlpack::bindings::markdown::GetPrintableParam (
    const util::ParamData & data,
    const typename boost::enable_if< arma::is_arma_type< T >>::type * = 0 )
```

Print a matrix option (this prints its size).

Print a matrix option (this just prints the filename).

Definition at line 59 of file `get_printable_param.hpp`.

38.13.1.8 GetPrintableParam() [4/6]

```
std::string mlpack::bindings::markdown::GetPrintableParam (
    const util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Print a serializable class option (this prints the class name).

Print a serializable class option (this just prints the filename).

Print a model option (this just prints the filename).

Definition at line 75 of file `get_printable_param.hpp`.

38.13.1.9 GetPrintableParam() [5/6]

```
std::string mlpack::bindings::markdown::GetPrintableParam (
    const util::ParamData & data,
    const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo,
arma::mat >>>::type * = 0 )
```

Print a combination DatasetInfo/matrix parameter.

Print a mapped matrix option (this just prints the filename).

Definition at line 89 of file get_printable_param.hpp.

38.13.1.10 GetPrintableParam() [6/6]

```
void mlpack::bindings::markdown::GetPrintableParam (
    const util::ParamData & data,
    const void * ,
    void * output )
```

Print an option into a std::string.

This should print a short, one-line representation of the object. The string will be stored in the output pointer.

Parameters

<i>data</i>	Parameter data struct.
<i>input</i>	Unused parameter.
<i>output</i>	Output storage for the string.

Definition at line 114 of file get_printable_param.hpp.

38.13.1.11 GetPrintableParamName() [1/5]

```
std::string mlpack::bindings::markdown::GetPrintableParamName (
    const util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo,
arma::mat >>>::type * = 0 )
```

Get the parameter name for a type that has no special handling.

38.13.1.12 GetPrintableParamName() [2/5]

```
std::string mlpack::bindings::markdown::GetPrintableParamName (
    const util::ParamData & data,
    const typename boost::enable_if< arma::is_arma_type< T >>::type * = 0 )
```

Get the parameter name for a matrix type (where the user has to pass the file that holds the matrix).

38.13.1.13 GetPrintableParamName() [3/5]

```
std::string mlpack::bindings::markdown::GetPrintableParamName (
    const util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Get the parameter name for a serializable model type (where the user has to pass the file that holds the matrix).

38.13.1.14 GetPrintableParamName() [4/5]

```
std::string mlpack::bindings::markdown::GetPrintableParamName (
    const util::ParamData & data,
    const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo,
    arma::mat >>>::type * = 0 )
```

Get the parameter name for a mapped matrix type (where the user has to pass the file that holds the matrix).

38.13.1.15 GetPrintableParamName() [5/5]

```
void mlpack::bindings::markdown::GetPrintableParamName (
    const util::ParamData & d,
    const void * ,
    void * output )
```

Get the parameter's name as seen by the user.

Definition at line 67 of file `get_printable_param_name.hpp`.

38.13.1.16 GetPrintableParamValue() [1/5]

```
std::string mlpack::bindings::markdown::GetPrintableParamValue (
    const util::ParamData & data,
    const std::string & value,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo,
arma::mat >>>::type * = 0 )
```

Get the parameter name for a type that has no special handling.

38.13.1.17 GetPrintableParamValue() [2/5]

```
std::string mlpack::bindings::markdown::GetPrintableParamValue (
    const util::ParamData & data,
    const std::string & value,
    const typename boost::enable_if< arma::is_arma_type< T >>::type * = 0 )
```

Get the parameter name for a matrix type (where the user has to pass the file that holds the matrix).

38.13.1.18 GetPrintableParamValue() [3/5]

```
std::string mlpack::bindings::markdown::GetPrintableParamValue (
    const util::ParamData & data,
    const std::string & value,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Get the parameter name for a serializable model type (where the user has to pass the file that holds the matrix).

38.13.1.19 GetPrintableParamValue() [4/5]

```
std::string mlpack::bindings::markdown::GetPrintableParamValue (
    const util::ParamData & data,
    const std::string & value,
    const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo,
arma::mat >>>::type * = 0 )
```

Get the parameter name for a mapped matrix type (where the user has to pass the file that holds the matrix).

38.13.1.20 GetPrintableParamValue() [5/5]

```
void mlpack::bindings::markdown::GetPrintableParamValue (
    const util::ParamData & d,
    const void * input,
    void * output )
```

Get the parameter's name as seen by the user.

Definition at line 71 of file `get_printable_param_value.hpp`.

38.13.1.21 GetPrintableType() [1/2]

```
void mlpack::bindings::markdown::GetPrintableType (
    const util::ParamData & data,
    const void * ,
    void * output )
```

Print the type of a parameter into the output string.

The type printed depends on the current setting of **BindingInfo::Language()** (p. 985).

Definition at line 30 of file `get_printable_type.hpp`.

References **BindingInfo::Language()**.

38.13.1.22 GetPrintableType() [2/2]

```
std::string mlpack::bindings::markdown::GetPrintableType (
    const util::ParamData & data )
```

Print the type of a parameter.

The type printed depends on the current setting of **BindingInfo::Language()** (p. 985).

Definition at line 56 of file `get_printable_type.hpp`.

38.13.1.23 IgnoreCheck()

```
bool mpack::bindings::markdown::IgnoreCheck (
    const T & ) [inline]
```

Return whether or not a runtime check on parameters should be ignored.

We don't ignore any runtime checks for **CLI** (p. 1117) bindings, so this always returns false.

Return whether or not a runtime check on parameters should be ignored.

For test bindings, we do not ignore any checks, so this always returns false.

Definition at line 111 of file print_doc_functions.hpp.

38.13.1.24 IsSerializable() [1/4]

```
bool mpack::bindings::markdown::IsSerializable (
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0 )
```

Return false, because the type is not serializable.

Definition at line 25 of file is_serializable.hpp.

38.13.1.25 IsSerializable() [2/4]

```
bool mpack::bindings::markdown::IsSerializable (
    const typename boost::enable_if< arma::is_arma_type< T >>::type * = 0 )
```

Return false, because even though the type is serializable, it is an Armadillo type not an mpack model.

Definition at line 36 of file is_serializable.hpp.

38.13.1.26 IsSerializable() [3/4]

```
bool mpack::bindings::markdown::IsSerializable (
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0 )
```

Return true, because the type is serializable.

Definition at line 46 of file is_serializable.hpp.

38.13.1.27 IsSerializable() [4/4]

```
void mlpack::bindings::markdown::IsSerializable (
    const    util::ParamData & ,
    const void * ,
    void * output )
```

Return whether or not the type is serializable.

Definition at line 57 of file `is_serializable.hpp`.

38.13.1.28 ParamString()

```
std::string mlpack::bindings::markdown::ParamString (
    const std::string & paramName ) [inline]
```

Print what a user would type to invoke the given option name.

Note that the name *must* exist in the **CLI** (p. 1117) module. (Note that because of the way ProgramInfo is structured, this doesn't mean that all of the `PARAM_*`() declarataions need to come before the **PROGRAM_INFO()** (p. 2733) declaration.)

38.13.1.29 ParamType()

```
std::string mlpack::bindings::markdown::ParamType (
    const    util::ParamData & d ) [inline]
```

Print the user-encountered type of an option.

38.13.1.30 PrintDataset()

```
std::string mlpack::bindings::markdown::PrintDataset (
    const std::string & dataset ) [inline]
```

Print a dataset type parameter (add .csv and return).

38.13.1.31 PrintDefault()

```
std::string mlpack::bindings::markdown::PrintDefault (
    const std::string & paramName ) [inline]
```

Print the default value of an option, unless it is required (in which case Markdown italicized '–' is printed).

38.13.1.32 PrintImport()

```
std::string mlpack::bindings::markdown::PrintImport (
    const std::string & bindingName ) [inline]
```

Print any imports that need to be done before using the binding.

38.13.1.33 PrintLanguage()

```
std::string mlpack::bindings::markdown::PrintLanguage (
    const std::string & language ) [inline]
```

Print the name of the given language.

38.13.1.34 PrintModel()

```
std::string mlpack::bindings::markdown::PrintModel (
    const std::string & model ) [inline]
```

Print a model type parameter (add .bin and return).

38.13.1.35 PrintOutputOptionInfo()

```
std::string mlpack::bindings::markdown::PrintOutputOptionInfo (
    const std::string & language ) [inline]
```

Print any special information about output options.

38.13.1.36 PrintTypeDoc()

```
std::string mlpack::bindings::markdown::PrintTypeDoc (
    const util::ParamData & data )
```

Print the type of a parameter into the output string.

The type printed depends on the current setting of **BindingInfo::Language()** (p. 985).

Definition at line 30 of file `print_type_doc.hpp`.

References **BindingInfo::Language()**.

38.13.1.37 PrintTypeDocs()

```
std::string mlpack::bindings::markdown::PrintTypeDocs ( ) [inline]
```

Print details about the different types for a language.

38.13.1.38 PrintValue()

```
std::string mlpack::bindings::markdown::PrintValue (
    const T & value,
    bool quotes ) [inline]
```

Given a parameter type, print the corresponding value.

38.13.1.39 ProgramCall() [1/2]

```
std::string mlpack::bindings::markdown::ProgramCall (
    const std::string & programName,
    Args... args )
```

Given a program name and arguments for it, print what its invocation would be.

38.13.1.40 ProgramCall() [2/2]

```
std::string mlpack::bindings::markdown::ProgramCall (
    const std::string & programName ) [inline]
```

Given a program name, print a call assuming that all arguments are specified.

38.14 mlpack::bindings::python Namespace Reference

Classes

- class **PyOption**

The Python option class.

Functions

- `template<typename T >`
`void DefaultParam (const util::ParamData &data, const void *, void *output)`
Return the default value of an option.
- `template<typename T >`
`std::string DefaultParamImpl (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::string >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< mlpack::data::DatasetInfo, arma::mat >>::type *=0)`
Return the default value of an option.
- `template<typename T >`
`std::string DefaultParamImpl (const util::ParamData &data, const typename boost::enable_if< util::IsStdVector< T >>::type *=0)`
Return the default value of a vector option.
- `template<typename T >`
`std::string DefaultParamImpl (const util::ParamData &data, const typename boost::enable_if< std::is_same< T, std::string >>::type *=0)`
Return the default value of a string option.
- `template<typename T >`
`std::string DefaultParamImpl (const util::ParamData &data, const typename boost::enable_if_c< arma::is_arma_type< T >::value || std::is_same< T, std::tuple< mlpack::data::DatasetInfo, arma::mat >>::value >>::type *=0)`
Return the default value of a matrix option, a tuple option, a serializable option, or a string option (this returns the default filename, or "" if the default is no file).
- `template<typename T >`
`std::string DefaultParamImpl (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)`
Return the default value of a model option (this returns the default filename, or "" if the default is no file).
- `template<typename T >`
`std::string GetArmaType ()`
This is used for arma::Mat<> types; it will return "mat" for matrices, "row" for row vectors, and "col" for column vectors.
- `std::string GetBindingName (const std::string &bindingName)`
Given the name of a binding, print its Python name.
- `template<typename T >`
`std::string GetCythonType (const util::ParamData &, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0)`
- `template<typename T >`
`std::string GetCythonType (const util::ParamData &d, const typename boost::enable_if< util::IsStdVector< T >>::type *=0)`
- `template<typename T >`
`std::string GetCythonType (const util::ParamData &d, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)`
- `template<typename T >`
`std::string GetCythonType (const util::ParamData &d, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)`
- `template<>`
`std::string GetCythonType< bool > (const util::ParamData &, const typename boost::disable_if< util::IsStdVector< bool >>::type *, const typename boost::disable_if< data::HasSerialize< bool >>::type *, const typename boost::disable_if< arma::is_arma_type< bool >>::type *)`

- `template<>`
`std::string GetCythonType< double > (const util::ParamData &, const typename boost::disable_if< util::IsStdVector< double >>::type *, const typename boost::disable_if< data::HasSerialize< double >>::type *, const typename boost::disable_if< arma::is_arma_type< double >>::type *)`
- `template<>`
`std::string GetCythonType< int > (const util::ParamData &, const typename boost::disable_if< util::IsStdVector< int >>::type *, const typename boost::disable_if< data::HasSerialize< int >>::type *, const typename boost::disable_if< arma::is_arma_type< int >>::type *)`
- `template<>`
`std::string GetCythonType< size_t > (const util::ParamData &, const typename boost::disable_if< util::IsStdVector< size_t >>::type *, const typename boost::disable_if< data::HasSerialize< size_t >>::type *, const typename boost::disable_if< arma::is_arma_type< size_t >>::type *)`
- `template<>`
`std::string GetCythonType< std::string > (const util::ParamData &, const typename boost::disable_if< util::IsStdVector< std::string >>::type *, const typename boost::disable_if< data::HasSerialize< std::string >>::type *, const typename boost::disable_if< arma::is_arma_type< std::string >>::type *)`
- `template<typename T >`
`std::string GetNumpyType ()`
- `template<>`
`std::string GetNumpyType< double > ()`
- `template<>`
`std::string GetNumpyType< size_t > ()`
- `template<typename T >`
`std::string GetNumpyTypeChar ()`
- `template<>`
`std::string GetNumpyTypeChar< arma::Col< size_t > > ()`
- `template<>`
`std::string GetNumpyTypeChar< arma::mat > ()`
- `template<>`
`std::string GetNumpyTypeChar< arma::Mat< size_t > > ()`
- `template<>`
`std::string GetNumpyTypeChar< arma::Row< size_t > > ()`
- `template<>`
`std::string GetNumpyTypeChar< arma::rowvec > ()`
- `template<>`
`std::string GetNumpyTypeChar< arma::vec > ()`
- `template<typename T >`
`void GetParam (const util::ParamData &d, const void *, void *output)`
All Python binding types are exactly what is held in the ParamData, so no special handling is necessary.
- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`
Print an option of a simple type.
- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::enable_if< util::IsStdVector< T >>::type *=0)`
Print a vector option, with spaces between it.
- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)`

Print a matrix option (this prints its size).

- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)`

Print a serializable class option (this prints the class name).

- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`

Print a combination DatasetInfo/matrix parameter.

- `template<typename T >`
`void GetPrintableParam (const util::ParamData &data, const void *, void *output)`

Print an option into a std::string.

- `template<typename T >`
`std::string GetPrintableType (const util::ParamData &, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`
- `template<typename T >`
`std::string GetPrintableType (const util::ParamData &d, const typename boost::enable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`
- `template<typename T >`
`std::string GetPrintableType (const util::ParamData &, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`
- `template<typename T >`
`std::string GetPrintableType (const util::ParamData &, const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`
- `template<typename T >`
`std::string GetPrintableType (const util::ParamData &d, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`
- `template<typename T >`
`void GetPrintableType (const util::ParamData &d, const void *, void *output)`
- `template<>`
`std::string GetPrintableType< bool > (const util::ParamData &, const typename boost::disable_if< util::IsStdVector< bool >>::type *, const typename boost::disable_if< data::HasSerialize< bool >>::type *, const typename boost::disable_if< arma::is_arma_type< bool >>::type *, const typename boost::disable_if< std::is_same< bool, std::tuple< data::DatasetInfo, arma::mat >>>::type *)`
- `template<>`
`std::string GetPrintableType< double > (const util::ParamData &, const typename boost::disable_if< util::IsStdVector< double >>::type *, const typename boost::disable_if< data::HasSerialize< double >>::type *, const typename boost::disable_if< arma::is_arma_type< double >>::type *, const typename boost::disable_if< std::is_same< double, std::tuple< data::DatasetInfo, arma::mat >>>::type *)`
- `template<>`
`std::string GetPrintableType< int > (const util::ParamData &, const typename boost::disable_if< util::IsStdVector< int >>::type *, const typename boost::disable_if< data::HasSerialize< int >>::type *, const typename boost::disable_if< arma::is_arma_type< int >>::type *, const typename boost::disable_if< std::is_same< int, std::tuple< data::DatasetInfo, arma::mat >>>::type *)`
- `template<>`
`std::string GetPrintableType< size_t > (const util::ParamData &, const typename boost::disable_if< util::IsStdVector< size_t >>::type *, const typename boost::disable_if< data::HasSerialize< size_t >>::type *,`

const typename boost::disable_if< arma::is_arma_type< size_t >>::type *, const typename boost::disable_if< std::is_same< size_t, std::tuple< **data::DatasetInfo**, arma::mat >>>::type *)

- template<>

std::string **GetPrintableType**< std::string > (const **util::ParamData** &, const typename boost::disable_if< **util::isStdVector**< std::string >>::type *, const typename boost::disable_if< **data::HasSerialize**< std::string >>::type *, const typename boost::disable_if< arma::is_arma_type< std::string >>::type *, const typename boost::disable_if< std::is_same< std::string, std::tuple< **data::DatasetInfo**, arma::mat >>>::type *)
- bool **IgnoreCheck** (const std::string ¶mName)

Print whether or not we should ignore a check on the given parameter.
- bool **IgnoreCheck** (const std::vector< std::string > &constraints)

Print whether or not we should ignore a check on the given set of constraints.
- bool **IgnoreCheck** (const std::vector< std::pair< std::string, bool >> &constraints, const std::string ¶mName)

Print whether or not we should ignore a check on the given set of constraints.
- template<typename T >

void **ImportDecl** (const **util::ParamData** &d, const size_t indent, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< **data::HasSerialize**< T >>::type *=0)

For a serializable type, print a cppclass definition.
- template<typename T >

void **ImportDecl** (const **util::ParamData** &, const size_t, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< **data::HasSerialize**< T >>::type *=0)

For a non-serializable type, print nothing.
- template<typename T >

void **ImportDecl** (const **util::ParamData** &, const size_t, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)

For a matrix type, print nothing.
- template<typename T >

void **ImportDecl** (const **util::ParamData** &d, const void *indent, void *)

Print the cppclass definition for a serializable model; print nothing for a non-serializable type.
- std::string **ParamString** (const std::string ¶mName)

Given the parameter name, determine what it would actually be when passed to the command line.
- template<typename T >

void **PrintClassDefn** (const **util::ParamData** &, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< **data::HasSerialize**< T >>::type *=0)

Non-serializable models don't require any special definitions, so this prints nothing.
- template<typename T >

void **PrintClassDefn** (const **util::ParamData** &, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)

Matrices don't require any special definitions, so this prints nothing.
- template<typename T >

void **PrintClassDefn** (const **util::ParamData** &d, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< **data::HasSerialize**< T >>::type *=0)

Serializable models require a special class definition.
- template<typename T >

void **PrintClassDefn** (const **util::ParamData** &d, const void *, void *)

Print the class definition to stdout.
- std::string **PrintDataset** (const std::string &datasetName)

Given the name of a matrix, print it.
- std::string **PrintDefault** (const std::string ¶mName)

Given a parameter name, print its corresponding default value.

- `template<typename T >`
`void PrintDefn (const util::ParamData &d, const void *, void *)`
Print the definition for a Python binding parameter to stdout.
- `template<typename T >`
`void PrintDoc (const util::ParamData &d, const void *input, void *)`
Print the docstring documentation for a given parameter.
- `std::string PrintImport (const std::string &bindingName)`
Print any import information for the Python binding.
- `std::string PrintInputOptions ()`
- `template<typename T , typename... Args>`
`std::string PrintInputOptions (const std::string ¶mName, const T &value, Args... args)`
Print an input option.
- `template<typename T >`
`void PrintInputProcessing (const util::ParamData &d, const size_t indent, const typename boost::disable_if<
util::IsStdVector< T >>::type ==0, const typename boost::disable_if< arma::is_arma_type< T >>::type ==0,
const typename boost::disable_if< data::HasSerialize< T >>::type ==0, const typename boost::disable_if<
std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type ==0)`
Print input processing for a standard option type.
- `template<typename T >`
`void PrintInputProcessing (const util::ParamData &d, const size_t indent, const typename boost::disable_if<
arma::is_arma_type< T >>::type ==0, const typename boost::disable_if< data::HasSerialize< T >>::type
==0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type
==0, const typename boost::enable_if< util::IsStdVector< T >>::type ==0)`
Print input processing for a vector type.
- `template<typename T >`
`void PrintInputProcessing (const util::ParamData &d, const size_t indent, const typename boost::disable_if<
util::IsStdVector< T >>::type ==0, const typename boost::enable_if< arma::is_arma_type< T >>::type ==0)`
Print input processing for a matrix type.
- `template<typename T >`
`void PrintInputProcessing (const util::ParamData &d, const size_t indent, const typename boost::disable_if<
util::IsStdVector< T >>::type ==0, const typename boost::disable_if< arma::is_arma_type< T >>::type ==0,
const typename boost::enable_if< data::HasSerialize< T >>::type ==0)`
Print input processing for a serializable type.
- `template<typename T >`
`void PrintInputProcessing (const util::ParamData &d, const size_t indent, const typename boost::disable_if<
util::IsStdVector< T >>::type ==0, const typename boost::enable_if< std::is_same< T, std::tuple< data::←
DatasetInfo, arma::mat >>>::type ==0)`
Print input processing for a matrix/DatasetInfo type.
- `template<typename T >`
`void PrintInputProcessing (const util::ParamData &d, const void *input, void *)`
Given parameter information and the current number of spaces for indentation, print the code to process the input to cout.
- `std::string PrintModel (const std::string &modelName)`
Given the name of a model, print it.
- `std::string PrintOutputOptionInfo ()`
Print any special information about output options.
- `std::string PrintOutputOptions ()`
- `template<typename T , typename... Args>`
`std::string PrintOutputOptions (const std::string ¶mName, const T &value, Args... args)`

- `template<typename T >`
`void PrintOutputProcessing (const util::ParamData &d, const size_t indent, const bool onlyOutput, const`
`typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< data::`
`::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::`
`DatasetInfo, arma::mat >>>::type *=0)`
Print output processing for a regular parameter type.
- `template<typename T >`
`void PrintOutputProcessing (const util::ParamData &d, const size_t indent, const bool onlyOutput, const`
`typename boost::enable_if< arma::is_arma_type< T >>::type *=0)`
Print output processing for a matrix type.
- `template<typename T >`
`void PrintOutputProcessing (const util::ParamData &d, const size_t indent, const bool onlyOutput, const`
`typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`
Print output processing for a dataset info / matrix combination.
- `template<typename T >`
`void PrintOutputProcessing (const util::ParamData &d, const size_t indent, const bool onlyOutput, const`
`typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::`
`::HasSerialize< T >>::type *=0)`
Print output processing for a serializable model.
- `template<typename T >`
`void PrintOutputProcessing (const util::ParamData &d, const void *input, void *)`
Given parameter information and the current number of spaces for indentation, print the code to process the output to
cout.
- `void PrintPYX (const util::ProgramDoc &programInfo, const std::string &mainFilename, const std::string`
`&functionName)`
Given a list of parameter definition and program documentation, print a generated .pyx file to stdout.
- `template<typename T >`
`std::string PrintTypeDoc (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_`
`type< T >>::type *=0, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename`
`boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T,`
`std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`
Return a string representing the command-line type of an option.
- `template<typename T >`
`std::string PrintTypeDoc (const util::ParamData &data, const typename std::enable_if< util::IsStdVector< T`
`>::value >::type *=0)`
Return a string representing the command-line type of a vector.
- `template<typename T >`
`std::string PrintTypeDoc (const util::ParamData &data, const typename std::enable_if< arma::is_arma_type<`
`T >::value >::type *=0)`
Return a string representing the command-line type of a matrix option.
- `template<typename T >`
`std::string PrintTypeDoc (const util::ParamData &data, const typename std::enable_if< std::is_same< T, std::`
`tuple< data::DatasetInfo, arma::mat >>>::value >::type *=0)`
Return a string representing the command-line type of a matrix tuple option.
- `template<typename T >`
`std::string PrintTypeDoc (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_`
`type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)`
Return a string representing the command-line type of a model.
- `template<typename T >`
`void PrintTypeDoc (const util::ParamData &data, const void *, void *output)`
Print the command-line type of an option into a string.

- `template<typename T >`
`std::string PrintValue (const T &value, bool quotes)`
Given a parameter type, print the corresponding value.
- `template<>`
`std::string PrintValue (const bool &value, bool quotes)`
- `template<typename... Args>`
`std::string ProgramCall (const std::string & programName, Args... args)`
Given a name of a binding and a variable number of arguments (and their contents), print the corresponding function call.
- `std::string ProgramCall (const std::string & programName)`
Given the name of a binding, print a program call assuming that all options are specified.
- `template<typename T >`
`void SerializeIn (T *t, const std::string &str, const std::string &name)`
- `template<typename T >`
`std::string SerializeOut (T *t, const std::string &name)`
- `void StripType (const std::string &inputType, std::string &strippedType, std::string &printedType, std::string &defaultsType)`
Given an input type like, e.g., "LogisticRegression<>", return three types that can be used in Python code.

Variables

- `std::string programName`

38.14.1 Function Documentation

38.14.1.1 DefaultParam()

```
void mlpack::bindings::python::DefaultParam (
    const util::ParamData & data,
    const void * ,
    void * output )
```

Return the default value of an option.

This is the function that will be placed into the **CLI** (p. 1117) `functionMap`.

Definition at line 80 of file `default_param.hpp`.

38.14.1.2 DefaultParamImpl() [1/5]

```
std::string mlpack::bindings::python::DefaultParamImpl (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *   = 0,
    const typename boost::disable_if<    util::IsStdVector< T >>::type *   = 0,
    const typename boost::disable_if<    data::HasSerialize< T >>::type *   = 0,
    const typename boost::disable_if< std::is_same< T, std::string >>::type *   = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple<    mlpack::data::↵
DatasetInfo, arma::mat >>>::type *   = 0 )
```

Return the default value of an option.

This is for regular types.

38.14.1.3 DefaultParamImpl() [2/5]

```
std::string mlpack::bindings::python::DefaultParamImpl (
    const    util::ParamData & data,
    const typename boost::enable_if<    util::IsStdVector< T >>::type *   = 0 )
```

Return the default value of a vector option.

38.14.1.4 DefaultParamImpl() [3/5]

```
std::string mlpack::bindings::python::DefaultParamImpl (
    const    util::ParamData & data,
    const typename boost::enable_if< std::is_same< T, std::string >>::type *   = 0 )
```

Return the default value of a string option.

38.14.1.5 DefaultParamImpl() [4/5]

```
std::string mlpack::bindings::python::DefaultParamImpl (
    const    util::ParamData & data,
    const typename boost::enable_if_c< arma::is_arma_type< T >::value||std::is_same< T,
std::tuple<    mlpack::data::DatasetInfo, arma::mat >>::value >::type *   = 0 )
```

Return the default value of a matrix option, a tuple option, a serializable option, or a string option (this returns the default filename, or " if the default is no file).

38.14.1.6 DefaultParamImpl() [5/5]

```
std::string mlpack::bindings::python::DefaultParamImpl (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if<    data::HasSerialize< T >>::type * = 0 )
```

Return the default value of a model option (this returns the default filename, or "" if the default is no file).

38.14.1.7 GetArmaType()

```
std::string mlpack::bindings::python::GetArmaType ( ) [inline]
```

This is used for arma::Mat<> types; it will return "mat" for matrices, "row" for row vectors, and "col" for column vectors.

Definition at line 28 of file get_arma_type.hpp.

38.14.1.8 GetBindingName()

```
std::string mlpack::bindings::python::GetBindingName (
    const std::string & bindingName ) [inline]
```

Given the name of a binding, print its Python name.

38.14.1.9 GetCythonType() [1/4]

```
std::string mlpack::bindings::python::GetCythonType (
    const    util::ParamData & ,
    const typename boost::disable_if<    util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if<    data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0 ) [inline]
```

Definition at line 24 of file get_cython_type.hpp.

38.14.1.10 GetCythonType() [2/4]

```
std::string mlpack::bindings::python::GetCythonType (
    const    util::ParamData & d,
    const typename boost::enable_if<    util::IsStdVector< T >>::type * = 0 ) [inline]
```

Definition at line 84 of file get_cython_type.hpp.

38.14.1.11 GetCythonType() [3/4]

```
std::string mlpack::bindings::python::GetCythonType (
    const    util::ParamData & d,
    const typename boost::enable_if< arma::is_arma_type< T >>::type *   = 0 ) [inline]
```

Definition at line 92 of file `get_cython_type.hpp`.

38.14.1.12 GetCythonType() [4/4]

```
std::string mlpack::bindings::python::GetCythonType (
    const    util::ParamData & d,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *   = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type *   = 0 ) [inline]
```

Definition at line 106 of file `get_cython_type.hpp`.

References `ParamData::cppType`.

38.14.1.13 GetCythonType< bool >()

```
std::string mlpack::bindings::python::GetCythonType< bool > (
    const    util::ParamData & ,
    const typename boost::disable_if< util::IsStdVector< bool >>::type * ,
    const typename boost::disable_if< data::HasSerialize< bool >>::type * ,
    const typename boost::disable_if< arma::is_arma_type< bool >>::type *   ) [inline]
```

Definition at line 74 of file `get_cython_type.hpp`.

38.14.1.14 GetCythonType< double >()

```
std::string mlpack::bindings::python::GetCythonType< double > (
    const    util::ParamData & ,
    const typename boost::disable_if< util::IsStdVector< double >>::type * ,
    const typename boost::disable_if< data::HasSerialize< double >>::type * ,
    const typename boost::disable_if< arma::is_arma_type< double >>::type *   ) [inline]
```

Definition at line 44 of file `get_cython_type.hpp`.

38.14.1.15 GetCythonType< int >()

```
std::string mlpack::bindings::python::GetCythonType< int > (
    const    util::ParamData & ,
    const typename boost::disable_if<    util::IsStdVector< int >>::type * ,
    const typename boost::disable_if<    data::HasSerialize< int >>::type * ,
    const typename boost::disable_if< arma::is_arma_type< int >>::type * ) [inline]
```

Definition at line 34 of file get_cython_type.hpp.

38.14.1.16 GetCythonType< size_t >()

```
std::string mlpack::bindings::python::GetCythonType< size_t > (
    const    util::ParamData & ,
    const typename boost::disable_if<    util::IsStdVector< size_t >>::type * ,
    const typename boost::disable_if<    data::HasSerialize< size_t >>::type * ,
    const typename boost::disable_if< arma::is_arma_type< size_t >>::type * ) [inline]
```

Definition at line 64 of file get_cython_type.hpp.

38.14.1.17 GetCythonType< std::string >()

```
std::string mlpack::bindings::python::GetCythonType< std::string > (
    const    util::ParamData & ,
    const typename boost::disable_if<    util::IsStdVector< std::string >>::type * ,
    const typename boost::disable_if<    data::HasSerialize< std::string >>::type * ,
    const typename boost::disable_if< arma::is_arma_type< std::string >>::type * )
[inline]
```

Definition at line 54 of file get_cython_type.hpp.

38.14.1.18 GetNumpyType()

```
std::string mlpack::bindings::python::GetNumpyType ( ) [inline]
```

Definition at line 22 of file get_numpy_type.hpp.

38.14.1.19 GetNumpyType< double >()

```
std::string  mlpack::bindings::python::GetNumpyType< double > ( )  [inline]
```

Definition at line 28 of file get_numpy_type.hpp.

38.14.1.20 GetNumpyType< size_t >()

```
std::string  mlpack::bindings::python::GetNumpyType< size_t > ( )  [inline]
```

Definition at line 34 of file get_numpy_type.hpp.

38.14.1.21 GetNumpyTypeChar()

```
std::string  mlpack::bindings::python::GetNumpyTypeChar ( )  [inline]
```

Definition at line 23 of file get_numpy_type_char.hpp.

38.14.1.22 GetNumpyTypeChar< arma::Col< size_t > >()

```
std::string  mlpack::bindings::python::GetNumpyTypeChar< arma::Col< size_t > > ( )  [inline]
```

Definition at line 36 of file get_numpy_type_char.hpp.

38.14.1.23 GetNumpyTypeChar< arma::mat >()

```
std::string  mlpack::bindings::python::GetNumpyTypeChar< arma::mat > ( )  [inline]
```

Definition at line 49 of file get_numpy_type_char.hpp.

38.14.1.24 GetNumpyTypeChar< arma::Mat< size_t > >()

```
std::string  mlpack::bindings::python::GetNumpyTypeChar< arma::Mat< size_t > > ( )  [inline]
```

Definition at line 30 of file get_numpy_type_char.hpp.

38.14.1.25 GetNumpyTypeChar< arma::Row< size_t > >()

```
std::string mlpack::bindings::python::GetNumpyTypeChar< arma::Row< size_t > > ( ) [inline]
```

Definition at line 42 of file get_numpy_type_char.hpp.

38.14.1.26 GetNumpyTypeChar< arma::rowvec >()

```
std::string mlpack::bindings::python::GetNumpyTypeChar< arma::rowvec > ( ) [inline]
```

Definition at line 61 of file get_numpy_type_char.hpp.

38.14.1.27 GetNumpyTypeChar< arma::vec >()

```
std::string mlpack::bindings::python::GetNumpyTypeChar< arma::vec > ( ) [inline]
```

Definition at line 55 of file get_numpy_type_char.hpp.

38.14.1.28 GetParam()

```
void mlpack::bindings::python::GetParam (
    const util::ParamData & d,
    const void * ,
    void * output )
```

All Python binding types are exactly what is held in the ParamData, so no special handling is necessary.

Definition at line 26 of file get_param.hpp.

References ParamData::value.

38.14.1.29 GetPrintableParam() [1/6]

```
std::string mlpack::bindings::python::GetPrintableParam (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *   = 0,
    const typename boost::disable_if<    util::IsStdVector< T >>::type *   = 0,
    const typename boost::disable_if<    data::HasSerialize< T >>::type *   = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple<    data::DatasetInfo,
arma::mat >>>::type *   = 0 )
```

Print an option of a simple type.

Print an option.

Definition at line 26 of file `get_printable_param.hpp`.

References `ParamData::value`.

38.14.1.30 GetPrintableParam() [2/6]

```
std::string mlpack::bindings::python::GetPrintableParam (
    const    util::ParamData & data,
    const typename boost::enable_if<    util::IsStdVector< T >>::type *   = 0 )
```

Print a vector option, with spaces between it.

Definition at line 43 of file `get_printable_param.hpp`.

References `ParamData::value`.

38.14.1.31 GetPrintableParam() [3/6]

```
std::string mlpack::bindings::python::GetPrintableParam (
    const    util::ParamData & data,
    const typename boost::enable_if< arma::is_arma_type< T >>::type *   = 0 )
```

Print a matrix option (this prints its size).

Print a matrix option (this just prints the filename).

Definition at line 59 of file `get_printable_param.hpp`.

References `ParamData::value`.

38.14.1.32 GetPrintableParam() [4/6]

```
std::string mlpack::bindings::python::GetPrintableParam (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *   = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type *   = 0 )
```

Print a serializable class option (this prints the class name).

Print a serializable class option (this just prints the filename).

Print a model option (this just prints the filename).

Definition at line 75 of file get_printable_param.hpp.

References ParamData::cppType, and ParamData::value.

38.14.1.33 GetPrintableParam() [5/6]

```
std::string mlpack::bindings::python::GetPrintableParam (
    const    util::ParamData & data,
    const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo,
arma::mat >>>::type *   = 0 )
```

Print a combination DatasetInfo/matrix parameter.

Print a mapped matrix option (this just prints the filename).

Definition at line 89 of file get_printable_param.hpp.

References ParamData::value.

38.14.1.34 GetPrintableParam() [6/6]

```
void mlpack::bindings::python::GetPrintableParam (
    const    util::ParamData & data,
    const void * ,
    void * output )
```

Print an option into a std::string.

This should print a short, one-line representation of the object. The string will be stored in the output pointer.

Parameters

<i>data</i>	Parameter data struct.
<i>input</i>	Unused parameter.
<i>output</i>	Output storage for the string.

Definition at line 114 of file `get_printable_param.hpp`.

38.14.1.35 `GetPrintableType()` [1/6]

```
std::string mlpack::bindings::python::GetPrintableType (
    const util::ParamData & ,
    const typename boost::disable_if< util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo,
arma::mat >>>::type * = 0 ) [inline]
```

38.14.1.36 `GetPrintableType()` [2/6]

```
std::string mlpack::bindings::python::GetPrintableType (
    const util::ParamData & d,
    const typename boost::enable_if< util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo,
arma::mat >>>::type * = 0 ) [inline]
```

38.14.1.37 `GetPrintableType()` [3/6]

```
std::string mlpack::bindings::python::GetPrintableType (
    const util::ParamData & ,
    const typename boost::enable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo,
arma::mat >>>::type * = 0 ) [inline]
```

38.14.1.38 `GetPrintableType()` [4/6]

```
std::string mlpack::bindings::python::GetPrintableType (
    const util::ParamData & ,
    const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo,
arma::mat >>>::type * = 0 ) [inline]
```

38.14.1.39 GetPrintableType() [5/6]

```
std::string mlpack::bindings::python::GetPrintableType (
    const    util::ParamData & d,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if<    data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple<    data::DatasetInfo,
arma::mat >>>::type * = 0 ) [inline]
```

38.14.1.40 GetPrintableType() [6/6]

```
void mlpack::bindings::python::GetPrintableType (
    const    util::ParamData & d,
    const void * ,
    void * output )
```

Definition at line 106 of file get_printable_type.hpp.

38.14.1.41 GetPrintableType< bool >()

```
std::string mlpack::bindings::python::GetPrintableType< bool > (
    const    util::ParamData & ,
    const typename boost::disable_if<    util::IsStdVector< bool >>::type * ,
    const typename boost::disable_if<    data::HasSerialize< bool >>::type * ,
    const typename boost::disable_if< arma::is_arma_type< bool >>::type * ,
    const typename boost::disable_if< std::is_same< bool, std::tuple<    data::Dataset←
Info, arma::mat >>>::type * ) [inline]
```

38.14.1.42 GetPrintableType< double >()

```
std::string mlpack::bindings::python::GetPrintableType< double > (
    const    util::ParamData & ,
    const typename boost::disable_if<    util::IsStdVector< double >>::type * ,
    const typename boost::disable_if<    data::HasSerialize< double >>::type * ,
    const typename boost::disable_if< arma::is_arma_type< double >>::type * ,
    const typename boost::disable_if< std::is_same< double, std::tuple<    data::Dataset←
Info, arma::mat >>>::type * ) [inline]
```

38.14.1.43 `GetPrintableType< int >()`

```
std::string mlpack::bindings::python::GetPrintableType< int > (
    const util::ParamData & ,
    const typename boost::disable_if< util::IsStdVector< int >>::type * ,
    const typename boost::disable_if< data::HasSerialize< int >>::type * ,
    const typename boost::disable_if< arma::is_arma_type< int >>::type * ,
    const typename boost::disable_if< std::is_same< int, std::tuple< data::DatasetInfo,
arma::mat >>>::type * ) [inline]
```

38.14.1.44 `GetPrintableType< size_t >()`

```
std::string mlpack::bindings::python::GetPrintableType< size_t > (
    const util::ParamData & ,
    const typename boost::disable_if< util::IsStdVector< size_t >>::type * ,
    const typename boost::disable_if< data::HasSerialize< size_t >>::type * ,
    const typename boost::disable_if< arma::is_arma_type< size_t >>::type * ,
    const typename boost::disable_if< std::is_same< size_t, std::tuple< data::Dataset←
Info, arma::mat >>>::type * ) [inline]
```

38.14.1.45 `GetPrintableType< std::string >()`

```
std::string mlpack::bindings::python::GetPrintableType< std::string > (
    const util::ParamData & ,
    const typename boost::disable_if< util::IsStdVector< std::string >>::type * ,
    const typename boost::disable_if< data::HasSerialize< std::string >>::type * ,
    const typename boost::disable_if< arma::is_arma_type< std::string >>::type * ,
    const typename boost::disable_if< std::is_same< std::string, std::tuple< data::←
DatasetInfo, arma::mat >>>::type * ) [inline]
```

38.14.1.46 `IgnoreCheck()` [1/3]

```
bool mlpack::bindings::python::IgnoreCheck (
    const std::string & paramName ) [inline]
```

Print whether or not we should ignore a check on the given parameter.

For Python bindings, we ignore any checks on output parameters, so if paramName is an output parameter, this returns true.

38.14.1.47 IgnoreCheck() [2/3]

```
bool mlpack::bindings::python::IgnoreCheck (
    const std::vector< std::string > & constraints ) [inline]
```

Print whether or not we should ignore a check on the given set of constraints.

For Python bindings, we ignore any checks on output parameters, so if any parameter is an output parameter, this returns true.

38.14.1.48 IgnoreCheck() [3/3]

```
bool mlpack::bindings::python::IgnoreCheck (
    const std::vector< std::pair< std::string, bool >> & constraints,
    const std::string & paramName ) [inline]
```

Print whether or not we should ignore a check on the given set of constraints.

For Python bindings, we ignore any checks on output parameters, so if any constraint parameter or the main parameter are output parameters, this returns true.

38.14.1.49 ImportDecl() [1/4]

```
void mlpack::bindings::python::ImportDecl (
    const util::ParamData & d,
    const size_t indent,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

For a serializable type, print a cppclass definition.

This will give output of the form:

```
cdef cppclass Type: Type() nogil
```

Definition at line 26 of file import_decl.hpp.

References ParamData::cppType, and StripType().

38.14.1.50 ImportDecl() [2/4]

```
void mlpack::bindings::python::ImportDecl (
    const util::ParamData & ,
    const size_t ,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0 )
```

For a non-serializable type, print nothing.

Definition at line 53 of file import_decl.hpp.

38.14.1.51 ImportDecl() [3/4]

```
void mlpack::bindings::python::ImportDecl (
    const    util::ParamData & ,
    const size_t ,
    const typename boost::enable_if< arma::is_arma_type< T >>::type *   = 0 )
```

For a matrix type, print nothing.

Definition at line 66 of file `import_decl.hpp`.

38.14.1.52 ImportDecl() [4/4]

```
void mlpack::bindings::python::ImportDecl (
    const    util::ParamData & d,
    const void * indent,
    void * )
```

Print the cppclass definition for a serializable model; print nothing for a non-serializable type.

Parameters

<i>d</i>	Parameter info struct.
<i>input</i>	Pointer to <code>size_t</code> indicating indent.
<i>output</i>	Unused parameter.

Definition at line 83 of file `import_decl.hpp`.

38.14.1.53 ParamString()

```
std::string mlpack::bindings::python::ParamString (
    const std::string & paramName ) [inline]
```

Given the parameter name, determine what it would actually be when passed to the command line.

38.14.1.54 PrintClassDefn() [1/4]

```
void mlpack::bindings::python::PrintClassDefn (
    const    util::ParamData & ,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *   = 0,
    const typename boost::disable_if<    data::HasSerialize< T >>::type *   = 0 )
```

Non-serializable models don't require any special definitions, so this prints nothing.

Definition at line 26 of file `print_class_defn.hpp`.

38.14.1.55 PrintClassDefn() [2/4]

```
void mlpack::bindings::python::PrintClassDefn (
    const    util::ParamData & ,
    const typename boost::enable_if< arma::is_arma_type< T >>::type *   = 0 )
```

Matrices don't require any special definitions, so this prints nothing.

Definition at line 38 of file `print_class_defn.hpp`.

38.14.1.56 PrintClassDefn() [3/4]

```
void mlpack::bindings::python::PrintClassDefn (
    const    util::ParamData & d,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *   = 0,
    const typename boost::enable_if<    data::HasSerialize< T >>::type *   = 0 )
```

Serializable models require a special class definition.

This will produce code like:

```
cdef class <ModelType>Type: cdef <ModelType>* modelptr

def cinit(self): self.modelptr = new <ModelType>()

def dealloc(self): del self.modelptr

def getstate(self): return SerializeOut(self.modelptr, "<ModelType>")

def setstate(self, state): SerializeIn(self.modelptr, state, "<ModelType>")

def reduce_ex(self): return (self.__class__, (), self.__getstate__())
```

Definition at line 49 of file `print_class_defn.hpp`.

References `ParamData::cppType`, and `StripType()`.

38.14.1.57 PrintClassDefn() [4/4]

```
void mlpack::bindings::python::PrintClassDefn (
    const    util::ParamData & d,
    const void * ,
    void *   )
```

Print the class definition to stdout.

Only serializable models require a different class definition, so anything else does nothing.

Parameters

<i>d</i>	Parameter data.
<i>input</i>	Unused parameter.
<i>output</i>	Unused parameter.

Definition at line 112 of file `print_class_defn.hpp`.

38.14.1.58 `PrintDataset()`

```
std::string mlpack::bindings::python::PrintDataset (
    const std::string & datasetName ) [inline]
```

Given the name of a matrix, print it.

Here we do not need to modify anything.

38.14.1.59 `PrintDefault()`

```
std::string mlpack::bindings::python::PrintDefault (
    const std::string & paramName ) [inline]
```

Given a parameter name, print its corresponding default value.

38.14.1.60 `PrintDefn()`

```
void mlpack::bindings::python::PrintDefn (
    const util::ParamData & d,
    const void * ,
    void * )
```

Print the definition for a Python binding parameter to stdout.

This is the definition in the function declaration.

Definition at line 26 of file `print_defn.hpp`.

References `ParamData::name`, and `ParamData::required`.

38.14.1.61 `PrintDoc()`

```
void mlpack::bindings::python::PrintDoc (
    const util::ParamData & d,
    const void * input,
    void * )
```

Print the docstring documentation for a given parameter.

You are responsible for setting up the line—this does not handle indentation or anything. This is meant to produce a line of documentation describing a single parameter.

The indent parameter (`void* input`, which should be a pointer to a `size_t`) should be passed to know how much to indent for a new line.

Parameters

<i>d</i>	Parameter data struct.
<i>input</i>	Pointer to size_t containing indent.
<i>output</i>	Unused parameter.

Definition at line 36 of file print_doc.hpp.

References ParamData::cppType, ParamData::desc, mlpack::util::HyphenateString(), ParamData::name, and ParamData::required.

38.14.1.62 PrintImport()

```
std::string mlpack::bindings::python::PrintImport (
    const std::string & bindingName ) [inline]
```

Print any import information for the Python binding.

38.14.1.63 PrintInputOptions() [1/2]

```
std::string mlpack::bindings::python::PrintInputOptions ( ) [inline]
```

38.14.1.64 PrintInputOptions() [2/2]

```
std::string mlpack::bindings::python::PrintInputOptions (
    const std::string & paramName,
    const T & value,
    Args... args )
```

Print an input option.

This will throw an exception if the parameter does not exist in **CLI** (p. 1117). For a parameter 'x' with value '5', this will print something like x=5.

38.14.1.65 PrintInputProcessing() [1/6]

```
void mlpack::bindings::python::PrintInputProcessing (
    const util::ParamData & d,
    const size_t indent,
    const typename boost::disable_if< util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo,
arma::mat >>>::type * = 0 )
```

Print input processing for a standard option type.

This gives us code like:

Detect if the parameter was passed; set if so.

```
if param_name is not None: if isinstance(param_name, int): SetParam[int](<const string>=""> 'param_name', param_name)
else: raise TypeError("'param_name' must have type 'list'")
else: raise TypeError("'param_name' must have type 'list'")
```

Definition at line 31 of file print_input_processing.hpp.

References ParamData::name, and ParamData::required.

38.14.1.66 PrintInputProcessing() [2/6]

```
void mlpack::bindings::python::PrintInputProcessing (
    const util::ParamData & d,
    const size_t indent,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo,
arma::mat >>>::type * = 0,
    const typename boost::enable_if< util::IsStdVector< T >>::type * = 0 )
```

Print input processing for a vector type.

```
This gives us code like: if param_name is not None: if isinstance(param_name, list): if len(param_name) > 0: if
isinstance(param_name[0], str): SetParam[vector[string]](<const string>=""> 'param_name', param_name)
else: raise TypeError("'param_name' must have type 'list of str'")
else: raise TypeError("'param_name' must have type 'list'")
```

Definition at line 164 of file print_input_processing.hpp.

References ParamData::name, and ParamData::required.

38.14.1.67 PrintInputProcessing() [3/6]

```
void mlpack::bindings::python::PrintInputProcessing (
    const    util::ParamData & d,
    const size_t indent,
    const typename boost::disable_if<    util::IsStdVector< T >>::type *    = 0,
    const typename boost::enable_if< arma::is_arma_type< T >>::type *    = 0 )
```

Print input processing for a matrix type.

This gives us code like:

Detect if the parameter was passed; set if so.

```
if param_name is not None: param_name_tuple = to_matrix(param_name) if param_name_tuple[0].shape[0] == 1 or
param_name_tuple[0].shape[1] == 1: param_name_tuple[0].shape = (param_name_tuple[0].size,) param_name_mat
= arma_numpy.numpy_to_mat_s(param_name_tuple[0], param_name_tuple[1]) SetParam[mat](<const string>="">
'param_name', dereference(param_name_mat)) CLI.SetPassed (p. 1125)(<const string>=""> 'param_name')
```

Definition at line 251 of file print_input_processing.hpp.

References ParamData::name, and ParamData::required.

38.14.1.68 PrintInputProcessing() [4/6]

```
void mlpack::bindings::python::PrintInputProcessing (
    const    util::ParamData & d,
    const size_t indent,
    const typename boost::disable_if<    util::IsStdVector< T >>::type *    = 0,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *    = 0,
    const typename boost::enable_if<    data::HasSerialize< T >>::type *    = 0 )
```

Print input processing for a serializable type.

This gives us code like:

Detect if the parameter was passed; set if so.

```
if param_name is not None: try: SetParamPtr[Model]('param_name', (<ModelType?> param_name).modelptr, CLI.
HasParam (p. 1123)('copy_all_inputs')) except TypeError as e: if type(param_name).__name__ == "ModelType": Set
ParamPtr[Model]('param_name', (<ModelType> param_name).modelptr, CLI.HasParam (p. 1123)('copy_all_inputs'))
else: raise e CLI.SetPassed (p. 1125)(<const string>=""> 'param_name')
```

Definition at line 372 of file print_input_processing.hpp.

References ParamData::cppType, ParamData::name, ParamData::required, and StripType().

38.14.1.69 PrintInputProcessing() [5/6]

```
void mlpack::bindings::python::PrintInputProcessing (
    const util::ParamData & d,
    const size_t indent,
    const typename boost::disable_if< util::IsStdVector< T >>::type * = 0,
    const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo,
arma::mat >>>::type * = 0 )
```

Print input processing for a matrix/DatasetInfo type.

We want to generate code like the following:

```
if param_name is not None: param_name_tuple = to_matrix_with_info(param_name) if len(param_name_←
tuple[0].shape) < 2: param_name_tuple[0].shape = (param_name_tuple[0].size,) param_name_mat = arma_←
_numpy.numpy_to_matrix_d(param_name_tuple[0]) SetParamWithInfo[mat](<const string>=""> 'param_name',
dereference(param_name_mat), &param_name_tuple[1][0]) CLI.SetPassed (p. 1125)(<const string>=""> 'param_←
name')
```

Definition at line 445 of file print_input_processing.hpp.

References ParamData::name, and ParamData::required.

38.14.1.70 PrintInputProcessing() [6/6]

```
void mlpack::bindings::python::PrintInputProcessing (
    const util::ParamData & d,
    const void * input,
    void * )
```

Given parameter information and the current number of spaces for indentation, print the code to process the input to cout.

This code assumes that data.input is true, and should not be called when data.input is false.

The number of spaces to indent should be passed through the input pointer.

Parameters

<i>d</i>	Parameter data struct.
<i>input</i>	Pointer to size_t holding the indentation.
<i>output</i>	Unused parameter.

Definition at line 525 of file print_input_processing.hpp.

38.14.1.71 PrintModel()

```
std::string mlpack::bindings::python::PrintModel (
    const std::string & modelName ) [inline]
```

Given the name of a model, print it.

Here we do not need to modify anything.

38.14.1.72 PrintOutputOptionInfo()

```
std::string mlpack::bindings::python::PrintOutputOptionInfo ( ) [inline]
```

Print any special information about output options.

38.14.1.73 PrintOutputOptions() [1/2]

```
std::string mlpack::bindings::python::PrintOutputOptions ( ) [inline]
```

38.14.1.74 PrintOutputOptions() [2/2]

```
std::string mlpack::bindings::python::PrintOutputOptions (
    const std::string & paramName,
    const T & value,
    Args... args )
```

38.14.1.75 PrintOutputProcessing() [1/5]

```
void mlpack::bindings::python::PrintOutputProcessing (
    const util::ParamData & d,
    const size_t indent,
    const bool onlyOutput,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo,
    arma::mat >>>::type * = 0 )
```

Print output processing for a regular parameter type.

This gives us code like:

```
result = CLI.GetParam (p.1122)[int]('param_name')
```

This gives us code like:

```
result['param_name'] = CLI.GetParam (p.1122)[int]('param_name')
```

Definition at line 29 of file print_output_processing.hpp.

References ParamData::name.

38.14.1.76 PrintOutputProcessing() [2/5]

```
void mlpack::bindings::python::PrintOutputProcessing (
    const util::ParamData & d,
    const size_t indent,
    const bool onlyOutput,
    const typename boost::enable_if< arma::is_arma_type< T >>::type * = 0 )
```

Print output processing for a matrix type.

This gives us code like:

```
result = arma_numpy.mat_to_numpy_X(CLI.GetParam (p.1122)[mat]("name"))
```

where X indicates the type to convert to.

This gives us code like:

```
result['param_name'] = arma_numpy.mat_to_numpy_X(CLI.GetParam (p.1122)[mat]('name'))
```

where X indicates the type to convert to.

Definition at line 85 of file `print_output_processing.hpp`.

References `ParamData::name`.

38.14.1.77 PrintOutputProcessing() [3/5]

```
void mlpack::bindings::python::PrintOutputProcessing (
    const util::ParamData & d,
    const size_t indent,
    const bool onlyOutput,
    const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo,
    arma::mat >>>::type * = 0 )
```

Print output processing for a dataset info / matrix combination.

This gives us code like:

```
result = arma_numpy.mat_to_numpy_X(GetParamWithInfo[mat]('name'))
```

This gives us code like:

```
result['param_name'] = arma_numpy.mat_to_numpy_X(GetParamWithInfo[mat]('name'))
```

Definition at line 127 of file `print_output_processing.hpp`.

References `ParamData::name`.

38.14.1.78 PrintOutputProcessing() [4/5]

```
void mlpack::bindings::python::PrintOutputProcessing (
    const    util::ParamData & d,
    const size_t indent,
    const bool onlyOutput,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Print output processing for a serializable model.

This gives us code like:

```
result = ModelType() (<ModelType?> result).modelptr = GetParamPtr[Model]('name')
```

But we also have to check to ensure there aren't any input model parameters of the same type that could have the same model pointer. So we need to loop through all input parameters that have the same type, and double-check.

This gives us code like:

```
result['name'] = ModelType() (<ModelType?> result['name']).modelptr = GetParamPtr[Model]('name'))
```

But we also have to check to ensure there aren't any input model parameters of the same type that could have the same model pointer. So we need to loop through all input parameters that have the same type, and double-check.

Definition at line 169 of file print_output_processing.hpp.

References ParamData::cppType, ParamData::input, ParamData::name, CLI::Parameters(), ParamData::required, and StripType().

38.14.1.79 PrintOutputProcessing() [5/5]

```
void mlpack::bindings::python::PrintOutputProcessing (
    const    util::ParamData & d,
    const void * input,
    void * )
```

Given parameter information and the current number of spaces for indentation, print the code to process the output to cout.

This code assumes that data.input is false, and should not be called when data.input is true. If this is the only output, the results will be different.

The input pointer should be a pointer to a std::tuple<size_t, bool> where the first element is the indentation and the second element is a boolean representing whether or not this is the only output parameter.

Parameters

<i>d</i>	Parameter data struct.
<i>input</i>	Pointer to size_t holding the indentation.
<i>output</i>	Unused parameter.

Definition at line 298 of file `print_output_processing.hpp`.

38.14.1.80 PrintPYX()

```
void mlpack::bindings::python::PrintPYX (
    const    util::ProgramDoc & programInfo,
    const std::string & mainFilename,
    const std::string & functionName )
```

Given a list of parameter definition and program documentation, print a generated .pyx file to stdout.

Parameters

<i>parameters</i>	List of parameters the program will use (from CLI (p. 1117)).
<i>programInfo</i>	Documentation for the program.
<i>mainFilename</i>	Filename of the main program (i.e. "/path/to/pca_main.cpp").
<i>functionName</i>	Name of the function (i.e. "pca").

38.14.1.81 PrintTypeDoc() [1/6]

```
std::string mlpack::bindings::python::PrintTypeDoc (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if<    util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if<    data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple<    data::DatasetInfo,
    arma::mat >>>::type * = 0 )
```

Return a string representing the command-line type of an option.

38.14.1.82 PrintTypeDoc() [2/6]

```
std::string mlpack::bindings::python::PrintTypeDoc (
    const    util::ParamData & data,
    const typename std::enable_if<    util::IsStdVector< T >::value >::type * = 0 )
```

Return a string representing the command-line type of a vector.

38.14.1.83 PrintTypeDoc() [3/6]

```
std::string mlpack::bindings::python::PrintTypeDoc (
    const util::ParamData & data,
    const typename std::enable_if< arma::is_arma_type< T >::value >::type * = 0 )
```

Return a string representing the command-line type of a matrix option.

38.14.1.84 PrintTypeDoc() [4/6]

```
std::string mlpack::bindings::python::PrintTypeDoc (
    const util::ParamData & data,
    const typename std::enable_if< std::is_same< T, std::tuple< data::DatasetInfo,
    arma::mat >>::value >::type * = 0 )
```

Return a string representing the command-line type of a matrix tuple option.

38.14.1.85 PrintTypeDoc() [5/6]

```
std::string mlpack::bindings::python::PrintTypeDoc (
    const util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Return a string representing the command-line type of a model.

38.14.1.86 PrintTypeDoc() [6/6]

```
void mlpack::bindings::python::PrintTypeDoc (
    const util::ParamData & data,
    const void * ,
    void * output )
```

Print the command-line type of an option into a string.

Definition at line 72 of file `print_type_doc.hpp`.

38.14.1.87 PrintValue() [1/2]

```
std::string mlpack::bindings::python::PrintValue (
    const T & value,
    bool quotes ) [inline]
```

Given a parameter type, print the corresponding value.

38.14.1.88 PrintValue() [2/2]

```
std::string mlpack::bindings::python::PrintValue (
    const bool & value,
    bool quotes ) [inline]
```

38.14.1.89 ProgramCall() [1/2]

```
std::string mlpack::bindings::python::ProgramCall (
    const std::string & programName,
    Args... args )
```

Given a name of a binding and a variable number of arguments (and their contents), print the corresponding function call.

38.14.1.90 ProgramCall() [2/2]

```
std::string mlpack::bindings::python::ProgramCall (
    const std::string & programName ) [inline]
```

Given the name of a binding, print a program call assuming that all options are specified.

38.14.1.91 SerializeIn()

```
void mlpack::bindings::python::SerializeIn (
    T * t,
    const std::string & str,
    const std::string & name )
```

Definition at line 34 of file `serialization.hpp`.

38.14.1.92 SerializeOut()

```
std::string mlpack::bindings::python::SerializeOut (
    T * t,
    const std::string & name )
```

Definition at line 22 of file serialization.hpp.

38.14.1.93 StripType()

```
void mlpack::bindings::python::StripType (
    const std::string & inputType,
    std::string & strippedType,
    std::string & printedType,
    std::string & defaultsType ) [inline]
```

Given an input type like, e.g., "LogisticRegression<>", return three types that can be used in Python code.

strippedType will be a type with no template parameters (e.g. "LogisticRegression"), printedType will be a printable type with the template parameters (e.g. "LogisticRegression[]"), and defaultsType will be a printable type with a default template parameter (e.g. "LogisticRegression[T=*]") that can be used for class definitions.

Definition at line 28 of file strip_type.hpp.

Referenced by ImportDecl(), PrintClassDefn(), PrintInputProcessing(), and PrintOutputProcessing().

38.14.2 Variable Documentation

38.14.2.1 programName

```
std::string programName
```

38.15 mlpack::bindings::tests Namespace Reference

Classes

- class **ProgramDoc**
A static object whose constructor registers program documentation with the **CLI** (p. 1117) class.
- class **TestOption**
A static object whose constructor registers a parameter with the **CLI** (p. 1117) class.

Functions

- void **CleanMemory** ()
*Delete any unique pointers that are held by the **CLI** (p. 1117) object.*
- template<typename T >
void **DeleteAllocatedMemory** (const **util::ParamData** &d, const void *, void *)
- template<typename T >
void **DeleteAllocatedMemoryImpl** (const **util::ParamData** &, const typename boost::disable_if< **data::HasSerialize**< T >>::type *=0, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0)
- template<typename T >
void **DeleteAllocatedMemoryImpl** (const **util::ParamData** &, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)
- template<typename T >
void **DeleteAllocatedMemoryImpl** (const **util::ParamData** &d, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< **data::HasSerialize**< T >>::type *=0)
- template<typename T >
void * **GetAllocatedMemory** (const **util::ParamData** &, const typename boost::disable_if< **data::HasSerialize**< T >>::type *=0, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0)
- template<typename T >
void * **GetAllocatedMemory** (const **util::ParamData** &, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)

- template<typename T >
void **GetAllocatedMemory** (const **util::ParamData** &d, const void *, void *output)
- template<typename T >
T & **GetParam** (**util::ParamData** &d)
This overload is called when nothing special needs to happen to the name of the parameter.
- template<typename T >
void **GetParam** (const **util::ParamData** &d, const void *, void *output)
Return a parameter casted to the given type.
- template<typename T >
std::string **GetPrintableParam** (const **util::ParamData** &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< **util::IsStdVector**< T >>::type *=0, const typename boost::disable_if< **data::HasSerialize**< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< **data::DatasetInfo**, arma::mat >>>::type *=0)
Print an option.
- template<typename T >
std::string **GetPrintableParam** (const **util::ParamData** &data, const typename boost::enable_if< **util::IsStdVector**< T >>::type *=0)
Print a vector option, with spaces between it.
- template<typename T >
std::string **GetPrintableParam** (const **util::ParamData** &data, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)
Print a matrix option (this just prints the filename).
- template<typename T >
std::string **GetPrintableParam** (const **util::ParamData** &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< **data::HasSerialize**< T >>::type *=0)
Print a serializable class option (this just prints the filename).

- template<typename T >
std::string **GetPrintableParam** (const **util::ParamData** &data, const typename boost::enable_if< std::is_same< T, std::tuple< **data::DatasetInfo**, arma::mat >>>::type !=0)
Print a mapped matrix option (this just prints the filename).
- template<typename T >
void **GetPrintableParam** (const **util::ParamData** &data, const void *, void *output)
Print an option into a std::string.
- template<typename T >
bool **IgnoreCheck** (const T &)
Return whether or not a parameter check should be ignored.

Variables

- std::string **programName**

38.15.1 Function Documentation

38.15.1.1 CleanMemory()

```
void mlpack::bindings::tests::CleanMemory ( )
```

Delete any unique pointers that are held by the **CLI** (p. 1117) object.

Referenced by **KDEModel::KernelType()**, and **RSModel::RandomBasis()**.

38.15.1.2 DeleteAllocatedMemory()

```
void mlpack::bindings::tests::DeleteAllocatedMemory (
    const util::ParamData & d,
    const void * ,
    void * )
```

Definition at line 49 of file `delete_allocated_memory.hpp`.

38.15.1.3 DeleteAllocatedMemoryImpl() [1/3]

```
void mlpack::bindings::tests::DeleteAllocatedMemoryImpl (
    const util::ParamData & ,
    const typename boost::disable_if< data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0 )
```

Definition at line 22 of file `delete_allocated_memory.hpp`.

38.15.1.4 DeleteAllocatedMemoryImpl() [2/3]

```
void mlpack::bindings::tests::DeleteAllocatedMemoryImpl (
    const    util::ParamData & ,
    const typename boost::enable_if< arma::is_arma_type< T >>::type *   = 0 )
```

Definition at line 31 of file delete_allocated_memory.hpp.

38.15.1.5 DeleteAllocatedMemoryImpl() [3/3]

```
void mlpack::bindings::tests::DeleteAllocatedMemoryImpl (
    const    util::ParamData & d,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *   = 0,
    const typename boost::enable_if<    data::HasSerialize< T >>::type *   = 0 )
```

Definition at line 39 of file delete_allocated_memory.hpp.

References ParamData::value.

38.15.1.6 GetAllocatedMemory() [1/4]

```
void* mlpack::bindings::tests::GetAllocatedMemory (
    const    util::ParamData & ,
    const typename boost::disable_if<    data::HasSerialize< T >>::type *   = 0,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *   = 0 )
```

Definition at line 23 of file get_allocated_memory.hpp.

38.15.1.7 GetAllocatedMemory() [2/4]

```
void* mlpack::bindings::tests::GetAllocatedMemory (
    const    util::ParamData & ,
    const typename boost::enable_if< arma::is_arma_type< T >>::type *   = 0 )
```

Definition at line 32 of file get_allocated_memory.hpp.

38.15.1.8 GetAllocatedMemory() [3/4]

```
void* mlpack::bindings::tests::GetAllocatedMemory (
    const util::ParamData & d,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::enable_if< data::HasSerialize< T >>::type * = 0 )
```

Definition at line 40 of file `get_allocated_memory.hpp`.

References `ParamData::value`.

38.15.1.9 GetAllocatedMemory() [4/4]

```
void mlpack::bindings::tests::GetAllocatedMemory (
    const util::ParamData & d,
    const void * ,
    void * output )
```

Definition at line 50 of file `get_allocated_memory.hpp`.

38.15.1.10 GetParam() [1/2]

```
T& mlpack::bindings::tests::GetParam (
    util::ParamData & d )
```

This overload is called when nothing special needs to happen to the name of the parameter.

Definition at line 26 of file `get_param.hpp`.

References `ParamData::value`.

38.15.1.11 GetParam() [2/2]

```
void mlpack::bindings::tests::GetParam (
    const util::ParamData & d,
    const void * ,
    void * output )
```

Return a parameter casted to the given type.

Type checking does not happen here!

Parameters

<i>d</i>	Parameter information.
<i>input</i>	Unused parameter.
<i>output</i>	Place to store pointer to value.

Definition at line 41 of file `get_param.hpp`.

38.15.1.12 `GetPrintableParam()` [1/6]

```
std::string mlpack::bindings::tests::GetPrintableParam (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type * = 0,
    const typename boost::disable_if<    util::IsStdVector< T >>::type * = 0,
    const typename boost::disable_if<    data::HasSerialize< T >>::type * = 0,
    const typename boost::disable_if< std::is_same< T, std::tuple<    data::DatasetInfo,
arma::mat >>>::type * = 0 )
```

Print an option.

Print an option.

Definition at line 26 of file `get_printable_param.hpp`.

References `ParamData::value`.

38.15.1.13 `GetPrintableParam()` [2/6]

```
std::string mlpack::bindings::tests::GetPrintableParam (
    const    util::ParamData & data,
    const typename boost::enable_if<    util::IsStdVector< T >>::type * = 0 )
```

Print a vector option, with spaces between it.

Definition at line 43 of file `get_printable_param.hpp`.

References `ParamData::value`.

38.15.1.14 GetPrintableParam() [3/6]

```
std::string mlpack::bindings::tests::GetPrintableParam (
    const    util::ParamData & data,
    const typename boost::enable_if< arma::is_arma_type< T >>::type *   = 0 )
```

Print a matrix option (this just prints the filename).

Print a matrix option (this just prints the filename).

Definition at line 59 of file get_printable_param.hpp.

References ParamData::value.

38.15.1.15 GetPrintableParam() [4/6]

```
std::string mlpack::bindings::tests::GetPrintableParam (
    const    util::ParamData & data,
    const typename boost::disable_if< arma::is_arma_type< T >>::type *   = 0,
    const typename boost::enable_if<    data::HasSerialize< T >>::type *   = 0 )
```

Print a serializable class option (this just prints the filename).

Print a serializable class option (this just prints the filename).

Print a model option (this just prints the filename).

Definition at line 75 of file get_printable_param.hpp.

References ParamData::cppType, and ParamData::value.

38.15.1.16 GetPrintableParam() [5/6]

```
std::string mlpack::bindings::tests::GetPrintableParam (
    const    util::ParamData & data,
    const typename boost::enable_if< std::is_same< T, std::tuple<    data::DatasetInfo,
arma::mat >>>::type *   = 0 )
```

Print a mapped matrix option (this just prints the filename).

Print a mapped matrix option (this just prints the filename).

Definition at line 89 of file get_printable_param.hpp.

References ParamData::value.

38.15.1.17 GetPrintableParam() [6/6]

```
void mlpack::bindings::tests::GetPrintableParam (
    const    util::ParamData & data,
    const void * ,
    void * output )
```

Print an option into a std::string.

This should print a short, one-line representation of the object. The string will be stored in the output pointer.

Definition at line 76 of file get_printable_param.hpp.

38.15.1.18 IgnoreCheck()

```
bool mlpack::bindings::tests::IgnoreCheck (
    const T & ) [inline]
```

Return whether or not a parameter check should be ignored.

Return whether or not a runtime check on parameters should be ignored.

For test bindings, we do not ignore any checks, so this always returns false.

Definition at line 24 of file ignore_check.hpp.

38.15.2 Variable Documentation

38.15.2.1 programName

```
std::string programName
```

38.16 mlpack::bound Namespace Reference

Namespaces

- **addr**
- **meta**

Metaprogramming utilities.

Classes

- class **BallBound**
Ball bound encloses a set of points at a specific distance (radius) from a specific point (center).
- struct **BoundTraits**
A class to obtain compile-time traits about BoundType classes.
- struct **BoundTraits**< **BallBound**< **MetricType**, **VecType** > >
*A specialization of **BoundTraits** (p. 1002) for this bound type.*
- struct **BoundTraits**< **CellBound**< **MetricType**, **ElemType** > >
- struct **BoundTraits**< **HollowBallBound**< **MetricType**, **ElemType** > >
*A specialization of **BoundTraits** (p. 1002) for this bound type.*
- struct **BoundTraits**< **HRectBound**< **MetricType**, **ElemType** > >
- class **CellBound**
*The **CellBound** (p. 1006) class describes a bound that consists of a number of hyperrectangles.*
- class **HollowBallBound**
Hollow ball bound encloses a set of points at a specific distance (radius) from a specific point (center) except points at a specific distance from another point (the center of the hole).
- class **HRectBound**
Hyper-rectangle bound for an L-metric.

38.17 mlpack::bound::addr Namespace Reference

Functions

- template<typename AddressType , typename VecType >
void **AddressToPoint** (VecType &point, const AddressType &address)
Translate the address to the point.
- template<typename AddressType1 , typename AddressType2 >
int **CompareAddresses** (const AddressType1 &addr1, const AddressType2 &addr2)
Compare two addresses.
- template<typename AddressType1 , typename AddressType2 , typename AddressType3 >
bool **Contains** (const AddressType1 &address, const AddressType2 &loBound, const AddressType3 &hiBound)
Returns true if an address is contained between two other addresses.
- template<typename AddressType , typename VecType >
void **PointToAddress** (AddressType &address, const VecType &point)
Calculate the address of a point.

38.17.1 Function Documentation

38.17.1.1 AddressToPoint()

```
void mlpack::bound::addr::AddressToPoint (
    VecType & point,
    const AddressType & address )
```

Translate the address to the point.

Be careful, the point and the address variables should be equal-sized and the type of the address should correspond to the type of the vector.

The function makes the backward transform to the function above.

Parameters

<i>address</i>	An address to translate.
<i>point</i>	The point that corresponds to the address.

Definition at line 153 of file address.hpp.

38.17.1.2 CompareAddresses()

```
int mlpack::bound::addr::CompareAddresses (
    const AddressType1 & addr1,
    const AddressType2 & addr2 )
```

Compare two addresses.

The function returns 1 if the first address is greater than the second one, -1 if the first address is less than the second one, otherwise the function returns 0.

Definition at line 233 of file address.hpp.

Referenced by Contains().

38.17.1.3 Contains()

```
bool mlpack::bound::addr::Contains (
    const AddressType1 & address,
    const AddressType2 & loBound,
    const AddressType3 & hiBound )
```

Returns true if an address is contained between two other addresses.

Definition at line 256 of file address.hpp.

References CompareAddresses().

Referenced by HRectBound< MetricType >::Metric().

38.17.1.4 PointToAddress()

```
void mlpack::bound::addr::PointToAddress (
    AddressType & address,
    const VecType & point )
```

Calculate the address of a point.

Be careful, the point and the address variables should be equal-sized and the type of the address should correspond to the type of the vector.

The function maps each floating point coordinate to an equal-sized unsigned integer datatype in such a way that the transform preserves the ordering (i.e. lower floating point values correspond to lower integers). Thus, the mapping saves the exponent and the mantissa of each floating point value consequently, furthermore the exponent is stored before the mantissa. In the case of negative numbers the resulting integer value should be inverted. In the multi-dimensional case, after we transform the representation, we have to interleave the bits of the new representation across all the elements in the address vector.

Parameters

<i>address</i>	The resulting address.
<i>point</i>	The point that is being translated to the address.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

Definition at line 57 of file address.hpp.

38.18 mlpack::bound::meta Namespace Reference

Metaprogramming utilities.

Classes

- struct **IsLMetric**
Utility struct where Value is true if and only if the argument is of type LMetric.
- struct **IsLMetric**< **metric::LMetric**< **Power**, **TakeRoot** > >
*Specialization for **IsLMetric** (p. 1028) when the argument is of type LMetric.*

38.18.1 Detailed Description

Metaprogramming utilities.

38.19 mlpack::cf Namespace Reference

Collaborative filtering.

Classes

- class **AverageInterpolation**
This class performs average interpolation to generate interpolation weights for neighborhood-based collaborative filtering.
- class **BatchSVDPolicy**
*Implementation of the Batch SVD policy to act as a wrapper when accessing Batch SVD from within **CFTYPE** (p. 1045).*
- class **BiasSVDPolicy**
*Implementation of the Bias SVD policy to act as a wrapper when accessing Bias SVD from within **CFTYPE** (p. 1045).*
- class **CFModel**
The model to save to disk.
- class **CFTYPE**

This class implements Collaborative Filtering (CF).

- class **CombinedNormalization**

This normalization class performs a sequence of normalization methods on raw ratings.

- class **CosineSearch**

Nearest neighbor search with cosine distance.

- class **DeleteVisitor**

***DeleteVisitor** (p. 1058) deletes the **CFTYPE** object which is pointed to by the variable **cf** in class **CFModel** (p. 1042).*

- class **DummyClass**

This class acts as a dummy class for passing as template parameter.

- class **GetValueVisitor**

***GetValueVisitor** (p. 1060) returns the pointer which points to the **CFTYPE** (p. 1045) object.*

- class **ItemMeanNormalization**

This normalization class performs item mean normalization on raw ratings.

- class **LMetricSearch**

Nearest neighbor search with L_p distance.

- class **NMFPolicy**

*Implementation of the NMF policy to act as a wrapper when accessing NMF from within **CFTYPE** (p. 1045).*

- class **NoNormalization**

This normalization class doesn't perform any normalization.

- class **OverallMeanNormalization**

This normalization class performs overall mean normalization on raw ratings.

- class **PearsonSearch**

Nearest neighbor search with pearson distance (or furthest neighbor search with pearson correlation).

- class **PredictVisitor**

***PredictVisitor** (p. 1077) uses the **CFTYPE** (p. 1045) object to make predictions on the given combinations of users and items.*

- class **RandomizedSVDPolicy**

*Implementation of the Randomized SVD policy to act as a wrapper when accessing Randomized SVD from within **CFTYPE** (p. 1045).*

- class **RecommendationVisitor**

***RecommendationVisitor** (p. 1084) uses the **CFTYPE** (p. 1045) object to get recommendations for the given users.*

- class **RegressionInterpolation**

Implementation of regression-based interpolation method.

- class **RegSVDPolicy**

*Implementation of the Regularized SVD policy to act as a wrapper when accessing Regularized SVD from within **CFTYPE** (p. 1045).*

- class **SimilarityInterpolation**

*With **SimilarityInterpolation** (p. 1092), interpolation weights are based on similarities between query user and its neighbors.*

- class **SVDCompletePolicy**

*Implementation of the SVD complete incremental policy to act as a wrapper when accessing SVD complete decomposition from within **CFTYPE** (p. 1045).*

- class **SVDIncompletePolicy**

*Implementation of the SVD incomplete incremental to act as a wrapper when accessing SVD incomplete incremental from within **CFTYPE** (p. 1045).*

- class **SVDPlusPlusPolicy**

*Implementation of the SVDPlusPlus policy to act as a wrapper when accessing SVDPlusPlus from within **CFTYPE** (p. 1045).*

- class **SVDWrapper**

This class acts as the wrapper for all SVD factorizers which are incompatible with CF module.

- class **UserMeanNormalization**

This normalization class performs user mean normalization on raw ratings.

- class **ZScoreNormalization**

This normalization class performs z-score normalization on raw ratings.

Typedefs

- typedef **SVDWrapper**< **DummyClass** > **ArmaSVDFactorizer**

add simple typedefs

- using **EuclideanSearch** = **LMetricSearch**< 2 >

38.19.1 Detailed Description

Collaborative filtering.

38.19.2 Typedef Documentation

38.19.2.1 ArmaSVDFactorizer

```
typedef SVDWrapper< DummyClass> ArmaSVDFactorizer
```

add simple typedefs

Definition at line 86 of file svd_wrapper.hpp.

38.19.2.2 EuclideanSearch

```
using EuclideanSearch = LMetricSearch<2>
```

Definition at line 79 of file lmetric_search.hpp.

38.20 mlpack::cv Namespace Reference

Classes

- class **Accuracy**

The **Accuracy** (p. 1127) is a metric of performance for classification algorithms that is equal to a proportion of correctly labeled test items among all ones for given test items.

- class **CVBase**

An auxiliary class for cross-validation.

- class **F1**

F1 (p. 1132) is a metric of performance for classification algorithms that for binary classification is equal to $2 * precision * recall / (precision + recall)$.

- class **KFoldCV**

The class **KFoldCV** (p. 1134) implements k-fold cross-validation for regression and classification algorithms.

- class **MetalInfoExtractor**

MetalInfoExtractor (p. 1140) is a tool for extracting meta information about a given machine learning algorithm.

- class **MSE**

The **MeanSquaredError** is a metric of performance for regression algorithms that is equal to the mean squared error between predicted values and ground truth (correct) values for given test items.

- struct **NotFoundMethodForm**

- class **Precision**

Precision (p. 1145) is a metric of performance for classification algorithms that for binary classification is equal to $tp / (tp + fp)$, where tp and fp are the numbers of true positives and false positives respectively.

- class **Recall**

Recall (p. 1147) is a metric of performance for classification algorithms that for binary classification is equal to $tp / (tp + fn)$, where tp and fn are the numbers of true positives and false negatives respectively.

- struct **SelectMethodForm**

A type function that selects a right method form.

- struct **SelectMethodForm**< **MLAlgorithm** >

- struct **SelectMethodForm**< **MLAlgorithm**, **HasMethodForm**, **HMFs...** >

- class **SimpleCV**

SimpleCV (p. 1151) splits data into two sets - training and validation sets - and then runs training on the training set and evaluates performance on the validation set.

- struct **TrainForm**

A wrapper struct for holding a Train form.

- struct **TrainForm**< **MT**, **PT**, **void**, **false**, **false** >

- struct **TrainForm**< **MT**, **PT**, **void**, **false**, **true** >

- struct **TrainForm**< **MT**, **PT**, **void**, **true**, **false** >

- struct **TrainForm**< **MT**, **PT**, **void**, **true**, **true** >

- struct **TrainForm**< **MT**, **PT**, **WT**, **false**, **false** >

- struct **TrainForm**< **MT**, **PT**, **WT**, **false**, **true** >

- struct **TrainForm**< **MT**, **PT**, **WT**, **true**, **false** >

- struct **TrainForm**< **MT**, **PT**, **WT**, **true**, **true** >

- struct **TrainFormBase4**

- struct **TrainFormBase5**

- struct **TrainFormBase6**

- struct **TrainFormBase7**

Enumerations

- enum **AverageStrategy** {
Binary,
Micro,
Macro }

This enum declares possible strategies for averaging that can be used in some metrics like precision, recall, and F1.

Functions

- template<typename DataType >
void **AssertSizes** (const DataType &data, const arma::Row< size_t > &labels, const std::string &caller←
Description)

Assert there is the same number of the given data points and labels.

38.20.1 Enumeration Type Documentation

38.20.1.1 AverageStrategy

enum **AverageStrategy**

This enum declares possible strategies for averaging that can be used in some metrics like precision, recall, and **F1** (p. 1132).

The "Binary" strategy means binary classification is going to be used, and there is no need to average.

Enumerator

Binary	
Micro	
Macro	

Definition at line 25 of file average_strategy.hpp.

38.20.2 Function Documentation

38.20.2.1 AssertSizes()

```
void mlpack::cv::AssertSizes (
    const DataType & data,
```

```
const arma::Row< size_t > & labels,
const std::string & callerDescription )
```

Assert there is the same number of the given data points and labels.

Parameters

<i>data</i>	Column-major data.
<i>labels</i>	Labels.
<i>callerDescription</i>	A description of the caller that can be used for error generation.

Definition at line 29 of file facilities.hpp.

38.21 mlpack::data Namespace Reference

Functions to load and save matrices and models.

Classes

- class **CustomImputation**
A simple custom imputation class.
- class **DatasetMapper**
Auxiliary information for a dataset, including mappings to/from strings (or other types) and the datatype of each dimension.
- struct **HasSerialize**
- struct **HasSerializeFunction**
- class **Imputer**
Given a dataset of a particular datatype, replace user-specified missing value with a variable dependent on the Strategy↔ Type and MapperType.
- class **IncrementPolicy**
IncrementPolicy (p. 1184) is used as a helper class for DatasetMapper (p. 1172).
- class **ListwiseDeletion**
A complete-case analysis to remove the values containing mappedValue.
- class **LoadCSV**
Load the csv file. This class use boost::spirit to implement the parser, please refer to following link [http↔://theboostcpplibraries.com/boost.spirit](http://theboostcpplibraries.com/boost.spirit) for quick review.
- class **MeanImputation**
A simple mean imputation class.
- class **MedianImputation**
This is a class implementation of simple median imputation.
- class **MissingPolicy**
MissingPolicy (p. 1193) is used as a helper class for DatasetMapper (p. 1172).

Typedefs

- using **DatasetInfo** = **DatasetMapper**< **data::IncrementPolicy** >

Enumerations

- enum **Datatype** : bool {
numeric = 0,
categorical = 1 }

The Datatype enum specifies the types of data mpack algorithms can use.

- enum **format** {
autodetect,
text,
xml,
binary }

*Define the formats we can read through **boost::serialization** (p. 251).*

Functions

- template<typename T >
void **Binarize** (const arma::Mat< T > &input, arma::Mat< T > &output, const double threshold)
Given an input dataset and threshold, set values greater than threshold to 1 and values less than or equal to the threshold to 0.
- template<typename T >
void **Binarize** (const arma::Mat< T > &input, arma::Mat< T > &output, const double threshold, const size_t dimension)
Given an input dataset and threshold, set values greater than threshold to 1 and values less than or equal to the threshold to 0.
- template<typename eT >
void **ConfusionMatrix** (const arma::Row< size_t > predictors, const arma::Row< size_t > responses, arma::Mat< eT > &output, const size_t numClasses)
A confusion matrix is a summary of prediction results on a classification problem.
- std::string **Extension** (const std::string &filename)
- HAS_EXACT_METHOD_FORM** (serialize, HasSerializeCheck)
- template<typename T >
bool **IsNaNInf** (T &val, const std::string &token)
See if the token is a NaN or an Inf, and if so, set the value accordingly and return a boolean representing whether or not it is.
- template<typename eT >
bool **Load** (const std::string &filename, arma::Mat< eT > &matrix, const bool fatal=false, const bool transpose=true)
Loads a matrix from file, guessing the filetype from the extension.
- template<typename eT >
bool **Load** (const std::string &filename, arma::Col< eT > &vec, const bool fatal=false)
Don't document these with doxygen; these declarations aren't helpful to users.
- template<typename eT >
bool **Load** (const std::string &filename, arma::Row< eT > &rowvec, const bool fatal=false)
Load a row vector from a file, guessing the filetype from the extension.
- template<typename eT, typename PolicyType >
bool **Load** (const std::string &filename, arma::Mat< eT > &matrix, **DatasetMapper**< PolicyType > &info, const bool fatal=false, const bool transpose=true)
*Loads a matrix from a file, guessing the filetype from the extension and mapping categorical features with a **DatasetMapper** (p. 1172) object.*

- `template<typename T >`
`bool Load (const std::string &filename, const std::string &name, T &t, const bool fatal=false, format f=format←
::autodetect)`
Don't document these with doxygen; they aren't helpful for users to know about.
- `template<typename eT >`
`void LoadARFF (const std::string &filename, arma::Mat< eT > &matrix)`
A utility function to load an ARFF dataset as numeric features (that is, as an Armadillo matrix without any modification).
- `template<typename eT, typename PolicyType >`
`void LoadARFF (const std::string &filename, arma::Mat< eT > &matrix, DatasetMapper< PolicyType > &info)`
A utility function to load an ARFF dataset as numeric and categorical features, using the DatasetInfo structure for mapping.
- `template<typename eT, typename RowType >`
`void NormalizeLabels (const RowType &labelsIn, arma::Row< size_t > &labels, arma::Col< eT > &mapping)`
Given a set of labels of a particular datatype, convert them to unsigned labels in the range [0, n) where n is the number of different labels.
- `template<typename eT, typename RowType >`
`void OneHotEncoding (const RowType &labelsIn, arma::Mat< eT > &output)`
Given a set of labels of a particular datatype, convert them to binary vector.
- `template<typename eT >`
`void RevertLabels (const arma::Row< size_t > &labels, const arma::Col< eT > &mapping, arma::Row< eT > &labelsOut)`
Given a set of labels that have been mapped to the range [0, n), map them back to the original labels given by the 'mapping' vector.
- `template<typename eT >`
`bool Save (const std::string &filename, const arma::Mat< eT > &matrix, const bool fatal=false, bool transpose=true)`
Saves a matrix to file, guessing the filetype from the extension.
- `template<typename T >`
`bool Save (const std::string &filename, const std::string &name, T &t, const bool fatal=false, format f=format←
::autodetect)`
Saves a model to file, guessing the filetype from the extension, or, optionally, saving the specified format.
- `template<typename T, typename U >`
`void Split (const arma::Mat< T > &input, const arma::Row< U > &inputLabel, arma::Mat< T > &trainData, arma::Mat< T > &testData, arma::Row< U > &trainLabel, arma::Row< U > &testLabel, const double testRatio)`
Given an input dataset and labels, split into a training set and test set.
- `template<typename T >`
`void Split (const arma::Mat< T > &input, arma::Mat< T > &trainData, arma::Mat< T > &testData, const double testRatio)`
Given an input dataset, split into a training set and test set.
- `template<typename T, typename U >`
`std::tuple< arma::Mat< T >, arma::Mat< T >, arma::Row< U >, arma::Row< U > > Split (const arma::Mat< T > &input, const arma::Row< U > &inputLabel, const double testRatio)`
Given an input dataset and labels, split into a training set and test set.
- `template<typename T >`
`std::tuple< arma::Mat< T >, arma::Mat< T > > Split (const arma::Mat< T > &input, const double testRatio)`
Given an input dataset, split into a training set and test set.

38.21.1 Detailed Description

Functions to load and save matrices and models.

Functions to load and save matrices.

38.21.2 Typedef Documentation

38.21.2.1 DatasetInfo

```
typedef DatasetMapper< IncrementPolicy, std::string > DatasetInfo
```

Definition at line 196 of file dataset_mapper.hpp.

38.21.3 Enumeration Type Documentation

38.21.3.1 Datatype

```
enum Datatype : bool
```

The Datatype enum specifies the types of data mlpack algorithms can use.

The vast majority of mlpack algorithms can only use numeric data (i.e. float/double/etc.), but some algorithms can use categorical data, specified via this Datatype enum and the **DatasetMapper** (p. 1172) class.

Enumerator

numeric	
categorical	

Definition at line 24 of file datatype.hpp.

38.21.3.2 format

```
enum format
```

Define the formats we can read through **boost::serialization** (p. 251).

Enumerator

autodetect	
text	
xml	
binary	

Definition at line 20 of file format.hpp.

38.21.4 Function Documentation

38.21.4.1 Binarize() [1/2]

```
void mlpack::data::Binarize (
    const arma::Mat< T > & input,
    arma::Mat< T > & output,
    const double threshold )
```

Given an input dataset and threshold, set values greater than threshold to 1 and values less than or equal to the threshold to 0.

This overload applies the changes to all dimensions.

```
arma::Mat<double> input = loadData();
arma::Mat<double> output;
double threshold = 0.5;

// Binarize the whole Matrix. All positive values in will be set to 1 and
// the values less than or equal to 0.5 will become 0.
Binarize<double>(input, output, threshold);
```

Parameters

<i>input</i>	Input matrix to Binarize.
<i>output</i>	Matrix you want to save binarized data into.
<i>threshold</i>	Threshold can by any number.

Definition at line 41 of file binarize.hpp.

References `omp_size_t`.

38.21.4.2 Binarize() [2/2]

```
void mlpack::data::Binarize (
    const arma::Mat< T > & input,
    arma::Mat< T > & output,
    const double threshold,
    const size_t dimension )
```

Given an input dataset and threshold, set values greater than threshold to 1 and values less than or equal to the threshold to 0.

This overload takes a dimension and applys the changes to the given dimension.

```
arma::Mat<double> input = loadData();
arma::Mat<double> output;
double threshold = 0.5;
size_t dimension = 0;

// Binarize the first dimension. All positive values in the first dimension
// will be set to 1 and the values less than or equal to 0 will become 0.
Binarize<double>(input, output, threshold, dimension);
```

Parameters

<i>input</i>	Input matrix to Binarize.
<i>output</i>	Matrix you want to save binarized data into.
<i>threshold</i>	Threshold can by any number.
<i>dimension</i>	Feature to apply the Binarize function.

Definition at line 77 of file binarize.hpp.

References `omp_size_t`.

38.21.4.3 ConfusionMatrix()

```
void mlpack::data::ConfusionMatrix (
    const arma::Row< size_t > predictors,
    const arma::Row< size_t > responses,
    arma::Mat< eT > & output,
    const size_t numClasses )
```

A confusion matrix is a summary of prediction results on a classification problem.

The number of correct and incorrect predictions are summarized by count and broken down by each class. For example, for 2 classes, the function call will be

```
ConfusionMatrix(predictors, responses, output, 2)
```

In this case, the output matrix will be of size 2 * 2:

	0	1
0	TP	FN
1	FP	TN

The confusion matrix for two labels will look like what is shown above. In this confusion matrix, TP represents the number of true positives, FP represents the number of false positives, FN represents the number of false negatives, and TN represents the number of true negatives.

When generalizing to 2 or more classes, the row index of the confusion matrix represents the predicted classes and column index represents the actual class.

Parameters

<i>predictors</i>	Vector of data points.
<i>responses</i>	The measured data for each point.
<i>output</i>	Matrix which is represented as confusion matrix.
<i>numClasses</i>	Number of classes.

38.21.4.4 Extension()

```
std::string mlpack::data::Extension (
    const std::string & filename ) [inline]
```

Definition at line 21 of file extension.hpp.

38.21.4.5 HAS_EXACT_METHOD_FORM()

```
mlpack::data::HAS_EXACT_METHOD_FORM (
    serialize ,
    HasSerializeCheck )
```

38.21.4.6 IsNaNInf()

```
bool mlpack::data::IsNaNInf (
    T & val,
    const std::string & token ) [inline]
```

See if the token is a NaN or an Inf, and if so, set the value accordingly and return a boolean representing whether or not it is.

Definition at line 27 of file is_naninf.hpp.

38.21.4.7 Load() [1/5]

```
bool mpack::data::Load (
    const std::string & filename,
    arma::Mat< eT > & matrix,
    const bool fatal = false,
    const bool transpose = true )
```

Loads a matrix from file, guessing the filetype from the extension.

This will transpose the matrix at load time (unless the transpose parameter is set to false). If the filetype cannot be determined, an error will be given.

The supported types of files are the same as found in Armadillo:

- CSV (csv_ascii), denoted by .csv, or optionally .txt
- TSV (raw_ascii), denoted by .tsv, .csv, or .txt
- ASCII (raw_ascii), denoted by .txt
- Armadillo ASCII (arma_ascii), also denoted by .txt
- PGM (pgm_binary), denoted by .pgm
- PPM (ppm_binary), denoted by .ppm
- Raw binary (raw_binary), denoted by .bin
- Armadillo binary (arma_binary), denoted by .bin
- HDF5, denoted by .hdf, .hdf5, .h5, or .he5

If the file extension is not one of those types, an error will be given. This is preferable to Armadillo's default behavior of loading an unknown filetype as raw_binary, which can have very confusing effects.

If the parameter 'fatal' is set to true, a std::runtime_error exception will be thrown if the matrix does not load successfully. The parameter 'transpose' controls whether or not the matrix is transposed after loading. In most cases, because data is generally stored in a row-major format and mpack requires column-major matrices, this should be left at its default value of 'true'.

Parameters

<i>filename</i>	Name of file to load.
<i>matrix</i>	Matrix to load contents of file into.
<i>fatal</i>	If an error should be reported as fatal (default false).
<i>transpose</i>	If true, transpose the matrix after loading.

Returns

Boolean value indicating success or failure of load.

Referenced by mpack::bindings::cli::GetParam().

38.21.4.8 Load() [2/5]

```
bool mlpack::data::Load (
    const std::string & filename,
    arma::Col< eT > & vec,
    const bool fatal = false )
```

Don't document these with doxygen; these declarations aren't helpful to users.

Load a column vector from a file, guessing the filetype from the extension.

The supported types of files are the same as found in Armadillo:

- CSV (csv_ascii), denoted by .csv, or optionally .txt
- TSV (raw_ascii), denoted by .tsv, .csv, or .txt
- ASCII (raw_ascii), denoted by .txt
- Armadillo ASCII (arma_ascii), also denoted by .txt
- PGM (pgm_binary), denoted by .pgm
- PPM (ppm_binary), denoted by .ppm
- Raw binary (raw_binary), denoted by .bin
- Armadillo binary (arma_binary), denoted by .bin
- HDF5, denoted by .hdf, .hdf5, .h5, or .he5

If the file extension is not one of those types, an error will be given. This is preferable to Armadillo's default behavior of loading an unknown filetype as raw_binary, which can have very confusing effects.

If the parameter 'fatal' is set to true, a std::runtime_error exception will be thrown if the matrix does not load successfully.

Parameters

<i>filename</i>	Name of file to load.
<i>colvec</i>	Column vector to load contents of file into.
<i>fatal</i>	If an error should be reported as fatal (default false).

Returns

Boolean value indicating success or failure of load.

38.21.4.9 Load() [3/5]

```
bool mlpack::data::Load (
    const std::string & filename,
```

```
arma::Row< eT > & rowvec,
const bool fatal = false )
```

Load a row vector from a file, guessing the filetype from the extension.

The supported types of files are the same as found in Armadillo:

- CSV (csv_ascii), denoted by .csv, or optionally .txt
- TSV (raw_ascii), denoted by .tsv, .csv, or .txt
- ASCII (raw_ascii), denoted by .txt
- Armadillo ASCII (arma_ascii), also denoted by .txt
- PGM (pgm_binary), denoted by .pgm
- PPM (ppm_binary), denoted by .ppm
- Raw binary (raw_binary), denoted by .bin
- Armadillo binary (arma_binary), denoted by .bin
- HDF5, denoted by .hdf, .hdf5, .h5, or .he5

If the file extension is not one of those types, an error will be given. This is preferable to Armadillo's default behavior of loading an unknown filetype as raw_binary, which can have very confusing effects.

If the parameter 'fatal' is set to true, a std::runtime_error exception will be thrown if the matrix does not load successfully.

Parameters

<i>filename</i>	Name of file to load.
<i>colvec</i>	Column vector to load contents of file into.
<i>fatal</i>	If an error should be reported as fatal (default false).

Returns

Boolean value indicating success or failure of load.

38.21.4.10 Load() [4/5]

```
bool mlpack::data::Load (
    const std::string & filename,
    arma::Mat< eT > & matrix,
    DatasetMapper< PolicyType > & info,
    const bool fatal = false,
    const bool transpose = true )
```

Loads a matrix from a file, guessing the filetype from the extension and mapping categorical features with a **DatasetMapper** (p. 1172) object.

This will transpose the matrix (unless the transpose parameter is set to false). This particular overload of **Load()** (p. 379) can only load text-based formats, such as those given below:

- CSV (csv_ascii), denoted by .csv, or optionally .txt
- TSV (raw_ascii), denoted by .tsv, .csv, or .txt
- ASCII (raw_ascii), denoted by .txt

If the file extension is not one of those types, an error will be given. This is preferable to Armadillo's default behavior of loading an unknown filetype as raw_binary, which can have very confusing effects.

If the parameter 'fatal' is set to true, a std::runtime_error exception will be thrown if the matrix does not load successfully. The parameter 'transpose' controls whether or not the matrix is transposed after loading. In most cases, because data is generally stored in a row-major format and mlpack requires column-major matrices, this should be left at its default value of 'true'.

The **DatasetMapper** (p. 1172) object passed to this function will be re-created, so any mappings from previous loads will be lost.

Parameters

<i>filename</i>	Name of file to load.
<i>matrix</i>	Matrix to load contents of file into.
<i>info</i>	DatasetMapper (p. 1172) object to populate with mappings and data types.
<i>fatal</i>	If an error should be reported as fatal (default false).
<i>transpose</i>	If true, transpose the matrix after loading.

Returns

Boolean value indicating success or failure of load.

38.21.4.11 Load() [5/5]

```
bool mlpack::data::Load (
    const std::string & filename,
    const std::string & name,
    T & t,
    const bool fatal = false,
    format f = format::autodetect )
```

Don't document these with doxygen; they aren't helpful for users to know about.

Load a model from a file, guessing the filetype from the extension, or, optionally, loading the specified format. If automatic extension detection is used and the filetype cannot be determined, an error will be given.

The supported types of files are the same as what is supported by the **boost::serialization** (p. 251) library:

- text, denoted by .txt
- xml, denoted by .xml
- binary, denoted by .bin

The format parameter can take any of the values in the 'format' enum: 'format::autodetect', 'format::text', 'format::xml', and 'format::binary'. The autodetect functionality operates on the file extension (so, "file.txt" would be autodetected as text).

The name parameter should be specified to indicate the name of the structure to be loaded. This should be the same as the name that was used to save the structure (otherwise, the loading procedure will fail).

If the parameter 'fatal' is set to true, then an exception will be thrown in the event of load failure. Otherwise, the method will return false and the relevant error information will be printed to **Log::Warn** (p. 1541).

38.21.4.12 LoadARFF() [1/2]

```
void mlpack::data::LoadARFF (
    const std::string & filename,
    arma::Mat< eT > & matrix )
```

A utility function to load an ARFF dataset as numeric features (that is, as an Armadillo matrix without any modification).

An exception will be thrown if any features are non-numeric.

38.21.4.13 LoadARFF() [2/2]

```
void mlpack::data::LoadARFF (
    const std::string & filename,
    arma::Mat< eT > & matrix,
    DatasetMapper< PolicyType > & info )
```

A utility function to load an ARFF dataset as numeric and categorical features, using the DatasetInfo structure for mapping.

An exception will be thrown upon failure.

A pre-existing DatasetInfo object can be passed in, but if the dimensionality of the given DatasetInfo object (info.Dimensionality()) does not match the dimensionality of the data, a std::invalid_argument exception will be thrown. If an empty DatasetInfo object is given (constructed with the default constructor or otherwise, so that info.Dimensionality() is 0), it will be set to the right dimensionality.

This ability to pass in pre-existing DatasetInfo objects is very necessary when, e.g., loading a test set after training. If the same DatasetInfo from loading the training set is not used, then the test set may be loaded with different mappings—which can cause horrible problems!

Parameters

<i>filename</i>	Name of ARFF file to load.
<i>matrix</i>	Matrix to load data into.
<i>info</i>	DatasetInfo object; can be default-constructed or pre-existing from another call to LoadARFF() (p. 384).

38.21.4.14 NormalizeLabels()

```
void mlpack::data::NormalizeLabels (
    const RowType & labelsIn,
    arma::Row< size_t > & labels,
    arma::Col< eT > & mapping )
```

Given a set of labels of a particular datatype, convert them to unsigned labels in the range [0, n) where n is the number of different labels.

Also, a reverse mapping from the new label to the old value is stored in the 'mapping' vector.

Parameters

<i>labelsIn</i>	Input labels of arbitrary datatype.
<i>labels</i>	Vector that unsigned labels will be stored in.
<i>mapping</i>	Reverse mapping to convert new labels back to old labels.

38.21.4.15 OneHotEncoding()

```
void mlpack::data::OneHotEncoding (
    const RowType & labelsIn,
    arma::Mat< eT > & output )
```

Given a set of labels of a particular datatype, convert them to binary vector.

The categorical values be mapped to integer values. Then, each integer value is represented as a binary vector that is all zero values except the index of the integer, which is marked with a 1.

Parameters

<i>labels↔ In</i>	Input labels of arbitrary datatype.
<i>output</i>	Binary matrix.

38.21.4.16 RevertLabels()

```
void mlpack::data::RevertLabels (
    const arma::Row< size_t > & labels,
```

```
const arma::Col< eT > & mapping,
arma::Row< eT > & labelsOut )
```

Given a set of labels that have been mapped to the range [0, n), map them back to the original labels given by the 'mapping' vector.

Parameters

<i>labels</i>	Set of normalized labels to convert.
<i>mapping</i>	Mapping to use to convert labels.
<i>labelsOut</i>	Vector to store new labels in.

38.21.4.17 Save() [1/2]

```
bool mlpack::data::Save (
    const std::string & filename,
    const arma::Mat< eT > & matrix,
    const bool fatal = false,
    bool transpose = true )
```

Saves a matrix to file, guessing the filetype from the extension.

This will transpose the matrix at save time. If the filetype cannot be determined, an error will be given.

The supported types of files are the same as found in Armadillo:

- CSV (csv_ascii), denoted by .csv, or optionally .txt
- ASCII (raw_ascii), denoted by .txt
- Armadillo ASCII (arma_ascii), also denoted by .txt
- PGM (pgm_binary), denoted by .pgm
- PPM (ppm_binary), denoted by .ppm
- Raw binary (raw_binary), denoted by .bin
- Armadillo binary (arma_binary), denoted by .bin
- HDF5 (hdf5_binary), denoted by .hdf5, .hdf, .h5, or .he5

If the file extension is not one of those types, an error will be given. If the 'fatal' parameter is set to true, a `std::runtime_error` exception will be thrown upon failure. If the 'transpose' parameter is set to true, the matrix will be transposed before saving. Generally, because mlpack stores matrices in a column-major format and most datasets are stored on disk as row-major, this parameter should be left at its default value of 'true'.

Parameters

<i>filename</i>	Name of file to save to.
<i>matrix</i>	Matrix to save into file.
<i>fatal</i>	If an error should be reported as fatal (default false).
<i>transpose</i>	If true, transpose the matrix before saving.

Returns

Boolean value indicating success or failure of save.

38.21.4.18 Save() [2/2]

```
bool mlpack::data::Save (
    const std::string & filename,
    const std::string & name,
    T & t,
    const bool fatal = false,
    format f = format::autodetect )
```

Saves a model to file, guessing the filetype from the extension, or, optionally, saving the specified format.

If automatic extension detection is used and the filetype cannot be determined, an error will be given.

The supported types of files are the same as what is supported by the **boost::serialization** (p. 251) library:

- text, denoted by .txt
- xml, denoted by .xml
- binary, denoted by .bin

The format parameter can take any of the values in the 'format' enum: 'format::autodetect', 'format::text', 'format::xml', and 'format::binary'. The autodetect functionality operates on the file extension (so, "file.txt" would be autodetected as text).

The name parameter should be specified to indicate the name of the structure to be saved. If **Load()** (p. 379) is later called on the generated file, the name used to load should be the same as the name used for this call to **Save()** (p. 386).

If the parameter 'fatal' is set to true, then an exception will be thrown in the event of a save failure. Otherwise, the method will return false and the relevant error information will be printed to **Log::Warn** (p. 1541).

38.21.4.19 Split() [1/4]

```
void mlpack::data::Split (
    const arma::Mat< T > & input,
    const arma::Row< U > & inputLabel,
    arma::Mat< T > & trainData,
    arma::Mat< T > & testData,
    arma::Row< U > & trainLabel,
    arma::Row< U > & testLabel,
    const double testRatio )
```

Given an input dataset and labels, split into a training set and test set.

Example usage below. This overload places the split dataset into the four output parameters given (trainData, testData, trainLabel, and testLabel).

```

arma::mat input = loadData();
arma::Row<size_t> label = loadLabel();
arma::mat trainData;
arma::mat testData;
arma::Row<size_t> trainLabel;
arma::Row<size_t> testLabel;
math::RandomSeed(100); // Set the seed if you like.

// Split the dataset into a training and test set, with 30% of the data being
// held out for the test set.
Split(input, label, trainData,
      testData, trainLabel, testLabel, 0.3);

```

Parameters

<i>input</i>	Input dataset to split.
<i>label</i>	Input labels to split.
<i>trainData</i>	Matrix to store training data into.
<i>testData</i>	Matrix to store test data into.
<i>trainLabel</i>	Vector to store training labels into.
<i>testLabel</i>	Vector to store test labels into.
<i>testRatio</i>	Percentage of dataset to use for test set (between 0 and 1).

Definition at line 49 of file `split_data.hpp`.

Referenced by `Split()`.

38.21.4.20 Split() [2/4]

```

void mlpack::data::Split (
    const arma::Mat< T > & input,
    arma::Mat< T > & trainData,
    arma::Mat< T > & testData,
    const double testRatio )

```

Given an input dataset, split into a training set and test set.

Example usage below. This overload places the split dataset into the two output parameters given (`trainData`, `testData`).

```

arma::mat input = loadData();
arma::mat trainData;
arma::mat testData;
math::RandomSeed(100); // Set the seed if you like.

// Split the dataset into a training and test set, with 30% of the data being
// held out for the test set.
Split(input, trainData, testData, 0.3);

```

Parameters

<i>input</i>	Input dataset to split.
<i>trainData</i>	Matrix to store training data into.
<i>testData</i>	Matrix to store test data into.
<i>testRatio</i>	Percentage of dataset to use for test set (between 0 and 1).

Definition at line 103 of file split_data.hpp.

38.21.4.21 Split() [3/4]

```
std::tuple<arma::Mat<T>, arma::Mat<T>, arma::Row<U>, arma::Row<U> > mlpack::data::Split (
    const arma::Mat< T > & input,
    const arma::Row< U > & inputLabel,
    const double testRatio )
```

Given an input dataset and labels, split into a training set and test set.

Example usage below. This overload returns the split dataset as a `std::tuple` with four elements: an `arma::Mat<T>` containing the training data, an `arma::Mat<T>` containing the test data, an `arma::Row<U>` containing the training labels, and an `arma::Row<U>` containing the test labels.

```
arma::mat input = loadData();
arma::Row<size_t> label = loadLabel();
auto splitResult = Split(input, label, 0.2);
```

Parameters

<i>input</i>	Input dataset to split.
<i>label</i>	Input labels to split.
<i>testRatio</i>	Percentage of dataset to use for test set (between 0 and 1).

Returns

`std::tuple` containing `trainData` (`arma::Mat<T>`), `testData` (`arma::Mat<T>`), `trainLabel` (`arma::Row<U>`), and `testLabel` (`arma::Row<U>`).

Definition at line 148 of file split_data.hpp.

References `Split()`.

38.21.4.22 Split() [4/4]

```
std::tuple<arma::Mat<T>, arma::Mat<T> > mlpack::data::Split (
    const arma::Mat< T > & input,
    const double testRatio )
```

Given an input dataset, split into a training set and test set.

Example usage below. This overload returns the split dataset as a `std::tuple` with two elements: an `arma::Mat<T>` containing the training data and an `arma::Mat<T>` containing the test data.

```
arma::mat input = loadData();
auto splitResult = Split(input, 0.2);
```

Parameters

<i>input</i>	Input dataset to split.
<i>testRatio</i>	Percentage of dataset to use for test set (between 0 and 1).

Returns

std::tuple containing trainData (arma::Mat<T>) and testData (arma::Mat<T>).

Definition at line 184 of file split_data.hpp.

References Split().

38.22 mlpack::dbscan Namespace Reference

Classes

- class **DBSCAN**
DBSCAN (p. 1197) (*Density-Based Spatial Clustering of Applications with Noise*) is a clustering technique described in the following paper:
- class **OrderedPointSelection**
This class can be used to sequentially select the next point to use for DBSCAN (p. 1197).
- class **RandomPointSelection**
This class can be used to randomly select the next point to use for DBSCAN (p. 1197).

38.23 mlpack::decision_stump Namespace Reference

Classes

- class **DecisionStump**
This class implements a decision stump.

38.24 mlpack::det Namespace Reference

Density Estimation Trees.

Classes

- class **DTree**
A density estimation tree is similar to both a decision tree and a space partitioning tree (like a kd-tree).
- class **PathCacher**
This class is responsible for caching the path to each node of the tree.

Functions

- `template<typename MatType, typename TagType >`
`void PrintLeafMembership (DTree< MatType, TagType > *dtree, const MatType &data, const arma::Mat< size_t > &labels, const size_t numClasses, const std::string &leafClassMembershipFile="")`
Print the membership of leaves of a density estimation tree given the labels and number of classes.
- `template<typename MatType, typename TagType >`
`void PrintVariableImportance (const DTree< MatType, TagType > *dtree, const std::string viFile="")`
Print the variable importance of each dimension of a density estimation tree.
- `template<typename MatType, typename TagType >`
`DTree< MatType, TagType > * Trainer (MatType &dataset, const size_t folds, const bool useVolumeReg=false, const size_t maxLeafSize=10, const size_t minLeafSize=5, const std::string unprunedTreeOutput="", const bool skipPruning=false)`
Train the optimal decision tree using cross-validation with the given number of folds.

38.24.1 Detailed Description

Density Estimation Trees.

38.24.2 Function Documentation

38.24.2.1 PrintLeafMembership()

```
void mlpack::det::PrintLeafMembership (
    DTree< MatType, TagType > * dtree,
    const MatType & data,
    const arma::Mat< size_t > & labels,
    const size_t numClasses,
    const std::string & leafClassMembershipFile = "" )
```

Print the membership of leaves of a density estimation tree given the labels and number of classes.

Optionally, pass the name of a file to print this information to (otherwise stdout is used).

Parameters

<i>dtree</i>	Tree to print membership of.
<i>data</i>	Dataset tree is built upon.
<i>labels</i>	Class labels of dataset.
<i>numClasses</i>	Number of classes in dataset.
<i>leafClassMembershipFile</i>	Name of file to print to (optional).

38.24.2.2 PrintVariableImportance()

```
void mlpack::det::PrintVariableImportance (
    const DTree< MatType, TagType > * dtree,
    const std::string viFile = "" )
```

Print the variable importance of each dimension of a density estimation tree.

Optionally, pass the name of a file to print this information to (otherwise stdout is used).

Parameters

<i>dtree</i>	Density tree to use.
<i>viFile</i>	Name of file to print to (optional).

38.24.2.3 Trainer()

```
DTree<MatType, TagType>* mlpack::det::Trainer (
    MatType & dataset,
    const size_t folds,
    const bool useVolumeReg = false,
    const size_t maxLeafSize = 10,
    const size_t minLeafSize = 5,
    const std::string unprunedTreeOutput = "",
    const bool skipPruning = false )
```

Train the optimal decision tree using cross-validation with the given number of folds.

Optionally, give a filename to print the unpruned tree to. This initializes a tree on the heap, so you are responsible for deleting it.

Parameters

<i>dataset</i>	Dataset for the tree to use.
<i>folds</i>	Number of folds to use for cross-validation.
<i>useVolumeReg</i>	If true, use volume regularization.
<i>maxLeafSize</i>	Maximum number of points allowed in a leaf.
<i>minLeafSize</i>	Minimum number of points allowed in a leaf.
<i>unprunedTreeOutput</i>	Filename to print unpruned tree to (optional).

38.25 mlpack::distribution Namespace Reference

Probability distributions.

Classes

- class **DiagonalGaussianDistribution**
A single multivariate Gaussian distribution with diagonal covariance.
- class **DiscreteDistribution**
A discrete distribution where the only observations are discrete observations.
- class **GammaDistribution**
This class represents the Gamma distribution.
- class **GaussianDistribution**
A single multivariate Gaussian distribution.
- class **LaplaceDistribution**
The multivariate Laplace distribution centered at 0 has pdf.
- class **RegressionDistribution**
A class that represents a univariate conditionally Gaussian distribution.

38.25.1 Detailed Description

Probability distributions.

38.26 mlpack::emst Namespace Reference

Euclidean Minimum Spanning Trees.

Classes

- class **DTBRules**
- class **DTBStat**
A statistic for use with mlpack trees, which stores the upper bound on distance to nearest neighbors and the component which this node belongs to.
- class **DualTreeBoruvka**
Performs the MST calculation using the Dual-Tree Boruvka algorithm, using any type of tree.
- class **EdgePair**
An edge pair is simply two indices and a distance.
- class **UnionFind**
A Union-Find data structure.

38.26.1 Detailed Description

Euclidean Minimum Spanning Trees.

38.27 mlpack::fastmks Namespace Reference

Fast max-kernel search.

Classes

- class **FastMKS**
An implementation of fast exact max-kernel search.
- class **FastMKSMoel**
*A utility struct to contain all the possible **FastMKS** (p. 1280) models, for use by the mlpack_fastmks program.*
- class **FastMKSRules**
*The **FastMKSRules** (p. 1298) class is a template helper class used by **FastMKS** (p. 1280) class when performing exact max-kernel search.*
- class **FastMKStat**
*The statistic used in trees with **FastMKS** (p. 1280).*

38.27.1 Detailed Description

Fast max-kernel search.

38.28 mlpack::gmm Namespace Reference

Gaussian Mixture Models.

Classes

- class **DiagonalConstraint**
Force a covariance matrix to be diagonal.
- class **DiagonalGMM**
A Diagonal Gaussian Mixture Model.
- class **EigenvalueRatioConstraint**
Given a vector of eigenvalue ratios, ensure that the covariance matrix always has those eigenvalue ratios.
- class **EMFit**
*This class contains methods which can fit a **GMM** (p. 1323) to observations using the EM algorithm.*
- class **GMM**
*A Gaussian Mixture Model (**GMM** (p. 1323)).*
- class **NoConstraint**
This class enforces no constraint on the covariance matrix.
- class **PositiveDefiniteConstraint**
Given a covariance matrix, force the matrix to be positive definite.

38.28.1 Detailed Description

Gaussian Mixture Models.

38.29 mlpack::hmm Namespace Reference

Hidden Markov Models.

Classes

- class **HMM**
A class that represents a Hidden Markov Model with an arbitrary type of emission distribution.
- class **HMMModel**
*A serializable **HMM** (p. 1335) model that also stores the type.*
- class **HMMRegression**
A class that represents a Hidden Markov Model Regression (HMMR).

Enumerations

- enum **HMMType** : char {
DiscreteHMM = 0,
GaussianHMM,
GaussianMixtureModelHMM,
DiagonalGaussianMixtureModelHMM,
DiscreteHMM = 0,
GaussianHMM,
GaussianMixtureModelHMM,
DiagonalGaussianMixtureModelHMM }
- enum **HMMType** : char {
DiscreteHMM = 0,
GaussianHMM,
GaussianMixtureModelHMM,
DiagonalGaussianMixtureModelHMM,
DiscreteHMM = 0,
GaussianHMM,
GaussianMixtureModelHMM,
DiagonalGaussianMixtureModelHMM }
HMMType, to be stored on disk.

Functions

- template<typename ActionType, typename ExtraInfoType = void>
void **LoadHMMAndPerformAction** (const std::string &modelFile, ExtraInfoType *x=NULL)
ActionType should implement static void Apply(HMMType&).
- template<typename HMMType >
void **SaveHMM** (**HMMType** &hmm, const std::string &modelFile)
*Save an **HMM** (p. 1335) to a file.*

38.29.1 Detailed Description

Hidden Markov Models.

38.29.2 Enumeration Type Documentation

38.29.2.1 HMMType [1/2]

```
enum HMMType : char
```

Enumerator

DiscreteHMM	
GaussianHMM	
GaussianMixtureModelHMM	
DiagonalGaussianMixtureModelHMM	
DiscreteHMM	
GaussianHMM	
GaussianMixtureModelHMM	
DiagonalGaussianMixtureModelHMM	

Definition at line 22 of file hmm_model.hpp.

38.29.2.2 HMMType [2/2]

```
enum HMMType : char
```

HMMType, to be stored on disk.

This is of type char, which is one byte. (I'm not sure what will happen on systems where one byte is not eight bits.)

Enumerator

DiscreteHMM	
GaussianHMM	
GaussianMixtureModelHMM	
DiagonalGaussianMixtureModelHMM	
DiscreteHMM	
GaussianHMM	
GaussianMixtureModelHMM	
DiagonalGaussianMixtureModelHMM	

Definition at line 22 of file hmm_util.hpp.

38.29.3 Function Documentation

38.29.3.1 LoadHMMAndPerformAction()

```
void mlpack::hmm::LoadHMMAndPerformAction (
    const std::string & modelFile,
    ExtraInfoType * x = NULL )
```

ActionType should implement static void Apply(HMMType&).

38.29.3.2 SaveHMM()

```
void mlpack::hmm::SaveHMM (
    HMMType & hmm,
    const std::string & modelFile )
```

Save an **HMM** (p. 1335) to a file.

The file must also encode what type of **HMM** (p. 1335) is being stored.

38.30 mlpack::hpt Namespace Reference

Classes

- class **CVFunction**
This wrapper serves for adapting the interface of the cross-validation classes to the one that can be utilized by the mlpack optimizers.
- struct **DeduceHyperParameterTypes**
*A type function for deducing types of hyper-parameters from types of arguments in the Optimize method in **Hyper↔ParameterTuner** (p. 1375).*
- struct **DeduceHyperParameterTypes< PreFixedArg< T >, Args... >**
*Defining **DeduceHyperParameterTypes** (p. 1365) for the case when not all argument types have been processed, and the next one is the type of an argument that should be fixed.*
- struct **DeduceHyperParameterTypes< T, Args... >**
*Defining **DeduceHyperParameterTypes** (p. 1365) for the case when not all argument types have been processed, and the next one (T) is a collection type or an arithmetic type.*
- struct **FixedArg**
A struct for storing information about a fixed argument.
- class **HyperParameterTuner**

The class **HyperParameterTuner** (p. 1375) for the given *MLAlgorithm* utilizes the provided *Optimizer* to find the values of hyper-parameters that optimize the value of the given *Metric*.

- class **IsPreFixedArg**

A type function for checking whether the given type is **PreFixedArg** (p. 1381).

- struct **PreFixedArg**

A struct for marking arguments as ones that should be fixed (it can be useful for the *Optimize* method of **HyperParameterTuner** (p. 1375)).

- struct **PreFixedArg< T & >**

The specialization of the template for references.

Typedefs

- template<typename... Args>

using **TupleOfHyperParameters** = typename **DeduceHyperParameterTypes**< Args... >::TupleType

A short alias for deducing types of hyper-parameters from types of arguments in the *Optimize* method in **HyperParameterTuner** (p. 1375).

Functions

- template<typename T >

PreFixedArg< T > Fixed (T &&value)

Mark the given argument as one that should be fixed.

38.30.1 Typedef Documentation

38.30.1.1 TupleOfHyperParameters

```
using TupleOfHyperParameters = typename DeduceHyperParameterTypes<Args...>::TupleType
```

A short alias for deducing types of hyper-parameters from types of arguments in the *Optimize* method in **HyperParameterTuner** (p. 1375).

Definition at line 127 of file `deduce_hp_types.hpp`.

38.30.2 Function Documentation

38.30.2.1 Fixed()

```
PreFixedArg<T> mlpack::hpt::Fixed (
    T && value )
```

Mark the given argument as one that should be fixed.

It can be applied to arguments that are passed to the Optimize method of **HyperParameterTuner** (p. 1375).

The implementation avoids data copying. If the passed argument is an l-value reference, we store it as a const l-value rereference inside the returned **PreFixedArg** (p. 1381) object. If the passed argument is an r-value reference, light-weight copying (by taking possession of the r-value) will be made during the initialization of the returned **PreFixedArg** (p. 1381) object.

Definition at line 36 of file fixed.hpp.

38.31 mlpack::kde Namespace Reference

Kernel Density Estimation.

Classes

- class **DeleteVisitor**
- class **DualBiKDE**
 - DualBiKDE* (p. 1384) computes a Kernel Density Estimation on the given KDEType.
- class **DualMonoKDE**
 - DualMonoKDE* (p. 1386) computes a Kernel Density Estimation on the given KDEType.
- class **KDE**
 - The KDE* (p. 1387) class is a template class for performing Kernel Density Estimations.
- class **KDEModel**
- class **KDERules**
 - A dual-tree traversal Rules class for kernel density estimation.*
- class **KDEStat**
 - Extra data for each node in the tree for the task of kernel density estimation.*
- class **KernelNormalizer**
 - KernelNormalizer* (p. 1410) holds a set of methods to normalize estimations applying in each case the appropriate kernel normalizer function.
- class **ModeVisitor**
 - ModeVisitor* (p. 1412) exposes the Mode() method of the KDEType.
- class **TrainVisitor**
 - TrainVisitor* (p. 1413) trains a given KDEType using a reference set.

Typedefs

- `template<typename KernelType, template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType> using KDEType = KDE< KernelType, metric::EuclideanDistance, arma::mat, TreeType, TreeType< metric::EuclideanDistance, kde::KDEStat, arma::mat >::template DualTreeTraverser, TreeType< metric::EuclideanDistance, kde::KDEStat, arma::mat >::template SingleTreeTraverser >`
- Alias template.*

Enumerations

- enum **KDEMode** {
DUAL_TREE_MODE,
SINGLE_TREE_MODE }

KDEMode represents the ways in which KDE algorithm can be executed.

38.31.1 Detailed Description

Kernel Density Estimation.

38.31.2 Typedef Documentation

38.31.2.1 KDEType

```
using KDEType = KDE<KernelType, metric::EuclideanDistance, arma::mat, TreeType, TreeType<
metric::EuclideanDistance, kde::KDEStat, arma::mat>::template DualTreeTraverser, TreeType< metric<
::EuclideanDistance, kde::KDEStat, arma::mat>::template SingleTreeTraverser>
```

Alias template.

Definition at line 45 of file kde_model.hpp.

38.31.3 Enumeration Type Documentation

38.31.3.1 KDEMode

```
enum KDEMode
```

KDEMode represents the ways in which **KDE** (p. 1387) algorithm can be executed.

Enumerator

DUAL_TREE_MODE

38.32 mlpack::kernel Namespace Reference

Kernel functions.

Classes

- class **CauchyKernel**
The Cauchy kernel.
- class **CosineDistance**
The cosine distance (or cosine similarity).
- class **EpanechnikovKernel**
The Epanechnikov kernel, defined as.
- class **ExampleKernel**
An example kernel function.
- class **GaussianKernel**
The standard Gaussian kernel.
- class **HyperbolicTangentKernel**
Hyperbolic tangent kernel.
- class **KernelTraits**
This is a template class that can provide information about various kernels.
- class **KernelTraits< CauchyKernel >**
Kernel traits for the Cauchy kernel.
- class **KernelTraits< CosineDistance >**
Kernel traits for the cosine distance.
- class **KernelTraits< EpanechnikovKernel >**
Kernel traits for the Epanechnikov kernel.
- class **KernelTraits< GaussianKernel >**
Kernel traits for the Gaussian kernel.
- class **KernelTraits< LaplacianKernel >**
Kernel traits of the Laplacian kernel.
- class **KernelTraits< SphericalKernel >**
Kernel traits for the spherical kernel.
- class **KernelTraits< TriangularKernel >**
Kernel traits for the triangular kernel.
- class **KMeansSelection**
Implementation of the kmeans sampling scheme.
- class **LaplacianKernel**
The standard Laplacian kernel.
- class **LinearKernel**
The simple linear kernel (dot product).
- class **NystroemMethod**
- class **OrderedSelection**
- class **PolynomialKernel**
The simple polynomial kernel.
- class **PSpectrumStringKernel**
The p-spectrum string kernel.

- class **RandomSelection**
- class **SphericalKernel**

The spherical kernel, which is 1 when the distance between the two argument points is less than or equal to the bandwidth, or 0 otherwise.

- class **TriangularKernel**

The trivially simple triangular kernel, defined by.

38.32.1 Detailed Description

Kernel functions.

This namespace contains kernel functions, which evaluate some kernel function $K(x, y)$ for some arbitrary vectors x and y of the same dimension. The single restriction on the function $K(x, y)$ is that it must satisfy Mercer's condition:

$$\int \int K(x, y) g(x) g(y) dx dy \geq 0$$

for all square integrable functions $g(x)$.

The kernels in this namespace all implement the KernelType policy. For more information, see **The KernelType policy documentation** (p. 173).

38.33 mlpack::kmeans Namespace Reference

K-Means clustering.

Classes

- class **AllowEmptyClusters**

Policy which allows K-Means to create empty clusters without any error being reported.

- class **DualTreeKMeans**

An algorithm for an exact Lloyd iteration which simply uses dual-tree nearest-neighbor search to find the nearest centroid for each point in the dataset.

- class **DualTreeKMeansRules**
- class **DualTreeKMeansStatistic**
- class **ElkanKMeans**
- class **HamerlyKMeans**
- class **KillEmptyClusters**

Policy which allows K-Means to "kill" empty clusters without any error being reported.

- class **KMeans**

This class implements K-Means clustering, using a variety of possible implementations of Lloyd's algorithm.

- class **MaxVarianceNewCluster**

When an empty cluster is detected, this class takes the point furthest from the centroid of the cluster with maximum variance as a new cluster.

- class **NaiveKMeans**

This is an implementation of a single iteration of Lloyd's algorithm for k-means.

- class **PellegMooreKMeans**

An implementation of Pelleg-Moore's 'blacklist' algorithm for k-means clustering.

- class **PellegMooreKMeansRules**

The rules class for the single-tree Pelleg-Moore kd-tree traversal for k-means clustering.

- class **PellegMooreKMeansStatistic**

A statistic for trees which holds the blacklist for Pelleg-Moore k-means clustering (which represents the clusters that cannot possibly own any points in a node).

- class **RandomPartition**

A very simple partitioner which partitions the data randomly into the number of desired clusters.

- class **RefinedStart**

A refined approach for choosing initial points for k-means clustering.

- class **SampleInitialization**

Typedefs

- template<typename MetricType , typename MatType >
using **CoverTreeDualTreeKMeans** = **DualTreeKMeans**< MetricType, MatType, **tree::StandardCoverTree** >
*A template typedef for the **DualTreeKMeans** (p. 1466) algorithm with the cover tree type.*
- template<typename MetricType , typename MatType >
using **DefaultDualTreeKMeans** = **DualTreeKMeans**< MetricType, MatType >
*A template typedef for the **DualTreeKMeans** (p. 1466) algorithm with the default tree type (a kd-tree).*

Functions

- template<typename TreeType >
void **HideChild** (TreeType &node, const size_t child, const typename **std::enable_if_t**< ! **tree::TreeTraits**< TreeType >::BinaryTree > *junk=0)
Utility function for hiding children.
- template<typename TreeType >
void **HideChild** (TreeType &node, const size_t child, const typename **std::enable_if_t**< **tree::TreeTraits**< TreeType >::BinaryTree > *junk=0)
Utility function for hiding children.
- template<typename TreeType >
void **RestoreChildren** (TreeType &node, const typename **std::enable_if_t**< ! **tree::TreeTraits**< TreeType >↵
::BinaryTree > *junk=0)
Utility function for restoring children to a non-binary tree.
- template<typename TreeType >
void **RestoreChildren** (TreeType &node, const typename **std::enable_if_t**< **tree::TreeTraits**< TreeType >↵
::BinaryTree > *junk=0)
Utility function for restoring children to a binary tree.

38.33.1 Detailed Description

K-Means clustering.

38.33.2 Typedef Documentation

38.33.2.1 CoverTreeDualTreeKMeans

```
using CoverTreeDualTreeKMeans = DualTreeKMeans<MetricType, MatType, tree::StandardCoverTree>
```

A template typedef for the **DualTreeKMeans** (p. 1466) algorithm with the cover tree type.

Definition at line 170 of file dual_tree_kmeans.hpp.

38.33.2.2 DefaultDualTreeKMeans

```
using DefaultDualTreeKMeans = DualTreeKMeans<MetricType, MatType>
```

A template typedef for the **DualTreeKMeans** (p. 1466) algorithm with the default tree type (a kd-tree).

Definition at line 164 of file dual_tree_kmeans.hpp.

38.33.3 Function Documentation

38.33.3.1 HideChild() [1/2]

```
void mlpack::kmeans::HideChild (
    TreeType & node,
    const size_t child,
    const typename std::enable_if_t< ! tree::TreeTraits< TreeType >::BinaryTree > *
junk = 0 )
```

Utility function for hiding children.

This actually does something, and is called if the tree is not a binary tree.

Referenced by DualTreeKMeans< MetricType, MatType, TreeType >::DistanceCalculations().

38.33.3.2 HideChild() [2/2]

```
void mlpack::kmeans::HideChild (
    TreeType & node,
    const size_t child,
    const typename std::enable_if_t< tree::TreeTraits< TreeType >::BinaryTree > * junk
    = 0 )
```

Utility function for hiding children.

This is called when the tree is a binary tree, and does nothing, because we don't hide binary children in this way.

38.33.3.3 RestoreChildren() [1/2]

```
void mlpack::kmeans::RestoreChildren (
    TreeType & node,
    const typename std::enable_if_t<! tree::TreeTraits< TreeType >::BinaryTree > *
    junk = 0 )
```

Utility function for restoring children to a non-binary tree.

Referenced by DualTreeKMeans< MetricType, MatType, TreeType >::DistanceCalculations().

38.33.3.4 RestoreChildren() [2/2]

```
void mlpack::kmeans::RestoreChildren (
    TreeType & node,
    const typename std::enable_if_t< tree::TreeTraits< TreeType >::BinaryTree > * junk
    = 0 )
```

Utility function for restoring children to a binary tree.

38.34 mlpack::kpca Namespace Reference

Classes

- class **KernelPCA**

This class performs kernel principal components analysis (Kernel PCA), for a given kernel.

- class **NaiveKernelRule**
- class **NystroemKernelRule**

38.35 mlpack::lcc Namespace Reference

Classes

- class **LocalCoordinateCoding**

An implementation of Local Coordinate Coding (LCC) that codes data which approximately lives on a manifold using a variation of l1-norm regularized sparse coding; in LCC, the penalty on the absolute value of each point's coefficient for each atom is weighted by the squared distance of that point to that atom.

38.36 mlpack::lmnn Namespace Reference

Large Margin Nearest Neighbor.

Classes

- class **Constraints**

Interface for generating distance based constraints on a given dataset, provided corresponding true labels and a quantity parameter (k) are specified.

- class **LMNN**

An implementation of Large Margin nearest neighbor metric learning technique.

- class **LMNNFunction**

The Large Margin Nearest Neighbors function.

38.36.1 Detailed Description

Large Margin Nearest Neighbor.

38.37 mlpack::math Namespace Reference

Miscellaneous math routines.

Classes

- class **ColumnsToBlocks**

Transform the columns of the given matrix into a block format.

- class **RangeType**

Simple real-valued range.

Typedefs

- typedef **RangeType**< double > **Range**

*3.0.0 TODO: break reverse-compatibility by changing **RangeType** (p. 1549) to **Range**.*

Functions

- template<typename T >
T::elem_type **AccuLog** (const T &x)
Sum a vector of log values.
- void **Center** (const arma::mat &x, arma::mat &xCentered)
Creates a centered matrix, where centering is done by subtracting the sum over the columns (a column vector) from each column of the matrix.
- double **ClampNonNegative** (const double d)
Forces a number to be non-negative, turning negative numbers into zero.
- double **ClampNonPositive** (const double d)
Forces a number to be non-positive, turning positive numbers into zero.
- double **ClampRange** (double value, const double rangeMin, const double rangeMax)
Clamp a number between a particular range.
- template<typename ElemType >
void **ClearAlias** (arma::Mat< ElemType > &mat)
Clear an alias so that no data is overwritten.
- template<typename ElemType >
void **ClearAlias** (arma::SpMat< ElemType > &)
Clear an alias for a sparse matrix.
- template<typename eT >
arma::Mat< eT > **ColumnCovariance** (const arma::Mat< eT > &A, const size_t norm_type=0)
- template<typename T >
arma::Mat< std::complex< T > > **ColumnCovariance** (const arma::Mat< std::complex< T > > &A, const size_t norm_type=0)
- void **FixedRandomSeed** ()
Set the random seed to a fixed number.
- template<typename T >
T **LogAdd** (T x, T y)
Internal log-addition.
- template<typename ElemType >
arma::Cube< ElemType > **MakeAlias** (arma::Cube< ElemType > &input, const bool strict=true)
Make an alias of a dense cube.
- template<typename ElemType >
arma::Mat< ElemType > **MakeAlias** (arma::Mat< ElemType > &input, const bool strict=true)
Make an alias of a dense matrix.
- template<typename ElemType >
arma::Row< ElemType > **MakeAlias** (arma::Row< ElemType > &input, const bool strict=true)
Make an alias of a dense row.
- template<typename ElemType >
arma::Col< ElemType > **MakeAlias** (arma::Col< ElemType > &input, const bool strict=true)
Make an alias of a dense column.
- template<typename ElemType >
arma::SpMat< ElemType > **MakeAlias** (const arma::SpMat< ElemType > &input, const bool=true)
Make a copy of a sparse matrix (an alias is not possible).
- template<typename ElemType >
arma::SpRow< ElemType > **MakeAlias** (const arma::SpRow< ElemType > &input, const bool=true)
Make a copy of a sparse row (an alias is not possible).
- template<typename ElemType >
arma::SpCol< ElemType > **MakeAlias** (const arma::SpCol< ElemType > &input, const bool=true)

Make a copy of a sparse column (an alias is not possible).

- void **ObtainDistinctSamples** (const size_t loInclusive, const size_t hiExclusive, const size_t maxNumSamples, arma::uvec &distinctSamples)

Obtains no more than maxNumSamples distinct samples.

- void **Orthogonalize** (const arma::mat &x, arma::mat &W)

Orthogonalize x and return the result in W, using eigendecomposition.

- void **Orthogonalize** (arma::mat &x)

Orthogonalize x in-place.

- double **RandBernoulli** (const double input)

Generates a 0/1 specified by the input.

- int **RandInt** (const int hiExclusive)

Generates a uniform random integer.

- int **RandInt** (const int lo, const int hiExclusive)

Generates a uniform random integer.

- double **RandNormal** ()

Generates a normally distributed random number with mean 0 and variance 1.

- double **RandNormal** (const double mean, const double variance)

Generates a normally distributed random number with specified mean and variance.

- double **Random** ()

Generates a uniform random number between 0 and 1.

- double **Random** (const double lo, const double hi)

Generates a uniform random number in the specified range.

- void **RandomBasis** (arma::mat &basis, const size_t d)

Create a random d-dimensional orthogonal basis, storing it in the given matrix.

- void **RandomSeed** (const size_t seed)

*Set the random seed used by the random functions (**Random()** (p. 418) and **RandInt()** (p. 417)).*

- void **RandVector** (arma::vec &v)

Overwrites a dimension-N vector to a random vector on the unit sphere in R^N .

- void **RemoveRows** (const arma::mat &input, const std::vector< size_t > &rowsToRemove, arma::mat &output)

Remove a certain set of rows in a matrix while copying to a second matrix.

- template<typename MatType, typename LabelsType >

```
void ShuffleData (const MatType &inputPoints, const LabelsType &inputLabels, MatType &outputPoints,
LabelsType &outputLabels, const std::enable_if_t<!arma::is_SpMat< MatType >::value > *==0, const std::enable_if_t<!arma::is_Cube< MatType >::value > *==0)
```

Shuffle a dataset and associated labels (or responses).

- template<typename MatType, typename LabelsType >

```
void ShuffleData (const MatType &inputPoints, const LabelsType &inputLabels, MatType &outputPoints,
LabelsType &outputLabels, const std::enable_if_t< arma::is_SpMat< MatType >::value > *==0, const std::enable_if_t< arma::is_Cube< MatType >::value > *==0)
```

Shuffle a sparse dataset and associated labels (or responses).

- template<typename MatType, typename LabelsType >

```
void ShuffleData (const MatType &inputPoints, const LabelsType &inputLabels, MatType &outputPoints,
LabelsType &outputLabels, const std::enable_if_t<!arma::is_SpMat< MatType >::value > *==0, const std::enable_if_t< arma::is_Cube< MatType >::value > *==0, const std::enable_if_t< arma::is_Cube< LabelsType >::value > *==0)
```

Shuffle a cube-shaped dataset and associated labels (or responses) which are also cube-shaped.

- `template<typename MatType, typename LabelsType, typename WeightsType >`
`void ShuffleData (const MatType &inputPoints, const LabelsType &inputLabels, const WeightsType &inputWeights, MatType &outputPoints, LabelsType &outputLabels, WeightsType &outputWeights, const std::enable_if_t<!arma::is_SpMat< MatType >::value > * = 0, const std::enable_if_t<!arma::is_Cube< MatType >::value > * = 0)`
Shuffle a dataset and associated labels (or responses) and weights.
- `template<typename MatType, typename LabelsType, typename WeightsType >`
`void ShuffleData (const MatType &inputPoints, const LabelsType &inputLabels, const WeightsType &inputWeights, MatType &outputPoints, LabelsType &outputLabels, WeightsType &outputWeights, const std::enable_if_t<arma::is_SpMat< MatType >::value > * = 0, const std::enable_if_t<!arma::is_Cube< MatType >::value > * = 0)`
Shuffle a sparse dataset and associated labels (or responses) and weights.
- `template<typename T >`
`T Sign (const T x)`
Signum function.
- `void Smat (const arma::vec &input, arma::mat &output)`
The inverse of Svec.
- `void Svec (const arma::mat &input, arma::vec &output)`
Upper triangular representation of a symmetric matrix, scaled such that, $\text{dot}(\text{Svec}(A), \text{Svec}(B)) == \text{dot}(A, B)$ for symmetric A, B .
- `void Svec (const arma::sp_mat &input, arma::sp_vec &output)`
- `size_t SvecIndex (size_t i, size_t j, size_t n)`
*Return the index such that $A[i,j] == \text{factr}(i, j) * \text{svec}(A)[\text{pos}(i, j)]$, where $\text{factr}(i, j) = \sqrt{2}$ if $i \neq j$ and 1 otherwise.*
- `void SymKronId (const arma::mat &A, arma::mat &op)`
*If A is a symmetric matrix, then **SymKronId** returns an operator Op such that.*
- `void VectorPower (arma::vec &vec, const double power)`
Auxiliary function to raise vector elements to a specific power.
- `void WhitenUsingEig (const arma::mat &x, arma::mat &xWhitened, arma::mat &whiteningMatrix)`
Whitens a matrix using the eigendecomposition of the covariance matrix.
- `void WhitenUsingSVD (const arma::mat &x, arma::mat &xWhitened, arma::mat &whiteningMatrix)`
Whitens a matrix using the singular value decomposition of the covariance matrix.

Variables

- `MLPACK_EXPORT std::mt19937 randGen`
MLPACK_EXPORT is required for global variables; it exports the symbols correctly on Windows.
- `MLPACK_EXPORT std::normal_distribution randNormalDist`
- `MLPACK_EXPORT std::uniform_real_distribution randUniformDist`

38.37.1 Detailed Description

Miscellaneous math routines.

38.37.2 Typedef Documentation

38.37.2.1 Range

```
typedef RangeType<double> Range
```

3.0.0 TODO: break reverse-compatibility by changing **RangeType** (p. 1549) to **Range**.

Definition at line 19 of file range.hpp.

38.37.3 Function Documentation

38.37.3.1 AccuLog()

```
T::elem_type mlpack::math::AccuLog (
    const T & x )
```

Sum a vector of log values.

(T should be an Armadillo type.)

Parameters

<i>x</i>	vector of log values
----------	----------------------

Returns

$\log(e^{x_0} + e^{x_1} + \dots)$

38.37.3.2 Center()

```
void mlpack::math::Center (
    const arma::mat & x,
    arma::mat & xCentered )
```

Creates a centered matrix, where centering is done by subtracting the sum over the columns (a column vector) from each column of the matrix.

Parameters

<i>x</i>	Input matrix
<i>xCentered</i>	Matrix to write centered output into

Referenced by NystroemKernelRule< KernelType, PointSelectionPolicy >::ApplyKernelMatrix(), and HRectBound< MetricType >::Metric().

38.37.3.3 ClampNonNegative()

```
double mlpack::math::ClampNonNegative (
    const double d ) [inline]
```

Forces a number to be non-negative, turning negative numbers into zero.

Avoids branching costs (this is a measurable improvement).

Parameters

d	Double to clamp.
-----	------------------

Returns

0 if $d < 0$, d otherwise.

Definition at line 28 of file clamp.hpp.

Referenced by ClampRange().

38.37.3.4 ClampNonPositive()

```
double mlpack::math::ClampNonPositive (
    const double d ) [inline]
```

Forces a number to be non-positive, turning positive numbers into zero.

Avoids branching costs (this is a measurable improvement).

Parameters

d	Double to clamp.
0	if $d > 0$, d otherwise.

Definition at line 40 of file clamp.hpp.

Referenced by ClampRange().

38.37.3.5 ClampRange()

```
double mlpack::math::ClampRange (
    double value,
    const double rangeMin,
    const double rangeMax ) [inline]
```

Clamp a number between a particular range.

Parameters

<i>value</i>	The number to clamp.
<i>rangeMin</i>	The first of the range.
<i>rangeMax</i>	The last of the range.

Returns

`max(rangeMin, min(rangeMax, d)).`

Definition at line 53 of file `clamp.hpp`.

References `ClampNonNegative()`, and `ClampNonPositive()`.

38.37.3.6 ClearAlias() [1/2]

```
void mlpack::math::ClearAlias (
    arma::Mat< ElemType > & mat )
```

Clear an alias so that no data is overwritten.

This resets the matrix if it is an alias (and does nothing otherwise).

Definition at line 110 of file `make_alias.hpp`.

38.37.3.7 ClearAlias() [2/2]

```
void mlpack::math::ClearAlias (
    arma::SpMat< ElemType > & )
```

Clear an alias for a sparse matrix.

This does nothing because no sparse matrices can have aliases.

Definition at line 121 of file `make_alias.hpp`.

38.37.3.8 ColumnCovariance() [1/2]

```
arma::Mat<eT> mlpack::math::ColumnCovariance (
    const arma::Mat< eT > & A,
    const size_t norm_type = 0 ) [inline]
```

38.37.3.9 ColumnCovariance() [2/2]

```
arma::Mat< std::complex<T> > mlpack::math::ColumnCovariance (
    const arma::Mat< std::complex< T > > & A,
    const size_t norm_type = 0 ) [inline]
```

38.37.3.10 FixedRandomSeed()

```
void mlpack::math::FixedRandomSeed ( ) [inline]
```

Set the random seed to a fixed number.

This function is used in binding tests to set a fixed random seed before calling `mlpack()`. In this way we can test whether a certain parameter makes a difference to execution of **CLI** (p. 1117) binding. Refer to pull request #1306 for discussion on this function.

Definition at line 59 of file `random.hpp`.

38.37.3.11 LogAdd()

```
T mlpack::math::LogAdd (
    T x,
    T y )
```

Internal log-addition.

Parameters

x	log value
y	log value

Returns

$\log(e^x + e^y)$

38.37.3.12 MakeAlias() [1/7]

```
arma::Cube<ElemType> mlpack::math::MakeAlias (
    arma::Cube< ElemType > & input,
    const bool strict = true )
```

Make an alias of a dense cube.

If strict is true, then the alias cannot be resized or pointed at new memory.

Definition at line 24 of file make_alias.hpp.

38.37.3.13 MakeAlias() [2/7]

```
arma::Mat<ElemType> mlpack::math::MakeAlias (
    arma::Mat< ElemType > & input,
    const bool strict = true )
```

Make an alias of a dense matrix.

If strict is true, then the alias cannot be resized or pointed at new memory.

Definition at line 37 of file make_alias.hpp.

38.37.3.14 MakeAlias() [3/7]

```
arma::Row<ElemType> mlpack::math::MakeAlias (
    arma::Row< ElemType > & input,
    const bool strict = true )
```

Make an alias of a dense row.

If strict is true, then the alias cannot be resized or pointed at new memory.

Definition at line 50 of file make_alias.hpp.

38.37.3.15 MakeAlias() [4/7]

```
arma::Col<ElemType> mlpack::math::MakeAlias (
    arma::Col< ElemType > & input,
    const bool strict = true )
```

Make an alias of a dense column.

If strict is true, then the alias cannot be resized or pointed at new memory.

Definition at line 62 of file make_alias.hpp.

38.37.3.16 MakeAlias() [5/7]

```
arma::SpMat<ElemType> mlpack::math::MakeAlias (
    const arma::SpMat< ElemType > & input,
    const bool = true )
```

Make a copy of a sparse matrix (an alias is not possible).

The strict parameter is ignored.

Definition at line 74 of file make_alias.hpp.

38.37.3.17 MakeAlias() [6/7]

```
arma::SpRow<ElemType> mlpack::math::MakeAlias (
    const arma::SpRow< ElemType > & input,
    const bool = true )
```

Make a copy of a sparse row (an alias is not possible).

The strict parameter is ignored.

Definition at line 86 of file make_alias.hpp.

38.37.3.18 MakeAlias() [7/7]

```
arma::SpCol<ElemType> mlpack::math::MakeAlias (
    const arma::SpCol< ElemType > & input,
    const bool = true )
```

Make a copy of a sparse column (an alias is not possible).

The strict parameter is ignored.

Definition at line 98 of file make_alias.hpp.

38.37.3.19 ObtainDistinctSamples()

```
void mlpack::math::ObtainDistinctSamples (
    const size_t loInclusive,
    const size_t hiExclusive,
    const size_t maxNumSamples,
    arma::uvec & distinctSamples ) [inline]
```

Obtains no more than maxNumSamples distinct samples.

Each sample belongs to [loInclusive, hiExclusive).

Parameters

<i>loInclusive</i>	The lower bound (inclusive).
<i>hiExclusive</i>	The high bound (exclusive).
<i>maxNumSamples</i>	The maximum number of samples to obtain.
<i>distinctSamples</i>	The samples that will be obtained.

Definition at line 141 of file random.hpp.

References RandInt().

38.37.3.20 Orthogonalize() [1/2]

```
void mlpack::math::Orthogonalize (
    const arma::mat & x,
    arma::mat & W )
```

Orthogonalize x and return the result in W, using eigendecomposition.

We will be using the formula $W = x(x^T x)^{-0.5}$.

38.37.3.21 Orthogonalize() [2/2]

```
void mlpack::math::Orthogonalize (
    arma::mat & x )
```

Orthogonalize x in-place.

This could be sped up by a custom implementation.

38.37.3.22 RandBernoulli()

```
double mlpack::math::RandBernoulli (
    const double input ) [inline]
```

Generates a 0/1 specified by the input.

Definition at line 87 of file random.hpp.

References Random().

38.37.3.23 RandInt() [1/2]

```
int mlpack::math::RandInt (
    const int hiExclusive ) [inline]
```

Generates a uniform random integer.

Definition at line 98 of file random.hpp.

References randUniformDist.

Referenced by RandomDimensionSelect::Begin(), MultipleRandomDimensionSelect::Begin(), SampleInitialization::Cluster(), DataDependentRandomInitializer::Initialize(), RandomAcolInitialization< columnsToAverage >::Initialize(), ObtainDistinctSamples(), GreedyPolicy< EnvironmentType >::Sample(), RandomSelection::Select(), and RandomPointSelection::Select().

38.37.3.24 RandInt() [2/2]

```
int mlpack::math::RandInt (
    const int lo,
    const int hiExclusive ) [inline]
```

Generates a uniform random integer.

Definition at line 106 of file random.hpp.

References randUniformDist.

38.37.3.25 RandNormal() [1/2]

```
double mlpack::math::RandNormal ( ) [inline]
```

Generates a normally distributed random number with mean 0 and variance 1.

Definition at line 115 of file random.hpp.

References randNormalDist.

Referenced by GaussianInitialization::Initialize().

38.37.3.26 RandNormal() [2/2]

```
double mlpack::math::RandNormal (
    const double mean,
    const double variance ) [inline]
```

Generates a normally distributed random number with specified mean and variance.

Parameters

<i>mean</i>	Mean of distribution.
<i>variance</i>	Variance of distribution.

Definition at line 127 of file random.hpp.

References randNormalDist.

38.37.3.27 Random() [1/2]

```
double mlpack::math::Random ( ) [inline]
```

Generates a uniform random number between 0 and 1.

Definition at line 71 of file random.hpp.

References randUniformDist.

Referenced by Pendulum::InitialSample(), ContinuousMountainCar::InitialSample(), MockCategoricalData(), RandBernoulli(), GreedyPolicy< EnvironmentType >::Sample(), and Acrobot::Torque().

38.37.3.28 Random() [2/2]

```
double mlpack::math::Random (
    const double lo,
    const double hi ) [inline]
```

Generates a uniform random number in the specified range.

Definition at line 79 of file random.hpp.

References randUniformDist.

38.37.3.29 RandomBasis()

```
void mlpack::math::RandomBasis (
    arma::mat & basis,
    const size_t d )
```

Create a random d-dimensional orthogonal basis, storing it in the given matrix.

Parameters

<i>basis</i>	Matrix to store basis in.
<i>d</i>	Desired number of dimensions in the basis.

38.37.3.30 RandomSeed()

```
void mlpack::math::RandomSeed (
    const size_t seed ) [inline]
```

Set the random seed used by the random functions (**Random()** (p. 418) and **RandInt()** (p. 417)).

The seed is casted to a 32-bit integer before being given to the random number generator, but a `size_t` is taken as a parameter for API consistency.

Parameters

<i>seed</i>	Seed for the random number generator.
-------------	---------------------------------------

Definition at line 40 of file random.hpp.

38.37.3.31 RandVector()

```
void mlpack::math::RandVector (
    arma::vec & v )
```

Overwrites a dimension-N vector to a random vector on the unit sphere in R^N .

38.37.3.32 RemoveRows()

```
void mlpack::math::RemoveRows (
    const arma::mat & input,
    const std::vector< size_t > & rowsToRemove,
    arma::mat & output )
```

Remove a certain set of rows in a matrix while copying to a second matrix.

Parameters

<i>input</i>	Input matrix to copy.
<i>rowsToRemove</i>	Vector containing indices of rows to be removed.
<i>output</i>	Matrix to copy non-removed rows into.

38.37.3.33 ShuffleData() [1/5]

```
void mlpack::math::ShuffleData (
    const MatType & inputPoints,
    const LabelsType & inputLabels,
    MatType & outputPoints,
    LabelsType & outputLabels,
    const std::enable_if_t<!arma::is_SpMat< MatType >::value > * = 0,
    const std::enable_if_t<!arma::is_Cube< MatType >::value > * = 0 )
```

Shuffle a dataset and associated labels (or responses).

It is expected that inputPoints and inputLabels have the same number of columns (so, be sure that inputLabels, if it is a vector, is a row vector).

Shuffled data will be output into outputPoints and outputLabels.

Definition at line 28 of file shuffle_data.hpp.

38.37.3.34 ShuffleData() [2/5]

```
void mlpack::math::ShuffleData (
    const MatType & inputPoints,
    const LabelsType & inputLabels,
    MatType & outputPoints,
    LabelsType & outputLabels,
    const std::enable_if_t< arma::is_SpMat< MatType >::value > * = 0,
    const std::enable_if_t<!arma::is_Cube< MatType >::value > * = 0 )
```

Shuffle a sparse dataset and associated labels (or responses).

It is expected that inputPoints and inputLabels have the same number of columns (so, be sure that inputLabels, if it is a vector, is a row vector).

Shuffled data will be output into outputPoints and outputLabels.

Definition at line 51 of file shuffle_data.hpp.

38.37.3.35 ShuffleData() [3/5]

```
void mlpack::math::ShuffleData (
    const MatType & inputPoints,
    const LabelsType & inputLabels,
    MatType & outputPoints,
    LabelsType & outputLabels,
    const std::enable_if_t<!arma::is_SpMat< MatType >::value > * = 0,
    const std::enable_if_t< arma::is_Cube< MatType >::value > * = 0,
    const std::enable_if_t< arma::is_Cube< LabelsType >::value > * = 0 )
```

Shuffle a cube-shaped dataset and associated labels (or responses) which are also cube-shaped.

It is expected that inputPoints and inputLabels have the same number of columns.

Shuffled data will be output into outputPoints and outputLabels.

Definition at line 103 of file shuffle_data.hpp.

38.37.3.36 ShuffleData() [4/5]

```
void mlpack::math::ShuffleData (
    const MatType & inputPoints,
    const LabelsType & inputLabels,
    const WeightsType & inputWeights,
    MatType & outputPoints,
    LabelsType & outputLabels,
    WeightsType & outputWeights,
    const std::enable_if_t<!arma::is_SpMat< MatType >::value > * = 0,
    const std::enable_if_t<!arma::is_Cube< MatType >::value > * = 0 )
```

Shuffle a dataset and associated labels (or responses) and weights.

It is expected that inputPoints and inputLabels and inputWeights have the same number of columns (so, be sure that inputLabels, if it is a vector, is a row vector).

Shuffled data will be output into outputPoints and outputLabels and outputWeights.

Definition at line 160 of file shuffle_data.hpp.

38.37.3.37 ShuffleData() [5/5]

```
void mlpack::math::ShuffleData (
    const MatType & inputPoints,
    const LabelsType & inputLabels,
    const WeightsType & inputWeights,
    MatType & outputPoints,
    LabelsType & outputLabels,
    WeightsType & outputWeights,
    const std::enable_if_t< arma::is_SpMat< MatType >::value > * = 0,
    const std::enable_if_t<!arma::is_Cube< MatType >::value > * = 0 )
```

Shuffle a sparse dataset and associated labels (or responses) and weights.

It is expected that inputPoints and inputLabels and inputWeights have the same number of columns (so, be sure that inputLabels, if it is a vector, is a row vector).

Shuffled data will be output into outputPoints and outputLabels and outputWeights.

Definition at line 188 of file shuffle_data.hpp.

38.37.3.38 Sign()

```
T mlpack::math::Sign (
    const T x )
```

Signum function.

Return 1 if $x > 0$; return 0 if $x = 0$; return -1 if $x < 0$. Return type are the same as input type.

Parameters

<i>x</i>	Number of any type.
----------	---------------------

Definition at line 135 of file `lin_alg.hpp`.

38.37.3.39 Smat()

```
void mlpack::math::Smat (
    const arma::vec & input,
    arma::mat & output )
```

The inverse of Svec.

That is, $\text{Smat}(\text{Svec}(A)) == A$.

Parameters

<i>input</i>	
<i>output</i>	A symmetric matrix

38.37.3.40 Svec() [1/2]

```
void mlpack::math::Svec (
    const arma::mat & input,
    arma::vec & output )
```

Upper triangular representation of a symmetric matrix, scaled such that, $\text{dot}(\text{Svec}(A), \text{Svec}(B)) == \text{dot}(A, B)$ for symmetric A, B .

Specifically,

$\text{Svec}(K) = [K_{11}, \sqrt{2} K_{12}, \dots, \sqrt{2} K_{1n}, K_{22}, \dots, \sqrt{2} K_{2n}, \dots, K_{nn}]^T$

Parameters

<i>input</i>	A symmetric matrix
<i>output</i>	

38.37.3.41 Svec() [2/2]

```
void mlpack::math::Svec (
    const arma::sp_mat & input,
    arma::sp_vec & output )
```

38.37.3.42 SvecIndex()

```
size_t mlpack::math::SvecIndex (
    size_t i,
    size_t j,
    size_t n ) [inline]
```

Return the index such that $A[i,j] == \text{factr}(i, j) * \text{svec}(A)[\text{pos}(i, j)]$, where $\text{factr}(i, j) = \sqrt{2}$ if $i \neq j$ and 1 otherwise.

Parameters

<i>i</i>	
<i>j</i>	
<i>n</i>	

38.37.3.43 SymKronId()

```
void mlpack::math::SymKronId (
    const arma::mat & A,
    arma::mat & op )
```

If *A* is a symmetric matrix, then SymKronId returns an operator *Op* such that.

$Op * \text{svec}(X) == \text{svec}(0.5 * (AX + XA))$

for every symmetric matrix *X*

Parameters

<i>A</i>	
<i>op</i>	

38.37.3.44 VectorPower()

```
void mlpack::math::VectorPower (
```

```
arma::vec & vec,  
const double power )
```

Auxiliary function to raise vector elements to a specific power.

The sign is ignored in the power operation and then re-added. Useful for eigenvalues.

38.37.3.45 WhitenUsingEig()

```
void mlpack::math::WhitenUsingEig (  
    const arma::mat & x,  
    arma::mat & xWhitened,  
    arma::mat & whiteningMatrix )
```

Whitens a matrix using the eigendecomposition of the covariance matrix.

Whitening means the covariance matrix of the result is the identity matrix.

38.37.3.46 WhitenUsingSVD()

```
void mlpack::math::WhitenUsingSVD (  
    const arma::mat & x,  
    arma::mat & xWhitened,  
    arma::mat & whiteningMatrix )
```

Whitens a matrix using the singular value decomposition of the covariance matrix.

Whitening means the covariance matrix of the result is the identity matrix.

38.37.4 Variable Documentation

38.37.4.1 randGen

```
MLPACK_EXPORT std::mt19937 randGen
```

MLPACK_EXPORT is required for global variables; it exports the symbols correctly on Windows.

38.37.4.2 randNormalDist

```
MLPACK_EXPORT std::normal_distribution randNormalDist
```

Referenced by RandNormal().

38.37.4.3 randUniformDist

MLPACK_EXPORT std::uniform_real_distribution randUniformDist

Referenced by RandInt(), and Random().

38.38 mlpack::matrix_completion Namespace Reference

Classes

- class **MatrixCompletion**

This class implements the popular nuclear norm minimization heuristic for matrix completion problems.

38.39 mlpack::meanshift Namespace Reference

Mean shift clustering.

Classes

- class **MeanShift**

This class implements mean shift clustering.

38.39.1 Detailed Description

Mean shift clustering.

38.40 mlpack::metric Namespace Reference

Classes

- class **IPMetric**

*The inner product metric, **IPMetric** (p. 1565), takes a given Mercer kernel (KernelType), and when **Evaluate()** (p. 1567) is called, returns the distance between the two points in kernel space:*

- class **LMetric**

The L_p metric for arbitrary integer p , with an option to take the root.

- class **MahalanobisDistance**

The Mahalanobis distance, which is essentially a stretched Euclidean distance.

Typedefs

- typedef **LMetric**< INT_MAX, false > **ChebyshevDistance**
The L-infinity distance.
- typedef **LMetric**< 2, true > **EuclideanDistance**
The Euclidean (L2) distance.
- typedef **LMetric**< 1, false > **ManhattanDistance**
The Manhattan (L1) distance.
- typedef **LMetric**< 2, false > **SquaredEuclideanDistance**
The squared Euclidean (L2) distance.

38.40.1 Typedef Documentation

38.40.1.1 ChebyshevDistance

```
typedef LMetric<INT_MAX, false> ChebyshevDistance
```

The L-infinity distance.

Definition at line 117 of file lmetric.hpp.

38.40.1.2 EuclideanDistance

```
typedef LMetric<2, true> EuclideanDistance
```

The Euclidean (L2) distance.

Definition at line 112 of file lmetric.hpp.

38.40.1.3 ManhattanDistance

```
typedef LMetric<1, false> ManhattanDistance
```

The Manhattan (L1) distance.

Definition at line 101 of file lmetric.hpp.

38.40.1.4 SquaredEuclideanDistance

```
typedef LMetric<2, false> SquaredEuclideanDistance
```

The squared Euclidean (L2) distance.

Note that this is not technically a metric! But it can sometimes be used when distances are required.

Definition at line 107 of file lmetric.hpp.

38.41 **mlpack::naive_bayes** Namespace Reference

The Naive Bayes Classifier.

Classes

- class **NaiveBayesClassifier**
The simple Naive Bayes classifier.

38.41.1 Detailed Description

The Naive Bayes Classifier.

38.42 **mlpack::nca** Namespace Reference

Neighborhood Components Analysis.

Classes

- class **NCA**
An implementation of Neighborhood Components Analysis, both a linear dimensionality reduction technique and a distance learning technique.
- class **SoftmaxErrorFunction**
The "softmax" stochastic neighbor assignment probability function.

38.42.1 Detailed Description

Neighborhood Components Analysis.

38.43 mlpack::neighbor Namespace Reference

Classes

- class **AlphaVisitor**
Exposes the Alpha() method of the given RAType.
- class **BiSearchVisitor**
***BiSearchVisitor** (p. 1591) executes a bichromatic neighbor search on the given NSType.*
- class **DeleteVisitor**
***DeleteVisitor** (p. 1595) deletes the given NSType instance.*
- class **DrusillaSelect**
- class **EpsilonVisitor**
***EpsilonVisitor** (p. 1600) exposes the Epsilon method of the given NSType.*
- class **FirstLeafExactVisitor**
Exposes the FirstLeafExact() method of the given RAType.
- class **FurthestNS**
*This class implements the necessary methods for the SortPolicy template parameter of the **NeighborSearch** (p. 1627) class.*
- class **LSHSearch**
*The **LSHSearch** (p. 1609) class; this class builds a hash on the reference set and uses this hash to compute the distance-approximate nearest-neighbors of the given queries.*
- class **MonoSearchVisitor**
***MonoSearchVisitor** (p. 1618) executes a monochromatic neighbor search on the given NSType.*
- class **NaiveVisitor**
***NaiveVisitor** (p. 1620) exposes the Naive() method of the given RAType.*
- class **NearestNS**
*This class implements the necessary methods for the SortPolicy template parameter of the **NeighborSearch** (p. 1627) class.*
- class **NeighborSearch**
*The **NeighborSearch** (p. 1627) class is a template class for performing distance-based neighbor searches.*
- class **NeighborSearchRules**
*The **NeighborSearchRules** (p. 1640) class is a template helper class used by **NeighborSearch** (p. 1627) class when performing distance-based neighbor searches.*
- class **NeighborSearchStat**
Extra data for each node in the tree.
- class **NSModel**
*The **NSModel** (p. 1657) class provides an easy way to serialize a model, abstracts away the different types of trees, and also reflects the **NeighborSearch** (p. 1627) API.*
- class **QDAFN**
- class **RAModel**
*The **RAModel** (p. 1669) class provides an abstraction for the **RASearch** (p. 1681) class, abstracting away the TreeType parameter and allowing it to be specified at runtime in this class.*
- class **RAQueryStat**
Extra data for each node in the tree.
- class **RASearch**
*The **RASearch** (p. 1681) class: This class provides a generic manner to perform rank-approximate search via random-sampling.*
- class **RASearchRules**

The **RASearchRules** (p. 1692) class is a template helper class used by **RASearch** (p. 1681) class when performing rank-approximate search via random-sampling.

- class **RAUtil**
- class **ReferenceSetVisitor**

ReferenceSetVisitor (p. 1701) exposes the `referenceSet` of the given `NSType`.

- class **SampleAtLeavesVisitor**

Exposes the `SampleAtLeaves()` method of the given `RAType`.

- class **SearchModeVisitor**

SearchModeVisitor (p. 1703) exposes the `SearchMode()` method of the given `NSType`.

- class **SingleModeVisitor**

Exposes the `SingleMode()` method of the given `RAType`.

- class **SingleSampleLimitVisitor**

Exposes the `SingleSampleLimit()` method of the given `RAType`.

- class **TauVisitor**

Exposes the `Tau()` method of the given `RAType`.

- class **TrainVisitor**

TrainVisitor (p. 1707) sets the reference set to a new reference set on the given `NSType`.

Typedefs

- `template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType = tree::SPTree> using DefeatistKNN = NeighborSearch< NearestNeighborSort, metric::EuclideanDistance, arma::mat, TreeType, TreeType< metric::EuclideanDistance, NeighborSearchStat< NearestNeighborSort >, arma::mat >::mat >::template DefeatistDualTreeTraverser, TreeType< metric::EuclideanDistance, NeighborSearchStat< NearestNeighborSort >, arma::mat >::template DefeatistSingleTreeTraverser >`

The **DefeatistKNN** class is the *k*-nearest-neighbors method considering defeatist search.

- using **FurthestNeighborSort = FurthestNS**
- typedef **NeighborSearch< FurthestNeighborSort, metric::EuclideanDistance > KFN**

The **KFN** class is the *k*-furthest-neighbors method.

- typedef **NeighborSearch< NearestNeighborSort, metric::EuclideanDistance > KNN**

The **KNN** class is the *k*-nearest-neighbors method.

- typedef **RASearch< FurthestNeighborSort > KRAFN**

The **KRAFN** class is the *k*-rank-approximate-furthest-neighbors method.

- typedef **RASearch KRANN**

The **KRANN** class is the *k*-rank-approximate-nearest-neighbors method.

- using **NearestNeighborSort = NearestNS**

- `template<typename SortPolicy, template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType> using NSType = NeighborSearch< SortPolicy, metric::EuclideanDistance, arma::mat, TreeType, TreeType< metric::EuclideanDistance, NeighborSearchStat< SortPolicy >, arma::mat >::template DualTreeTraverser >`

Alias template for euclidean neighbor search.

- `template<typename SortPolicy, template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType> using RAType = RASearch< SortPolicy, metric::EuclideanDistance, arma::mat, TreeType >`

Alias template for **RASearch** (p. 1681).

- typedef **DefeatistKNN< tree::SPTree > SpillKNN**

The **SpillKNN** class is the *k*-nearest-neighbors method considering defeatist search on *SPTree*.

Enumerations

- enum **NeighborSearchMode** {
NAIVE_MODE,
SINGLE_TREE_MODE,
DUAL_TREE_MODE,
GREEDY_SINGLE_TREE_MODE }

NeighborSearchMode represents the different neighbor search modes available.

Functions

- void **Unmap** (const arma::Mat< size_t > &neighbors, const arma::mat &distances, const std::vector< size_t > &referenceMap, const std::vector< size_t > &queryMap, arma::Mat< size_t > &neighborsOut, arma::mat &distancesOut, const bool squareRoot=false)

Assuming that the datasets have been mapped using the referenceMap and the queryMap (such as during kd-tree construction), unmap the columns of the distances and neighbors matrices into neighborsOut and distancesOut, and also unmap the entries in each row of neighbors.

- void **Unmap** (const arma::Mat< size_t > &neighbors, const arma::mat &distances, const std::vector< size_t > &referenceMap, arma::Mat< size_t > &neighborsOut, arma::mat &distancesOut, const bool squareRoot=false)

Assuming that the datasets have been mapped using referenceMap (such as during kd-tree construction), unmap the columns of the distances and neighbors matrices into neighborsOut and distancesOut, and also unmap the entries in each row of neighbors.

38.43.1 Typedef Documentation

38.43.1.1 DefeatistKNN

```
using DefeatistKNN = NeighborSearch< NearestNeighborSort, metric::EuclideanDistance, arma::mat, TreeType, TreeType< metric::EuclideanDistance, NeighborSearchStat< NearestNeighborSort>, arma::mat>::template DefeatistDualTreeTraverser, TreeType< metric::EuclideanDistance, NeighborSearchStat< NearestNeighborSort>, arma::mat>::template DefeatistSingleTreeTraverser>
```

The DefeatistKNN class is the k-nearest-neighbors method considering defeatist search.

It returns L2 distances (Euclidean distances) for each of the k nearest neighbors found.

Template Parameters

<i>TreeType</i>	The tree type to use; must adhere to the TreeType API, and implement Defeatist Traversers.
-----------------	--

Definition at line 60 of file typedef.hpp.

38.43.1.2 FurthestNeighborSort

```
using FurthestNeighborSort = FurthestNS
```

Definition at line 201 of file furthest_neighbor_sort.hpp.

38.43.1.3 KFN

```
typedef NeighborSearch< FurthestNeighborSort, metric::EuclideanDistance> KFN
```

The KFN class is the k-furthest-neighbors method.

It returns L2 distances (Euclidean distances) for each of the k furthest neighbors.

Definition at line 38 of file typedef.hpp.

38.43.1.4 KNN

```
typedef NeighborSearch< NearestNeighborSort, metric::EuclideanDistance> KNN
```

The KNN class is the k-nearest-neighbors method.

It returns L2 distances (Euclidean distances) for each of the k nearest neighbors.

Definition at line 32 of file typedef.hpp.

38.43.1.5 KRAFN

```
typedef RASearch< FurthestNeighborSort> KRAFN
```

The KRAFN class is the k-rank-approximate-farthest-neighbors method.

It returns L2 distances for each of the k rank-approximate farthest-neighbors.

The approximation is controlled with two parameters (see allkrann_main.cpp) which can be specified at search time. So the tree building is done only once while the search can be performed multiple times with different approximation levels.

Definition at line 47 of file ra_typedef.hpp.

38.43.1.6 KRANN

```
typedef RASearch KRANN
```

The KRANN class is the k-rank-approximate-nearest-neighbors method.

It returns L2 distances for each of the k rank-approximate nearest-neighbors.

The approximation is controlled with two parameters (see allkrann_main.cpp) which can be specified at search time. So the tree building is done only once while the search can be performed multiple times with different approximation levels.

Definition at line 36 of file ra_typedef.hpp.

38.43.1.7 NearestNeighborSort

```
using NearestNeighborSort = NearestNS
```

Definition at line 200 of file nearest_neighbor_sort.hpp.

38.43.1.8 NSType

```
using NSType = NeighborSearch<SortPolicy, metric::EuclideanDistance, arma::mat, TreeType,  
TreeType< metric::EuclideanDistance, NeighborSearchStat<SortPolicy>, arma::mat>::template Dual<  
TreeTraverser>
```

Alias template for euclidean neighbor search.

Definition at line 42 of file ns_model.hpp.

38.43.1.9 RAType

```
using RAType = RASearch<SortPolicy, metric::EuclideanDistance, arma::mat, TreeType>
```

Alias template for **RASearch** (p. 1681).

Definition at line 37 of file ra_model.hpp.

38.43.1.10 SpillKNN

```
typedef DefeatistKNN< tree::SPTree> SpillKNN
```

The SpillKNN class is the k-nearest-neighbors method considering defeatist search on SPTree.

It returns L2 distances (Euclidean distances) for each of the k nearest neighbors found.

Definition at line 67 of file typedef.hpp.

38.43.2 Enumeration Type Documentation

38.43.2.1 NeighborSearchMode

```
enum NeighborSearchMode
```

NeighborSearchMode represents the different neighbor search modes available.

Enumerator

NAIVE_MODE	
SINGLE_TREE_MODE	
DUAL_TREE_MODE	
GREEDY_SINGLE_TREE_MODE	

Definition at line 38 of file neighbor_search.hpp.

38.43.3 Function Documentation

38.43.3.1 Unmap() [1/2]

```
void mlpack::neighbor::Unmap (
    const arma::Mat< size_t > & neighbors,
    const arma::mat & distances,
    const std::vector< size_t > & referenceMap,
    const std::vector< size_t > & queryMap,
    arma::Mat< size_t > & neighborsOut,
    arma::mat & distancesOut,
    const bool squareRoot = false )
```

Assuming that the datasets have been mapped using the `referenceMap` and the `queryMap` (such as during kd-tree construction), unmap the columns of the distances and neighbors matrices into `neighborsOut` and `distancesOut`, and also unmap the entries in each row of neighbors.

This is useful for the dual-tree case.

Parameters

<i>neighbors</i>	Matrix of neighbors resulting from neighbor search.
<i>distances</i>	Matrix of distances resulting from neighbor search.
<i>referenceMap</i>	Mapping of reference set to old points.
<i>queryMap</i>	Mapping of query set to old points.
<i>neighborsOut</i>	Matrix to store unmapped neighbors into.
<i>distancesOut</i>	Matrix to store unmapped distances into.
<i>squareRoot</i>	If true, take the square root of the distances.

38.43.3.2 Unmap() [2/2]

```
void mlpack::neighbor::Unmap (
    const arma::Mat< size_t > & neighbors,
    const arma::mat & distances,
    const std::vector< size_t > & referenceMap,
    arma::Mat< size_t > & neighborsOut,
    arma::mat & distancesOut,
    const bool squareRoot = false )
```

Assuming that the datasets have been mapped using `referenceMap` (such as during kd-tree construction), unmap the columns of the distances and neighbors matrices into `neighborsOut` and `distancesOut`, and also unmap the entries in each row of neighbors.

This is useful for the single-tree case.

Parameters

<i>neighbors</i>	Matrix of neighbors resulting from neighbor search.
<i>distances</i>	Matrix of distances resulting from neighbor search.
<i>referenceMap</i>	Mapping of reference set to old points.
<i>neighborsOut</i>	Matrix to store unmapped neighbors into.
<i>distancesOut</i>	Matrix to store unmapped distances into.
<i>squareRoot</i>	If true, take the square root of the distances.

38.44 mlpack::nn Namespace Reference

Classes

- class **SparseAutoencoder**
A sparse autoencoder is a neural network whose aim to learn compressed representations of the data, typically for dimensionality reduction, with a constraint on the activity of the neurons in the network.
- class **SparseAutoencoderFunction**
This is a class for the sparse autoencoder objective function.

Functions

- void **MaximalInputs** (const arma::mat ¶meters, arma::mat &output)
Given a parameters matrix from an autoencoder, maximize the hidden units of the parameters, storing the maximal inputs in the given output matrix.
- void **NormalizeColByMax** (const arma::mat &input, arma::mat &output)
Normalize each column of the input matrix by its maximum value, if that maximum value is not zero.

38.44.1 Function Documentation

38.44.1.1 MaximalInputs()

```
void mlpack::nn::MaximalInputs (
    const arma::mat & parameters,
    arma::mat & output )
```

Given a parameters matrix from an autoencoder, maximize the hidden units of the parameters, storing the maximal inputs in the given output matrix.

Details can be found on the 'Visualizing a Trained Autoencoder' page of the Stanford UFLDL tutorial:

http://deeplearning.stanford.edu/wiki/index.php/Main_Page

This function is based on the implementation (display_network.m) from the "Exercise: Sparse Autoencoder" page of the UFLDL tutorial:

http://deeplearning.stanford.edu/wiki/index.php/Exercise:Sparse_Autoencoder

Example usage of this function can be seen below. Note that this function can work with the ColumnsToBlocks class in order to reshape the maximal inputs for visualization, as in the UFLDL tutorial. The code below demonstrates this.

```
arma::mat data; // Data matrix.
const size_t vSize = 64; // Size of visible layer, depends on the data.
const size_t hSize = 25; // Size of hidden layer, depends on requirements.

const size_t numBasis = 5; // Parameter required for L-BFGS algorithm.
const size_t numIterations = 100; // Maximum number of iterations.

// Use an instantiated optimizer for the training.
SparseAutoencoder<L_BFGS> encoder(data, vSize, hSize);

arma::mat maximalInput; // Store the features learned by sparse autoencoder
mlpack::nn::MaximalInputs(encoder.Parameters(), maximalInput);

arma::mat outputs;
const bool scale = true;

ColumnsToBlocks ctb(5,5);
arma::mat output;
ctb.Transform(maximalInput, output);
// Save the output as PGM, for visualization.
output.save(fileName, arma::pgm_binary);
```

Precondition

Layout of parameters

The layout of the parameters matrix should be same as following

```
//      vSize  1
//      |      |
// hSize|  w1  |bl|
//      |_____|_|
//      |      |
// hSize|  w2'  |  |
//      |_____|_|
//      1|  b2'  |  |
```

Also, the square root of vSize must be an integer (i.e. vSize must be a perfect square).

Parameters

<i>parameters</i>	The parameters of the autoencoder.
<i>output</i>	Matrix to store the maximal inputs in.

38.44.1.2 NormalizeColByMax()

```
void mlpack::nn::NormalizeColByMax (
    const arma::mat & input,
    arma::mat & output )
```

Normalize each column of the input matrix by its maximum value, if that maximum value is not zero.

Parameters

<i>input</i>	The input data to normalize.
<i>output</i>	A matrix to store the input data in after normalization.

38.45 mlpack::pca Namespace Reference**Classes**

- class **ExactSVDPolicy**
Implementation of the exact SVD policy.
- class **PCA**
*This class implements principal components analysis (**PCA** (p. 1723)).*
- class **QUICSVDPolicy**

Implementation of the QUIC-SVD policy.

- class **RandomizedBlockKrylovSVDPolicy**

Implementation of the randomized block krylov SVD policy.

- class **RandomizedSVDPolicy**

Implementation of the randomized SVD policy.

38.46 mlpack::perceptron Namespace Reference

Classes

- class **Perceptron**

This class implements a simple perceptron (i.e., a single layer neural network).

- class **RandomInitialization**

This class is used to initialize weights for the weightVectors matrix in a random manner.

- class **SimpleWeightUpdate**

- class **ZeroInitialization**

This class is used to initialize the matrix weightVectors to zero.

38.47 mlpack::radical Namespace Reference

Classes

- class **Radical**

An implementation of RADICAL, an algorithm for independent component analysis (ICA).

Functions

- void **WhitenFeatureMajorMatrix** (const arma::mat &matX, arma::mat &matXWhitened, arma::mat &mat←Whitening)

38.47.1 Function Documentation

38.47.1.1 WhitenFeatureMajorMatrix()

```
void mlpack::radical::WhitenFeatureMajorMatrix (
    const arma::mat & matX,
    arma::mat & matXWhitened,
    arma::mat & matWhitening )
```

Referenced by Radical::Sweeps().

38.48 mlpack::range Namespace Reference

Range-search routines.

Classes

- class **BiSearchVisitor**
***BiSearchVisitor** (p. 1748) executes a bichromatic range search on the given RSType.*
- class **DeleteVisitor**
***DeleteVisitor** (p. 1751) deletes the given RSType instance.*
- class **MonoSearchVisitor**
***MonoSearchVisitor** (p. 1752) executes a monochromatic range search on the given RSType.*
- class **NaiveVisitor**
***NaiveVisitor** (p. 1753) exposes the Naive() method of the given RSType.*
- class **RangeSearch**
*The **RangeSearch** (p. 1754) class is a template class for performing range searches.*
- class **RangeSearchRules**
*The **RangeSearchRules** (p. 1764) class is a template helper class used by **RangeSearch** (p. 1754) class when performing range searches.*
- class **RangeSearchStat**
*Statistic class for **RangeSearch** (p. 1754), to be set to the StatisticType of the tree type that range search is being performed with.*
- class **ReferenceSetVisitor**
***ReferenceSetVisitor** (p. 1771) exposes the referenceSet of the given RSType.*
- class **RSModel**
- class **SingleModeVisitor**
***SingleModeVisitor** (p. 1779) exposes the SingleMode() method of the given RSType.*
- class **TrainVisitor**
***TrainVisitor** (p. 1780) sets the reference set to a new reference set on the given RSType.*

Typedefs

- template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType>
 using **RSType** = **RangeSearch**< **metric::EuclideanDistance**, arma::mat, TreeType >
Alias template for Range Search.

38.48.1 Detailed Description

Range-search routines.

38.48.2 Typedef Documentation

38.48.2.1 RSType

```
using RSType = RangeSearch< metric::EuclideanDistance, arma::mat, TreeType>
```

Alias template for Range Search.

Definition at line 34 of file rs_model.hpp.

38.49 mlpack::regression Namespace Reference

Regression methods.

Classes

- class **LARS**
*An implementation of **LARS** (p. 1783), a stage-wise homotopy-based algorithm for l1-regularized linear regression (LASSO) and l1+l2 regularized linear regression (Elastic Net).*
- class **LinearRegression**
A simple linear regression algorithm using ordinary least squares.
- class **LogisticRegression**
*The **LogisticRegression** (p. 1795) class implements an L2-regularized logistic regression model, and supports training with multiple optimizers and classification.*
- class **LogisticRegressionFunction**
The log-likelihood function for the logistic regression objective function.
- class **SoftmaxRegression**
Softmax Regression is a classifier which can be used for classification when the data available can take two or more class values.
- class **SoftmaxRegressionFunction**

38.49.1 Detailed Description

Regression methods.

38.50 mlpack::rl Namespace Reference

Classes

- class **Acrobot**
*Implementation of **Acrobot** (p. 1825) game.*
- class **AggregatedPolicy**
- class **AsyncLearning**
Wrapper of various asynchronous learning algorithms, e.g.
- class **CartPole**

- Implementation of Cart Pole task.*
- class **ContinuousMountainCar**
 - Implementation of Continuous Mountain Car task.*
- class **GreedyPolicy**
 - Implementation for epsilon greedy policy.*
- class **MountainCar**
 - Implementation of Mountain Car task.*
- class **NStepQLearningWorker**
 - Forward declaration of **NStepQLearningWorker** (p. 1868).*
- class **OneStepQLearningWorker**
 - Forward declaration of **OneStepQLearningWorker** (p. 1871).*
- class **OneStepSarsaWorker**
 - Forward declaration of **OneStepSarsaWorker** (p. 1875).*
- class **Pendulum**
 - Implementation of **Pendulum** (p. 1878) task.*
- class **QLearning**
 - Implementation of various Q-Learning algorithms, such as DQN, double DQN.*
- class **RandomReplay**
 - Implementation of random experience replay.*
- class **RewardClipping**
 - Interface for clipping the reward to some value between the specified maximum and minimum value (Clipping here is implemented as $g_{clipped} = \max(g_{min}, \min(g_{min}, g))$.)*
- class **TrainingConfig**

Typedefs

- typedef **Acrobot Acrobot**
 - Add an alias for backward compatibility.*
- template<typename EnvironmentType , typename NetworkType , typename UpdaterType , typename PolicyType >
 using **NStepQLearning = AsyncLearning< NStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >, EnvironmentType, NetworkType, UpdaterType, PolicyType >**
 - Convenient typedef for async n step q-learning.*
- template<typename EnvironmentType , typename NetworkType , typename UpdaterType , typename PolicyType >
 using **OneStepQLearning = AsyncLearning< OneStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >, EnvironmentType, NetworkType, UpdaterType, PolicyType >**
 - Convenient typedef for async one step q-learning.*
- template<typename EnvironmentType , typename NetworkType , typename UpdaterType , typename PolicyType >
 using **OneStepSarsa = AsyncLearning< OneStepSarsaWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >, EnvironmentType, NetworkType, UpdaterType, PolicyType >**
 - Convenient typedef for async one step Sarsa.*

38.50.1 Typedef Documentation

38.50.1.1 Acrobat

```
typedef Acrobot Acrobat
```

Add an alias for backward compatibility.

Definition at line 357 of file acrobot.hpp.

38.50.1.2 NStepQLearning

```
using NStepQLearning = AsyncLearning< NStepQLearningWorker<EnvironmentType, NetworkType, UpdaterType, PolicyType>, EnvironmentType, NetworkType, UpdaterType, PolicyType>
```

Convenient typedef for async n step q-learning.

Template Parameters

<i>EnvironmentType</i>	The type of the reinforcement learning task.
<i>NetworkType</i>	The type of the network model.
<i>UpdaterType</i>	The type of the optimizer.
<i>PolicyType</i>	The type of the behavior policy.

Definition at line 233 of file async_learning.hpp.

38.50.1.3 OneStepQLearning

```
using OneStepQLearning = AsyncLearning< OneStepQLearningWorker<EnvironmentType, NetworkType, UpdaterType, PolicyType>, EnvironmentType, NetworkType, UpdaterType, PolicyType>
```

Convenient typedef for async one step q-learning.

Template Parameters

<i>EnvironmentType</i>	The type of the reinforcement learning task.
<i>NetworkType</i>	The type of the network model.
<i>UpdaterType</i>	The type of the optimizer.
<i>PolicyType</i>	The type of the behavior policy.

Definition at line 197 of file async_learning.hpp.

38.50.1.4 OneStepSarsa

```
using OneStepSarsa = AsyncLearning< OneStepSarsaWorker<EnvironmentType, NetworkType, UpdaterType, PolicyType>, EnvironmentType, NetworkType, UpdaterType, PolicyType>
```

Convenient typedef for async one step Sarsa.

Template Parameters

<i>EnvironmentType</i>	The type of the reinforcement learning task.
<i>NetworkType</i>	The type of the network model.
<i>UpdaterType</i>	The type of the optimizer.
<i>PolicyType</i>	The type of the behavior policy.

Definition at line 215 of file `async_learning.hpp`.

38.51 mlpack::sfinae Namespace Reference

Classes

- struct **MethodFormDetector**

- struct **SigCheck**

Utility struct for checking signatures.

38.52 mlpack::sparse_coding Namespace Reference

Classes

- class **DataDependentRandomInitializer**
*A data-dependent random dictionary initializer for **SparseCoding** (p. 1916).*
- class **NothingInitializer**
*A DictionaryInitializer for **SparseCoding** (p. 1916) which does not initialize anything; it is useful for when the dictionary is already known and will be set with **SparseCoding::Dictionary()** (p. 1920).*
- class **RandomInitializer**
*A DictionaryInitializer for use with the **SparseCoding** (p. 1916) class.*
- class **SparseCoding**
An implementation of Sparse Coding with Dictionary Learning that achieves sparsity via an l_1 -norm regularizer on the codes (LASSO) or an (l_1+l_2) -norm regularizer on the codes (the Elastic Net).

38.53 mlpack::svd Namespace Reference

Classes

- class **BiasSVD**
Bias SVD is an improvement on Regularized SVD which is a matrix factorization techniques.
- class **BiasSVDFunction**
*This class contains methods which are used to calculate the cost of **BiasSVD** (p. 1925)'s objective function, to calculate gradient of parameters with respect to the objective function, etc.*
- class **QUIC_SVD**
QUIC-SVD is a matrix factorization technique, which operates in a subspace such that A's approximation in that subspace has minimum error(A being the data matrix).
- class **RandomizedBlockKrylovSVD**
Randomized block krylov SVD is a matrix factorization that is based on randomized matrix approximation techniques, developed in in "Randomized Block Krylov Methods for Stronger and Faster Approximate Singular Value Decomposition".
- class **RandomizedSVD**
Randomized SVD is a matrix factorization that is based on randomized matrix approximation techniques, developed in in "Finding structure with randomness: Probabilistic algorithms for constructing approximate matrix decompositions".
- class **RegularizedSVD**
Regularized SVD is a matrix factorization technique that seeks to reduce the error on the training set, that is on the examples for which the ratings have been provided by the users.
- class **RegularizedSVDFunction**
The data is stored in a matrix of type MatType, so that this class can be used with both dense and sparse matrix types.
- class **SVDPlusPlus**
SVD++ is a matrix decomposition technique used in collaborative filtering.
- class **SVDPlusPlusFunction**
This class contains methods which are used to calculate the cost of SVD++'s objective function, to calculate gradient of parameters with respect to the objective function, etc.

38.54 mlpack::svm Namespace Reference

Classes

- class **LinearSVM**
*The **LinearSVM** (p. 1959) class implements an L2-regularized support vector machine model, and supports training with multiple optimizers and classification.*
- class **LinearSVMFunction**
The hinge loss function for the linear SVM objective function.

38.55 mlpack::tree Namespace Reference

Trees and tree-building procedures.

Namespaces

- **enumerate**
- **split**

Classes

- class **AllCategoricalSplit**
*The **AllCategoricalSplit** (p. 1981) is a splitting function that will split categorical features into many children: one child for each category.*
- class **AllDimensionSelect**
This dimension selection policy allows any dimension to be selected for splitting.
- class **AxisParallelProjVector**
***AxisParallelProjVector** (p. 1986) defines an axis-parallel projection vector.*
- class **BestBinaryNumericSplit**
*The **BestBinaryNumericSplit** (p. 1989) is a splitting function for decision trees that will exhaustively search a numeric dimension for the best binary split.*
- class **BinaryNumericSplit**
*The **BinaryNumericSplit** (p. 1992) class implements the numeric feature splitting strategy devised by Gama, Rocha, and Medas in the following paper:*
- class **BinaryNumericSplitInfo**
- class **BinarySpaceTree**
A binary space partitioning tree, such as a KD-tree or a ball tree.
- class **CategoricalSplitInfo**
- class **CompareCosineNode**
- class **CosineTree**
- class **CoverTree**
A cover tree is a tree specifically designed to speed up nearest-neighbor computation in high-dimensional spaces.
- class **DecisionTree**
This class implements a generic decision tree learner.
- class **DiscreteHilbertValue**
*The **DiscreteHilbertValue** (p. 2079) class stores Hilbert values for all of the points in a **RectangleTree** (p. 2207) node, and calculates Hilbert values for new points.*
- class **EmptyStatistic**
Empty statistic if you are not interested in storing statistics in your tree.
- class **ExampleTree**
This is not an actual space tree but instead an example tree that exists to show and document all the functions that mlpack trees must implement.
- class **FirstPointIsRoot**
*This class is meant to be used as a choice for the policy class RootPointPolicy of the **CoverTree** (p. 2040) class.*
- class **GiniGain**
The Gini gain, a measure of set purity usable as a fitness function (FitnessFunction) for decision trees.
- class **GiniImpurity**
- class **GreedySingleTreeTraverser**
- class **HilbertRTreeAuxiliaryInformation**
- class **HilbertRTreeDescentHeuristic**
This class chooses the best child of a node in a Hilbert R tree when inserting a new point.
- class **HilbertRTreeSplit**

The splitting procedure for the Hilbert R tree.

- class **HoeffdingCategoricalSplit**

This is the standard Hoeffding-bound categorical feature proposed in the paper below:

- class **HoeffdingNumericSplit**

*The **HoeffdingNumericSplit** (p. 2108) class implements the numeric feature splitting strategy alluded to by Domingos and Hulten in the following paper:*

- class **HoeffdingTree**

*The **HoeffdingTree** (p. 2113) object represents all of the necessary information for a Hoeffding-bound-based decision tree.*

- class **HoeffdingTreeModel**

This class is a serializable Hoeffding tree model that can hold four different types of Hoeffding trees.

- class **HyperplaneBase**

***HyperplaneBase** (p. 2133) defines a splitting hyperplane based on a projection vector and projection value.*

- class **InformationGain**

The standard information gain criterion, used for calculating gain in decision trees.

- struct **IsSpillTree**

- struct **IsSpillTree**< **tree::SpillTree**< **MetricType**, **StatisticType**, **MatType**, **HyperplaneType**, **SplitType** > >

- class **MeanSpaceSplit**

- class **MeanSplit**

A binary space partitioning tree node is split into its left and right child.

- class **MidpointSpaceSplit**

- class **MidpointSplit**

A binary space partitioning tree node is split into its left and right child.

- class **MinimalCoverageSweep**

*The **MinimalCoverageSweep** (p. 2151) class finds a partition along which we can split a node according to the coverage of two resulting nodes.*

- class **MinimalSplitsNumberSweep**

*The **MinimalSplitsNumberSweep** (p. 2155) class finds a partition along which we can split a node according to the number of required splits of the node.*

- class **MultipleRandomDimensionSelect**

This dimension selection policy allows the selection from a few random dimensions.

- class **NoAuxiliaryInformation**

- class **NumericSplitInfo**

- class **Octree**

- class **ProjVector**

***ProjVector** (p. 2190) defines a general projection vector (not necessarily axis-parallel).*

- struct **QueueFrame**

- class **RandomDimensionSelect**

This dimension selection policy only selects one single random dimension.

- class **RandomForest**

- class **RectangleTree**

A rectangle type tree tree, such as an R-tree or X-tree.

- class **RPlusPlusTreeAuxiliaryInformation**

- class **RPlusPlusTreeDescentHeuristic**

- class **RPlusPlusTreeSplitPolicy**

*The **RPlusPlusTreeSplitPolicy** (p. 2247) helps to determine the subtree into which we should insert a child of an intermediate node that is being split.*

- class **RPlusTreeDescentHeuristic**

- class **RPlusTreeSplit**

The **RPlusTreeSplit** (p. 2251) class performs the split process of a node on overflow.

- class **RPlusTreeSplitPolicy**

The **RPlusPlusTreeSplitPolicy** (p. 2247) helps to determine the subtree into which we should insert a child of an intermediate node that is being split.

- class **RPTreeMaxSplit**

This class splits a node by a random hyperplane.

- class **RPTreeMeanSplit**

This class splits a binary space tree.

- class **RStarTreeDescentHeuristic**

When descending a **RectangleTree** (p. 2207) to insert a point, we need to have a way to choose a child node when the point isn't enclosed by any of them.

- class **RStarTreeSplit**

A Rectangle Tree has new points inserted at the bottom.

- class **RTreeDescentHeuristic**

When descending a **RectangleTree** (p. 2207) to insert a point, we need to have a way to choose a child node when the point isn't enclosed by any of them.

- class **RTreeSplit**

A Rectangle Tree has new points inserted at the bottom.

- class **SpaceSplit**

- class **SpillTree**

A hybrid spill tree is a variant of binary space trees in which the children of a node can "spill over" each other, and contain shared datapoints.

- class **TraversalInfo**

The **TraversalInfo** (p. 2299) class holds traversal information which is used in dual-tree (and single-tree) traversals.

- class **TreeTraits**

The **TreeTraits** (p. 2302) class provides compile-time information on the characteristics of a given tree type.

- class **TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, bound::BallBound, SplitType > >**

This is a specialization of the **TreeType** class to the **BallTree** tree type.

- class **TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, bound::CellBound, SplitType > >**

This is a specialization of the **TreeType** class to the **UBTree** tree type.

- class **TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, bound::HollowBallBound, SplitType > >**

This is a specialization of the **TreeType** class to an arbitrary tree with **HollowBallBound** (currently only the vantage point tree is supported).

- class **TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, RPTreeMaxSplit > >**

This is a specialization of the **TreeType** class to the max-split random projection tree.

- class **TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, RPTreeMeanSplit > >**

This is a specialization of the **TreeType** class to the mean-split random projection tree.

- class **TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > >**

This is a specialization of the **TreeTraits** (p. 2302) class to the **BinarySpaceTree** (p. 1998) tree type.

- class **TreeTraits< CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > >**

The specialization of the **TreeTraits** (p. 2302) class for the **CoverTree** (p. 2040) tree type.

- class **TreeTraits< Octree< MetricType, StatisticType, MatType > >**

This is a specialization of the **TreeTraits** (p. 2302) class to the **Octree** (p. 2167) tree type.

- class **TreeTraits**< **RectangleTree**< **MetricType**, **StatisticType**, **MatType**, **RPlusTreeSplit**< **SplitPolicyType**, **SweepType** >, **DescentType**, **AuxiliaryInformationType** > >
Since the R+/R++ tree can not have overlapping children, we should define traits for the R+/R++ tree.
- class **TreeTraits**< **RectangleTree**< **MetricType**, **StatisticType**, **MatType**, **SplitType**, **DescentType**, **AuxiliaryInformationType** > >
*This is a specialization of the TreeType class to the **RectangleTree** (p. 2207) tree type.*
- class **TreeTraits**< **SpillTree**< **MetricType**, **StatisticType**, **MatType**, **HyperplaneType**, **SplitType** > >
*This is a specialization of the TreeType class to the **SpillTree** (p. 2274) tree type.*
- class **UBTreeSplit**
Split a node into two parts according to the median address of points contained in the node.
- class **VantagePointSplit**
The class splits a binary space partitioning tree node according to the median distance to the vantage point.
- class **XTreeAuxiliaryInformation**
*The **XTreeAuxiliaryInformation** (p. 2338) class provides information specific to X trees for each node in a **RectangleTree** (p. 2207).*
- class **XTreeSplit**
A Rectangle Tree has new points inserted at the bottom.

Typedefs

- template<typename MetricType >
using **AxisOrthogonalHyperplane** = **HyperplaneBase**< **bound::HRectBound**< MetricType >, **Axis**< **ParallelProjVector** >
AxisOrthogonalHyperplane represents a hyperplane orthogonal to an axis.
- template<typename MetricType , typename StatisticType , typename MatType >
using **BallTree** = **BinarySpaceTree**< MetricType, StatisticType, MatType, **bound::BallBound**, **MidpointSplit** >
A midpoint-split ball tree.
- template<typename FitnessFunction >
using **BinaryDoubleNumericSplit** = **BinaryNumericSplit**< FitnessFunction, double >
- typedef boost::heap::priority_queue< **CosineTree** *, boost::heap::compare< **CompareCosineNode** > > **CosineNodeQueue**
- template<typename FitnessFunction = GiniGain, template< typename > class NumericSplitType = BestBinaryNumericSplit, template< typename > class CategoricalSplitType = AllCategoricalSplit, typename DimensionSelectType = AllDimensionSelect, typename ElemType = double>
using **DecisionStump** = **DecisionTree**< FitnessFunction, NumericSplitType, CategoricalSplitType, DimensionSelectType, ElemType, false >
Convenience typedef for decision stumps (single level decision trees).
- template<typename TreeType >
using **DiscreteHilbertRTreeAuxiliaryInformation** = **HilbertRTreeAuxiliaryInformation**< TreeType, **DiscreteHilbertValue** >
The Hilbert R-tree, a variant of the R tree with an ordering along the Hilbert curve.
- template<typename MetricType , typename StatisticType , typename MatType >
using **HilbertRTree** = **RectangleTree**< MetricType, StatisticType, MatType, **HilbertRTreeSplit**< 2 >, **Hilbert**< **RTreeDescentHeuristic**, **DiscreteHilbertRTreeAuxiliaryInformation** >
- template<typename FitnessFunction >
using **HoeffdingDoubleNumericSplit** = **HoeffdingNumericSplit**< FitnessFunction, double >
Convenience typedef.
- typedef StreamingDecisionTree< **HoeffdingTree**<> > **HoeffdingTreeType**

- `template<typename MetricType >`
`using Hyperplane = HyperplaneBase< bound::BallBound< MetricType >, ProjVector >`
Hyperplane represents a general hyperplane (not necessarily axis-orthogonal).
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using KDTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::HRectBound, MidpointSplit`
`>`
The standard midpoint-split kd-tree.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using MaxRPTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::HRectBound, RPTree↵`
`MaxSplit >`
A max-split random projection tree.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using MeanSplitBallTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::BallBound,`
`MeanSplit >`
A mean-split ball tree.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using MeanSplitKDTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::HRectBound,`
`MeanSplit >`
A mean-split kd-tree.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using MeanSPTree = SpillTree< MetricType, StatisticType, MatType, AxisOrthogonalHyperplane, Mean↵`
`SpaceSplit >`
A mean-split hybrid spill tree.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using NonOrtMeanSPTree = SpillTree< MetricType, StatisticType, MatType, Hyperplane, MeanSpaceSplit`
`>`
A mean-split hybrid spill tree considering general splitting hyperplanes (not necessarily axis-orthogonal).
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using NonOrtSPTree = SpillTree< MetricType, StatisticType, MatType, Hyperplane, MidpointSpaceSplit >`
A hybrid spill tree considering general splitting hyperplanes (not necessarily axis-orthogonal).
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using RPlusPlusTree = RectangleTree< MetricType, StatisticType, MatType, RPlusTreeSplit< RPlus↵`
`PlusTreeSplitPolicy, MinimalSplitsNumberSweep >, RPlusPlusTreeDescentHeuristic, RPlusPlusTree↵`
`AuxiliaryInformation >`
The R++ tree, a variant of the R+ tree with maximum bounding rectangles.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using RPlusTree = RectangleTree< MetricType, StatisticType, MatType, RPlusTreeSplit< RPlusTreeSplit↵`
`Policy, MinimalCoverageSweep >, RPlusTreeDescentHeuristic, NoAuxiliaryInformation >`
The R+ tree, a variant of the R tree that avoids overlapping rectangles.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using RPTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::HRectBound, RPTree↵`
`MeanSplit >`
A mean-split random projection tree.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using RStarTree = RectangleTree< MetricType, StatisticType, MatType, RStarTreeSplit, RStarTree↵`
`DescentHeuristic, NoAuxiliaryInformation >`
The R-tree, a more recent variant of the R tree.*
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using RTree = RectangleTree< MetricType, StatisticType, MatType, RTreeSplit, RTreeDescentHeuristic,`
`NoAuxiliaryInformation >`

An implementation of the R tree that satisfies the TreeType policy API.

- `template<typename MetricType , typename StatisticType , typename MatType >`
`using SPTree = SpillTree< MetricType, StatisticType, MatType, AxisOrthogonalHyperplane, Midpoint↵`
`SpaceSplit >`

The hybrid spill tree.

- `template<typename MetricType , typename StatisticType , typename MatType >`
`using StandardCoverTree = CoverTree< MetricType, StatisticType, MatType, FirstPointsRoot >`

The standard cover tree, as detailed in the original cover tree paper:

- `template<typename MetricType , typename StatisticType , typename MatType >`
`using UBTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::CellBound, UBTreeSplit >`

The Universal B-tree.

- `template<typename MetricType , typename StatisticType , typename MatType >`
`using VPTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::HollowBallBound, VP↵`
`TreeSplit >`

- `template<typename BoundType , typename MatType = arma::mat>`
`using VPTreeSplit = VantagePointSplit< BoundType, MatType, 100 >`

The vantage point tree (which is also called the metric tree).

- `template<typename MetricType , typename StatisticType , typename MatType >`
`using XTree = RectangleTree< MetricType, StatisticType, MatType, XTreeSplit, RTreeDescentHeuristic,`
`XTreeAuxiliaryInformation >`

The X-tree, a variant of the R tree with supernodes.

Functions

- `template<bool UseWeights, typename MatType , typename LabelsType , typename WeightsType >`
`void Bootstrap (const MatType &dataset, const LabelsType &labels, const WeightsType &weights, MatType`
`&bootstrapDataset, LabelsType &bootstrapLabels, WeightsType &bootstrapWeights)`

Given a dataset, create another dataset via bootstrap sampling, with labels.

- `template<class TreeType , class Walker >`
`void EnumerateTree (TreeType *tree, Walker &walker)`

Traverses all nodes of the tree, including the inner ones.

Variables

- `const double MAX_OVERLAP = 0.2`

The X-tree paper says that a maximum allowable overlap of 20% works well.

38.55.1 Detailed Description

Trees and tree-building procedures.

38.55.2 Typedef Documentation

38.55.2.1 AxisOrthogonalHyperplane

```
using AxisOrthogonalHyperplane = HyperplaneBase< bound::HRectBound<MetricType>, AxisParallel↵
ProjVector>
```

AxisOrthogonalHyperplane represents a hyperplane orthogonal to an axis.

Definition at line 145 of file hyperplane.hpp.

38.55.2.2 BallTree

```
using BallTree = BinarySpaceTree<MetricType, StatisticType, MatType, bound::BallBound, Midpoint↵
Split>
```

A midpoint-split ball tree.

This tree holds its points only in the leaves, similar to the KDTree and MeanSplitKDTree. However, the bounding shape of each node is a ball, not a hyper-rectangle. This can make the ball tree advantageous in some higher-dimensional situations and for some datasets. The tree construction algorithm here is the same as Omohundro's 'K-d construction algorithm', except the splitting value is the midpoint, not the median. This can result in trees that better reflect the data, although they may be unbalanced.

```
@techreport{omohundro1989five,
  author={S.M. Omohundro},
  title={Five balltree construction algorithms},
  year={1989},
  institution={University of California, Berkeley International Computer
    Science Institute Technical Reports},
  number={TR-89-063}
}
```

This template typedef satisfies the TreeType policy API.

Definition at line 112 of file typedef.hpp.

38.55.2.3 BinaryDoubleNumericSplit

```
using BinaryDoubleNumericSplit = BinaryNumericSplit<FitnessFunction, double>
```

Definition at line 128 of file binary_numeric_split.hpp.

38.55.2.4 CosineNodeQueue

```
typedef boost::heap::priority_queue< CosineTree*, boost::heap::compare< CompareCosineNode> >
CosineNodeQueue
```

Definition at line 23 of file cosine_tree.hpp.

38.55.2.5 DecisionStump

```
using DecisionStump = DecisionTree<FitnessFunction, NumericSplitType, CategoricalSplitType,
DimensionSelectType, ElemType, false>
```

Convenience typedef for decision stumps (single level decision trees).

Definition at line 510 of file decision_tree.hpp.

38.55.2.6 DiscreteHilbertRTreeAuxiliaryInformation

```
using DiscreteHilbertRTreeAuxiliaryInformation = HilbertRTreeAuxiliaryInformation<TreeType,
DiscreteHilbertValue>
```

The Hilbert R-tree, a variant of the R tree with an ordering along the Hilbert curve.

This template typedef satisfies the TreeType policy API.

```

38.55.2.7 HilbertRTree

```
using HilbertRTree = RectangleTree<MetricType, StatisticType, MatType, HilbertRTreeSplit<2>,
HilbertRTreeDescentHeuristic, DiscreteHilbertRTreeAuxiliaryInformation>
```

Definition at line 136 of file typedef.hpp.

38.55.2.8 HoeffdingDoubleNumericSplit

```
using HoeffdingDoubleNumericSplit = HoeffdingNumericSplit<FitnessFunction, double>
```

Convenience typedef.

Definition at line 148 of file hoeffding_numeric_split.hpp.

38.55.2.9 HoeffdingTreeType

```
typedef StreamingDecisionTree< HoeffdingTree<> > HoeffdingTreeType
```

Definition at line 21 of file typedef.hpp.

38.55.2.10 Hyperplane

```
using Hyperplane = HyperplaneBase< bound::BallBound<MetricType>, ProjVector>
```

Hyperplane represents a general hyperplane (not necessarily axis-orthogonal).

Definition at line 151 of file hyperplane.hpp.

38.55.2.11 KDTree

```
using KDTree = BinarySpaceTree<MetricType, StatisticType, MatType, bound::HRectBound, Midpoint↵  
Split>
```

The standard midpoint-split kd-tree.

This is not the original formulation by Bentley but instead the later formulation by Deng and Moore, which only holds points in the leaves of the tree. When recursively splitting nodes, the KDTree class select the dimension with maximum variance to split on, and picks the midpoint of the range in that dimension as the value on which to split nodes.

For more information, see the following papers.

```
@article{bentley1975multidimensional,

}
```

This template typedef satisfies the TreeType policy API.

See also

The TreeType policy in mlpack (p. 179), **BinarySpaceTree** (p. 1998), **MeanSplitKDTree** (p. 455)

Definition at line 63 of file typedef.hpp.

38.55.2.12 MaxRPTree

```
using MaxRPTree = BinarySpaceTree<MetricType, StatisticType, MatType, bound::HRectBound, RP↵  
TreeMaxSplit>
```

A max-split random projection tree.

When recursively splitting nodes, the MaxSplitRPTree class selects a random hyperplane and splits a node by the hyperplane. The tree holds points in leaf nodes. In contrast to the k-d tree, children of a MaxSplitRPTree node may overlap.

```
@inproceedings{dasgupta2008,

The TreeType policy in mlpack (p.179), **BinarySpaceTree** (p.1998), **BallTree** (p.451), **MeanSplitKDTree** (p.455)

Definition at line 232 of file typedef.hpp.

38.55.2.13 MeanSplitBallTree

```
using MeanSplitBallTree = BinarySpaceTree<MetricType, StatisticType, MatType, bound::Ball↔  
Bound, MeanSplit>
```

A mean-split ball tree.

This tree, like the BallTree, holds its points only in the leaves. The tree construction algorithm here is the same as Omohundro's 'K-dc onstruction algorithm', except the splitting value is the mean, not the median. This can result in trees that better reflect the data, although they may be unbalanced.

```
@techreport{omohundro1989five,
  author={S.M. Omohundro},
  title={Five balltree construction algorithms},
  year={1989},
  institution={University of California, Berkeley International Computer
    Science Institute Technical Reports},
  number={TR-89-063}
}
```

This template typedef satisfies the TreeType policy API.

The TreeType policy in mlpack (p.179), **BinarySpaceTree** (p.1998), **BallTree** (p.451), **MeanSplitKDTree** (p.455)

Definition at line 141 of file typedef.hpp.

38.55.2.14 MeanSplitKdTree

```
using MeanSplitKdTree = BinarySpaceTree<MetricType, StatisticType, MatType, bound::HRectBound, MeanSplit>
```

A mean-split kd-tree.

This is the same as the KdTree, but this particular implementation will use the mean of the data in the split dimension as the value on which to split, instead of the midpoint. This can sometimes give better performance, but it is not always clear which type of tree is best.

This template typedef satisfies the TreeType policy API.

See also

The TreeType policy in mlpack (p. 179), **BinarySpaceTree** (p. 1998), **KdTree** (p. 453)

Definition at line 80 of file typedef.hpp.

38.55.2.15 MeanSPTree

```
using MeanSPTree = SpillTree<MetricType, StatisticType, MatType, AxisOrthogonalHyperplane, MeanSpaceSplit>
```

A mean-split hybrid spill tree.

This is the same as the SPTree, but this particular implementation will use the mean of the data in the split dimension as the value on which to split, instead of the midpoint. This can sometimes give better performance, but it is not always clear which type of tree is best.

This template typedef satisfies the TreeType policy API.

See also

The TreeType policy in mlpack (p. 179), **SpillTree** (p. 2274), **SPTree** (p. 460)

Definition at line 80 of file typedef.hpp.

38.55.2.16 NonOrtMeanSPTree

```
using NonOrtMeanSPTree = SpillTree<MetricType, StatisticType, MatType, Hyperplane, MeanSpace↵
Split>
```

A mean-split hybrid spill tree considering general splitting hyperplanes (not necessarily axis-orthogonal).

This is the same as the NonOrtSPTree, but this particular implementation will use the mean of the data in the split projection as the value on which to split, instead of the midpoint. This can sometimes give better performance, but it is not always clear which type of tree is best.

This template typedef satisfies the TreeType policy API.

See also

The TreeType policy in mlpack (p. 179), **SpillTree** (p. 2274), **MeanSPTree** (p. 456), **NonOrtSPTree** (p. 457)

Definition at line 119 of file typedef.hpp.

38.55.2.17 NonOrtSPTree

```
using NonOrtSPTree = SpillTree<MetricType, StatisticType, MatType, Hyperplane, MidpointSpace↵
Split>
```

A hybrid spill tree considering general splitting hyperplanes (not necessarily axis-orthogonal).

This particular implementation will consider the midpoint of the projection of the data in the vector determined by the farthest pair of points. This can sometimes give better performance, but generally it doesn't because it takes $O(d)$ to calculate the projection of the query point when deciding which node to traverse, while when using a axis-orthogonal hyperplane, as SPTree does, we can do it in $O(1)$.

This template typedef satisfies the TreeType policy API.

38.55.2.20 RPTree

```
using RPTree = BinarySpaceTree<MetricType, StatisticType, MatType, bound::HRectBound, RPTree↵
MeanSplit>
```

A mean-split random projection tree.

When recursively splitting nodes, the RPTree class may perform one of two different kinds of split. Depending on the diameter and the average distance between points, the node may be split by a random hyperplane or according to the distance from the mean point. The tree holds points in leaf nodes. In contrast to the k-d tree, children of a MaxSplitR↵PTree node may overlap.

```

The TreeType policy in mlpack (p.179), **RTree** (p.459)

Definition at line 75 of file typedef.hpp.

38.55.2.22 RTree

```
using RTree = RectangleTree<MetricType, StatisticType, MatType, RTreeSplit, RTreeDescent↵
Heuristic, NoAuxiliaryInformation>
```

An implementation of the R tree that satisfies the TreeType policy API.

This is the same R-tree structure as proposed by Guttman:

```
@inproceedings{guttman1984r,
  title={R-trees: a dynamic index structure for spatial searching},
  author={Guttman, A.},
  booktitle={Proceedings of the 1984 ACM SIGMOD International Conference on
    Management of Data (SIGMOD '84)},
  volume={14},
  number={2},
  year={1984},
  publisher={ACM}
}
```

See also

The TreeType policy in mlpack (p. 179), **RStarTree** (p. 459)

Definition at line 47 of file typedef.hpp.

38.55.2.23 SPTree

```
using SPTree = SpillTree<MetricType, StatisticType, MatType, AxisOrthogonalHyperplane, Midpoint↵
SpaceSplit>
```

The hybrid spill tree.

It is a variant of metric-trees in which the children of a node can "spill over" onto each other, and contain shared datapoints.

When recursively splitting nodes, the SPTree class select the dimension with maximum width to split on, and picks the midpoint of the range in that dimension as the value on which to split nodes.

In each case a "overlapping buffer" is defined, included points at a distance less than tau from the decision boundary defined by the midpoint.

For each node, we first split the points considering the overlapping buffer. If either of its children contains more than rho fraction of the total points we undo the overlapping splitting. Instead a conventional partition is used. In this way, we can ensure that each split reduces the number of points of a node by at least a constant factor.

For more information, see the following paper.

```
@inproceedings{
  author = {Ting Liu, Andrew W. Moore, Alexander Gray and Ke Yang},
  title = {An Investigation of Practical Approximate Nearest Neighbor
    Algorithms},
  booktitle = {Advances in Neural Information Processing Systems 17},
  year = {2005},
  pages = {825--832}
}
```

This template typedef satisfies the TreeType policy API.

See also

The TreeType policy in mlpack (p. 179), **SpillTree** (p. 2274), **MeanSPTree** (p. 456)

Definition at line 62 of file typedef.hpp.

38.55.2.24 StandardCoverTree

```
using StandardCoverTree = CoverTree<MetricType, StatisticType, MatType, FirstPointIsRoot>
```

The standard cover tree, as detailed in the original cover tree paper:

```
@inproceedings{
  author={Beygelzimer, A. and Kakade, S. and Langford, J.},
  title={Cover trees for nearest neighbor},
  booktitle={Proceedings of the 23rd International Conference on Machine
    Learning (ICML 2006)},
  pages={97--104},
  year={2006}
}
```

This template typedef satisfies the requirements of the TreeType API.

See also

The TreeType policy in mlpack (p. 179), **CoverTree** (p. 2040)

Definition at line 42 of file typedef.hpp.

38.55.2.25 UBTree

```
using UBTree = BinarySpaceTree<MetricType, StatisticType, MatType, bound::CellBound, UBTree←  
Split>
```

The Universal B-tree.

When recursively splitting nodes, the class calculates addresses of all points and splits each node according to the median address. Children may overlap since the implementation of a tighter bound requires a lot of arithmetic operations. In order to get a tighter bound increase the CellBound::maxNumBounds constant.

```
@inproceedings{bayer1997,
  author = {Bayer, Rudolf},
  title = {The Universal B-Tree for Multidimensional Indexing: General
    Concepts},
  booktitle = {Proceedings of the International Conference on Worldwide
    Computing and Its Applications},

38.55.2.26 VPTree

```
using VPTree = BinarySpaceTree<MetricType, StatisticType, MatType, bound::HollowBallBound, V↔
PTreeSplit>
```

Definition at line 199 of file typedef.hpp.

38.55.2.27 VPTreeSplit

```
using VPTreeSplit = VantagePointSplit<BoundType, MatType, 100>
```

The vantage point tree (which is also called the metric tree.

Vantage point trees and metric trees were invented independently by Yianilos an Uhlmann) is a kind of the binary space tree. When recursively splitting nodes, the VPTree class selects the vantage point and splits the node according to the distance to this point. Thus, points that are closer to the vantage point form the inner subtree. Other points form the outer subtree. The vantage point is contained in the first (inner) node.

This implementation differs from the original algorithms. Namely, vantage points are not contained in intermediate nodes. The tree has points only in the leaves of the tree.

For more information, see the following papers.

38.55.3 Function Documentation

38.55.3.1 Bootstrap()

```
void mlpack::tree::Bootstrap (
    const MatType & dataset,
    const LabelsType & labels,
    const WeightsType & weights,
    MatType & bootstrapDataset,
    LabelsType & bootstrapLabels,
    WeightsType & bootstrapWeights )
```

Given a dataset, create another dataset via bootstrap sampling, with labels.

Definition at line 26 of file bootstrap.hpp.

38.55.3.2 EnumerateTree()

```
void mlpack::tree::EnumerateTree (
    TreeType * tree,
    Walker & walker ) [inline]
```

Traverses all nodes of the tree, including the inner ones.

On each node two methods of the `enum` are called:

`Enter(TreeType* node, TreeType* parent);` `Leave(TreeType* node, TreeType* parent);`

Parameters

<i>walker</i>	An instance of custom class, receiver of the enumeration.
---------------	---

Definition at line 55 of file `enumerate_tree.hpp`.

References `mlpack::tree::enumerate::EnumerateTreeImpl()`.

38.55.4 Variable Documentation

38.55.4.1 MAX_OVERLAP

```
const double MAX_OVERLAP = 0.2
```

The X-tree paper says that a maximum allowable overlap of 20% works well.

This code should eventually be refactored so as to avoid polluting `mlpack::tree` (p. 444) with this random double.

Definition at line 29 of file `x_tree_split.hpp`.

38.56 mlpack::tree::enumerate Namespace Reference

Functions

Functions

- template<typename MatType , typename SplitType >
size_t **PerformSplit** (MatType &data, const size_t begin, const size_t count, const typename SplitType::SplitInfo &splitInfo)

This function implements the default split behavior i.e.

- template<typename MatType , typename SplitType >
size_t **PerformSplit** (MatType &data, const size_t begin, const size_t count, const typename SplitType::SplitInfo &splitInfo, std::vector< size_t > &oldFromNew)

This function implements the default split behavior i.e.

38.57.1 Function Documentation

38.57.1.1 PerformSplit() [1/2]

```
size_t mlpack::tree::split::PerformSplit (
    MatType & data,
    const size_t begin,
    const size_t count,
    const typename SplitType::SplitInfo & splitInfo )
```

This function implements the default split behavior i.e.

it rearranges points according to the split information. The SplitType::AssignToLeftNode() function is used in order to determine the child that contains any particular point.

Parameters

<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	The information about the split.

Definition at line 36 of file perform_split.hpp.

References Log::Assert().

38.57.1.2 PerformSplit() [2/2]

```
size_t mlpack::tree::split::PerformSplit (
    MatType & data,
```

```

const size_t begin,
const size_t count,
const typename SplitType::SplitInfo & splitInfo,
std::vector< size_t > & oldFromNew )

```

This function implements the default split behavior i.e.

it rearranges points according to the split information. The `SplitType::AssignToLeftNode()` function is used in order to determine the child that contains any particular point. The function takes care of indices and returns the list of changed indices.

Parameters

<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	The information about the split.
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.

Definition at line 101 of file `perform_split.hpp`.

References `Log::Assert()`.

38.58 mlpack::util Namespace Reference

Classes

- struct **IsStdVector**
Metaprogramming structure for vector detection.
- struct **IsStdVector**< `std::vector`< **T**, **A** > >
Metaprogramming structure for vector detection.
- class **NullOutputStream**
*Used for **Log::Debug** (p. 1540) when not compiled with debugging symbols.*
- struct **ParamData**
*This structure holds all of the information about a single parameter, including its value (which is set when **ParseCommandLine()** (p. 302) is called).*
- class **PrefixedOutputStream**
Allows us to output to an ostream with a prefix at the beginning of each line, in the same way we would output to cout or cerr.
- class **ProgramDoc**
*A static object whose constructor registers program documentation with the **CLI** (p. 1117) class.*

Functions

- void **DisableBacktrace** ()
Disable backtraces.
- void **DisableVerbose** ()
Turn verbose output off.
- void **EnableTimers** ()
Enable timing.
- void **EnableVerbose** ()
Turn verbose output on.
- template<typename T >
T * **GetParamPtr** (const std::string ¶mName)
Return a pointer.
- template<typename T >
T & **GetParamWithInfo** (const std::string ¶mName)
Return the matrix part of a matrix + dataset info parameter.
- std::string **GetVersion** ()
This will return either "mlpack x.y.z" or "mlpack master-XXXXXXX" depending on whether or not this is a stable version of mlpack or a git repository.
- std::string **HyphenateString** (const std::string &str, int padding)
** Hyphenate a string or split it onto multiple 80-character lines, with some * amount of padding on each line.*
- void **ReportIgnoredParam** (const std::vector< std::pair< std::string, bool >> &constraints, const std::string ¶mName)
Report that a parameter is ignored, if each of the constraints given are satisfied.
- void **ReportIgnoredParam** (const std::string ¶mName, const std::string &reason)
If the given parameter is passed, report that it is ignored, supplying a custom reason.
- void **RequireAtLeastOnePassed** (const std::vector< std::string > &constraints, const bool fatal=true, const std::string &customErrorMessage="")
*Require that at least one of the given parameters in the constraints set was passed to the **CLI** (p. 1117) object; otherwise, issue a warning or fatal error, optionally with the given custom error message.*
- void **RequireNoneOrAllPassed** (const std::vector< std::string > &constraints, const bool fatal=true, const std::string &customErrorMessage="")
*Require that either none or all of the given parameters in the constraints set were passed to the **CLI** (p. 1117) object; otherwise, issue a warning or fatal error, optionally with the given custom error message.*
- void **RequireOnlyOnePassed** (const std::vector< std::string > &constraints, const bool fatal=true, const std::string &customErrorMessage="")
*Require that only one of the given parameters in the constraints set was passed to the **CLI** (p. 1117) object; otherwise, issue a warning or fatal error, optionally with the given custom error message.*
- template<typename T >
void **RequireParamInSet** (const std::string ¶mName, const std::vector< T > &set, const bool fatal, const std::string &errorMessage)
Require that a given parameter is in a set of allowable parameters.
- template<typename T >
void **RequireParamValue** (const std::string ¶mName, const std::function< bool(T)> &conditional, const bool fatal, const std::string &errorMessage)
Require that a given parameter satisfies the given conditional function.
- void **ResetTimers** ()
Reset the status of all timers.
- template<typename T >
void **SetInputParam** (const std::string &name, T &&value)

Utility function that is used in binding tests for setting a parameter and marking it as passed; it uses copy semantics for lvalues and move semantics for rvalues.

- `template<typename T >`
`void SetParam (const std::string &identifier, T &value)`
Set the parameter to the given value.
- `template<typename T >`
`void SetParamPtr (const std::string &identifier, T *value, const bool copy)`
Set the parameter to the given value, given that the type is a pointer.
- `template<typename T >`
`void SetParamWithInfo (const std::string &identifier, T &matrix, const bool *dims)`
Set the parameter (which is a matrix/DatasetInfo tuple) to the given value.

38.58.1 Function Documentation

38.58.1.1 DisableBacktrace()

```
void mlpack::util::DisableBacktrace ( ) [inline]
```

Disable backtraces.

Definition at line 144 of file `cli_util.hpp`.

References `PrefixedOutputStream::backtrace`, and `Log::Fatal`.

38.58.1.2 DisableVerbose()

```
void mlpack::util::DisableVerbose ( ) [inline]
```

Turn verbose output off.

Definition at line 136 of file `cli_util.hpp`.

References `PrefixedOutputStream::ignoreInput`, and `Log::Info`.

38.58.1.3 EnableTimers()

```
void mlpack::util::EnableTimers ( ) [inline]
```

Enable timing.

Definition at line 161 of file `cli_util.hpp`.

References `Timer::EnableTiming()`.

38.58.1.4 EnableVerbose()

```
void mlpack::util::EnableVerbose ( ) [inline]
```

Turn verbose output on.

Definition at line 128 of file cli_util.hpp.

References PrefixedOutputStream::ignoreInput, and Log::Info.

38.58.1.5 GetParamPtr()

```
T* mlpack::util::GetParamPtr (
    const std::string & paramName )
```

Return a pointer.

This function exists to work around Cython's seeming lack of support for template pointer types.

Definition at line 109 of file cli_util.hpp.

38.58.1.6 GetParamWithInfo()

```
T& mlpack::util::GetParamWithInfo (
    const std::string & paramName )
```

Return the matrix part of a matrix + dataset info parameter.

Definition at line 118 of file cli_util.hpp.

38.58.1.7 GetVersion()

```
std::string mlpack::util::GetVersion ( )
```

This will return either "mlpack x.y.z" or "mlpack master-XXXXXXX" depending on whether or not this is a stable version of mlpack or a git repository.

Referenced by mlpack::bindings::cli::ParseCommandLine().

38.58.1.8 HyphenateString()

```
std::string mlpack::util::HyphenateString (
    const std::string & str,
    int padding ) [inline]
```

* Hyphenate a string or split it onto multiple 80-character lines, with some * amount of padding on each line.

This is used for option output. * *

Parameters

<i>str</i>	String to hyphenate (splits are on ' '). *
<i>padding</i>	Amount of padding on the left for each new line.

Definition at line 25 of file hyphenate_string.hpp.

Referenced by `mlpack::bindings::python::PrintDoc()`.

38.58.1.9 ReportIgnoredParam() [1/2]

```
void mlpack::util::ReportIgnoredParam (
    const std::vector< std::pair< std::string, bool >> & constraints,
    const std::string & paramName )
```

Report that a parameter is ignored, if each of the constraints given are satisfied.

The constraints should be a set of string/bool pairs. If all of the constraints are true, and the given parameter in 'paramName' is passed, then a warning will be issued noting that the parameter is ignored. The warning will go to **Log::Warn** (p. 1541).

Parameters

<i>constraints</i>	Set of constraints.
<i>paramName</i>	Name of parameter to check.

38.58.1.10 ReportIgnoredParam() [2/2]

```
void mlpack::util::ReportIgnoredParam (
    const std::string & paramName,
    const std::string & reason )
```

If the given parameter is passed, report that it is ignored, supplying a custom reason.

The reason should specify, in short and clear terms, why the parameter is ignored. So, for example, the output may be similar to:

```
--iterations (-i) ignored because <reason>.
```

and in this case a good reason might be "SGD is not being used as an optimizer". Be sure that when you write the reason, the full message makes sense.

Parameters

<i>paramName</i>	Name of parameter to check.
<i>reason</i>	Reason that parameter is ignored, if it is passed.

38.58.1.11 RequireAtLeastOnePassed()

```
void mlpack::util::RequireAtLeastOnePassed (
    const std::vector< std::string > & constraints,
    const bool fatal = true,
    const std::string & customErrorMessage = "" )
```

Require that at least one of the given parameters in the constraints set was passed to the **CLI** (p. 1117) object; otherwise, issue a warning or fatal error, optionally with the given custom error message.

This uses the correct binding type name for each parameter (i.e. '-parameter' for **CLI** (p. 1117) bindings, 'parameter' for Python bindings).

This can be used with a set of only one constraint and the output is still sensible.

If you use a custom error message, be aware that the given output will be similar to, for example:

```
Should pass one of '--codes_file (-c)', '--dictionary_file (-d)', or
'--output_model_file (-M)'; <custom error message>!
```

so when you write your custom error message, be sure that the sentence makes sense. The custom error message should not have a capitalized first character and no ending punctuation (a '!' will be added by this function).

Parameters

<i>constraints</i>	Set of parameters from which only one should be passed.
<i>fatal</i>	If true, output goes to Log::Fatal (p. 1540) instead of Log::Warn (p. 1541) and an exception is thrown.
<i>customErrorMessage</i>	Error message to append.

38.58.1.12 RequireNoneOrAllPassed()

```
void mlpack::util::RequireNoneOrAllPassed (
    const std::vector< std::string > & constraints,
    const bool fatal = true,
    const std::string & customErrorMessage = "" )
```

Require that either none or all of the given parameters in the constraints set were passed to the **CLI** (p. 1117) object; otherwise, issue a warning or fatal error, optionally with the given custom error message.

This uses the correct binding type name for each parameter (i.e. '-parameter' for **CLI** (p. 1117) bindings, 'parameter' for Python bindings).

If you use a custom error message, be aware that the given output will be similar to, for example:

```
Must pass none or all of '--codes_file (-c)', '--dictionary_file (-d)', and
'--output_model_file (-M)'; <custom error message>!
```

so when you write your custom error message, be sure that the sentence makes sense. The custom error message should not have a capitalized first character and no ending punctuation (a '!' will be added by this function).

Parameters

<i>constraints</i>	Set of parameters of which none or all should be passed.
<i>fatal</i>	If true, output goes to Log::Fatal (p. 1540) instead of Log::Warn (p. 1541) and an exception is thrown.
<i>customErrorMessage</i>	Error message to append.

38.58.1.13 RequireOnlyOnePassed()

```
void mlpack::util::RequireOnlyOnePassed (
    const std::vector< std::string > & constraints,
    const bool fatal = true,
    const std::string & customErrorMessage = "" )
```

Require that only one of the given parameters in the constraints set was passed to the **CLI** (p. 1117) object; otherwise, issue a warning or fatal error, optionally with the given custom error message.

This uses the correct binding type name for each parameter (i.e. '-parameter' for **CLI** (p. 1117) bindings, 'parameter' for Python bindings).

If you use a custom error message, be aware that the given output will be similar to, for example:

```
Must specify one of '--reference_file (-r)' or '--input_model_file (-m)';
<custom error message here>!
```

so when you write your custom error message, be sure that the sentence makes sense. The custom error message should not have a capitalized first character and no ending punctuation (a '!' will be added by this function).

Parameters

<i>constraints</i>	Set of parameters from which only one should be passed.
<i>fatal</i>	If true, output goes to Log::Fatal (p. 1540) instead of Log::Warn (p. 1541) and an exception is thrown.
<i>customErrorMessage</i>	Error message to append.

38.58.1.14 RequireParamInSet()

```
void mlpack::util::RequireParamInSet (
    const std::string & paramName,
    const std::vector< T > & set,
    const bool fatal,
    const std::string & errorMessage )
```

Require that a given parameter is in a set of allowable parameters.

This is probably most useful with `T = std::string`. If `fatal` is true, then an exception is thrown. An error message is not optional and must be specified. The error message does *not* need to specify the values in the set; this function will already output them. So, for example, the output may be similar to:

```
Invalid value of '--weak_learner (-w)' specified ('something'); <error
message>; must be one of 'decision_stump', or 'perceptron'!
```

so when you write the error message, make sure that the message makes sense. For example, in the message above, a good error message might be "unknown weak learner type".

Template Parameters

<i>T</i>	Type of parameter.
----------	--------------------

Parameters

<i>paramName</i>	Name of parameter to check.
<i>set</i>	Set of valid values for parameter.
<i>fatal</i>	If true, an exception is thrown and output goes to Log::Fatal (p. 1540).
<i>errorMessage</i>	Error message to output.

38.58.1.15 RequireParamValue()

```
void mlpack::util::RequireParamValue (
    const std::string & paramName,
    const std::function< bool(T)> & conditional,
    const bool fatal,
    const std::string & errorMessage )
```

Require that a given parameter satisfies the given conditional function.

This is useful for, e.g., checking that a given parameter is greater than 0. If `fatal` is true, then an exception is thrown. An error message is not optional and must be specified. The error message should specify, in clear terms, what the value of the parameter *should* be. So, for example, the output may be similar to:

Invalid value of '`--iterations (-i)`' specified (-1); <error message>!

and in this case a good error message might be "number of iterations must be positive". Be sure that when you write the error message, the message makes sense.

Template Parameters

<i>T</i>	Type of parameter to check.
----------	-----------------------------

Parameters

<i>paramName</i>	Name of parameter to check.
<i>conditional</i>	Function to use to check parameter value; should return 'true' if the parameter value is okay.
<i>fatal</i>	If true, an exception is thrown and output goes to Log::Fatal (p. 1540).
<i>errorMessage</i>	Error message to output.

38.58.1.16 ResetTimers()

```
void mlpack::util::ResetTimers ( ) [inline]
```

Reset the status of all timers.

Definition at line 152 of file cli_util.hpp.

References CLI::GetSingleton(), Timers::Reset(), and CLI::timer.

38.58.1.17 SetInputParam()

```
void mlpack::util::SetInputParam (
    const std::string & name,
    T && value )
```

Utility function that is used in binding tests for setting a parameter and marking it as passed; it uses copy semantics for lvalues and move semantics for rvalues.

Parameters

<i>name</i>	Name of parameter to set.
<i>value</i>	Value to set parameter to.

Definition at line 29 of file test_helper.hpp.

References CLI::SetPassed().

38.58.1.18 SetParam()

```
void mlpack::util::SetParam (
    const std::string & identifier,
    T & value ) [inline]
```

Set the parameter to the given value.

This function exists to work around Cython's lack of support for lvalue references.

Parameters

<i>identifier</i>	Name of parameter.
<i>value</i>	Value to set parameter to.

Definition at line 32 of file cli_util.hpp.

38.58.1.19 SetParamPtr()

```
void mlpack::util::SetParamPtr (
    const std::string & identifier,
    T * value,
    const bool copy ) [inline]
```

Set the parameter to the given value, given that the type is a pointer.

This function exists to work around both Cython's lack of support for lvalue references and also its seeming lack of support for template pointer types.

Parameters

<i>identifier</i>	Name of parameter.
<i>value</i>	Value to set parameter to.
<i>copy</i>	Whether or not the object should be copied.

Definition at line 48 of file cli_util.hpp.

38.58.1.20 SetParamWithInfo()

```
void mlpack::util::SetParamWithInfo (
    const std::string & identifier,
    T & matrix,
    const bool * dims ) [inline]
```

Set the parameter (which is a matrix/DatasetInfo tuple) to the given value.

Definition at line 59 of file cli_util.hpp.

References mlpack::data::categorical, DatasetMapper< PolicyType, InputType >::MapString(), and DatasetMapper< PolicyType, InputType >::Type().

38.59 std Namespace Reference

Chapter 39

Class Documentation

39.1 `version< mlpack::adaboost::AdaBoost< WeakLearnerType, MatType > >` Struct Template Reference

Public Member Functions

- **BOOST_STATIC_CONSTANT** (int, value=1)

39.1.1 Detailed Description

```
template<typename WeakLearnerType, typename MatType>
struct boost::serialization::version< mlpack::adaboost::AdaBoost< WeakLearnerType, MatType > >
```

Definition at line 184 of file `adaboost.hpp`.

39.1.2 Member Function Documentation

39.1.2.1 `BOOST_STATIC_CONSTANT()`

```
BOOST_STATIC_CONSTANT (
    int ,
    value = 1 )
```

The documentation for this struct was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/adaboost/ adaboost.hpp`

39.2 `version< mlpack::ann::BRNN< OutputLayerType, MergeLayerType, MergeOutputType, InitializationRuleType, CustomLayer... > > Struct Template Reference`

Public Member Functions

- **BOOST_STATIC_CONSTANT** (int, value=1)

39.2.1 Detailed Description

```
template<typename OutputLayerType, typename InitializationRuleType, typename MergeLayerType, typename MergeOutputType, type-
name... CustomLayer>
struct boost::serialization::version< mlpack::ann::BRNN< OutputLayerType, MergeLayerType, MergeOutputType, InitializationRule<
Type, CustomLayer... > >
```

Definition at line 396 of file `brnn.hpp`.

39.2.2 Member Function Documentation

39.2.2.1 `BOOST_STATIC_CONSTANT()`

```
BOOST_STATIC_CONSTANT (
    int ,
    value = 1 )
```

The documentation for this struct was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/brnn.hpp`

39.3 `version< mlpack::ann::FFN< OutputLayerType, InitializationRuleType, CustomLayer... > > Struct Template Reference`

Public Member Functions

- **BOOST_STATIC_CONSTANT** (int, value=1)

39.3.1 Detailed Description

```
template<typename OutputLayerType, typename InitializationRuleType, typename... CustomLayer>
struct boost::serialization::version< mlpack::ann::FFN< OutputLayerType, InitializationRuleType, CustomLayer... > >
```

Definition at line 477 of file `ffn.hpp`.

39.3.2 Member Function Documentation

39.3.2.1 BOOST_STATIC_CONSTANT()

```
BOOST_STATIC_CONSTANT (
    int ,
    value = 1 )
```

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/ **ffn.hpp**

39.4 version< mlpack::ann::RNN< OutputLayerType, InitializationRuleType, CustomLayer... > > Struct Template Reference

Public Member Functions

- **BOOST_STATIC_CONSTANT** (int, value=1)

39.4.1 Detailed Description

```
template<typename OutputLayerType, typename InitializationRuleType, typename... CustomLayer>
struct boost::serialization::version< mlpack::ann::RNN< OutputLayerType, InitializationRuleType, CustomLayer... > >
```

Definition at line 409 of file rnn.hpp.

39.4.2 Member Function Documentation

39.4.2.1 BOOST_STATIC_CONSTANT()

```
BOOST_STATIC_CONSTANT (
    int ,
    value = 1 )
```

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/ **rnn.hpp**

39.5 InitHMMModel Struct Reference

Static Public Member Functions

- `template<typename HMMType >`
`static void Apply (HMMType &hmm, vector< mat > *trainSeq)`
- `static void Create (HMM< DiscreteDistribution > &hmm, vector< mat > &trainSeq, size_t states, double tolerance=1e-05)`
Helper function to create discrete HMM.
- `static void Create (HMM< GaussianDistribution > &hmm, vector< mat > &trainSeq, size_t states, double tolerance=1e-05)`
- `static void Create (HMM< GMM > &hmm, vector< mat > &trainSeq, size_t states, double tolerance=1e-05)`
- `static void Create (HMM< DiagonalGMM > &hmm, vector< mat > &trainSeq, size_t states, double tolerance=1e-05)`
Helper function to create Diagonal GMM HMM.
- `static void RandomInitialize (vector< DiscreteDistribution > &e)`
Helper function for discrete emission distributions.
- `static void RandomInitialize (vector< GaussianDistribution > &e)`
- `static void RandomInitialize (vector< GMM > &e)`
- `static void RandomInitialize (vector< DiagonalGMM > &e)`
Helper function for diagonal GMM emission distributions.

39.5.1 Detailed Description

Definition at line 21 of file `hmm_test_utils.hpp`.

39.5.2 Member Function Documentation

39.5.2.1 Apply()

```
static void Apply (
    HMMType & hmm,
    vector< mat > * trainSeq ) [inline], [static]
```

Definition at line 24 of file `hmm_test_utils.hpp`.

References `Create()`, and `RandomInitialize()`.

39.5.2.2 Create() [1/4]

```
static void Create (
    HMM< DiscreteDistribution > & hmm,
    vector< mat > & trainSeq,
    size_t states,
    double tolerance = 1e-05 ) [inline], [static]
```

Helper function to create discrete HMM.

Definition at line 37 of file `hmm_test_utils.hpp`.

Referenced by `Apply()`.

39.5.2.3 Create() [2/4]

```
static void Create (

39.5.2.4 Create() [3/4]

```
static void Create (
    HMM< GMM > & hmm,
    vector< mat > & trainSeq,
    size_t states,
    double tolerance = 1e-05 ) [inline], [static]
```

Definition at line 82 of file `hmm_test_utils.hpp`.

39.5.2.5 Create() [4/4]

```
static void Create (
    HMM< DiagonalGMM > & hmm,
    vector< mat > & trainSeq,
    size_t states,
    double tolerance = 1e-05 ) [inline], [static]
```

Helper function to create Diagonal GMM HMM.

Definition at line 109 of file `hmm_test_utils.hpp`.

39.5.2.6 RandomInitialize() [1/4]

```
static void RandomInitialize (
    vector< DiscreteDistribution > & e ) [inline], [static]
```

Helper function for discrete emission distributions.

Definition at line 136 of file `hmm_test_utils.hpp`.

Referenced by `Apply()`.

39.5.2.7 RandomInitialize() [2/4]

```
static void RandomInitialize (
    vector< GaussianDistribution > & e ) [inline], [static]
```

Definition at line 145 of file `hmm_test_utils.hpp`.

39.5.2.8 RandomInitialize() [3/4]

```
static void RandomInitialize (
    vector< GMM > & e ) [inline], [static]
```

Definition at line 157 of file `hmm_test_utils.hpp`.

39.5.2.9 RandomInitialize() [4/4]

```
static void RandomInitialize (
    vector< DiagonalGMM > & e ) [inline], [static]
```

Helper function for diagonal GMM emission distributions.

Definition at line 180 of file `hmm_test_utils.hpp`.

The documentation for this struct was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/tests/main_tests/ hmm_test_utils.hpp`

39.6 IsVector< VecType > Struct Template Reference

If value == true, then `VecType` is some sort of Armadillo vector or subview.

Static Public Attributes

- static const bool **value** = false

39.6.1 Detailed Description

```
template<typename VecType>
struct IsVector< VecType >
```

If value == true, then VecType is some sort of Armadillo vector or subview.

You might use this struct like this:

```
// Only accepts VecTypes that are actually Armadillo vector types.
template<typename VecType>
void Function(const VecType& argumentA,
              typename std::enable_if_t<IsVector<VecType>::value>* = 0);
```

The use of the enable_if_t object allows the compiler to instantiate Function() only if VecType is one of the Armadillo vector types. It has a default argument because it isn't meant to be used in either the function call or the function body.

Definition at line 35 of file arma_traits.hpp.

39.6.2 Member Data Documentation

39.6.2.1 value

```
const bool value = false [static]
```

Definition at line 37 of file arma_traits.hpp.

39.14 AdaBoost< WeakLearnerType, MatType > Class Template Reference

The **AdaBoost** (p. 488) class.

Inheritance diagram for AdaBoost< WeakLearnerType, MatType >:

Public Member Functions

- **AdaBoost** (const MatType &data, const arma::Row< size_t > &labels, const size_t numClasses, const WeakLearnerType &other, const size_t iterations=100, const double tolerance=1e-6)
Constructor.
- **AdaBoost** (const double tolerance=1e-6)
*Create the **AdaBoost** (p. 488) object without training.*
- double **Alpha** (const size_t i) const
Get the weights for the given weak learner.
- double & **Alpha** (const size_t i)
Modify the weight for the given weak learner (be careful!).
- void **Classify** (const MatType &test, arma::Row< size_t > &predictedLabels)
Classify the given test points.
- size_t **NumClasses** () const
Get the number of classes this model is trained on.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
*Serialize the **AdaBoost** (p. 488) model.*
- double **Tolerance** () const
Get the tolerance for stopping the optimization during training.
- double & **Tolerance** ()
Modify the tolerance for stopping the optimization during training.
- double **Train** (const MatType &data, const arma::Row< size_t > &labels, const size_t numClasses, const WeakLearnerType &learner, const size_t iterations=100, const double tolerance=1e-6)
*Train **AdaBoost** (p. 488) on the given dataset.*
- const WeakLearnerType & **WeakLearner** (const size_t i) const
Get the given weak learner.
- WeakLearnerType & **WeakLearner** (const size_t i)
Modify the given weak learner (be careful!).
- size_t **WeakLearners** () const
Get the number of weak learners in the model.

39.14.1 Detailed Description

```
template<typename WeakLearnerType = mlpack::perceptron::Perceptron<>, typename MatType = arma::mat>
class mlpack::adaboost::AdaBoost< WeakLearnerType, MatType >
```

The **AdaBoost** (p. 488) class.

AdaBoost (p. 488) is a boosting algorithm, meaning that it combines an ensemble of weak learners to produce a strong learner. For more information on **AdaBoost** (p. 488), see the following paper:

```
@article{schapire1999improved,
  author = {Schapire, Robert E. and Singer, Yoram},
  title = {Improved Boosting Algorithms Using Confidence-rated Predictions},
  journal = {Machine Learning},
  volume = {37},
  number = {3},
  month = dec,
  year = {1999},
  issn = {0885-6125},
  pages = {297--336},
}
```

This class is general, and can be used with any type of weak learner, so long as the learner implements the following functions:

```
// A boosting constructor, which learns using the training parameters of the
// given other WeakLearner, but uses the given instance weights for training.
WeakLearner(WeakLearner& other,
            const MatType& data,
            const arma::Row<size_t>& labels,
            const arma::rowvec& weights);

// Given the test points, classify them and output predictions into
// predictedLabels.
void Classify(const MatType& data, arma::Row<size_t>& predictedLabels);
```

For more information on and examples of weak learners, see `perceptron::Perceptron<>` and `decision_stump::DecisionStump<>`.

Template Parameters

<i>MatType</i>	Data matrix type (i.e. <code>arma::mat</code> or <code>arma::sp_mat</code>).
<i>WeakLearnerType</i>	Type of weak learner to use.

Definition at line 81 of file `adaboost.hpp`.

39.14.2 Constructor & Destructor Documentation

39.14.2.1 AdaBoost() [1/2]

```
AdaBoost (
    const MatType & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const WeakLearnerType & other,
    const size_t iterations = 100,
    const double tolerance = 1e-6 )
```

Constructor.

This runs the AdaBoost.MH algorithm to provide a trained boosting model. This constructor takes an already-initialized weak learner; all other weak learners will learn with the same parameters as the given weak learner.

Parameters

<i>data</i>	Input data.
<i>labels</i>	Corresponding labels.
<i>iterations</i>	Number of boosting rounds.
<i>tol</i>	The tolerance for change in values of <i>rt</i> .
<i>other</i>	Weak learner that has already been initialized.

39.14.2.2 AdaBoost() [2/2]

```
AdaBoost (  
    const double tolerance = 1e-6 )
```

Create the **AdaBoost** (p. 488) object without training.

Be sure to call **Train()** (p. 492) before calling **Classify()** (p. 491)!

39.14.3 Member Function Documentation

39.14.3.1 Alpha() [1/2]

```
double Alpha (  
    const size_t i ) const [inline]
```

Get the weights for the given weak learner.

Definition at line 121 of file adaboost.hpp.

39.14.3.2 Alpha() [2/2]

```
double& Alpha (  
    const size_t i ) [inline]
```

Modify the weight for the given weak learner (be careful!).

Definition at line 123 of file adaboost.hpp.

39.14.3.3 Classify()

```
void Classify (  
    const MatType & test,  
    arma::Row< size_t > & predictedLabels )
```

Classify the given test points.

Parameters

<i>test</i>	Testing data.
<i>predictedLabels</i>	Vector in which to the predicted labels of the test set will be stored.

Referenced by AdaBoost< mlpack::perceptron::Perceptron<> >::WeakLearner().

39.14.3.4 NumClasses()

```
size_t NumClasses ( ) const [inline]
```

Get the number of classes this model is trained on.

Definition at line 115 of file adaboost.hpp.

39.14.3.5 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the **AdaBoost** (p. 488) model.

Referenced by AdaBoost< mlpack::perceptron::Perceptron<> >::WeakLearner().

39.14.3.6 Tolerance() [1/2]

```
double Tolerance ( ) const [inline]
```

Get the tolerance for stopping the optimization during training.

Definition at line 110 of file adaboost.hpp.

39.14.3.7 Tolerance() [2/2]

```
double& Tolerance ( ) [inline]
```

Modify the tolerance for stopping the optimization during training.

Definition at line 112 of file adaboost.hpp.

39.14.3.8 Train()

```
double Train (
    const MatType & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const WeakLearnerType & learner,
    const size_t iterations = 100,
    const double tolerance = 1e-6 )
```

Train **AdaBoost** (p. 488) on the given dataset.

This method takes an initialized **WeakLearnerType**; the parameters for this weak learner will be used to train each of the weak learners during **AdaBoost** (p. 488) training. Note that this will completely overwrite any model that has already been trained with this object.

Parameters

<i>data</i>	Dataset to train on.
<i>labels</i>	Labels for each point in the dataset.
<i>learner</i>	Learner to use for training.

Returns

The upper bound for training error.

Referenced by AdaBoost< mlpack::perceptron::Perceptron<> >::WeakLearner().

39.14.3.9 WeakLearner() [1/2]

```
const WeakLearnerType& WeakLearner (
    const size_t i ) const [inline]
```

Get the given weak learner.

Definition at line 126 of file adaboost.hpp.

39.14.3.10 WeakLearner() [2/2]

```
WeakLearnerType& WeakLearner (
    const size_t i ) [inline]
```

Modify the given weak learner (be careful!).

Definition at line 128 of file adaboost.hpp.

39.14.3.11 WeakLearners()

```
size_t WeakLearners ( ) const [inline]
```

Get the number of weak learners in the model.

Definition at line 118 of file `adaboost.hpp`.

39.16 AMF< TerminationPolicyType, InitializationRuleType, UpdateRuleType > Class Template Reference

This class implements **AMF** (p. 499) (alternating matrix factorization) on the given matrix V.

Public Member Functions

- **AMF** (const TerminationPolicyType &terminationPolicy=TerminationPolicyType(), const InitializationRuleType &initializeRule=InitializationRuleType(), const UpdateRuleType &update=UpdateRuleType())
*Create the **AMF** (p. 499) object and (optionally) set the parameters which **AMF** (p. 499) will run with.*
- template<typename MatType >
double **Apply** (const MatType &V, const size_t r, arma::mat &W, arma::mat &H)
Apply Alternating Matrix Factorization to the provided matrix.
- const InitializationRuleType & **InitializeRule** () const
Access the initialization rule.
- InitializationRuleType & **InitializeRule** ()
Modify the initialization rule.
- const TerminationPolicyType & **TerminationPolicy** () const
Access the termination policy.
- TerminationPolicyType & **TerminationPolicy** ()
Modify the termination policy.
- const UpdateRuleType & **Update** () const
Access the update rule.
- UpdateRuleType & **Update** ()
Modify the update rule.

39.16.1 Detailed Description

```
template<typename TerminationPolicyType = SimpleResidueTermination, typename InitializationRuleType = RandomAcol,
        Initialization<>, typename UpdateRuleType = NMFMultiplicativeDistanceUpdate>
class mlpack::amf::AMF< TerminationPolicyType, InitializationRuleType, UpdateRuleType >
```

This class implements **AMF** (p. 499) (alternating matrix factorization) on the given matrix V.

Alternating matrix factorization decomposes V in the form $V \approx WH$ where W is called the basis matrix and H is called the encoding matrix. V is taken to be of size n x m and the obtained W is n x r and H is r x m. The size r is called the rank of the factorization.

The implementation requires three template types; the first contains the policy used to determine when the algorithm has converged; the second contains the initialization rule for the W and H matrix; the last contains the update rule to be used during each iteration. This templization allows the user to try various update rules, initialization rules, and termination policies (including ones not supplied with mlpack) for factorization. By default, the template parameters to **AMF** (p. 499) implement non-negative matrix factorization with the multiplicative distance update.

A simple example of how to run **AMF** (p. 499) (or NMF) is shown below.

```
extern arma::mat V; // Matrix that we want to perform LMF on.
size_t r = 10; // Rank of decomposition
arma::mat W; // Basis matrix
arma::mat H; // Encoding matrix

AMF<> amf; // Default options: NMF with multiplicative distance update rules.
amf.Apply(V, r, W, H);
```

Template Parameters

<i>TerminationPolicy</i>	The policy to use for determining when the factorization has converged.
<i>InitializationRule</i>	The initialization rule for initializing W and H matrix.
<i>UpdateRule</i>	The update rule for calculating W and H matrix at each iteration.

See also

NMFMultiplicativeDistanceUpdate (p. 519), **SimpleResidueTermination** (p. 529)

Definition at line 78 of file amf.hpp.

39.16.2 Constructor & Destructor Documentation

39.16.2.1 AMF()

```
AMF (
    const TerminationPolicyType & terminationPolicy = TerminationPolicyType(),
    const InitializationRuleType & initializeRule = InitializationRuleType(),
    const UpdateRuleType & update = UpdateRuleType() )
```

Create the **AMF** (p. 499) object and (optionally) set the parameters which **AMF** (p. 499) will run with.

The minimum residue refers to the root mean square of the difference between two subsequent iterations of the product $W * H$. A low residue indicates that subsequent iterations are not producing much change in W and H. Once the residue goes below the specified minimum residue, the algorithm terminates.

Parameters

<i>initializationRule</i>	Optional instantiated InitializationRule object for initializing the W and H matrices.
<i>updateRule</i>	Optional instantiated UpdateRule object; this parameter is useful when the update rule for the W and H vector has state that it needs to store (i.e. HUpdate() and WUpdate() are not static functions).
<i>terminationPolicy</i>	Optional instantiated TerminationPolicy object.

39.16.3 Member Function Documentation

39.16.3.1 Apply()

```
double Apply (
    const MatType & V,
    const size_t r,
    arma::mat & W,
    arma::mat & H )
```

Apply Alternating Matrix Factorization to the provided matrix.

Parameters

V	Input matrix to be factorized.
W	Basis matrix to be output.
H	Encoding matrix to output.
r	Rank r of the factorization.

Referenced by NMFPolicy::Apply(), BatchSVDPolicy::Apply(), SVDCompletePolicy::Apply(), and SVDIncompletePolicy::Apply().

39.16.3.2 InitializeRule() [1/2]

```
const InitializationRuleType& InitializeRule ( ) const [inline]
```

Access the initialization rule.

39.17 AveragelInitialization Class Reference

This initialization rule initializes matrix W and H to root of the average of V, perturbed with uniform noise.

Public Member Functions

- **AveragelInitialization** ()
- `template<typename Archive >`
`void serialize (Archive &, const unsigned int)`
Serialize the object (in this case, there is nothing to do).

Static Public Member Functions

- `template<typename MatType >`
`static void Initialize (const MatType &V, const size_t r, arma::mat &W, arma::mat &H)`
Initialize the matrices W and H to the average value of V with uniform random noise added.

39.17.1 Detailed Description

This initialization rule initializes matrix W and H to root of the average of V, perturbed with uniform noise.

Uniform noise is generated by Armadillo's 'randu' function. For better performance, the lowest element of the matrix is subtracted from the average before dividing it by the factorization rank. This computed value is added with the random noise.

Definition at line 27 of file `average_init.hpp`.

39.17.2 Constructor & Destructor Documentation

39.17.2.1 AverageInitialization()

```
AverageInitialization ( ) [inline]
```

Definition at line 31 of file `average_init.hpp`.

39.17.3 Member Function Documentation

39.17.3.1 Initialize()

```
static void Initialize (
    const MatType & V,
    const size_t r,
    arma::mat & W,
    arma::mat & H ) [inline], [static]
```

Initialize the matrices W and H to the average value of V with uniform random noise added.

Parameters

<i>V</i>	Input matrix.
<i>r</i>	Rank of matrix.
<i>W</i>	W matrix, to be initialized.
<i>H</i>	H matrix, to be initialized.

Definition at line 43 of file average_init.hpp.

39.17.3.2 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serialize the object (in this case, there is nothing to do).

Definition at line 79 of file average_init.hpp.

The documentation for this class was generated from the following file:

39.18 CompleteIncrementalTermination< TerminationPolicy > Class Template Reference

This class acts as a wrapper for basic termination policies to be used by **SVDCompleteIncrementalLearning** (p. 542).

Public Member Functions

- **CompleteIncrementalTermination** (TerminationPolicy tPolicy=TerminationPolicy())
Empty constructor.
- const double & **Index** () const
Get current value of residue.
- template<class MatType >
void **Initialize** (const MatType &V)
Initializes the termination policy before stating the factorization.
- void **Initialize** (const arma::sp_mat &V)
Initializes the termination policy before stating the factorization.
- bool **IsConverged** (arma::mat &W, arma::mat &H)
Check if termination criterion is met, if the current iteration means that each point has been visited.
- const size_t & **Iteration** () const
Get current iteration count.
- const size_t & **MaxIterations** () const
Access upper limit of iteration count.
- size_t & **MaxIterations** ()
Modify maximum number of iterations.
- const TerminationPolicy & **TPolicy** () const
Access the wrapped termination policy.
- TerminationPolicy & **TPolicy** ()
Modify the wrapped termination policy.

39.18.1 Detailed Description

```
template<class TerminationPolicy>
class mlpack::amf::CompleteIncrementalTermination< TerminationPolicy >
```

This class acts as a wrapper for basic termination policies to be used by **SVDCCompleteIncrementalLearning** (p. 542).

This class calls the wrapped class functions after every n calls to main class functions where n is the number of non-zero entries in the matrix being factorized. This is necessary for **SVDCCompleteIncrementalLearning** (p. 542), because otherwise **IsConverged()** (p. 506) is called after every point, which is very slow.

See also

AMF (p. 499), **SVDCCompleteIncrementalLearning** (p. 542)

Definition at line 29 of file complete_incremental_termination.hpp.

39.18.2 Constructor & Destructor Documentation

39.18.2.1 CompleteIncrementalTermination()

```
CompleteIncrementalTermination (
    TerminationPolicy tPolicy = TerminationPolicy() ) [inline]
```

Empty constructor.

Parameters

<i>tPolicy</i>	object of wrapped class.

const double& Index ( ) const [inline]
```

Get current value of residue.

Definition at line 92 of file complete_incremental_termination.hpp.

39.18.3.2 Initialize() [1/2]

```
void Initialize (
    const MatType & V ) [inline]
```

Initializes the termination policy before stating the factorization.

Parameters

<i>V</i>	Input matrix to be factorized.
----------	--------------------------------

Definition at line 47 of file complete_incremental_termination.hpp.

39.18.3.3 Initialize() [2/2]

```
void Initialize (
    const arma::sp_mat & V ) [inline]
```

Initializes the termination policy before stating the factorization.

This is a specialization for sparse matrices.

Parameters

<i>V</i>	Input matrix to be factorized.
----------	--------------------------------

Definition at line 62 of file complete_incremental_termination.hpp.

39.18.3.4 IsConverged()

```
bool IsConverged (
    arma::mat & W,
    arma::mat & H ) [inline]
```

Check if termination criterion is met, if the current iteration means that each point has been visited.

Parameters

<i>W</i>	Basis matrix of output.
<i>H</i>	Encoding matrix of output.

Definition at line 78 of file complete_incremental_termination.hpp.

39.18.3.5 Iteration()

```
const size_t& Iteration ( ) const [inline]
```

Get current iteration count.

Definition at line 95 of file complete_incremental_termination.hpp.

39.18.3.6 MaxIterations() [1/2]

```
const size_t& MaxIterations ( ) const [inline]
```

Access upper limit of iteration count.

Definition at line 98 of file complete_incremental_termination.hpp.

39.18.3.7 MaxIterations() [2/2]

```
size_t& MaxIterations ( ) [inline]
```

Modify maximum number of iterations.

Definition at line 100 of file complete_incremental_termination.hpp.

39.18.3.8 TPolicy() [1/2]

```
const TerminationPolicy& TPolicy ( ) const [inline]
```

Access the wrapped termination policy.

Definition at line 103 of file complete_incremental_termination.hpp.

39.18.3.9 TPolicy() [2/2]

```
TerminationPolicy& TPolicy ( ) [inline]
```

Modify the wrapped termination policy.

Definition at line 105 of file complete_incremental_termination.hpp.

39.19 GivenInitialization Class Reference

This initialization rule for **AMF** (p. 499) simply fills the W and H matrices with the matrices given to the constructor of this object.

Public Member Functions

- **GivenInitialization** ()
- **GivenInitialization** (const arma::mat &w, const arma::mat &h)
- **GivenInitialization** (const arma::mat &&w, const arma::mat &&h)
- template<typename MatType >
void **Initialize** (const MatType &V, const size_t r, arma::mat &W, arma::mat &H)
Fill W and H with random uniform noise.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the object (in this case, there is nothing to serialize).

39.19.1 Detailed Description

This initialization rule for **AMF** (p. 499) simply fills the W and H matrices with the matrices given to the constructor of this object.

Note that this object does not use std::move() during the **Initialize()** (p. 509) method, so it can be reused for multiple **AMF** (p. 499) objects, but will incur copies of the W and H matrices.

Definition at line 27 of file given_init.hpp.

Definition at line 36 of file `incomplete_incremental_termination.hpp`.

39.20.3 Member Function Documentation

39.20.3.1 Index()

```
const double& Index ( ) const [inline]
```

Get current value of residue.

Definition at line 75 of file `incomplete_incremental_termination.hpp`.

39.20.3.2 Initialize()

```
void Initialize (
    const MatType & V ) [inline]
```

Initializes the termination policy before stating the factorization.

Parameters

<i>V</i>	Input matrix to be factorized.
----------	--------------------------------

Definition at line 46 of file incomplete_incremental_termination.hpp.

39.20.3.3 IsConverged()

```
bool IsConverged (
    arma::mat & W,
    arma::mat & H ) [inline]
```

Check if termination criterio is met.

Parameters

<i>W</i>	Basis matrix of output.
<i>H</i>	Encoding matrix of output.

Definition at line 61 of file incomplete_incremental_termination.hpp.

39.20.3.4 Iteration()

```
const size_t& Iteration ( ) const [inline]
```

Get current iteration count.

Definition at line 78 of file incomplete_incremental_termination.hpp.

39.20.3.5 MaxIterations() [1/2]

```
size_t MaxIterations ( ) const [inline]
```

Access maximum number of iterations.

Definition at line 81 of file incomplete_incremental_termination.hpp.

39.20.3.6 MaxIterations() [2/2]

```
size_t& MaxIterations ( ) [inline]
```

Modify maximum number of iterations.

Definition at line 83 of file `incomplete_incremental_termination.hpp`.

39.20.3.7 TPolicy() [1/2]

```
const TerminationPolicy& TPolicy ( ) const [inline]
```

Access the wrapped termination policy.

Definition at line 86 of file `incomplete_incremental_termination.hpp`.

39.20.3.8 TPolicy() [2/2]

```
TerminationPolicy& TPolicy ( ) [inline]
```

Modify the wrapped termination policy.

Definition at line 88 of file `incomplete_incremental_termination.hpp`.

39.21 MaxIterationTermination Class Reference

This termination policy only terminates when the maximum number of iterations has been reached.

Public Member Functions

- **MaxIterationTermination** (const size_t maxIterations)
Construct the termination policy with the given number of iterations allowed (default 1000).
- size_t **Index** ()
Return something similar to the residue, which in this case is just the number of iterations left, since we don't have access to anything else.
- template<typename MatType >
void **Initialize** (const MatType &)
Initialize for the given matrix V (there is nothing to do).
- bool **IsConverged** (const arma::mat &, const arma::mat &)
Check if convergence has occurred.
- size_t **Iteration** () const
Get the current iteration.
- size_t & **Iteration** ()
Modify the current iteration.
- size_t **MaxIterations** () const
Get the maximum number of iterations.
- size_t & **MaxIterations** ()
Modify the maximum number of iterations.

39.21.1 Detailed Description

This termination policy only terminates when the maximum number of iterations has been reached.

Definition at line 23 of file max_iteration_termination.hpp.

39.21.2 Constructor & Destructor Documentation

39.21.2.1 MaxIterationTermination()

```
MaxIterationTermination (  
    const size_t maxIterations ) [inline]
```

Construct the termination policy with the given number of iterations allowed (default 1000).

If maxIterations is 0, then termination will never occur.

Parameters

<i>maxIterations</i>	Maximum number of allowed iterations.
----------------------	---------------------------------------

Definition at line 33 of file max_iteration_termination.hpp.

References Log::Warn.

39.21.3 Member Function Documentation

39.21.3.1 Index()

```
size_t Index ( ) [inline]
```

Return something similar to the residue, which in this case is just the number of iterations left, since we don't have access to anything else.

Definition at line 60 of file max_iteration_termination.hpp.

39.21.3.2 Initialize()

```
void Initialize (
    const MatType & ) [inline]
```

Initialize for the given matrix V (there is nothing to do).

Definition at line 47 of file max_iteration_termination.hpp.

39.21.3.3 IsConverged()

```
bool IsConverged (
    const arma::mat & ,
    const arma::mat & ) [inline]
```

Check if convergence has occurred.

Definition at line 52 of file max_iteration_termination.hpp.

39.21.3.4 Iteration() [1/2]

```
size_t Iteration ( ) const [inline]
```

Get the current iteration.

Definition at line 66 of file max_iteration_termination.hpp.

39.21.3.5 Iteration() [2/2]

```
size_t& Iteration ( ) [inline]
```

Modify the current iteration.

Definition at line 68 of file max_iteration_termination.hpp.

39.21.3.6 MaxIterations() [1/2]

```
size_t MaxIterations ( ) const [inline]
```

Get the maximum number of iterations.

Definition at line 71 of file max_iteration_termination.hpp.

39.21.3.7 MaxIterations() [2/2]

```
size_t& MaxIterations ( ) [inline]
```

Modify the maximum number of iterations.

Definition at line 73 of file max_iteration_termination.hpp.

39.22 NMFALSUpdate Class Reference

This class implements a method titled 'Alternating Least Squares' described in the following paper:

Public Member Functions

- **NMFALSUpdate ()**
Empty constructor required for the UpdateRule template.
- template<typename MatType >
void **Initialize** (const MatType &, const size_t)
Set initial values for the factorization.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialize the object (in this case, there is nothing to serialize).

Static Public Member Functions

- template<typename MatType >
static void **HUpdate** (const MatType &V, const arma::mat &W, arma::mat &H)
The update rule for the encoding matrix H.
- template<typename MatType >
static void **WUpdate** (const MatType &V, arma::mat &W, const arma::mat &H)
The update rule for the basis matrix W.

39.22.1 Detailed Description

This class implements a method titled 'Alternating Least Squares' described in the following paper:

```
@article{paatero1994positive,
  title={Positive matrix factorization: A non-negative factor model with
    optimal utilization of error estimates of data values},
  author={Paatero, P. and Tapper, U.},
  journal={Environmetrics},
  volume={5},
  number={2},
  pages={111--126},
  year={1994}
}
```

It uses the least squares projection formula to reduce the error value of $\sqrt{\sum_i \sum_j (V - WH)^2}$ by alternately calculating W and H respectively while holding the other matrix constant.

Definition at line 41 of file nmf_als.hpp.

39.22.2 Constructor & Destructor Documentation

39.22.2.1 NMFALSUpdate()

```
NMFALSUpdate ( ) [inline]
```

Empty constructor required for the UpdateRule template.

Definition at line 45 of file nmf_als.hpp.

39.22.3 Member Function Documentation

39.22.3.1 HUpdate()

```
static void HUpdate (
    const MatType & V,
    const arma::mat & W,
    arma::mat & H ) [inline], [static]
```

The update rule for the encoding matrix H.

The formula used is

$$H = \frac{W^T V}{W^T W}$$

The function takes in all the matrices and only changes the value of the H matrix.

Parameters

<i>V</i>	Input matrix to be factorized.
<i>W</i>	Basis matrix.
<i>H</i>	Encoding matrix to be updated.

Definition at line 105 of file nmf_als.hpp.

39.22.3.2 Initialize()

```
void Initialize (
    const MatType & ,
    const size_t ) [inline]
```

Set initial values for the factorization.

In this case, we don't need to set anything.

Definition at line 52 of file nmf_als.hpp.

39.22.3.3 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serialize the object (in this case, there is nothing to serialize).

Definition at line 123 of file nmf_als.hpp.

39.22.3.4 WUpdate()

```
static void WUpdate (
    const MatType & V,
    arma::mat & W,
    const arma::mat & H ) [inline], [static]
```

The update rule for the basis matrix W.

The formula used is

$$W^T = \frac{HV^T}{HH^T}$$

The function takes in all the matrices and only changes the value of the W matrix.

Parameters

<i>V</i>	Input matrix to be factorized.
<i>W</i>	Basis matrix to be updated.
<i>H</i>	Encoding matrix.

Definition at line 72 of file nmf_als.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/amf/update_rules/ **nmf_als.hpp**

39.23 NMFMultiplicativeDistanceUpdate Class Reference

The multiplicative distance update rules for matrices W and H.

Public Member Functions

- **NMFMultiplicativeDistanceUpdate** ()
- template<typename MatType >
void **Initialize** (const MatType &, const size_t)
Initialize the factorization.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialize the object (in this case, there is nothing to serialize).

Static Public Member Functions

- `template<typename MatType >`
`static void HUpdate (const MatType &V, const arma::mat &W, arma::mat &H)`
The update rule for the encoding matrix H.
- `template<typename MatType >`
`static void WUpdate (const MatType &V, arma::mat &W, const arma::mat &H)`
The update rule for the basis matrix W.

39.23.1 Detailed Description

The multiplicative distance update rules for matrices W and H.

This follows a method described in the following paper:

```
@inproceedings{lee2001algorithms,
  title={Algorithms for non-negative matrix factorization},
  author={Lee, D.D. and Seung, H.S.},
  booktitle={Advances in Neural Information Processing Systems 13
    (NIPS 2000)},
  pages={556--562},
  year={2001}
}
```

This is a multiplicative rule that ensures that the Frobenius norm $\sqrt{\sum_i \sum_j (V - WH)^2}$ is non-increasing between subsequent iterations. Both of the update rules for W and H are defined in this file.

Definition at line 39 of file `nmf_mult_dist.hpp`.

39.23.2 Constructor & Destructor Documentation

39.23.2.1 NMFMultiplicativeDistanceUpdate()

```
NFMultiplicativeDistanceUpdate ( ) [inline]
```

Definition at line 43 of file `nmf_mult_dist.hpp`.

39.23.3 Member Function Documentation

39.23.3.1 HUpdate()

```
static void HUpdate (
    const MatType & V,
    const arma::mat & W,
    arma::mat & H ) [inline], [static]
```

The update rule for the encoding matrix H.

The formula used is

$$H_{a\mu} \leftarrow H_{a\mu} \frac{(W^T V)_{a\mu}}{(W^T W H)_{a\mu}}$$

The function takes in all the matrices and only changes the value of the H matrix.

Parameters

V	Input matrix to be factorized.
W	Basis matrix.
H	Encoding matrix to be updated.

Definition at line 92 of file nmf_mult_dist.hpp.

39.23.3.2 Initialize()

```
void Initialize (
    const MatType & ,
    const size_t ) [inline]
```

Initialize the factorization.

These update rules hold no information, so the input parameters are ignored.

Definition at line 50 of file nmf_mult_dist.hpp.

39.23.3.3 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serialize the object (in this case, there is nothing to serialize).

Definition at line 101 of file nmf_mult_dist.hpp.

39.23.3.4 WUpdate()

```
static void WUpdate (
    const MatType & V,
    arma::mat & W,
    const arma::mat & H ) [inline], [static]
```

The update rule for the basis matrix W.

The formula used is

$$W_{ia} \leftarrow W_{ia} \frac{(VH^T)_{ia}}{(WHH^T)_{ia}}$$

The function takes in all the matrices and only changes the value of the W matrix.

Parameters

V	Input matrix to be factorized.
W	Basis matrix to be updated.
H	Encoding matrix.

Definition at line 70 of file nmf_mult_dist.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/amf/update_rules/ **nmf_mult_dist.hpp**

39.24 NMFMultiplicativeDivergenceUpdate Class Reference

This follows a method described in the paper 'Algorithms for Non-negative.

Public Member Functions

- **NMFMultiplicativeDivergenceUpdate** ()
- template<typename MatType >
void **Initialize** (const MatType &, const size_t)
Initialize the factorization.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialize the object (in this case, there is nothing to serialize).

Static Public Member Functions

- template<typename MatType >
static void **HUpdate** (const MatType &V, const arma::mat &W, arma::mat &H)
The update rule for the encoding matrix H.
- template<typename MatType >
static void **WUpdate** (const MatType &V, arma::mat &W, const arma::mat &H)
The update rule for the basis matrix W.

39.24.1 Detailed Description

This follows a method described in the paper 'Algorithms for Non-negative.

```
@inproceedings{lee2001algorithms,
  title={Algorithms for non-negative matrix factorization},
  author={Lee, D.D. and Seung, H.S.},
  booktitle={Advances in Neural Information Processing Systems 13
    (NIPS 2000)},
  pages={556--562},
  year={2001}
}
```

This is a multiplicative rule that ensures that the Kullback–Leibler divergence

$$\sum_i \sum_j (V_{ij} \log \frac{V_{ij}}{(WH)_{ij}} - V_{ij} + (WH)_{ij})$$

is non-increasing between subsequent iterations. Both of the update rules for W and H are defined in this file.

This set of update rules is not meant to work with sparse matrices. Using sparse matrices often causes NaNs in the output, so other choices of update rules are better in that situation.

Definition at line 48 of file nmf_mult_div.hpp.

39.24.2 Constructor & Destructor Documentation

39.24.2.1 NMFMultiplicativeDivergenceUpdate()

```
NMFMultiplicativeDivergenceUpdate ( ) [inline]
```

Definition at line 52 of file nmf_mult_div.hpp.

39.24.3 Member Function Documentation

39.24.3.1 HUpdate()

```
static void HUpdate (
    const MatType & V,
    const arma::mat & W,
    arma::mat & H ) [inline], [static]
```

The update rule for the encoding matrix H.

The formula used is

$$H_{a\mu} \leftarrow H_{a\mu} \frac{\sum_i W_{ia} V_{i\mu} / (WH)_{i\mu}}{\sum_k H_{ka}}$$

The function takes in all the matrices and only changes the value of the H matrix.

Parameters

V	Input matrix to be factorized.
W	Basis matrix.
H	Encoding matrix to updated.

Definition at line 124 of file nmf_mult_div.hpp.

39.24.3.2 Initialize()

```
void Initialize (
    const MatType & ,
    const size_t ) [inline]
```

Initialize the factorization.

These rules don't store any state, so the input values are ignore.

Definition at line 59 of file nmf_mult_div.hpp.

39.24.3.3 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serialize the object (in this case, there is nothing to serialize).

Definition at line 154 of file nmf_mult_div.hpp.

39.24.3.4 WUpdate()

```
static void WUpdate (
    const MatType & V,
    arma::mat & W,
    const arma::mat & H ) [inline], [static]
```

The update rule for the basis matrix W.

The formula used is

$$W_{ia} \leftarrow W_{ia} \frac{\sum_{\mu} H_{a\mu} V_{i\mu} / (WH)_{i\mu}}{\sum_{\nu} H_{a\nu}}$$

The function takes in all the matrices and only changes the value of the W matrix.

Parameters

V	Input matrix to be factorized.
W	Basis matrix to be updated.
H	Encoding matrix.

Definition at line 80 of file nmf_mult_div.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/amf/update_rules/ **nmf_mult_div.hpp**

39.25 RandomAcolInitialization< columnsToAverage > Class Template Reference

This class initializes the W matrix of the **AMF** (p. 499) algorithm by averaging p randomly chosen columns of V .

Public Member Functions

- **RandomAcolInitialization** ()
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialize the object (in this case, there is nothing to serialize).

Static Public Member Functions

- template<typename MatType >
static void **Initialize** (const MatType & V , const size_t r , arma::mat & W , arma::mat & H)

39.25.1 Detailed Description

```
template<size_t columnsToAverage = 5>
class mlpack::amf::RandomAcolInitialization< columnsToAverage >
```

This class initializes the W matrix of the **AMF** (p. 499) algorithm by averaging p randomly chosen columns of V .

In this case, p is a template parameter. H is then filled using a uniform distribution in the range $[0, 1]$.

This simple initialization is the "random Acol initialization" found in the following paper:

```
@techreport{langville2014algorithms,
  title = {Algorithms, Initializations, and Convergence for the Nonnegative
    Matrix Factorization},
  author = {Langville, A.N. and Meyer, C.D. and Albright, R. and Cox, J. and
    Duling, D.},
  year = {2014},
  institution = {NCSU Technical Report Math 81706}
}
```

Template Parameters

<i>columnsToAverage</i>	The number of random columns to average for each column of <i>W</i> .
-------------------------	---

39.27 SimpleResidueTermination Class Reference

This class implements a simple residue-based termination policy.

Public Member Functions

- **SimpleResidueTermination** (const double **minResidue**=1e-5, const size_t maxIterations=10000)
*Construct the **SimpleResidueTermination** (p. 529) object with the given minimum residue (or the default) and the given maximum number of iterations (or the default).*
- const double & **Index** () const
Get current value of residue.
- template<typename MatType >
void **Initialize** (const MatType &V)
Initializes the termination policy before stating the factorization.
- bool **IsConverged** (arma::mat &W, arma::mat &H)
Check if termination criterion is met.
- const size_t & **Iteration** () const
Get current iteration count.
- const size_t & **MaxIterations** () const
Access max iteration count.
- size_t & **MaxIterations** ()
- const double & **MinResidue** () const
Access minimum residue value.
- double & **MinResidue** ()

Public Attributes

- `size_t iteration`
current iteration count
- `size_t maxIterations`
iteration threshold
- `double minResidue`
residue threshold
- `size_t nm`
- `double normOld`
norm of previous iteration
- `double residue`
current value of residue

39.27.1 Detailed Description

This class implements a simple residue-based termination policy.

The termination decision depends on two factors: the value of the residue (the difference between the norm of WH this iteration and the previous iteration), and the number of iterations. If the current value of residue drops below the threshold or the number of iterations goes above the iteration limit, **IsConverged()** (p. 531) will return true. This class is meant for use with the **AMF** (p. 499) (alternating matrix factorization) class.

39.28 SimpleToleranceTermination< MatType > Class Template Reference

This class implements residue tolerance termination policy.

Public Member Functions

- **SimpleToleranceTermination** (const double tolerance=1e-5, const size_t maxIterations=10000, const size_t reverseStepTolerance=3)
empty constructor
- const double & **Index** () const
Get current value of residue.
- void **Initialize** (const MatType &V)
Initializes the termination policy before stating the factorization.
- bool **IsConverged** (arma::mat &W, arma::mat &H)
Check if termination criterio is met.
- const size_t & **Iteration** () const
Get current iteration count.
- const size_t & **MaxIterations** () const
Access upper limit of iteration count.
- size_t & **MaxIterations** ()
- const double & **Tolerance** () const
Access tolerance value.
- double & **Tolerance** ()

39.28.1 Detailed Description

```
template<class MatType>
class mlpack::amf::SimpleToleranceTermination< MatType >
```

This class implements residue tolerance termination policy.

Termination criterion is met when increase in residue value drops below the given tolerance. To accommodate spikes certain number of successive residue drops are accepted. This upper imit on successive drops can be adjusted with reverseStepCount. Secondary termination criterion terminates algorithm when iteration count goes above the threshold.

39.29 SVDBatchLearning Class Reference

This class implements SVD batch learning with momentum.

Public Member Functions

- **SVDBatchLearning** (double u=0.0002, double kw=0, double kh=0, double momentum=0.9)
SVD Batch learning constructor.
- template<typename MatType >
void **HUpdate** (const MatType &V, const arma::mat &W, arma::mat &H)
The update rule for the encoding matrix H.
- template<typename MatType >
void **Initialize** (const MatType &dataset, const size_t rank)
Initialize parameters before factorization.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the SVDBatch object.
- template<typename MatType >
void **WUpdate** (const MatType &V, arma::mat &W, const arma::mat &H)
The update rule for the basis matrix W.

39.29.1 Detailed Description

This class implements SVD batch learning with momentum.

This procedure is described in the following paper:

```
@techreport{ma2008guide,
  title={A Guide to Singular Value Decomposition for Collaborative
    Filtering},
  author={Ma, Chih-Chao},
  year={2008},
  institution={Department of Computer Science, National Taiwan University}
}
```

This class implements 'Algorithm 4' as given in the paper.

The factorizer decomposes the matrix V into two matrices W and H such that sum of sum of squared error between V and W * H is minimum. This optimization is performed with gradient descent. To make gradient descent faster, momentum is added.

Definition at line 41 of file svd_batch_learning.hpp.

39.29.2 Constructor & Destructor Documentation

39.29.2.1 SVDBatchLearning()

```
SVDBatchLearning (
    double u = 0.0002,
    double kw = 0,
    double kh = 0,
    double momentum = 0.9 ) [inline]
```

SVD Batch learning constructor.

Parameters

<i>u</i>	step value used in batch learning
<i>kw</i>	regularization constant for W matrix
<i>kh</i>	regularization constant for H matrix
<i>momentum</i>	momentum applied to batch learning process

Definition at line 52 of file `svd_batch_learning.hpp`.

39.29.3 Member Function Documentation

39.29.3.1 HUpdate()

```
void HUpdate (
    const MatType & V,
    const arma::mat & W,
    arma::mat & H ) [inline]
```

The update rule for the encoding matrix H.

The function takes in all the matrices and only changes the value of the H matrix.

Parameters

<i>V</i>	Input matrix to be factorized.
<i>W</i>	Basis matrix.
<i>H</i>	Encoding matrix to be updated.

Definition at line 133 of file `svd_batch_learning.hpp`.

39.29.3.2 Initialize()

```
void Initialize (
    const MatType & dataset,
    const size_t rank ) [inline]
```

Initialize parameters before factorization.

This function must be called before a new factorization. This resets the internally-held momentum.

Parameters

<i>dataset</i>	Input matrix to be factorized.
<i>rank</i>	rank of factorization

Definition at line 69 of file `svd_batch_learning.hpp`.

39.29.3.3 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the SVDBatch object.

Definition at line 169 of file `svd_batch_learning.hpp`.

39.29.3.4 WUpdate()

```
void WUpdate (
    const MatType & V,
    arma::mat & W,
    const arma::mat & H ) [inline]
```

The update rule for the basis matrix W .

The function takes in all the matrices and only changes the value of the W matrix.

Parameters

V	Input matrix to be factorized.
W	Basis matrix to be updated.
H	Encoding matrix.

Definition at line 88 of file `svd_batch_learning.hpp`.

The documentation for this class was generated from the following file:

39.30 **SVDCompleteIncrementalLearning**< MatType > Class Template Reference

This class computes SVD using complete incremental batch learning, as described in the following paper:

Public Member Functions

- **SVDCompleteIncrementalLearning** (double $u=0.0001$, double $kw=0$, double $kh=0$)
*Initialize the **SVDCompleteIncrementalLearning** (p. 542) class with the given parameters.*
- void **HUpdate** (const MatType &V, const arma::mat &W, arma::mat &H)
The update rule for the encoding matrix H .
- void **Initialize** (const MatType &, const size_t)
Initialize parameters before factorization.
- void **WUpdate** (const MatType &V, arma::mat &W, const arma::mat &H)
The update rule for the basis matrix W .

39.30.1 Detailed Description

```
template<class MatType>
class mlpack::amf::SVDCompleteIncrementalLearning< MatType >
```

This class computes SVD using complete incremental batch learning, as described in the following paper:

```
@techreport{ma2008guide,
  title={A Guide to Singular Value Decomposition for Collaborative
    Filtering},
  author={Ma, Chih-Chao},
  year={2008},
  institution={Department of Computer Science, National Taiwan University}
}
```

This class implements 'Algorithm 3' given in the paper. Complete incremental learning is an extreme case of incremental learning, where feature vectors are updated after looking at each single element in the input matrix (V). This approach differs from incomplete incremental learning where feature vectors are updated after seeing columns of elements in the input matrix.

See also

SVDIncompleteIncrementalLearning (p. 547)

Definition at line 45 of file `svd_complete_incremental_learning.hpp`.

39.30.2 Constructor & Destructor Documentation

39.30.2.1 SVDCompleteIncrementalLearning()

```
SVDCompleteIncrementalLearning (
    double u = 0.0001,
    double kw = 0,
    double kh = 0 ) [inline]
```

Initialize the **SVDCompleteIncrementalLearning** (p. 542) class with the given parameters.

Parameters

<i>u</i>	Step value used in batch learning.
<i>kw</i>	Regularization constant for W matrix.
<i>kh</i>	Regularization constant for H matrix.

Definition at line 56 of file svd_complete_incremental_learning.hpp.

39.30.3 Member Function Documentation

39.30.3.1 HUpdate()

```
void HUpdate (
    const MatType & V,
    const arma::mat & W,
    arma::mat & H ) [inline]
```

The update rule for the encoding matrix H.

The function takes in all the matrices and only changes the value of the H matrix.

Parameters

<i>V</i>	Input matrix to be factorized.
<i>W</i>	Basis matrix.
<i>H</i>	Encoding matrix to be updated.

Definition at line 123 of file svd_complete_incremental_learning.hpp.

39.30.3.2 Initialize()

```
void Initialize (
    const MatType & ,
    const size_t ) [inline]
```

Initialize parameters before factorization.

This function must be called before a new factorization. For this initialization, the input parameters are unnecessary; we are only setting the current element index to 0.

Parameters

<i>dataset</i>	Input matrix to be factorized.
<i>rank</i>	rank of factorization

Definition at line 72 of file `svd_complete_incremental_learning.hpp`.

39.30.3.3 WUpdate()

```
void WUpdate (
    const MatType & V,
    arma::mat & W,
    const arma::mat & H ) [inline]
```

The update rule for the basis matrix W .

The function takes in all the matrices and only changes the value of the W matrix.

Parameters

V	Input matrix to be factorized.
W	Basis matrix to be updated.
H	Encoding matrix.

Definition at line 87 of file `svd_complete_incremental_learning.hpp`.

learning.hpp`

39.32 SVDIncompleteIncrementalLearning Class Reference

This class computes SVD using incomplete incremental batch learning, as described in the following paper:

Public Member Functions

- **SVDIncompleteIncrementalLearning** (double $u=0.001$, double $kw=0$, double $kh=0$)
*Initialize the parameters of **SVDIncompleteIncrementalLearning** (p. 547).*
- `template<typename MatType >`
`void HUpdate (const MatType &V, const arma::mat &W, arma::mat &H)`
The update rule for the encoding matrix H.
- `template<typename MatType >`
`void Initialize (const MatType &, const size_t)`
Initialize parameters before factorization.
- `template<typename MatType >`
`void WUpdate (const MatType &V, arma::mat &W, const arma::mat &H)`
The update rule for the basis matrix W.

39.32.1 Detailed Description

This class computes SVD using incomplete incremental batch learning, as described in the following paper:

```
@techreport{ma2008guide,
  title={A Guide to Singular Value Decomposition for Collaborative
    Filtering},
  author={Ma, Chih-Chao},
  year={2008},
  institution={Department of Computer Science, National Taiwan University}
}
```

This class implements 'Algorithm 2' as given in the paper. Incremental learning modifies only some feature values in W and H after scanning part of the input matrix (V). This differs from batch learning, which considers every element in V for each update of W and H . The regularization technique is also different: in incomplete incremental learning, regularization takes into account the number of elements in a given column of V .

See also

SVDBatchLearning (p. 539)

Definition at line 43 of file `svd_incomplete_incremental_learning.hpp`.

39.32.2 Constructor & Destructor Documentation

39.32.2.1 SVDIncompleteIncrementalLearning()

```
SVDIncompleteIncrementalLearning (
    double u = 0.001,
    double kw = 0,
    double kh = 0 ) [inline]
```

Initialize the parameters of **SVDIncompleteIncrementalLearning** (p. 547).

Parameters

<i>u</i>	Step value used in batch learning.
<i>kw</i>	Regularization constant for W matrix.
<i>kh</i>	Regularization constant for H matrix.

Definition at line 53 of file svd_incomplete_incremental_learning.hpp.

39.32.3 Member Function Documentation

39.32.3.1 HUpdate()

```
void HUpdate (
    const MatType & V,
    const arma::mat & W,
    arma::mat & H ) [inline]
```

The update rule for the encoding matrix H.

The function takes in all the matrices and only changes the value of the H matrix.

Parameters

<i>V</i>	Input matrix to be factorized.
<i>W</i>	Basis matrix.
<i>H</i>	Encoding matrix to be updated.

Definition at line 121 of file svd_incomplete_incremental_learning.hpp.

39.32.3.2 Initialize()

```
void Initialize (
    const MatType & ,
    const size_t ) [inline]
```

Initialize parameters before factorization.

This function must be called before a new factorization. This simply sets the column being considered to 0, so the input matrix and rank are not used.

Parameters

<i>dataset</i>	Input matrix to be factorized.
<i>rank</i>	rank of factorization

Definition at line 70 of file svd_incomplete_incremental_learning.hpp.

39.32.3.3 WUpdate()

```
void WUpdate (
    const MatType & V,
    arma::mat & W,
    const arma::mat & H ) [inline]
```

The update rule for the basis matrix W.

The function takes in all the matrices and only changes the value of the W matrix.

Parameters

<i>V</i>	Input matrix to be factorized.
<i>W</i>	Basis matrix to be updated.
<i>H</i>	Encoding matrix.

39.33 ValidationRMSETermination< MatType > Class Template Reference

This class implements validation termination policy based on RMSE index.

Public Member Functions

- **ValidationRMSETermination** (MatType &V, size_t num_test_points, double tolerance=1e-5, size_t max←Iterations=10000, size_t reverseStepTolerance=3)
Create a validation set according to given parameters and nullifies this set in data matrix(training set).
- const double & **Index** () const
Get current value of residue.
- void **Initialize** (const MatType &)
Initializes the termination policy before stating the factorization.
- bool **IsConverged** (arma::mat &W, arma::mat &H)
Check if termination criterio is met.
- const size_t & **Iteration** () const
Get current iteration count.
- const size_t & **MaxIterations** () const
Access upper limit of iteration count.
- size_t & **MaxIterations** ()
- const size_t & **NumTestPoints** () const
Get number of validation points.
- const double & **Tolerance** () const
Access tolerance value.
- double & **Tolerance** ()

39.33.1 Detailed Description

```
template<class MatType>
class mlpack::amf::ValidationRMSETermination< MatType >
```

This class implements validation termination policy based on RMSE index.

The input data matrix is divided into 2 sets, training set and validation set. Entries of validation set are nullified in the input matrix. Termination criterion is met when increase in validation set RMSe value drops below the given tolerance. To accommodate spikes certain number of successive validation RMSE drops are accepted. This upper imit on successive drops can be adjusted with reverseStepCount. Secondary termination criterion terminates algorithm when iteration count goes above the threshold.

Note

The input matrix is modified by this termination policy.

39.34 Add< InputDataType, OutputDataType > Class Template Reference

Implementation of the **Add** (p. 553) module class.

Public Member Functions

- **Add** (const size_t outSize=0)
Create the **Add** (p. 553) object using the specified number of output units.
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&, const arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename eT >
void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- template<typename eT >
void **Gradient** (const arma::Mat< eT > &&, arma::Mat< eT > &&error, arma::Mat< eT > &&gradient)
Calculate the gradient using the output delta and the input activation.
- OutputDataType const & **Gradient** () const
Get the gradient.
- OutputDataType & **Gradient** ()
Modify the gradient.
- OutputDataType const & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- OutputDataType const & **Parameters** () const
Get the parameters.
- OutputDataType & **Parameters** ()
Modify the parameters.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.34.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::Add< InputDataType, OutputDataType >
```

Implementation of the **Add** (p. 553) module class.

The **Add** (p. 553) module applies a bias term to the incoming data.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 34 of file add.hpp.

39.34.2 Constructor & Destructor Documentation

39.34.2.1 Add()

```
Add (
    const size_t outSize = 0 )
```

Create the **Add** (p. 553) object using the specified number of output units.

Parameters

<i>outSize</i>	The number of output units.
----------------	-----------------------------

39.34.3 Member Function Documentation

39.34.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    const arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.34.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 91 of file add.hpp.

39.34.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 93 of file add.hpp.

39.34.3.4 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.34.3.5 Gradient() [1/3]

```
void Gradient (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient )
```

Calculate the gradient using the output delta and the input activation.

Parameters

<i>input</i>	The propagated input.
<i>error</i>	The calculated error.
<i>gradient</i>	The calculated gradient.

39.34.3.6 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 96 of file add.hpp.

39.34.3.7 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 98 of file add.hpp.

References Add< InputDataType, OutputDataType >::serialize().

39.34.3.8 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 86 of file add.hpp.

39.34.3.9 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 88 of file add.hpp.

39.34.3.10 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 81 of file add.hpp.

39.34.3.11 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 83 of file add.hpp.

39.34.3.12 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Get the value of run parameter.
- bool & **Run** ()
Modify the value of run parameter.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.35.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat, typename... CustomLayers>
class mlpack::ann::AddMerge< InputDataType, OutputDataType, CustomLayers >
```

Implementation of the **AddMerge** (p. 558) module class.

The **AddMerge** (p. 558) class accumulates the output of various modules.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>CustomLayers</i>	Additional custom layers that can be added.

Definition at line 42 of file add_merge.hpp.

39.35.2 Constructor & Destructor Documentation

39.35.2.1 AddMerge()

```
AddMerge (
    const bool model = false,
    const bool run = true )
```

Create the **AddMerge** (p. 558) object using the specified parameters.

Parameters

<i>model</i>	Expose all the network modules.
<i>run</i>	Call the Forward/Backward method before the output is merged.

39.35.2.2 ~AddMerge()

```
~ AddMerge ( )
```

Destructor to release allocated memory.

39.35.3 Member Function Documentation

39.35.3.1 Add() [1/2]

```
void Add (
    Args... args ) [inline]
```

Definition at line 128 of file add_merge.hpp.

39.35.3.2 Add() [2/2]

```
void Add (
    LayerTypes< CustomLayers... > layer ) [inline]
```

Definition at line 135 of file add_merge.hpp.

39.35.3.3 Backward() [1/2]

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.35.3.4 Backward() [2/2]

```
void Backward (
    const arma::Mat< eT > && ,
```

```

arma::Mat< eT > && gy,
arma::Mat< eT > && g,
const size_t index )

```

This is the overload of **Backward()** (p. 561) that runs only a specific layer with the given input.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.
<i>The</i>	index of the layer to run.

39.35.3.5 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 148 of file add_merge.hpp.

39.35.3.6 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 150 of file add_merge.hpp.

39.35.3.7 Forward()

```

void Forward (
    InputType && ,
    OutputType && output )

```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.35.3.8 Gradient() [1/2]

```
void Gradient (
    arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient )
```

39.35.3.9 Gradient() [2/2]

```
void Gradient (
    arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient,
    const size_t index )
```

39.35.3.10 InputParameter() [1/2]

```
InputDataType const& InputParameter ( ) const [inline]
```

Get the input parameter.

Definition at line 138 of file add_merge.hpp.

39.35.3.11 InputParameter() [2/2]

```
InputDataType& InputParameter ( ) [inline]
```

Modify the input parameter.

Definition at line 140 of file add_merge.hpp.

39.35.3.12 Model()

```
std::vector< LayerTypes<CustomLayers...> >& Model ( ) [inline]
```

Return the model modules.

Definition at line 153 of file add_merge.hpp.

39.35.3.13 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 143 of file add_merge.hpp.

39.35.3.14 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 145 of file add_merge.hpp.

39.35.3.15 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 164 of file add_merge.hpp.

39.35.3.16 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 166 of file add_merge.hpp.

39.35.3.17 Run() [1/2]

```
bool Run ( ) const [inline]
```

Get the value of run parameter.

Definition at line 169 of file add_merge.hpp.

39.35.3.18 Run() [2/2]

```
bool& Run ( ) [inline]
```

Modify the value of run parameter.

Definition at line 171 of file add_merge.hpp.

References AddMerge< InputDataType, OutputDataType, CustomLayers >::serialize().

39.35.3.19 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by AddMerge< InputDataType, OutputDataType, CustomLayers >::Run().

39.36 AddVisitor< CustomLayers > Class Template Reference

AddVisitor (p. 565) exposes the Add() method of the given module.

Inheritance diagram for AddVisitor< CustomLayers >:

Public Member Functions

- `template<typename T >`
AddVisitor (T newLayer)
Exposes the Add() method of the given module.
- `template<typename LayerType >`
void operator() (LayerType *layer) const
Exposes the Add() method.

39.36.1 Detailed Description

```
template<typename... CustomLayers>
class mlpack::ann::AddVisitor< CustomLayers >
```

AddVisitor (p. 565) exposes the Add() method of the given module.

Definition at line 28 of file add_visitor.hpp.

39.36.2 Constructor & Destructor Documentation

39.36.2.1 AddVisitor()

```
AddVisitor (
    T newLayer )
```

Exposes the Add() method of the given module.

39.36.3 Member Function Documentation

39.36.3.1 operator>()

```
void operator() (
    LayerType * layer ) const
```

Exposes the Add() method.

The documentation for this class was generated from the following file:

39.37 AlphaDropout< InputDataType, OutputDataType > Class Template Reference

The alpha - dropout layer is a regularizer that randomly with probability 'ratio' sets input values to alphaDash.

Public Member Functions

- **AlphaDropout** (const double ratio=0.5, const double alphaDash=-alpha *lambda)
Create the Alpha_Dropout object using the specified ratio.
- double **A** () const
Value to be multiplied with x for affine transformation.
- double **AlphaDash** () const
Value of alphaDash.
- double **B** () const
*Value to be added to a*x for affine transformation.*
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of the alpha_dropout layer.
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- bool **Deterministic** () const
The value of the deterministic parameter.
- bool & **Deterministic** ()
Modify the value of the deterministic parameter.
- template<typename eT >
void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Ordinary feed forward pass of the alpha_dropout layer.
- OutputDataType const & **Mask** () const
Get the mask.
- OutputDataType const & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- double **Ratio** () const
The probability of setting a value to alphaDash.
- void **Ratio** (const double r)
Modify the probability of setting a value to alphaDash.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.37.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::AlphaDropout< InputDataType, OutputDataType >
```

The alpha - dropout layer is a regularizer that randomly with probability 'ratio' sets input values to alphaDash.

The alpha - dropout layer is mostly used for SELU activation function where successive layers don't have same mean and variance.

For more information, see the following.

```
@article{Klambauer2017,
  author = {Gunter Klambauer and Thomas Unterthiner and
            Andreas Mayr},
  title = {Self-Normalizing Neural Networks},
  journal = {Advances in Neural Information Processing Systems},
  year = {2017}
}
```

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 50 of file alpha_dropout.hpp.

39.37.2 Constructor & Destructor Documentation

39.37.2.1 AlphaDropout()

```
AlphaDropout (
    const double ratio = 0.5,
    const double alphaDash = -alpha * lambda )
```

Create the Alpha_Dropout object using the specified ratio.

Parameters

<i>ratio</i>	The probability of setting a value to alphaDash.
<i>alphaDash</i>	The dropout scaling parameter.

39.37.3 Member Function Documentation

39.37.3.1 A()

```
double A ( ) const [inline]
```

Value to be multiplied with x for affine transformation.

Definition at line 102 of file alpha_dropout.hpp.

39.37.3.2 AlphaDash()

```
double AlphaDash ( ) const [inline]
```

Value of alphaDash.

Definition at line 108 of file alpha_dropout.hpp.

39.37.3.3 B()

```
double B ( ) const [inline]
```

Value to be added to a*x for affine transformation.

Definition at line 105 of file alpha_dropout.hpp.

39.37.3.4 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of the alpha_dropout layer.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.37.3.5 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 89 of file alpha_dropout.hpp.

39.37.3.6 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 91 of file alpha_dropout.hpp.

39.37.3.7 Deterministic() [1/2]

```
bool Deterministic ( ) const [inline]
```

The value of the deterministic parameter.

Definition at line 94 of file alpha_dropout.hpp.

39.37.3.8 Deterministic() [2/2]

```
bool& Deterministic ( ) [inline]
```

Modify the value of the deterministic parameter.

Definition at line 96 of file alpha_dropout.hpp.

39.37.3.9 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of the alpha_dropout layer.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.37.3.10 Mask()

```
OutputDataType const& Mask ( ) const [inline]
```

Get the mask.

Definition at line 111 of file alpha_dropout.hpp.

39.37.3.11 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 84 of file alpha_dropout.hpp.

39.37.3.12 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 86 of file alpha_dropout.hpp.

39.37.3.13 Ratio() [1/2]

```
double Ratio ( ) const [inline]
```

The probability of setting a value to alphaDash.

Definition at line 99 of file alpha_dropout.hpp.

39.37.3.14 Ratio() [2/2]

```
void Ratio (
    const double r ) [inline]
```

Modify the probability of setting a value to alphaDash.

As 'a' and 'b' depend on 'ratio', modify them as well.

Definition at line 115 of file alpha_dropout.hpp.

References AlphaDropout< InputDataType, OutputDataType >::serialize().

39.37.3.15 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

39.38 AtrousConvolution< ForwardConvolutionRule, BackwardConvolutionRule, GradientConvolutionRule, InputDataType, OutputDataType > Class Template Reference

Implementation of the Atrous **Convolution** (p. 643) class.

Public Member Functions

- **AtrousConvolution** ()

*Create the **AtrousConvolution** (p. 572) object.*

- **AtrousConvolution** (const size_t inSize, const size_t outSize, const size_t kW, const size_t kH, const size_t dW=1, const size_t dH=1, const size_t padW=0, const size_t padH=0, const size_t inputWidth=0, const size_t inputHeight=0, const size_t dilationW=1, const size_t dilationH=1)

*Create the **AtrousConvolution** (p. 572) object using the specified number of input maps, output maps, filter size, stride, dilation and padding parameter.*

- template<typename eT >

void **Backward** (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

- OutputDataType const & **Delta** () const

Get the delta.

- OutputDataType & **Delta** ()

Modify the delta.

- template<typename eT >

void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

- template<typename eT >

void **Gradient** (const arma::Mat< eT > &&, arma::Mat< eT > &&error, arma::Mat< eT > &&gradient)

- OutputDataType const & **Gradient** () const

Get the gradient.

- OutputDataType & **Gradient** ()

Modify the gradient.

- size_t const & **InputHeight** () const

Get the input height.

- size_t & **InputHeight** ()

Modify the input height.

- size_t const & **InputWidth** () const

Get the input width.

- size_t & **InputWidth** ()

Modify input the width.

- size_t const & **OutputHeight** () const

Get the output height.

- size_t & **OutputHeight** ()

Modify the output height.

- OutputDataType const & **OutputParameter** () const

Get the output parameter.

- OutputDataType & **OutputParameter** ()

Modify the output parameter.

- size_t const & **OutputWidth** () const

Get the output width.

- size_t & **OutputWidth** ()

Modify the output width.

- OutputDataType const & **Parameters** () const

Get the parameters.

- OutputDataType & **Parameters** ()

Modify the parameters.

- void **Reset** ()
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)

Serialize the layer.

39.38.1 Detailed Description

```
template<typename ForwardConvolutionRule = NaiveConvolution<ValidConvolution>, typename BackwardConvolutionRule =
NaiveConvolution<FullConvolution>, typename GradientConvolutionRule = NaiveConvolution<ValidConvolution>, typename
InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::AtrousConvolution< ForwardConvolutionRule, BackwardConvolutionRule, GradientConvolutionRule, InputData↵
Type, OutputDataType >
```

Implementation of the Atrous **Convolution** (p. 643) class.

The Atrous **Convolution** (p. 643) class represents a single layer of a neural network. Atrous (or Dilated) Convolutions are just simple convolutions applied to input with the defined, spaces included between the kernel cells, in order to capture a larger field of reception, without having to increase discrete kernel sizes.

Template Parameters

<i>ForwardConvolutionRule</i>	Atrous Convolution (p. 643) to perform forward process.
<i>BackwardConvolutionRule</i>	Atrous Convolution (p. 643) to perform backward process.
<i>GradientConvolutionRule</i>	Atrous Convolution (p. 643) to calculate gradient.
<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 50 of file atrous_convolution.hpp.

39.38.2 Constructor & Destructor Documentation

39.38.2.1 AtrousConvolution() [1/2]

```
AtrousConvolution ( )
```

Create the **AtrousConvolution** (p. 572) object.

39.38.2.2 AtrousConvolution() [2/2]

```

AtrousConvolution (
    const size_t inSize,
    const size_t outSize,
    const size_t kW,
    const size_t kH,
    const size_t dW = 1,
    const size_t dH = 1,
    const size_t padW = 0,
    const size_t padH = 0,
    const size_t inputWidth = 0,
    const size_t inputHeight = 0,
    const size_t dilationW = 1,
    const size_t dilationH = 1 )

```

Create the **AtrousConvolution** (p. 572) object using the specified number of input maps, output maps, filter size, stride, dilation and padding parameter.

Parameters

<i>inSize</i>	The number of input maps.
<i>outSize</i>	The number of output maps.
<i>kW</i>	Width of the filter/kernel.
<i>kH</i>	Height of the filter/kernel.
<i>dW</i>	Stride of filter application in the x direction.
<i>dH</i>	Stride of filter application in the y direction.
<i>padW</i>	Padding width of the input.
<i>padH</i>	Padding height of the input.
<i>inputWidth</i>	The widht of the input data.
<i>inputHeight</i>	The height of the input data.
<i>dilationW</i>	The space between the cells of filters in x direction.
<i>dilationH</i>	The space between the cells of filters in y direction.

39.38.3 Member Function Documentation

39.38.3.1 Backward()

```

void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )

```

Ordinary feed backward pass of a neural network, calculating the function f(x) by propagating x backwards through f. Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.38.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 139 of file `atrous_convolution.hpp`.

39.38.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 141 of file `atrous_convolution.hpp`.

39.38.3.4 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.38.3.5 Gradient() [1/3]

```
void Gradient (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient )
```

39.38.3.6 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 144 of file atrous_convolution.hpp.

39.38.3.7 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 146 of file atrous_convolution.hpp.

39.38.3.8 InputHeight() [1/2]

```
size_t const& InputHeight ( ) const [inline]
```

Get the input height.

Definition at line 154 of file atrous_convolution.hpp.

39.38.3.9 InputHeight() [2/2]

```
size_t& InputHeight ( ) [inline]
```

Modify the input height.

Definition at line 156 of file atrous_convolution.hpp.

39.38.3.10 InputWidth() [1/2]

```
size_t const& InputWidth ( ) const [inline]
```

Get the input width.

Definition at line 149 of file `atrous_convolution.hpp`.

39.39 AddTask Class Reference

Generator of instances of the binary addition task.

Public Member Functions

- **AddTask** (const size_t bitLen)
Creates an instance of the binary addition task.
- void **Generate** (arma::field< arma::mat > &input, arma::field< arma::mat > &labels, const size_t batchSize, const bool fixedLength=false) const
Generate dataset of a given size.
- void **Generate** (arma::mat &input, arma::mat &labels, const size_t batchSize) const
Generate dataset of a given size and store it in arma::mat object.

39.39.1 Detailed Description

Generator of instances of the binary addition task.

The parameters are:

- maximum binary length;

Every element of sequence is encoded as 1-dimensional vector (possible vector elements are {0, 1, 0.5} - the latter corresponds to '+' sign'). Generated datasets are compliant with mlpack format - every dataset element is shaped as a vector of length 3 * (sequence length),

Example of generated dataset (binary length = 2):

- Input sequence: [0,1,0,0,0,1,0,1,0,1,0,0]
- Output sequences: [0,1,0,0,1,0]

Definition at line 42 of file add.hpp.

39.39.2 Constructor & Destructor Documentation

39.39.2.1 AddTask()

```
AddTask (
    const size_t bitLen )
```

Creates an instance of the binary addition task.

Parameters

<i>bitLen</i>	Maximum binary length of added numbers.
---------------	---

39.39.3 Member Function Documentation

39.39.3.1 Generate() [1/2]

```
void Generate (
    arma::field< arma::mat > & input,
```

```
arma::field< arma::mat > & labels,
const size_t batchSize,
const bool fixedLength = false ) const
```

Generate dataset of a given size.

Parameters

<i>input</i>	The variable to store input sequences.
<i>labels</i>	The variable to store output sequences.
<i>batchSize</i>	The dataset size.
<i>fixedLength</i>	Flag that indicates whether the method should return sequences of even length.

39.39.3.2 Generate() [2/2]

```
void Generate (
    arma::mat & input,
    arma::mat & labels,
    const size_t batchSize ) const
```

Generate dataset of a given size and store it in arma::mat object.

Parameters

<i>input</i>	The variable to store input sequences.
<i>labels</i>	The variable to store output sequences.
<i>batchSize</i>	The dataset size.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/augmented/tasks/ **add.hpp**

39.40 CopyTask Class Reference

Generator of instances of the binary sequence copy task.

Public Member Functions

- **CopyTask** (const size_t maxLength, const size_t nRepeats, const bool addSeparator=false)
Creates an instance of the sequence copy task.
- void **Generate** (arma::field< arma::mat > &input, arma::field< arma::mat > &labels, const size_t batchSize, bool fixedLength=false) const
Generate dataset of a given size.
- void **Generate** (arma::mat &input, arma::mat &labels, const size_t batchSize) const
Generate dataset of a given size and store it in arma::mat object.

39.40.1 Detailed Description

Generator of instances of the binary sequence copy task.

The parameters are:

- maximum sequence length;
- number of sequence repetitions.

Input/output sequences are aligned to have the same length: input sequence is padded with zeros from the right end, output sequence is padded with zeros from the left end. The sequences are formed of 2-dimensional vectors of the format [sequence element, input flag], where input flag = 0 iff first vector element is a sequence element.

Generated datasets are compliant with mpack format - every dataset element is shaped as a vector of length (elem-length) * (input sequence length + target sequence length), where elem-length is 2 for input sequences and 1 for output sequences.

Example of generated dataset (sequence length = 3, repetition count = 2):

- Input sequence: [1,0,0,0,1,0,0,1,0,1,0,1,0,1,0,1]
- Output sequences: [0,0,0,1,0,1,1,0,1]

Definition at line 48 of file copy.hpp.

39.40.2 Constructor & Destructor Documentation

39.40.2.1 CopyTask()

```
CopyTask (
    const size_t maxLength,
    const size_t nRepeats,
    const bool addSeparator = false )
```

Creates an instance of the sequence copy task.

Parameters

<i>maxLength</i>	Maximum length of sequence that has to be repeated by model.
<i>nRepeats</i>	Number of repeats required to solve the task.
<i>addSeparator</i>	Flag indicating whether generator should emit separating symbol after input sequence.

39.40.3 Member Function Documentation

39.40.3.1 Generate() [1/2]

```
void Generate (
    arma::field< arma::mat > & input,
    arma::field< arma::mat > & labels,
    const size_t batchSize,
    bool fixedLength = false ) const
```

Generate dataset of a given size.

Parameters

<i>input</i>	The variable to store input sequences.
<i>labels</i>	The variable to store output sequences.
<i>batchSize</i>	The dataset size.

39.40.3.2 Generate() [2/2]

```
void Generate (
    arma::mat & input,
    arma::mat & labels,
    const size_t batchSize ) const
```

Generate dataset of a given size and store it in arma::mat object.

Parameters

<i>input</i>	The variable to store input sequences.
<i>labels</i>	The variable to store output sequences.
<i>batchSize</i>	The dataset size.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/augmented/tasks/ **copy.hpp**

39.41 SortTask Class Reference

Generator of instances of the sequence sort task.

Public Member Functions

- **SortTask** (const size_t maxLength, const size_t bitLen, bool addSeparator=false)
Creates an instance of the sequence sort task.
- void **Generate** (arma::field< arma::mat > &input, arma::field< arma::mat > &labels, const size_t batchSize, bool fixedLength=false) const
Generate dataset of a given size.
- void **Generate** (arma::mat &input, arma::mat &labels, const size_t batchSize) const
Generate dataset of a given size and store it in arma::mat object.

39.41.1 Detailed Description

Generator of instances of the sequence sort task.

The parameters are:

- maximum sequence length;
- binary length of sequence elements.

Generated datasets are compliant with mlpack format - every dataset element is shaped as a vector of length (binary length) * (sequence length).

Example of generated dataset (sequence length = 3, binary length = 2):

- Input sequences: [1,1,0,0,0,1] (three numbers in the sequence are 11, 00, and 01)
- Output sequences: [0,0,0,1,1,1] (00, 01, 11 - reordering of the numbers above in the ascending order)

Definition at line 41 of file sort.hpp.

39.41.2 Constructor & Destructor Documentation

39.41.2.1 SortTask()

```
SortTask (
    const size_t maxLength,
    const size_t bitLen,
    bool addSeparator = false )
```

Creates an instance of the sequence sort task.

Parameters

<i>maxLength</i>	Maximum length of the number sequence.
<i>bitLen</i>	Binary length of sorted numbers.
<i>addSeparator</i>	Flag indicating whether generator should emit separating symbol after input sequence.

39.41.3 Member Function Documentation

39.41.3.1 **Generate()** [1/2]

```
void Generate (
    arma::field< arma::mat > & input,
    arma::field< arma::mat > & labels,
    const size_t batchSize,
    bool fixedLength = false ) const
```

Generate dataset of a given size.

Parameters

<i>input</i>	The variable to store input sequences.
<i>labels</i>	The variable to store output sequences.
<i>batchSize</i>	The dataset size.
<i>fixedLength</i>	Flag indicating whether generator should emit sequences of pairwise equal length.

39.41.3.2 **Generate()** [2/2]

```
void Generate (
    arma::mat & input,
    arma::mat & labels,
    const size_t batchSize ) const
```

Generate dataset of a given size and store it in arma::mat object.

Parameters

<i>input</i>	The variable to store input sequences.
<i>labels</i>	The variable to store output sequences.
<i>batchSize</i>	The dataset size.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/augmented/tasks/ **sort.hpp**

39.42 BackwardVisitor Class Reference

BackwardVisitor (p. 587) executes the Backward() function given the input, error and delta parameter.

Inheritance diagram for BackwardVisitor:

Public Member Functions

- **BackwardVisitor** (arma::mat &&input, arma::mat &&error, arma::mat &&delta)
Execute the Backward() function given the input, error and delta parameter.
- **BackwardVisitor** (arma::mat &&input, arma::mat &&error, arma::mat &&delta, const size_t index)
Execute the Backward() function for the layer with the specified index.
- template<typename LayerType >
void **operator()** (LayerType *layer) const
Execute the Backward() function.

39.42.1 Detailed Description

BackwardVisitor (p. 587) executes the Backward() function given the input, error and delta parameter.

Definition at line 28 of file backward_visitor.hpp.

39.42.2 Constructor & Destructor Documentation

39.42.2.1 BackwardVisitor() [1/2]

```
BackwardVisitor (
    arma::mat && input,
    arma::mat && error,
    arma::mat && delta )
```

Execute the Backward() function given the input, error and delta parameter.

39.42.2.2 BackwardVisitor() [2/2]

```
BackwardVisitor (
    arma::mat && input,
    arma::mat && error,
    arma::mat && delta,
    const size_t index )
```

Execute the Backward() function for the layer with the specified index.

39.42.3 Member Function Documentation

39.42.3.1 operator>()

```
void operator() (
    LayerType * layer ) const
```

Execute the Backward() function.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **backward_visitor.hpp**

39.43 BaseLayer< ActivationFunction, InputDataType, OutputDataType > Class Template Reference

Implementation of the base layer.

Public Member Functions

- **BaseLayer** ()
Create the **BaseLayer** (p. 588) object.
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename InputType , typename OutputType >
void **Forward** (const InputType &&input, OutputType &&output)
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- OutputDataType const & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialize the layer.

39.43.1 Detailed Description

```
template<class ActivationFunction = LogisticFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::BaseLayer< ActivationFunction, InputDataType, OutputDataType >
```

Implementation of the base layer.

The base layer works as a metaclass which attaches various functions to the embedding layer.

A few convenience typedefs are given:

- SigmoidLayer
- IdentityLayer
- ReLULayer
- TanHLayer

Template Parameters

<i>ActivationFunction</i>	Activation function used for the embedding layer.
<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 49 of file base_layer.hpp.

39.43.2 Constructor & Destructor Documentation

39.43.2.1 BaseLayer()

```
BaseLayer ( ) [inline]
```

Create the **BaseLayer** (p. 588) object.

Definition at line 55 of file base_layer.hpp.

39.43.3 Member Function Documentation

39.43.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g ) [inline]
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

Definition at line 83 of file base_layer.hpp.

39.43.3.2 Delta() ^[1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 98 of file base_layer.hpp.

39.43.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 100 of file base_layer.hpp.

39.43.3.4 Forward()

```
void Forward (
    const InputType && input,
    OutputType && output ) [inline]
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

Definition at line 68 of file base_layer.hpp.

39.43.3.5 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 93 of file base_layer.hpp.

39.43.3.6 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 95 of file base_layer.hpp.

39.43.3.7 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serialize the layer.

Definition at line 106 of file base_layer.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ **base_layer.hpp**

39.44 BatchNorm< InputDataType, OutputDataType > Class Template Reference

Declaration of the Batch Normalization layer class.

Public Member Functions

- **BatchNorm** ()
*Create the **BatchNorm** (p. 592) object.*
- **BatchNorm** (const size_t size, const double eps=1e-8)
*Create the **BatchNorm** (p. 592) layer object for a specified number of input units.*
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Backward pass through the layer.
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- bool **Deterministic** () const
Get the value of deterministic parameter.
- bool & **Deterministic** ()
Modify the value of deterministic parameter.

- `template<typename eT >`
`void Forward (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)`
Forward pass of the Batch Normalization layer.
- `template<typename eT >`
`void Gradient (const arma::Mat< eT > &&input, arma::Mat< eT > &&error, arma::Mat< eT > &&gradient)`
Calculate the gradient using the output delta and the input activations.
- `OutputDataType const & Gradient () const`
Get the gradient.
- `OutputDataType & Gradient ()`
Modify the gradient.
- `OutputDataType const & OutputParameter () const`
Get the output parameter.
- `OutputDataType & OutputParameter ()`
Modify the output parameter.
- `OutputDataType const & Parameters () const`
Get the parameters.
- `OutputDataType & Parameters ()`
Modify the parameters.
- `void Reset ()`
Reset the layer parameters.
- `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialize the layer.
- `OutputDataType TrainingMean ()`
Get the mean over the training data.
- `OutputDataType TrainingVariance ()`
Get the variance over the training data.

39.44.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::BatchNorm< InputDataType, OutputDataType >
```

Declaration of the Batch Normalization layer class.

The layer transforms the input data into zero mean and unit variance and then scales and shifts the data by parameters, gamma and beta respectively. These parameters are learnt by the network.

If deterministic is false (training), the mean and variance over the batch is calculated and the data is normalized. If it is set to true (testing) then the mean and variance accrued over the training set is used.

For more information, refer to the following paper,

```
@article{Ioffe15,
  author    = {Sergey Ioffe and
              Christian Szegedy},
  title     = {Batch Normalization: Accelerating Deep Network Training by
              Reducing Internal Covariate Shift},
  journal   = {CoRR},
  volume    = {abs/1502.03167},

  url       = {http://arxiv.org/abs/1502.03167},
  eprint    = {1502.03167},
}
```

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 56 of file batch_norm.hpp.

39.44.2 Constructor & Destructor Documentation

39.44.2.1 BatchNorm() [1/2]

```
BatchNorm ( )
```

Create the **BatchNorm** (p. 592) object.

39.44.2.2 BatchNorm() [2/2]

```
BatchNorm (
    const size_t size,
    const double eps = 1e-8 )
```

Create the **BatchNorm** (p. 592) layer object for a specified number of input units.

Parameters

<i>size</i>	The number of input units.
<i>eps</i>	The epsilon added to variance to ensure numerical stability.

39.44.3 Member Function Documentation

39.44.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && input,
```

```
arma::Mat< eT > && gy,  
arma::Mat< eT > && g )
```

Backward pass through the layer.

Parameters

<i>input</i>	The input activations
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.44.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 121 of file batch_norm.hpp.

39.44.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 123 of file batch_norm.hpp.

39.44.3.4 Deterministic() [1/2]

```
bool Deterministic ( ) const [inline]
```

Get the value of deterministic parameter.

Definition at line 131 of file batch_norm.hpp.

39.44.3.5 Deterministic() [2/2]

```
bool& Deterministic ( ) [inline]
```

Modify the value of deterministic parameter.

Definition at line 133 of file batch_norm.hpp.

39.44.3.6 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Forward pass of the Batch Normalization layer.

Transforms the input data into zero mean and unit variance, scales the data by a factor gamma and shifts it by beta.

Parameters

<i>input</i>	Input data for the layer
<i>output</i>	Resulting output activations.

39.44.3.7 Gradient() [1/3]

```
void Gradient (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient )
```

Calculate the gradient using the output delta and the input activations.

Parameters

<i>input</i>	The input activations
<i>error</i>	The calculated error
<i>gradient</i>	The calculated gradient.

39.44.3.8 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 126 of file batch_norm.hpp.

39.44.3.9 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 128 of file batch_norm.hpp.

39.44.3.10 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 116 of file batch_norm.hpp.

39.44.3.11 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

39.44.3.12 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 111 of file batch_norm.hpp.

39.44.3.13 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 113 of file batch_norm.hpp.

39.44.3.14 Reset()

```
void Reset ( )
```

Reset the layer parameters.

39.44.3.15 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by BatchNorm< InputDataType, OutputDataType >::TrainingVariance().

39.44.3.16 TrainingMean()

```
OutputDataType TrainingMean ( ) [inline]
```

Get the mean over the training data.

Definition at line 136 of file batch_norm.hpp.

39.44.3.17 TrainingVariance()

```
OutputDataType TrainingVariance ( ) [inline]
```

Get the variance over the training data.

Definition at line 139 of file batch_norm.hpp.

References BatchNorm< InputDataType, OutputDataType >::serialize().

39.45 BernoulliDistribution< DataType > Class Template Reference

Multiple independent Bernoulli distributions.

Public Member Functions

- **BernoulliDistribution** ()
Default constructor, which creates a Bernoulli distribution with zero dimension.
 - **BernoulliDistribution** (const DataType &¶m, const bool applyLogistic=true, const double eps=1e-10)
Create multiple independent Bernoulli distributions whose p values are given by the param parameter.
 - const DataType & **Logits** () const
Return the logits matrix.
 - DataType & **Logits** ()
Return a modifiable copy of the pre probability matrix.
 - double **LogProbability** (const DataType &&observation) const
Return the log probabilities of the given matrix of observations.
 - void **LogProbBackward** (const DataType &&observation, DataType &&output) const
Stores the gradient of the log probabilities of the observations in the output matrix.
 - double **Probability** (const DataType &&observation) const
Return the probabilities of the given matrix of observations.
 - const DataType & **Probability** () const
Return the probability matrix.
 - DataType & **Probability** ()
Return a modifiable copy of the probability matrix.
 - DataType **Sample** () const
Return a matrix of randomly generated samples according to the probability distributions defined by this object.
 - template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
- Serialize the distribution.*

39.45.1 Detailed Description

```
template<typename DataType = arma::mat>
class mlpack::ann::BernoulliDistribution< DataType >
```

Multiple independent Bernoulli distributions.

Bernoulli distribution is the discrete probability distribution of a random variable which takes the value 1 with probability p and the value 0 with probability $q = 1 - p$. In this implementation, the p values of the distributions are given by the param matrix.

Template Parameters

<i>DataType</i>	Type of the input data. (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
-----------------	--

Definition at line 34 of file bernoulli_distribution.hpp.

39.45.2 Constructor & Destructor Documentation

39.45.2.1 BernoulliDistribution() [1/2]

```
BernoulliDistribution ( )
```

Default constructor, which creates a Bernoulli distribution with zero dimension.

39.45.2.2 BernoulliDistribution() [2/2]

```
BernoulliDistribution (
    const DataType && param,
    const bool applyLogistic = true,
    const double eps = 1e-10 )
```

Create multiple independent Bernoulli distributions whose p values are given by the param parameter.

Thus, we create `nofRows * nofColumns` distributions. The shape of the matrix of distributions is the same as the shape of the param matrix as each element of the param matrix parameterizes one Bernoulli distribution. This is used in the ANN module to define distribution for each feature in each batch, where number of features becomes `nofRows` and batch size becomes `nofColumns`.

`applyLogistic` has to be true if all the elements of param matrix are not in the range [0, 1].

Parameters

<i>param</i>	The matrix of probabilities or pre probabilities of the multiple distributions.
<i>applyLogistic</i>	If true, we apply Logistic function to the param matrix (pre probability) to get probability.
<i>eps</i>	The minimum value used for computing logarithms and denominators.

39.45.3 Member Function Documentation

39.45.3.1 Logits() [1/2]

```
const DataType& Logits ( ) const [inline]
```

Return the logits matrix.

Definition at line 108 of file `bernoulli_distribution.hpp`.

39.45.3.2 Logits() [2/2]

```
DataType& Logits ( ) [inline]
```

Return a modifiable copy of the pre probability matrix.

Definition at line 111 of file bernoulli_distribution.hpp.

39.45.3.3 LogProbability()

```
double LogProbability (
    const DataType && observation ) const
```

Return the log probabilities of the given matrix of observations.

Parameters

<i>observation</i>	The observation matrix.
--------------------	-------------------------

Referenced by BernoulliDistribution< DataType >::Probability().

39.45.3.4 LogProbBackward()

```
void LogProbBackward (
    const DataType && observation,
    DataType && output ) const
```

Stores the gradient of the log probabilities of the observations in the output matrix.

Parameters

<i>observation</i>	The observation matrix.
<i>output</i>	The output matrix where the gradients are stored.

Referenced by BernoulliDistribution< DataType >::Probability().

39.45.3.5 Probability() [1/3]

```
double Probability (
    const DataType && observation ) const [inline]
```

Return the probabilities of the given matrix of observations.

Parameters

<i>observation</i>	The observation matrix.
--------------------	-------------------------

Definition at line 72 of file bernoulli_distribution.hpp.

References `BernoulliDistribution< DataType >::LogProbability()`, `BernoulliDistribution< DataType >::LogProb←Backward()`, and `BernoulliDistribution< DataType >::Sample()`.

39.45.3.6 Probability() [2/3]

```
const DataType& Probability ( ) const [inline]
```

Return the probability matrix.

Definition at line 102 of file bernoulli_distribution.hpp.

39.45.3.7 Probability() [3/3]

```
DataType& Probability ( ) [inline]
```

Return a modifiable copy of the probability matrix.

Definition at line 105 of file bernoulli_distribution.hpp.

39.45.3.8 Sample()

```
DataType Sample ( ) const
```

Return a matrix of randomly generated samples according to the probability distributions defined by this object.

Returns

Matrix(integer) of random samples from the multiple Bernoulli distributions.

Referenced by `BernoulliDistribution< DataType >::Probability()`.

39.45.3.9 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the distribution.

Definition at line 117 of file bernoulli_distribution.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/dists/ **bernoulli_distribution.hpp**

39.46 BilinearInterpolation< InputDataType, OutputDataType > Class Template Reference

Definition and Implementation of the Bilinear Interpolation Layer.

Public Member Functions

- **BilinearInterpolation ()**
Create the Bilinear Interpolation object.
- **BilinearInterpolation** (const size_t inRowSize, const size_t inColSize, const size_t outRowSize, const size_t outColSize, const size_t depth)
The constructor for the Bilinear Interpolation.
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&, arma::Mat< eT > &&gradient, arma::Mat< eT > &&output)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename eT >
void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Forward pass through the layer.
- OutputDataType const & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.46.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::BilinearInterpolation< InputDataType, OutputDataType >
```

Definition and Implementation of the Bilinear Interpolation Layer.

Bilinear Interpolation is an mathematical technique, primarily used for scaling purposes. It is an extension of linear interpolation, for interpolating functions of two variables on a rectangular grid. The key idea is to perform linear interpolation first in one direction (e.g., along x-axis), and then again in the other direction (i.e., y-axis), on four different known points in the grid. This way, we represent any arbitrary point, present within the grid, as a function of those four points.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 39 of file bilinear_interpolation.hpp.

39.46.2 Constructor & Destructor Documentation

39.46.2.1 BilinearInterpolation() [1/2]

```
BilinearInterpolation ( )
```

Create the Bilinear Interpolation object.

39.46.2.2 BilinearInterpolation() [2/2]

```
BilinearInterpolation (
    const size_t inRowSize,
    const size_t inColSize,
    const size_t outRowSize,
    const size_t outColSize,
    const size_t depth )
```

The constructor for the Bilinear Interpolation.

Parameters

<i>inRowSize</i>	Number of input rows.
<i>inColSize</i>	Number of input columns.
<i>outRowSize</i>	Number of output rows.
<i>outColSize</i>	Number of output columns.
<i>depth</i>	Number of input slices.

39.46.3 Member Function Documentation

39.46.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gradient,
    arma::Mat< eT > && output )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass. Since the layer does not have any learn-able parameters, we just have to down-sample the gradient to make its size compatible with the input size.

Parameters

<i>input</i>	The input matrix.
<i>gradient</i>	The computed backward gradient.
<i>output</i>	The resulting down-sampled output.

39.46.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 92 of file `bilinear_interpolation.hpp`.

39.46.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 94 of file `bilinear_interpolation.hpp`.

References `BilinearInterpolation< InputDataType, OutputDataType >::serialize()`.

39.46.3.4 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Forward pass through the layer.

The layer interpolates the matrix using the given Bilinear Interpolation method.

Parameters

<i>input</i>	The input matrix.
<i>output</i>	The resulting interpolated output matrix.

39.46.3.5 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 87 of file `bilinear_interpolation.hpp`.

39.46.3.6 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 89 of file `bilinear_interpolation.hpp`.

39.46.3.7 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by `BilinearInterpolation< InputDataType, OutputDataType >::Delta()`.

The documentation for this class was generated from the following file:

39.48 **BRNN**< **OutputLayerType**, **MergeLayerType**, **MergeOutputType**, **InitializationRuleType**, **CustomLayers** > Class Template Reference

Implementation of a standard bidirectional recurrent neural network container.

Public Types

- using **NetworkType** = **BRNN**< **OutputLayerType**, **MergeLayerType**, **MergeOutputType**, **InitializationRuleType**, **CustomLayers**... >
Convenience typedef for the internal model construction.

Public Member Functions

- **BRNN** (const size_t rho, const bool single=false, **OutputLayerType** outputLayer=**OutputLayerType**(), **MergeLayerType** mergeLayer=**MergeLayerType**(), **MergeOutputType** mergeOutput=**MergeOutputType**(), **InitializationRuleType** initializeRule=**InitializationRuleType**())
*Create the **BRNN** (p. 610) object.*
- template<class LayerType, class... Args>
void **Add** (Args... args)
- void **Add** (**LayerTypes**< **CustomLayers**... > layer)
- double **Evaluate** (const arma::mat ¶meters, const size_t begin, const size_t batchSize, const bool deterministic)
Evaluate the bidirectional recurrent neural network with the given parameters.
- double **Evaluate** (const arma::mat ¶meters, const size_t begin, const size_t batchSize)
Evaluate the bidirectional recurrent neural network with the given parameters.
- template<typename GradType >
double **EvaluateWithGradient** (const arma::mat ¶meters, const size_t begin, GradType &gradient, const size_t batchSize)
Evaluate the bidirectional recurrent neural network with the given parameters.

- void **Gradient** (const arma::mat ¶meters, const size_t begin, arma::mat &gradient, const size_t batchSize)
Evaluate the gradient of the bidirectional recurrent neural network with the given parameters, and with respect to only one point in the dataset.
- size_t **NumFunctions** () const
Return the number of separable functions. (number of predictor points).
- const arma::mat & **Parameters** () const
Return the initial point for the optimization.
- arma::mat & **Parameters** ()
Modify the initial point for the optimization.
- void **Predict** (arma::cube predictors, arma::cube &results, const size_t batchSize=256)
Predict the responses to a given set of predictors.
- const arma::cube & **Predictors** () const
Get the matrix of data points (predictors).
- arma::cube & **Predictors** ()
Modify the matrix of data points (predictors).
- void **Reset** ()
Reset the state of the network.
- void **ResetParameters** ()
Reset the module information (weights/parameters).
- const arma::cube & **Responses** () const
Get the matrix of responses to the input data points.
- arma::cube & **Responses** ()
Modify the matrix of responses to the input data points.
- const size_t & **Rho** () const
Return the maximum length of backpropagation through time.
- size_t & **Rho** ()
Modify the maximum length of backpropagation through time.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the model.
- void **Shuffle** ()
Shuffle the order of function visitation.
- template<typename OptimizerType >
double **Train** (arma::cube predictors, arma::cube responses, OptimizerType &optimizer)
Train the bidirectional recurrent neural network on the given input data using the given optimizer.
- template<typename OptimizerType = ens::StandardSGD>
double **Train** (arma::cube predictors, arma::cube responses)
Train the bidirectional recurrent neural network on the given input data.

39.48.1 Detailed Description

```
template<typename OutputLayerType = NegativeLogLikelihood<>, typename MergeLayerType = Concat<>, typename MergeOutputType = LogSoftMax<>, typename InitializationRuleType = RandomInitialization, typename... CustomLayers>
class mlpack::ann::BRNN< OutputLayerType, MergeLayerType, MergeOutputType, InitializationRuleType, CustomLayers >
```

Implementation of a standard bidirectional recurrent neural network container.

Template Parameters

<i>OutputLayerType</i>	The output layer type used to evaluate the network.
<i>InitializationRuleType</i>	Rule used to initialize the weight matrix.

Definition at line 47 of file brnn.hpp.

39.48.2 Member Typedef Documentation

39.48.2.1 NetworkType

```
using NetworkType = BRNN<OutputLayerType, MergeLayerType, MergeOutputType, InitializationRuleType, CustomLayers...>
```

Convenience typedef for the internal model construction.

Definition at line 55 of file brnn.hpp.

39.48.3 Constructor & Destructor Documentation

39.48.3.1 BRNN()

```
BRNN (
    const size_t rho,
    const bool single = false,
    OutputLayerType outputLayer = OutputLayerType(),
    MergeLayerType mergeLayer = MergeLayerType(),
    MergeOutputType mergeOutput = MergeOutputType(),
    InitializationRuleType initializeRule = InitializationRuleType() )
```

Create the **BRNN** (p. 610) object.

Optionally, specify which initialize rule and performance function should be used.

If you want to pass in a parameter and discard the original parameter object, be sure to use `std::move` to avoid unnecessary copy.

Parameters

<i>rho</i>	Maximum number of steps to backpropagate through time (BPTT).
<i>single</i>	Predict only the last element of the input sequence.
<i>outputLayer</i>	Output layer used to evaluate the network.
<i>initializeRule</i>	Optional instantiated InitializationRule object for initializing the network parameter.

39.48.4 Member Function Documentation

39.48.4.1 Add() [1/2]

```
void Add (
    Args... args )
```

39.48.4.2 Add() [2/2]

```
void Add (
    LayerTypes< CustomLayers... > layer )
```

39.48.4.3 Evaluate() [1/2]

```
double Evaluate (
    const arma::mat & parameters,
    const size_t begin,
    const size_t batchSize,
    const bool deterministic )
```

Evaluate the bidirectional recurrent neural network with the given parameters.

This function is usually called by the optimizer to train the model.

Parameters

<i>parameters</i>	Matrix model parameters.
<i>begin</i>	Index of the starting point to use for objective function evaluation.
<i>batchSize</i>	Number of points to be passed at a time to use for objective function evaluation.
<i>deterministic</i>	Whether or not to train or test the model. Note some layer act differently in training or testing mode.

39.48.4.4 Evaluate() [2/2]

```
double Evaluate (
    const arma::mat & parameters,
```

```

    const size_t begin,
    const size_t batchSize )

```

Evaluate the bidirectional recurrent neural network with the given parameters.

This function is usually called by the optimizer to train the model. This just calls the other overload of **Evaluate()** (p. 613) with `deterministic = true`.

Parameters

<i>parameters</i>	Matrix model parameters.
<i>begin</i>	Index of the starting point to use for objective function evaluation.
<i>batchSize</i>	Number of points to be passed at a time to use for objective function evaluation.

39.48.4.5 EvaluateWithGradient()

```

double EvaluateWithGradient (
    const arma::mat & parameters,
    const size_t begin,
    GradType & gradient,
    const size_t batchSize )

```

Evaluate the bidirectional recurrent neural network with the given parameters.

This function is usually called by the optimizer to train the model. This just calls the other overload of **Evaluate()** (p. 613) with `deterministic = true`.

Parameters

<i>parameters</i>	Matrix model parameters.
<i>begin</i>	Index of the starting point to use for objective function evaluation.
<i>gradient</i>	Matrix to output gradient into.
<i>batchSize</i>	Number of points to be passed at a time to use for objective function evaluation.

39.48.4.6 Gradient()

```

void Gradient (
    const arma::mat & parameters,
    const size_t begin,
    arma::mat & gradient,
    const size_t batchSize )

```

Evaluate the gradient of the bidirectional recurrent neural network with the given parameters, and with respect to only one point in the dataset.

This is useful for optimizers such as SGD, which require a separable objective function.

Parameters

<i>parameters</i>	Matrix of the model parameters to be optimized.
<i>begin</i>	Index of the starting point to use for objective function gradient evaluation.
<i>gradient</i>	Matrix to output gradient into.
<i>batchSize</i>	Number of points to be processed as a batch for objective function gradient evaluation.

39.48.4.7 NumFunctions()

```
size_t NumFunctions ( ) const [inline]
```

Return the number of separable functions. (number of predictor points).

Definition at line 249 of file brnn.hpp.

39.48.4.8 Parameters() [1/2]

```
const arma::mat& Parameters ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 252 of file brnn.hpp.

39.48.4.9 Parameters() [2/2]

```
arma::mat& Parameters ( ) [inline]
```

Modify the initial point for the optimization.

Definition at line 254 of file brnn.hpp.

39.48.4.10 Predict()

```
void Predict (
    arma::cube predictors,
    arma::cube & results,
    const size_t batchSize = 256 )
```

Predict the responses to a given set of predictors.

The responses will reflect the output of the given output layer as returned by the output layer function.

If you want to pass in a parameter and discard the original parameter object, be sure to use `std::move` to avoid unnecessary copy.

The format of the data should be as follows:

- each slice should correspond to a time step
- each column should correspond to a data point
- each row should correspond to a dimension So, e.g., `predictors(i, j, k)` is the *i*'th dimension of the *j*'th data point at time slice *k*. The responses will be in the same format.

Parameters

<i>predictors</i>	Input predictors.
<i>results</i>	Matrix to put output predictions of responses into.
<i>batchSize</i>	Number of points to predict at once.

39.48.4.11 Predictors() [1/2]

```
const arma::cube& Predictors ( ) const [inline]
```

Get the matrix of data points (predictors).

Definition at line 267 of file `brnn.hpp`.

39.48.4.12 Predictors() [2/2]

```
arma::cube& Predictors ( ) [inline]
```

Modify the matrix of data points (predictors).

Definition at line 269 of file `brnn.hpp`.

References `BRNN< OutputLayerType, MergeLayerType, MergeOutputType, InitializationRuleType, CustomLayers >::Reset()`, `BRNN< OutputLayerType, MergeLayerType, MergeOutputType, InitializationRuleType, CustomLayers >::ResetParameters()`, and `BRNN< OutputLayerType, MergeLayerType, MergeOutputType, InitializationRuleType, CustomLayers >::serialize()`.

39.48.4.13 Reset()

```
void Reset ( )
```

Reset the state of the network.

This ensures that all internally-held gradients are set to 0, all memory cells are reset, and the parameters matrix is the right size.

Referenced by `BRNN< OutputLayerType, MergeLayerType, MergeOutputType, InitializationRuleType, CustomLayers >::Predictors()`.

39.48.4.14 ResetParameters()

```
void ResetParameters ( )
```

Reset the module information (weights/parameters).

Referenced by `BRNN< OutputLayerType, MergeLayerType, MergeOutputType, InitializationRuleType, CustomLayers >::Predictors()`.

39.48.4.15 Responses() [1/2]

```
const arma::cube& Responses ( ) const [inline]
```

Get the matrix of responses to the input data points.

Definition at line 262 of file `brnn.hpp`.

39.48.4.16 Responses() [2/2]

```
arma::cube& Responses ( ) [inline]
```

Modify the matrix of responses to the input data points.

Definition at line 264 of file `brnn.hpp`.

39.48.4.17 Rho() [1/2]

```
const size_t& Rho ( ) const [inline]
```

Return the maximum length of backpropagation through time.

Definition at line 257 of file brnn.hpp.

39.48.4.18 Rho() [2/2]

```
size_t& Rho ( ) [inline]
```

Modify the maximum length of backpropagation through time.

Definition at line 259 of file brnn.hpp.

39.48.4.19 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the model.

Referenced by BRNN< OutputLayerType, MergeLayerType, MergeOutputType, InitializationRuleType, CustomLayers >::Predictors().

39.48.4.20 Shuffle()

```
void Shuffle ( )
```

Shuffle the order of function visitation.

This may be called by the optimizer.

39.48.4.21 Train() [1/2]

```
double Train (
    arma::cube predictors,
    arma::cube responses,
    OptimizerType & optimizer )
```

Train the bidirectional recurrent neural network on the given input data using the given optimizer.

This will use the existing model parameters as a starting point for the optimization. If this is not what you want, then you should access the parameters vector directly with **Parameters()** (p. 616) and modify it as desired.

If you want to pass in a parameter and discard the original parameter object, be sure to use `std::move` to avoid unnecessary copy.

The format of the data should be as follows:

- each slice should correspond to a time step
- each column should correspond to a data point
- each row should correspond to a dimension So, e.g., `predictors(i, j, k)` is the *i*'th dimension of the *j*'th data point at time slice *k*.

Template Parameters

<i>OptimizerType</i>	Type of optimizer to use to train the model.
----------------------	--

Parameters

<i>predictors</i>	Input training variables.
<i>responses</i>	Outputs results from input training variables.
<i>optimizer</i>	Instantiated optimizer used to train the model.

39.48.4.22 Train() [2/2]

```
double Train (
    arma::cube predictors,
    arma::cube responses )
```

Train the bidirectional recurrent neural network on the given input data.

By default, the SGD optimization algorithm is used, but others can be specified (such as `ens::RMSprop`).

This will use the existing model parameters as a starting point for the optimization. If this is not what you want, then you should access the parameters vector directly with **Parameters()** (p. 616) and modify it as desired.

If you want to pass in a parameter and discard the original parameter object, be sure to use `std::move` to avoid unnecessary copy.

The format of the data should be as follows:

- each slice should correspond to a time step
- each column should correspond to a data point
- each row should correspond to a dimension So, e.g., `predictors(i, j, k)` is the *i*'th dimension of the *j*'th data point at time slice *k*.

Template Parameters

<i>OptimizerType</i>	Type of optimizer to use to train the model.
----------------------	--

Parameters

<i>predictors</i>	Input training variables.
<i>responses</i>	Outputs results from input training variables.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/ brnn.hpp`

39.49 Concat< InputDataType, OutputDataType, CustomLayers > Class Template Reference

Implementation of the **Concat** (p. 621) class.

Public Member Functions

- **Concat** (const bool model=false, const bool run=true)
*Create the **Concat** (p. 621) object using the specified parameters.*
- **Concat** (arma::Row< size_t > &inputSize, const size_t axis, const bool model=false, const bool run=true)
*Create the **Concat** (p. 621) object using the specified parameters.*
- **~Concat** ()
Destroy the layers held by the model.
- `template<typename LayerType >`
`void Add (const LayerType &layer)`
- `template<class LayerType , class... Args>`
`void Add (Args... args)`
- `void Add (LayerTypes< CustomLayers... > layer)`

- `template<typename eT >`
`void Backward (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)`
Ordinary feed backward pass of a neural network, using 3rd-order tensors as input, calculating the function $f(x)$ by propagating x backwards through f .
- `template<typename eT >`
`void Backward (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g, const size_t index)`
*This is the overload of **Backward()** (p. 625) that runs only a specific layer with the given input.*
- `arma::mat const & Delta () const`
Get the delta.e.
- `arma::mat & Delta ()`
Modify the delta.
- `template<typename eT >`
`void Forward (arma::Mat< eT > &&input, arma::Mat< eT > &&output)`
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- `template<typename eT >`
`void Gradient (arma::Mat< eT > &&, arma::Mat< eT > &&error, arma::Mat< eT > &&)`
- `template<typename eT >`
`void Gradient (arma::Mat< eT > &&input, arma::Mat< eT > &&error, arma::Mat< eT > &&gradient, const size_t index)`
- `arma::mat const & Gradient () const`
Get the gradient.
- `arma::mat & Gradient ()`
Modify the gradient.
- `arma::mat const & InputParameter () const`
- `arma::mat & InputParameter ()`
Modify the input parameter.
- `std::vector< LayerTypes< CustomLayers... > > & Model ()`
Return the model modules.
- `arma::mat const & OutputParameter () const`
Get the output parameter.
- `arma::mat & OutputParameter ()`
Modify the output parameter.
- `const arma::mat & Parameters () const`
Return the initial point for the optimization.
- `arma::mat & Parameters ()`
Modify the initial point for the optimization.
- `bool Run () const`
Get the value of run parameter.
- `bool & Run ()`
Modify the value of run parameter.
- `template<typename Archive >`
`void serialize (Archive &, const unsigned int)`
Serialize the layer.

39.49.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat, typename... CustomLayers>
class mlpack::ann::Concat< InputDataType, OutputDataType, CustomLayers >
```

Implementation of the **Concat** (p. 621) class.

The **Concat** (p. 621) class works as a feed-forward fully connected network container which plugs various layers together.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>CustomLayers</i>	Additional custom layers if required.

Definition at line 45 of file concat.hpp.

39.49.2 Constructor & Destructor Documentation

39.49.2.1 Concat() [1/2]

```
Concat (
    const bool model = false,
    const bool run = true )
```

Create the **Concat** (p. 621) object using the specified parameters.

Parameters

<i>model</i>	Expose all network modules.
<i>run</i>	Call the Forward/Backward method before the output is merged.

39.49.2.2 Concat() [2/2]

```
Concat (
    arma::Row< size_t > & inputSize,
    const size_t axis,
    const bool model = false,
    const bool run = true )
```

Create the **Concat** (p. 621) object using the specified parameters.

Parameters

<i>inputSize</i>	A vector denoting input size of each layer added.
<i>axis</i>	Concat (p. 621) axis.
<i>model</i>	Expose all network modules.
<i>run</i>	Call the Forward/Backward method before the output is merged.

39.49.2.3 ~Concat()

~ **Concat** ()

Destroy the layers held by the model.

39.49.3 Member Function Documentation

39.49.3.1 Add() [1/3]

```
void Add (
    const LayerType & layer ) [inline]
```

Definition at line 147 of file concat.hpp.

39.49.3.2 Add() [2/3]

```
void Add (
    Args... args ) [inline]
```

Definition at line 155 of file concat.hpp.

39.49.3.3 Add() [3/3]

```
void Add (
    LayerTypes< CustomLayers... > layer ) [inline]
```

Definition at line 162 of file concat.hpp.

39.49.3.4 Backward() [1/2]

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, using 3rd-order tensors as input, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.49.3.5 Backward() [2/2]

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g,
    const size_t index )
```

This is the overload of **Backward()** (p. 625) that runs only a specific layer with the given input.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.
<i>The</i>	index of the layer to run.

39.49.3.6 Delta() [1/2]

```
arma::mat const& Delta ( ) const [inline]
```

Get the delta.e.

Definition at line 195 of file concat.hpp.

39.49.3.7 Delta() [2/2]

```
arma::mat& Delta ( ) [inline]
```

Modify the delta.

Definition at line 197 of file concat.hpp.

39.49.3.8 Forward()

```
void Forward (
    arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.49.3.9 Gradient() [1/4]

```
void Gradient (
    arma::Mat< eT > && ,
    arma::Mat< eT > && error,
    arma::Mat< eT > && )
```

39.49.3.10 Gradient() [2/4]

```
void Gradient (
    arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient,
    const size_t index )
```

39.49.3.11 Gradient() [3/4]

```
arma::mat const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 200 of file concat.hpp.

39.49.3.12 Gradient() [4/4]

```
arma::mat& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 202 of file concat.hpp.

References Concat< InputDataType, OutputDataType, CustomLayers >::serialize().

39.49.3.13 InputParameter() [1/2]

```
arma::mat const& InputParameter ( ) const [inline]
```

Definition at line 185 of file concat.hpp.

39.49.3.14 InputParameter() [2/2]

```
arma::mat& InputParameter ( ) [inline]
```

Modify the input parameter.

Definition at line 187 of file concat.hpp.

39.49.3.15 Model()

```
std::vector< LayerTypes<CustomLayers...> >& Model ( ) [inline]
```

Return the model modules.

Definition at line 165 of file concat.hpp.

39.49.3.16 OutputParameter() [1/2]

```
arma::mat const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 190 of file concat.hpp.

39.49.3.17 OutputParameter() [2/2]

```
arma::mat& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 192 of file concat.hpp.

39.49.3.18 Parameters() [1/2]

```
const arma::mat& Parameters ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 176 of file concat.hpp.

39.49.3.19 Parameters() [2/2]

```
arma::mat& Parameters ( ) [inline]
```

Modify the initial point for the optimization.

Definition at line 178 of file concat.hpp.

39.49.3.20 Run() [1/2]

```
bool Run ( ) const [inline]
```

Get the value of run parameter.

Definition at line 181 of file concat.hpp.

39.49.3.21 Run() [2/2]

```
bool& Run ( ) [inline]
```

Modify the value of run parameter.

Definition at line 183 of file concat.hpp.

39.49.3.22 serialize()

```
void serialize (
    Archive & ,
    const unsigned int )
```

Serialize the layer.

Referenced by Concat< InputDataType, OutputDataType, CustomLayers >::Gradient().

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ **concat.hpp**

39.50 Concatenate< InputDataType, OutputDataType > Class Template Reference

Implementation of the **Concatenate** (p. 630) module class.

Public Member Functions

- **Concatenate** ()
*Create the **Concatenate** (p. 630) object using the specified number of output units.*
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&, const arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType const & **Concat** () const
Get the concat matrix.
- OutputDataType & **Concat** ()
Modify the delta.
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename eT >
void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

- OutputDataType const & **OutputParameter** () const

Get the output parameter.

- OutputDataType & **OutputParameter** ()

Modify the output parameter.

- OutputDataType const & **Parameters** () const

Get the parameters.

- OutputDataType & **Parameters** ()

Modify the parameters.

- template<typename Archive >

void **serialize** (Archive &, const unsigned int)

Serialize the layer.

39.50.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::Concatenate< InputDataType, OutputDataType >
```

Implementation of the **Concatenate** (p. 630) module class.

The **Concatenate** (p. 630) module concatenates a constant given matrix to the incoming data. Note: Users need to use the **Concat()** (p. 632) function to provide the concat matrix.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 36 of file concatenate.hpp.

39.50.2 Constructor & Destructor Documentation

39.50.2.1 Concatenate()

Concatenate ()

Create the **Concatenate** (p. 630) object using the specified number of output units.

39.50.3 Member Function Documentation

39.50.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    const arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.50.3.2 Concat() [1/2]

```
OutputDataType const& Concat ( ) const [inline]
```

Get the concat matrix.

Definition at line 84 of file concatenate.hpp.

39.50.3.3 Concat() [2/2]

```
OutputDataType& Concat ( ) [inline]
```

Modify the delta.

Definition at line 86 of file concatenate.hpp.

39.50.3.4 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 79 of file concatenate.hpp.

39.50.3.5 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 81 of file concatenate.hpp.

39.50.3.6 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.50.3.7 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 74 of file concatenate.hpp.

39.50.3.8 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 76 of file concatenate.hpp.

39.50.3.9 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 69 of file concatenate.hpp.

39.50.3.10 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 71 of file concatenate.hpp.

39.50.3.11 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serialize the layer.

Definition at line 92 of file concatenate.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ **concatenate.hpp**

39.51 ConcatPerformance< OutputLayerType, InputDataType, OutputDataType > Class Template Reference

Implementation of the concat performance class.

Public Member Functions

- **ConcatPerformance** (const size_t inSize=0, OutputLayerType &&outputLayer=OutputLayerType())
*Create the **ConcatPerformance** (p. 634) object.*
 - template<typename eT >
void **Backward** (const arma::Mat< eT > &&input, const arma::Mat< eT > &&target, arma::Mat< eT > &&output)
Ordinary feed backward pass of a neural network.
 - OutputDataType & **Delta** () const
Get the delta.
 - OutputDataType & **Delta** ()
Modify the delta.
 - template<typename eT >
double **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&target)
 - OutputDataType & **OutputParameter** () const
Get the output parameter.
 - OutputDataType & **OutputParameter** ()
Modify the output parameter.
 - template<typename Archive >
void **serialize** (Archive &, const unsigned int)
- Serialize the layer.*

39.51.1 Detailed Description

```
template<typename OutputLayerType = NegativeLogLikelihood<>, typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
```

```
class mlpack::ann::ConcatPerformance< OutputLayerType, InputDataType, OutputDataType >
```

Implementation of the concat performance class.

The class works as a feed-forward fully connected network container which plugs performance layers together.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 39 of file concat_performance.hpp.

39.51.2 Constructor & Destructor Documentation

39.51.2.1 ConcatPerformance()

```
ConcatPerformance (
    const size_t inSize = 0,
    OutputLayerType && outputLayer = OutputLayerType() )
```

Create the **ConcatPerformance** (p. 634) object.

Parameters

<i>inSize</i>	The number of inputs.
<i>outputLayer</i>	Output layer used to evaluate the network.

39.51.3 Member Function Documentation

39.51.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && input,
    const arma::Mat< eT > && target,
    arma::Mat< eT > && output )
```

Ordinary feed backward pass of a neural network.

The negative log likelihood layer expects that the input contains log-probabilities for each class. The layer also expects a class index, in the range between 1 and the number of classes, as target when calling the Forward function.

Parameters

<i>input</i>	The propagated input activation.
<i>target</i>	The target vector, that contains the class index in the range between 1 and the number of classes.
<i>output</i>	The calculated error.

39.51.3.2 Delta() [1/2]

```
OutputDataType& Delta ( ) const [inline]
```

Get the delta.

Definition at line 81 of file concat_performance.hpp.

39.51.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 83 of file concat_performance.hpp.

References ConcatPerformance< OutputLayerType, InputDataType, OutputDataType >::serialize().

39.51.3.4 Forward()

```
double Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && target )
```

39.51.3.5 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 76 of file concat_performance.hpp.

39.51.3.6 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 78 of file concat_performance.hpp.

39.51.3.7 serialize()

```
void serialize (
    Archive & ,
    const unsigned int )
```

Serialize the layer.

Referenced by ConcatPerformance< OutputLayerType, InputDataType, OutputDataType >::Delta().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ **concat_performance.hpp**

39.52 Constant< InputDataType, OutputDataType > Class Template Reference

Implementation of the constant layer.

Public Member Functions

- **Constant** (const size_t outSize=0, const double scalar=0.0)
*Create the **Constant** (p. 638) object that outputs a given constant scalar value given any input value.*
- template<typename DataType >
void **Backward** (const DataType &&, DataType &&, DataType &&g)
Ordinary feed backward pass of a neural network.
- OutputDataType & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename InputType , typename OutputType >
void **Forward** (const InputType &&input, OutputType &&output)
Ordinary feed forward pass of a neural network.
- OutputDataType & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.52.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::Constant< InputDataType, OutputDataType >
```

Implementation of the constant layer.

The constant layer outputs a given constant value given any input value.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 34 of file constant.hpp.

39.52.2 Constructor & Destructor Documentation

39.52.2.1 Constant()

```

Constant (
    const size_t outSize = 0,
    const double scalar = 0.0 )

```

Create the **Constant** (p. 638) object that outputs a given constant scalar value given any input value.

Parameters

<i>outSize</i>	The number of output units.
<i>scalar</i>	The constant value used to create the constant output.

39.52.3 Member Function Documentation

39.52.3.1 Backward()

```

void Backward (
    const DataType && ,
    DataType && ,
    DataType && g )

```

Ordinary feed backward pass of a neural network.

The backward pass of the constant layer is returns always a zero output error matrix.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.52.3.2 Delta() [1/2]

```

OutputDataType& Delta ( ) const [inline]

```

Get the delta.

Definition at line 75 of file constant.hpp.

39.52.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 77 of file constant.hpp.

References `Constant< InputDataType, OutputDataType >::serialize()`.

39.52.3.4 Forward()

```
void Forward (
    const InputType && input,
    OutputType && output )
```

Ordinary feed forward pass of a neural network.

The forward pass fills the output with the specified constant parameter.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.52.3.5 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 70 of file constant.hpp.

39.52.3.6 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 72 of file constant.hpp.

39.52.3.7 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by `Constant< InputDataType, OutputDataType >::Delta()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ constant.hpp`

39.53 ConstInitialization Class Reference

This class is used to initialize weight matrix with constant values.

Public Member Functions

- **ConstInitialization** (const double initVal=0)
Create the ConstantInitialization object.
- `template<typename eT >`
`void Initialize (arma::Mat< eT > &W, const size_t rows, const size_t cols)`
Initialize the elements of the specified weight matrix.
- `template<typename eT >`
`void Initialize (arma::Cube< eT > &W, const size_t rows, const size_t cols, const size_t slices)`
Initialize the elements of the specified weight (3rd order tensor).
- `double const & InitValue () const`
Get the initialization value.
- `double & initValue ()`
Modify the initialization value.

39.53.1 Detailed Description

This class is used to initialize weight matrix with constant values.

Definition at line 25 of file `const_init.hpp`.

39.53.2 Constructor & Destructor Documentation

39.53.2.1 ConstInitialization()

```
ConstInitialization (
    const double initVal = 0 ) [inline]
```

Create the ConstantInitialization object.

Definition at line 31 of file const_init.hpp.

39.53.3 Member Function Documentation

39.53.3.1 Initialize() [1/2]

```
void Initialize (
    arma::Mat< eT > & W,
    const size_t rows,
    const size_t cols ) [inline]
```

Initialize the elements of the specified weight matrix.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.

Definition at line 42 of file const_init.hpp.

39.53.3.2 Initialize() [2/2]

```
void Initialize (
    arma::Cube< eT > & W,
    const size_t rows,
    const size_t cols,
    const size_t slices ) [inline]
```

Initialize the elements of the specified weight (3rd order tensor).

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.

Definition at line 56 of file const_init.hpp.

39.53.3.3 InitValue()

```
double const& InitValue ( ) const [inline]
```

Get the initialization value.

Definition at line 66 of file const_init.hpp.

39.53.3.4 initValue()

```
double& initValue ( ) [inline]
```

Modify the initialization value.

Definition at line 68 of file const_init.hpp.

39.54 Convolution< ForwardConvolutionRule, BackwardConvolutionRule, GradientConvolutionRule, InputDataType, OutputDataType > Class Template Reference

Implementation of the **Convolution** (p. 643) class.

Public Member Functions

- **Convolution** ()
*Create the **Convolution** (p. 643) object.*
- **Convolution** (const size_t inSize, const size_t outSize, const size_t kW, const size_t kH, const size_t dW=1, const size_t dH=1, const size_t padW=0, const size_t padH=0, const size_t inputWidth=0, const size_t inputHeight=0)
*Create the **Convolution** (p. 643) object using the specified number of input maps, output maps, filter size, stride and padding parameter.*
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of a neural network, calculating the function f(x) by propagating x backwards through f.
- OutputDataType const & **Delta** () const
Get the delta.

- OutputDataType & **Delta** ()
Modify the delta.
- template<typename eT >
void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- template<typename eT >
void **Gradient** (const arma::Mat< eT > &&, arma::Mat< eT > &&error, arma::Mat< eT > &&gradient)
- OutputDataType const & **Gradient** () const
Get the gradient.
- OutputDataType & **Gradient** ()
Modify the gradient.
- size_t const & **InputHeight** () const
Get the input height.
- size_t & **InputHeight** ()
Modify the input height.
- InputDataType const & **InputParameter** () const
Get the input parameter.
- InputDataType & **InputParameter** ()
Modify the input parameter.
- size_t const & **InputWidth** () const
Get the input width.
- size_t & **InputWidth** ()
Modify input the width.
- size_t const & **OutputHeight** () const
Get the output height.
- size_t & **OutputHeight** ()
Modify the output height.
- OutputDataType const & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- size_t const & **OutputWidth** () const
Get the output width.
- size_t & **OutputWidth** ()
Modify the output width.
- OutputDataType const & **Parameters** () const
Get the parameters.
- OutputDataType & **Parameters** ()
Modify the parameters.
- void **Reset** ()
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.54.1 Detailed Description

```
template<typename ForwardConvolutionRule = NaiveConvolution<ValidConvolution>, typename BackwardConvolutionRule =
NaiveConvolution<FullConvolution>, typename GradientConvolutionRule = NaiveConvolution<ValidConvolution>, typename
InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::Convolution< ForwardConvolutionRule, BackwardConvolutionRule, GradientConvolutionRule, InputDataType,
OutputDataType >
```

Implementation of the **Convolution** (p. 643) class.

The **Convolution** (p. 643) class represents a single layer of a neural network.

Template Parameters

<i>ForwardConvolutionRule</i>	Convolution (p. 643) to perform forward process.
<i>BackwardConvolutionRule</i>	Convolution (p. 643) to perform backward process.
<i>GradientConvolutionRule</i>	Convolution (p. 643) to calculate gradient.
<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 46 of file convolution.hpp.

39.54.2 Constructor & Destructor Documentation

39.54.2.1 Convolution() [1/2]

```
Convolution ( )
```

Create the **Convolution** (p. 643) object.

39.54.2.2 Convolution() [2/2]

```
Convolution (
    const size_t inSize,
    const size_t outSize,
    const size_t kW,
    const size_t kH,
    const size_t dW = 1,
    const size_t dH = 1,
    const size_t padW = 0,
    const size_t padH = 0,
    const size_t inputWidth = 0,
    const size_t inputHeight = 0 )
```

Create the **Convolution** (p. 643) object using the specified number of input maps, output maps, filter size, stride and padding parameter.

Parameters

<i>inSize</i>	The number of input maps.
<i>outSize</i>	The number of output maps.
<i>kW</i>	Width of the filter/kernel.
<i>kH</i>	Height of the filter/kernel.
<i>dW</i>	Stride of filter application in the x direction.
<i>dH</i>	Stride of filter application in the y direction.
<i>padW</i>	Padding width of the input.
<i>padH</i>	Padding height of the input.
<i>inputWidth</i>	The width of the input data.
<i>inputHeight</i>	The height of the input data.

39.54.3 Member Function Documentation

39.54.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.54.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 135 of file convolution.hpp.

39.54.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 137 of file convolution.hpp.

39.54.3.4 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.54.3.5 Gradient() [1/3]

```
void Gradient (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient )
```

39.54.3.6 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 140 of file convolution.hpp.

39.54.3.7 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 142 of file convolution.hpp.

39.54.3.8 InputHeight() [1/2]

```
size_t const& InputHeight ( ) const [inline]
```

Get the input height.

Definition at line 150 of file convolution.hpp.

39.54.3.9 InputHeight() [2/2]

```
size_t& InputHeight ( ) [inline]
```

Modify the input height.

Definition at line 152 of file convolution.hpp.

39.54.3.10 InputParameter() [1/2]

```
InputDataType const& InputParameter ( ) const [inline]
```

Get the input parameter.

Definition at line 125 of file convolution.hpp.

39.54.3.11 InputParameter() [2/2]

```
InputDataType& InputParameter ( ) [inline]
```

Modify the input parameter.

Definition at line 127 of file convolution.hpp.

39.54.3.12 InputWidth() [1/2]

```
size_t const& InputWidth ( ) const [inline]
```

Get the input width.

Definition at line 145 of file convolution.hpp.

39.54.3.13 InputWidth() [2/2]

```
size_t& InputWidth ( ) [inline]
```

Modify input the width.

Definition at line 147 of file convolution.hpp.

39.54.3.14 OutputHeight() [1/2]

```
size_t const& OutputHeight ( ) const [inline]
```

Get the output height.

Definition at line 160 of file convolution.hpp.

39.54.3.15 OutputHeight() [2/2]

```
size_t& OutputHeight ( ) [inline]
```

Modify the output height.

Definition at line 162 of file convolution.hpp.

References Convolution< ForwardConvolutionRule, BackwardConvolutionRule, GradientConvolutionRule, InputDataType, OutputDataType >::serialize().

39.54.3.16 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 130 of file convolution.hpp.

39.54.3.17 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 132 of file convolution.hpp.

39.54.3.18 OutputWidth() [1/2]

```
size_t const& OutputWidth ( ) const [inline]
```

Get the output width.

Definition at line 155 of file convolution.hpp.

39.54.3.19 OutputWidth() [2/2]

```
size_t& OutputWidth ( ) [inline]
```

Modify the output width.

Definition at line 157 of file convolution.hpp.

39.54.3.20 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 120 of file convolution.hpp.

39.54.3.21 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 122 of file convolution.hpp.

39.54.3.22 Reset()

```
void Reset ( )
```

39.54.3.23 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by Convolution< ForwardConvolutionRule, BackwardConvolutionRule, GradientConvolutionRule, Input←DataType, OutputDataType >::OutputHeight().

39.55 CopyVisitor< CustomLayers > Class Template Reference

This visitor is to support copy constructor for neural network module.

Inheritance diagram for CopyVisitor< CustomLayers >:

Public Member Functions

- `template<typename LayerType >`
LayerTypes< CustomLayers... > **operator()** (LayerType *) const

39.55.1 Detailed Description

```
template<typename... CustomLayers>
class mlpack::ann::CopyVisitor< CustomLayers >
```

This visitor is to support copy constructor for neural network module.

We want a layer-wise copy rather than simple duplicate the pointer.

Definition at line 26 of file `copy_visitor.hpp`.

39.55.2 Member Function Documentation

39.55.2.1 `operator()`

```
LayerTypes<CustomLayers...> operator() (
    LayerType * ) const
```

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ copy_visitor.hpp`

39.56 CReLU< InputDataType, OutputDataType > Class Template Reference

A concatenated ReLU has two outputs, one ReLU and one negative ReLU, concatenated together.

Public Member Functions

- **CReLU** ()
*Create the **CReLU** (p. 652) object.*
- template<typename DataType >
void **Backward** (const DataType &&input, DataType &&gy, DataType &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename InputType , typename OutputType >
void **Forward** (const InputType &&input, OutputType &&output)
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- OutputDataType const & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialize the layer.

39.56.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::CReLU< InputDataType, OutputDataType >
```

A concatenated ReLU has two outputs, one ReLU and one negative ReLU, concatenated together.

In other words, for positive x it produces $[x, 0]$, and for negative x it produces $[0, x]$. Because it has two outputs, **CReLU** (p. 652) doubles the output dimension.

Note: The **CReLU** (p. 652) doubles the output size.

For more information, see the following.

```
@inproceedings{ICML2016,
  title = {Understanding and Improving Convolutional Neural Networks
    via Concatenated Rectified Linear Units},
  author = {LWenling Shang, Kihyuk Sohn, Diogo Almeida, Honglak Lee},
  year = {2016}
}
```

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 49 of file c_relu.hpp.

39.56.2 Constructor & Destructor Documentation

39.56.2.1 CReLU()

CReLU ()

Create the **CReLU** (p. 652) object.

39.56.3 Member Function Documentation

39.56.3.1 Backward()

```
void Backward (
    const DataType && input,
    DataType && gy,
    DataType && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.56.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 86 of file c_relu.hpp.

39.56.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 88 of file c_relu.hpp.

References CReLU< InputDataType, OutputDataType >::serialize().

39.56.3.4 Forward()

```
void Forward (
    const InputType && input,
    OutputType && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Works only for 2D Tenosrs.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.56.3.5 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 81 of file c_relu.hpp.

39.56.3.6 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 83 of file c_relu.hpp.

39.56.3.7 serialize()

```
void serialize (
    Archive & ,
    const unsigned int )
```

Serialize the layer.

Referenced by CReLU< InputDataType, OutputDataType >::Delta().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ **c_relu.hpp**

39.57 CrossEntropyError< InputDataType, OutputDataType > Class Template Reference

The cross-entropy performance function measures the network's performance according to the cross-entropy between the input and target distributions.

Public Member Functions

- **CrossEntropyError** (const double eps=1e-10)
*Create the **CrossEntropyError** (p. 656) object.*
- template<typename InputType , typename TargetType , typename OutputType >
void **Backward** (const InputType &&input, const TargetType &&target, OutputType &&output)
Ordinary feed backward pass of a neural network.
- double **Eps** () const
Get the epsilon.
- double & **Eps** ()
Modify the epsilon.
- template<typename InputType , typename TargetType >
double **Forward** (const InputType &&input, const TargetType &&target)
Computes the cross-entropy function.
- OutputDataType & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.57.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::CrossEntropyError< InputDataType, OutputDataType >
```

The cross-entropy performance function measures the network's performance according to the cross-entropy between the input and target distributions.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 34 of file cross_entropy_error.hpp.

39.57.2 Constructor & Destructor Documentation

39.57.2.1 CrossEntropyError()

```
CrossEntropyError (
    const double eps = 1e-10 )
```

Create the **CrossEntropyError** (p. 656) object.

Parameters

<i>eps</i>	The minimum value used for computing logarithms and denominators in a numerically stable way.
------------	---

39.57.3 Member Function Documentation

39.57.3.1 Backward()

```
void Backward (
    const InputType && input,
    const TargetType && target,
    OutputType && output )
```

Ordinary feed backward pass of a neural network.

Parameters

<i>input</i>	The propagated input activation.
<i>target</i>	The target vector.
<i>output</i>	The calculated error.

39.57.3.2 Eps() [1/2]

```
double Eps ( ) const [inline]
```

Get the epsilon.

Definition at line 72 of file `cross_entropy_error.hpp`.

39.57.3.3 Eps() [2/2]

```
double& Eps ( ) [inline]
```

Modify the epsilon.

Definition at line 74 of file `cross_entropy_error.hpp`.

References `CrossEntropyError< InputDataType, OutputDataType >::serialize()`.

39.57.3.4 Forward()

```
double Forward (
    const InputType && input,
    const TargetType && target )
```

Computes the cross-entropy function.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>target</i>	The target vector.

39.57.3.5 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 67 of file `cross_entropy_error.hpp`.

39.57.3.6 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 69 of file `cross_entropy_error.hpp`.

39.57.3.7 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by `CrossEntropyError< InputDataType, OutputDataType >::Eps()`.

39.58 DeleteVisitor Class Reference

DeleteVisitor (p. 659) executes the destructor of the instantiated object.

Inheritance diagram for DeleteVisitor:

Public Member Functions

- `template<typename LayerType >`
`void operator() (LayerType *layer) const`
Execute the destructor.

39.58.1 Detailed Description

DeleteVisitor (p. 659) executes the destructor of the instantiated object.

Definition at line 27 of file delete_visitor.hpp.

39.58.2 Member Function Documentation

39.58.2.1 operator()

```
void operator() (
    LayerType * layer ) const
```

Execute the destructor.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **delete_visitor.hpp**

39.59 DeltaVisitor Class Reference

DeltaVisitor (p. 660) exposes the delta parameter of the given module.

Inheritance diagram for DeltaVisitor:

Public Member Functions

- `template<typename LayerType >`
`arma::mat & operator() (LayerType *layer) const`
Return the delta parameter.

39.59.1 Detailed Description

DeltaVisitor (p. 660) exposes the delta parameter of the given module.

Definition at line 27 of file delta_visitor.hpp.

39.59.2 Member Function Documentation

39.59.2.1 operator>()

```
arma::mat& operator() (
    LayerType * layer ) const
```

Return the delta parameter.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **delta_visitor.hpp**

39.60 DeterministicSetVisitor Class Reference

DeterministicSetVisitor (p. 661) set the deterministic parameter given the deterministic value.

Inheritance diagram for DeterministicSetVisitor:

Public Member Functions

- **DeterministicSetVisitor** (const bool deterministic=true)
Set the deterministic parameter given the current deterministic value.
- template<typename LayerType >
void **operator()** (LayerType *layer) const
Set the deterministic parameter.

39.60.1 Detailed Description

DeterministicSetVisitor (p. 661) set the deterministic parameter given the deterministic value.

Definition at line 28 of file `deterministic_set_visitor.hpp`.

39.60.2 Constructor & Destructor Documentation

39.60.2.1 DeterministicSetVisitor()

```
DeterministicSetVisitor (  
    const bool deterministic = true )
```

Set the deterministic parameter given the current deterministic value.

39.60.3 Member Function Documentation

39.60.3.1 operator()

```
void operator() (  
    LayerType * layer ) const
```

Set the deterministic parameter.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ deterministic_set_visitor.hpp`

39.61 DiceLoss< InputDataType, OutputDataType > Class Template Reference

The dice loss performance function measures the network's performance according to the dice coefficient between the input and target distributions.

Public Member Functions

- **DiceLoss** (const double smooth=1)
*Create the **DiceLoss** (p. 662) object.*
- template<typename InputType , typename TargetType , typename OutputType >
void **Backward** (const InputType &&input, const TargetType &&target, OutputType &&output)
Ordinary feed backward pass of a neural network.
- template<typename InputType , typename TargetType >
double **Forward** (const InputType &&input, const TargetType &&target)
Computes the dice loss function.
- OutputDataType & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.
- double **Smooth** () const
Get the smooth.
- double & **Smooth** ()
Modify the smooth.

39.61.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::DiceLoss< InputDataType, OutputDataType >
```

The dice loss performance function measures the network's performance according to the dice coefficient between the input and target distributions.

For more information see the following.

{Milletari2016, author = {Fausto Milletari and Nassir Navab and Seyed{-}Ahmad Ahmadi}, title = {V-Net: Fully Convolutional Neural Networks for Volumetric Medical Image Segmentation}, journal = {CoRR}, volume = {abs/1606.04797}, year = {2016}, url = {http://arxiv.org/abs/1606.04797}, archivePrefix = {arXiv}, eprint = {1606.04797}, }

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 48 of file dice_loss.hpp.

39.61.2 Constructor & Destructor Documentation

39.61.2.1 DiceLoss()

```
DiceLoss (  
    const double smooth = 1 )
```

Create the **DiceLoss** (p. 662) object.

Parameters

<i>smooth</i>	The Laplace smoothing parameter.
---------------	----------------------------------

39.61.3 Member Function Documentation

39.61.3.1 Backward()

```
void Backward (  
    const InputType && input,  
    const TargetType && target,  
    OutputType && output )
```

Ordinary feed backward pass of a neural network.

Parameters

<i>input</i>	The propagated input activation.
<i>target</i>	The target vector.
<i>output</i>	The calculated error.

39.61.3.2 Forward()

```
double Forward (  
    const InputType && input,  
    const TargetType && target )
```

Computes the dice loss function.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>target</i>	The target vector.

39.61.3.3 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 80 of file dice_loss.hpp.

39.61.3.4 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 82 of file dice_loss.hpp.

39.61.3.5 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by DiceLoss< InputDataType, OutputDataType >::Smooth().

Get the parameters.
 - OutputDataType & **Parameters** ()
Modify the parameters.
 - double **Ratio** () const
The probability of setting a value to zero.
 - void **Ratio** (const double r)
Modify the probability of setting a value to zero.
 - template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
- Serialize the layer.*

39.62.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::DropConnect< InputDataType, OutputDataType >
```

The **DropConnect** (p.666) layer is a regularizer that randomly with probability ratio sets the connection values to zero and scales the remaining elements by factor $1 / (1 - \text{ratio})$.

The output is scaled with $1 / (1 - p)$ when deterministic is false. In the deterministic mode(during testing), the layer just computes the output. The output is computed according to the input layer. If no input layer is given, it will take a linear layer as default.

Note: During training you should set deterministic to false and during testing you should set deterministic to true.

For more information, see the following.

```
@inproceedings{WanICML2013,
  title={Regularization of Neural Networks using DropConnect},
  booktitle = {Proceedings of the 30th International Conference on Machine
    Learning(ICML - 13)},
  author = {Li Wan and Matthew Zeiler and Sixin Zhang and Yann L. Cun and
    Rob Fergus},
  year = {2013}
}
```

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 62 of file dropconnect.hpp.

39.62.2 Constructor & Destructor Documentation

39.62.2.1 DropConnect() [1/2]

```
DropConnect ( )
```

Create the **DropConnect** (p. 666) object.

39.62.2.2 DropConnect() [2/2]

```
DropConnect (  
    const size_t inSize,  
    const size_t outSize,  
    const double ratio = 0.5 )
```

Creates the **DropConnect** (p. 666) Layer as a **Linear** (p. 776) Object that takes input size, output size and ratio as parameter.

Parameters

<i>inSize</i>	The number of input units.
<i>outSize</i>	The number of output units.
<i>ratio</i>	The probability of setting a value to zero.

39.62.2.3 ~DropConnect()

```
~ DropConnect ( )
```

39.62.3 Member Function Documentation

39.62.3.1 Backward()

```
void Backward (
    arma::Mat< eT > && input,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of the **DropConnect** (p. 666) layer.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.62.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 129 of file dropconnect.hpp.

39.62.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 131 of file dropconnect.hpp.

39.62.3.4 Deterministic() [1/2]

```
bool Deterministic ( ) const [inline]
```

The value of the deterministic parameter.

Definition at line 139 of file dropconnect.hpp.

39.62.3.5 Deterministic() [2/2]

```
bool& Deterministic ( ) [inline]
```

Modify the value of the deterministic parameter.

Definition at line 142 of file dropconnect.hpp.

39.62.3.6 Forward()

```
void Forward (
    arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of the **DropConnect** (p. 666) layer.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.62.3.7 Gradient() [1/3]

```
void Gradient (
    arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && )
```

Calculate the gradient using the output delta and the input activation.

Parameters

<i>input</i>	The propagated input.
<i>d</i>	The calculated error.

Serialize the layer.

39.63.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::Dropout< InputDataType, OutputDataType >
```

The dropout layer is a regularizer that randomly with probability 'ratio' sets input values to zero and scales the remaining elements by factor $1 / (1 - \text{ratio})$ rather than during test time so as to keep the expected sum same.

In the deterministic mode (during testing), there is no change in the input.

Note: During training you should set deterministic to false and during testing you should set deterministic to true.

For more information, see the following.

```

Ordinary feed forward pass of a neural network.
- OutputDataType & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.64.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::EarthMoverDistance< InputDataType, OutputDataType >
```

The earth mover distance function measures the network's performance according to the Kantorovich-Rubinstein duality approximation.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 33 of file earth_mover_distance.hpp.

39.64.2 Constructor & Destructor Documentation

39.64.2.1 EarthMoverDistance()

EarthMoverDistance ()

Create the **EarthMoverDistance** (p. 677) object.

39.64.3 Member Function Documentation

39.64.3.1 Backward()

```
void Backward (
    const InputType && input,
    const TargetType && target,
    OutputType && output )
```

Ordinary feed backward pass of a neural network.

Parameters

<i>input</i>	The propagated input activation.
<i>target</i>	The target vector.
<i>output</i>	The calculated error.

39.64.3.2 Forward()

```
double Forward (
    const InputType && input,
    const TargetType && target )
```

Ordinary feed forward pass of a neural network.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>target</i>	The target vector.

39.64.3.3 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 63 of file earth_mover_distance.hpp.

39.65 ELU< InputDataType, OutputDataType > Class Template Reference

The **ELU** (p. 680) activation function, defined by.

Public Member Functions

- **ELU** ()
*Create the **ELU** (p. 680) object.*
- **ELU** (const double alpha)
*Create the **ELU** (p. 680) object using the specified parameter.*
- double const & **Alpha** () const
Get the non zero gradient.
- double & **Alpha** ()
Modify the non zero gradient.
- template<typename DataType >
void **Backward** (const DataType &&input, DataType &&gy, DataType &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()

Modify the delta.

- `template<typename InputType , typename OutputType >`

`void Forward (const InputType &&input, OutputType &&output)`

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

- `double const & Lambda () const`

Get the lambda parameter.

- `OutputDataType const & OutputParameter () const`

Get the output parameter.

- `OutputDataType & OutputParameter ()`

Modify the output parameter.

- `template<typename Archive >`

`void serialize (Archive &ar, const unsigned int)`

Serialize the layer.

39.65.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::ELU< InputDataType, OutputDataType >
```

The **ELU** (p. 680) activation function, defined by.

$$f(x) = \begin{cases} x & : x > 0 \\ \alpha(e^x - 1) & : x \leq 0 \end{cases}$$

$$f'(x) = \begin{cases} 1 & : x > 0 \\ f(x) + \alpha & : x \leq 0 \end{cases}$$

For more information, read the following paper:

```
@article{Clevert2015,
  author = {Djork{-}Arn{\'{e}} Clevert and Thomas Unterthiner and
    Sepp Hochreiter},
  title = {Fast and Accurate Deep Network Learning by Exponential Linear
    Units (ELUs)},
  journal = {CoRR},
  year = {2015}
}
```

The SELU activation function is defined by

$$f(x) = \begin{cases} \lambda * x & : x > 0 \\ \lambda * \alpha(e^x - 1) & : x \leq 0 \end{cases}$$

$$f'(x) = \begin{cases} \lambda & : x > 0 \\ f(x) + \lambda * \alpha & : x \leq 0 \end{cases}$$

For more information, read the following paper:

```
@article{Klambauer2017,
  author = {Gunter Klambauer and Thomas Unterthiner and
    Andreas Mayr},
  title = {Self-Normalizing Neural Networks},
  journal = {Advances in Neural Information Processing Systems},
  year = {2017}
}
```

In the deterministic mode, there is no computation of the derivative.

Note

During training deterministic should be set to false and during testing/inference deterministic should be set to true. Make sure to use SELU activation function with normalized inputs and weights initialized with Lecun Normal Initialization.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 109 of file elu.hpp.

39.65.2 Constructor & Destructor Documentation**39.65.2.1 ELU()** [1/2]

```
ELU ( )
```

Create the **ELU** (p. 680) object.

NOTE: Use this constructor for SELU activation function.

39.65.2.2 ELU() [2/2]

```
ELU (
    const double alpha )
```

Create the **ELU** (p. 680) object using the specified parameter.

The non zero gradient for negative inputs can be adjusted by specifying the **ELU** (p. 680) hyperparameter alpha (alpha > 0).

Note

Use this constructor for **ELU** (p. 680) activation function.

Parameters

<i>alpha</i>	Scale parameter for the negative factor.
--------------	--

39.65.3 Member Function Documentation

39.65.3.1 Alpha() [1/2]

```
double const& Alpha ( ) const [inline]
```

Get the non zero gradient.

Definition at line 162 of file elu.hpp.

39.65.3.2 Alpha() [2/2]

39.66.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::FastLSTM< InputDataType, OutputDataType >
```

An implementation of a faster version of the Fast **LSTM** (p. 801) network layer.

Basically by combining the calculation of the input, forget, output gates and hidden state in a single step. The standard formula changes as follows:

$$i = \text{sigmoid}(W \cdot x + W \cdot h + b) \quad (39.1)$$

$$f = \text{sigmoid}(W \cdot x + W \cdot h + b) \quad (39.2)$$

$$z = \tanh(W \cdot x + W \cdot h + b) \quad (39.3)$$

$$c = f \cdot c + i \cdot z \quad (39.4)$$

$$o = \text{sigmoid}(W \cdot x + W \cdot h + b) \quad (39.5)$$

$$h = o \cdot \tanh(c) \quad (39.6)$$

Note that **FastLSTM** (p. 685) network layer does not use peephole connections between the cell and gates.

For more information, see the following.

```
@article{Hochreiter1997,
  author = {Hochreiter, Sepp and Schmidhuber, J\"{u}rgen},
  title = {Long Short-term Memory},
  journal = {Neural Comput.},
  year = {1997}
}
```

39.66.3 Constructor & Destructor Documentation

39.66.3.1 FastLSTM() [1/2]

```
FastLSTM ( )
```

Create the Fast **LSTM** (p. 801) object.

39.66.3.2 FastLSTM() [2/2]

```
FastLSTM (
    const size_t inSize,
    const size_t outSize,
    const size_t rho = std::numeric_limits< size_t >::max() )
```

Create the Fast **LSTM** (p. 801) layer object using the specified parameters.

Parameters

<i>inSize</i>	The number of input units.
<i>outSize</i>	The number of output units.
<i>rho</i>	Maximum number of steps to backpropagate through time (BPTT).

39.66.4 Member Function Documentation

39.66.4.1 Backward()

```
void Backward (
    const InputType && input,
```

```
ErrorType && gy,  
GradientType && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.66.4.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 147 of file fast_lstm.hpp.

39.66.4.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

void **Add** (Args... args)
- void **Add** (**LayerTypes**< CustomLayers... > layer)
- double **Backward** (arma::mat targets, arma::mat &gradients)
Perform the backward pass of the data in real batch mode.
- double **Evaluate** (arma::mat predictors, arma::mat responses)
Evaluate the feedforward network with the given predictors and responses.
- double **Evaluate** (const arma::mat ¶meters)
Evaluate the feedforward network with the given parameters.
- double **Evaluate** (const arma::mat ¶meters, const size_t begin, const size_t batchSize, const bool deterministic)
Evaluate the feedforward network with the given parameters, but using only a number of data points.
- double **Evaluate** (const arma::mat ¶meters, const size_t begin, const size_t batchSize)
Evaluate the feedforward network with the given parameters, but using only a number of data points.
- template<typename GradType >
double **EvaluateWithGradient** (const arma::mat ¶meters, GradType &gradient)
Evaluate the feedforward network with the given parameters.
- template<typename GradType >
double **EvaluateWithGradient** (const arma::mat ¶meters, const size_t begin, GradType &gradient, const size_t batchSize)
Evaluate the feedforward network with the given parameters, but using only a number of data points.
- void **Forward** (arma::mat inputs, arma::mat &results)
Perform the forward pass of the data in real batch mode.
- void **Forward** (arma::mat inputs, arma::mat &results, const size_t begin, const size_t end)
Perform a partial forward pass of the data.
- void **Gradient** (const arma::mat ¶meters, const size_t begin, arma::mat &gradient, const size_t batchSize)
Evaluate the gradient of the feedforward network with the given parameters, and with respect to only a number of points in the dataset.
- size_t **NumFunctions** () const
Return the number of separable functions (the number of predictor points).
- **FFN** & **operator=** (**FFN**)
Copy/move assignment operator.
- const arma::mat & **Parameters** () const
Return the initial point for the optimization.
- arma::mat & **Parameters** ()
Modify the initial point for the optimization.
- void **Predict** (arma::mat predictors, arma::mat &results)

- Predict the responses to a given set of predictors.*
- const arma::mat & **Predictors** () const
Get the matrix of data points (predictors).
- arma::mat & **Predictors** ()
Modify the matrix of data points (predictors).
- void **ResetParameters** ()
Reset the module information (weights/parameters).
- const arma::mat & **Responses** () const
Get the matrix of responses to the input data points.
- arma::mat & **Responses** ()
Modify the matrix of responses to the input data points.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the model.
- void **Shuffle** ()
Shuffle the order of function visitation.
- template<typename OptimizerType >
double **Train** (arma::mat predictors, arma::mat responses, OptimizerType &optimizer)
Train the feedforward network on the given input data using the given optimizer.
- template<typename OptimizerType = ens::RMSProp>
double **Train** (arma::mat predictors, arma::mat responses)
Train the feedforward network on the given input data.

39.67.1 Detailed Description

template<typename OutputLayerType = NegativeLogLikelihood<>, typename InitializationRuleType = RandomInitialization, typename... CustomLayers>

class mlpack::ann::FFN< OutputLayerType, InitializationRuleType, CustomLayers >

Implementation of a standard feed forward network.

Template Parameters

<i>OutputLayerType</i>	The output layer type used to evaluate the network.
<i>InitializationRuleType</i>	Rule used to initialize the weight matrix.
<i>CustomLayers</i>	Any set of custom layers that could be a part of the feed forward network.

Definition at line 51 of file ffn.hpp.

39.67.2 Member Typedef Documentation

39.67.2.1 NetworkType

```
using NetworkType = FFN<OutputLayerType, InitializationRuleType>
```

Convenience typedef for the internal model construction.

Definition at line 55 of file ffnn.hpp.

39.67.3 Constructor & Destructor Documentation

39.67.3.1 FFN() [1/3]

```
FFN (
    OutputLayerType outputLayer = OutputLayerType(),
    InitializationRuleType initializeRule = InitializationRuleType() )
```

Create the **FFN** (p. 692) object.

Optionally, specify which initialize rule and performance function should be used.

If you want to pass in a parameter and discard the original parameter object, be sure to use `std::move` to avoid unnecessary copy.

Parameters

<i>outputLayer</i>	Output layer used to evaluate the network.
<i>initializeRule</i>	Optional instantiated InitializationRule object for initializing the network parameter.

39.67.3.2 FFN() [2/3]

```
FFN (
    const FFN< OutputLayerType, InitializationRuleType, CustomLayers > & )
```

Copy constructor.

39.67.3.3 FFN() [3/3]

```
FFN (
    FFN< OutputLayerType, InitializationRuleType, CustomLayers > && )
```

Move constructor.

39.67.3.4 ~FFN()

~ **FFN** ()

Destructor to release allocated memory.

39.67.4 Member Function Documentation

39.67.4.1 Add() [1/2]

```
void Add (
    Args... args ) [inline]
```

Definition at line 251 of file ffnn.hpp.

39.67.4.2 Add() [2/2]

```
void Add (
    LayerTypes< CustomLayers... > layer ) [inline]
```

Definition at line 258 of file ffnn.hpp.

39.67.4.3 Backward()

```
double Backward (
    arma::mat targets,
    arma::mat & gradients )
```

Perform the backward pass of the data in real batch mode.

Forward and Backward should be used as a pair, and they are designed mainly for advanced users. User should try to use Predict and Train unless those two functions can't satisfy some special requirements.

Parameters

<i>targets</i>	The training target.
<i>gradients</i>	Computed gradients.

Returns

Training error of the current pass.

Referenced by FFN< OutputLayerType, InitializationRuleType, CustomLayers >::Predictors().

39.67.4.4 Evaluate() [1/4]

```
double Evaluate (
    arma::mat predictors,
    arma::mat responses )
```

Evaluate the feedforward network with the given predictors and responses.

This functions is usually used to monitor progress while training.

Parameters

<i>predictors</i>	Input variables.
<i>responses</i>	Target outputs for input variables.

39.67.4.5 Evaluate() [2/4]

```
double Evaluate (
    const arma::mat & parameters )
```

Evaluate the feedforward network with the given parameters.

This function is usually called by the optimizer to train the model.

Parameters

<i>parameters</i>	Matrix model parameters.
<i>deterministic</i>	Whether or not to train or test the model. Note some layer act differently in training or testing mode.

39.67.4.6 Evaluate() [3/4]

```
double Evaluate (
    const arma::mat & parameters,
```

```

    const size_t begin,
    const size_t batchSize,
    const bool deterministic )

```

Evaluate the feedforward network with the given parameters, but using only a number of data points.

This is useful for optimizers such as SGD, which require a separable objective function.

Parameters

<i>parameters</i>	Matrix model parameters.
<i>begin</i>	Index of the starting point to use for objective function evaluation.
<i>batchSize</i>	Number of points to be passed at a time to use for objective function evaluation.
<i>deterministic</i>	Whether or not to train or test the model. Note some layer act differently in training or testing mode.

39.67.4.7 Evaluate() [4/4]

```

double Evaluate (
    const arma::mat & parameters,
    const size_t begin,
    const size_t batchSize )

```

Evaluate the feedforward network with the given parameters, but using only a number of data points.

This is useful for optimizers such as SGD, which require a separable objective function. This just calls the overload of **Evaluate()** (p. 697) with `deterministic = true`.

Parameters

<i>parameters</i>	Matrix model parameters.
<i>begin</i>	Index of the starting point to use for objective function evaluation.
<i>batchSize</i>	Number of points to be passed at a time to use for objective function evaluation.

39.67.4.8 EvaluateWithGradient() [1/2]

```

double EvaluateWithGradient (
    const arma::mat & parameters,
    GradType & gradient )

```

Evaluate the feedforward network with the given parameters.

This function is usually called by the optimizer to train the model. This just calls the overload of **EvaluateWithGradient()** (p. 698) with `batchSize = 1`.

Parameters

<i>parameters</i>	Matrix model parameters.
<i>gradient</i>	Matrix to output gradient into.

39.67.4.9 EvaluateWithGradient() [2/2]

```
double EvaluateWithGradient (
    const arma::mat & parameters,
    const size_t begin,
    GradType & gradient,
    const size_t batchSize )
```

Evaluate the feedforward network with the given parameters, but using only a number of data points.

This is useful for optimizers such as SGD, which require a separable objective function.

Parameters

<i>parameters</i>	Matrix model parameters.
<i>begin</i>	Index of the starting point to use for objective function evaluation.
<i>gradient</i>	Matrix to output gradient into.
<i>batchSize</i>	Number of points to be passed at a time to use for objective function evaluation.

39.67.4.10 Forward() [1/2]

```
void Forward (
    arma::mat inputs,
    arma::mat & results )
```

Perform the forward pass of the data in real batch mode.

Forward and Backward should be used as a pair, and they are designed mainly for advanced users. User should try to use Predict and Train unless those two functions can't satisfy some special requirements.

Parameters

<i>inputs</i>	The input data.
<i>results</i>	The predicted results.

Referenced by FFN< OutputLayerType, InitializationRuleType, CustomLayers >::Predictors().

39.67.4.11 Forward() [2/2]

```
void Forward (
    arma::mat inputs,
    arma::mat & results,
    const size_t begin,
    const size_t end )
```

Perform a partial forward pass of the data.

This function is meant for the cases when users require a forward pass only through certain layers and not the entire network.

Parameters

<i>inputs</i>	The input data for the specified first layer.
<i>results</i>	The predicted results from the specified last layer.
<i>begin</i>	The index of the first layer.
<i>end</i>	The index of the last layer.

39.67.4.12 Gradient()

```
void Gradient (
    const arma::mat & parameters,
    const size_t begin,
    arma::mat & gradient,
    const size_t batchSize )
```

Evaluate the gradient of the feedforward network with the given parameters, and with respect to only a number of points in the dataset.

This is useful for optimizers such as SGD, which require a separable objective function.

Parameters

<i>parameters</i>	Matrix of the model parameters to be optimized.
<i>begin</i>	Index of the starting point to use for objective function gradient evaluation.
<i>gradient</i>	Matrix to output gradient into.
<i>batchSize</i>	Number of points to be processed as a batch for objective function gradient evaluation.

Referenced by FFN< OutputLayerType, InitializationRuleType, CustomLayers >::Predictors().

39.67.4.13 NumFunctions()

```
size_t NumFunctions ( ) const [inline]
```

Return the number of separable functions (the number of predictor points).

Definition at line 261 of file `ffn.hpp`.

39.67.4.14 operator=()

```
FFN& operator= (
    FFN< OutputLayerType, InitializationRuleType, CustomLayers > )
```

Copy/move assignment operator.

39.67.4.15 Parameters() [1/2]

```
const arma::mat& Parameters ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 264 of file `ffn.hpp`.

39.67.4.16 Parameters() [2/2]

```
arma::mat& Parameters ( ) [inline]
```

Modify the initial point for the optimization.

Definition at line 266 of file `ffn.hpp`.

39.67.4.17 Predict()

```
void Predict (
    arma::mat predictors,
    arma::mat & results )
```

Predict the responses to a given set of predictors.

The responses will reflect the output of the given output layer as returned by the output layer function.

If you want to pass in a parameter and discard the original parameter object, be sure to use `std::move` to avoid unnecessary copy.

Parameters

<i>predictors</i>	Input predictors.
<i>results</i>	Matrix to put output predictions of responses into.

39.67.4.18 Predictors() [1/2]

```
const arma::mat& Predictors ( ) const [inline]
```

Get the matrix of data points (predictors).

Definition at line 274 of file `ffn.hpp`.

39.67.4.19 Predictors() [2/2]

```
arma::mat& Predictors ( ) [inline]
```

Modify the matrix of data points (predictors).

Definition at line 276 of file `ffn.hpp`.

References `FFN< OutputLayerType, InitializationRuleType, CustomLayers >::Backward()`, `FFN< OutputLayerType, InitializationRuleType, CustomLayers >::Forward()`, `FFN< OutputLayerType, InitializationRuleType, CustomLayers >::Gradient()`, `FFN< OutputLayerType, InitializationRuleType, CustomLayers >::ResetParameters()`, and `FFN< OutputLayerType, InitializationRuleType, CustomLayers >::serialize()`.

39.67.4.20 ResetParameters()

```
void ResetParameters ( )
```

Reset the module information (weights/parameters).

Referenced by `FFN< OutputLayerType, InitializationRuleType, CustomLayers >::Predictors()`.

39.67.4.21 Responses() [1/2]

```
const arma::mat& Responses ( ) const [inline]
```

Get the matrix of responses to the input data points.

Definition at line 269 of file `ffn.hpp`.

39.67.4.22 Responses() [2/2]

```
arma::mat& Responses ( ) [inline]
```

Modify the matrix of responses to the input data points.

Definition at line 271 of file `ffn.hpp`.

39.67.4.23 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the model.

Referenced by `FFN< OutputLayerType, InitializationRuleType, CustomLayers >::Predictors()`.

39.67.4.24 Shuffle()

```
void Shuffle ( )
```

Shuffle the order of function visitation.

This may be called by the optimizer.

39.67.4.25 Train() [1/2]

```
double Train (
    arma::mat predictors,
    arma::mat responses,
    OptimizerType & optimizer )
```

Train the feedforward network on the given input data using the given optimizer.

This will use the existing model parameters as a starting point for the optimization. If this is not what you want, then you should access the parameters vector directly with **Parameters()** (p. 701) and modify it as desired.

If you want to pass in a parameter and discard the original parameter object, be sure to use `std::move` to avoid unnecessary copy.

Template Parameters

<i>OptimizerType</i>	Type of optimizer to use to train the model.
----------------------	--

Parameters

<i>predictors</i>	Input training variables.
<i>responses</i>	Outputs results from input training variables.
<i>optimizer</i>	Instantiated optimizer used to train the model.

Returns

The final objective of the trained model (NaN or Inf on error).

39.67.4.26 Train() [2/2]

```
double Train (
    arma::mat predictors,
    arma::mat responses )
```

Train the feedforward network on the given input data.

By default, the RMSProp optimization algorithm is used, but others can be specified (such as ens::SGD).

This will use the existing model parameters as a starting point for the optimization. If this is not what you want, then you should access the parameters vector directly with **Parameters()** (p. 701) and modify it as desired.

If you want to pass in a parameter and discard the original parameter object, be sure to use std::move to avoid unnecessary copy.

Template Parameters

<i>OptimizerType</i>	Type of optimizer to use to train the model.
----------------------	--

Parameters

<i>predictors</i>	Input training variables.
<i>responses</i>	Outputs results from input training variables.

Returns

The final objective of the trained model (NaN or Inf on error).

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/ **ffn.hpp**

39.68 FFTConvolution< BorderMode, padLastDim > Class Template Reference

Computes the two-dimensional convolution through fft.

Static Public Member Functions

- template<typename eT , typename Border = BorderMode>
static std::enable_if< std::is_same< Border, **ValidConvolution** >::value, void >::type **Convolution** (const arma::Mat< eT > &input, const arma::Mat< eT > &filter, arma::Mat< eT > &output)
- template<typename eT , typename Border = BorderMode>
static std::enable_if< std::is_same< Border, **FullConvolution** >::value, void >::type **Convolution** (const arma::Mat< eT > &input, const arma::Mat< eT > &filter, arma::Mat< eT > &output)
- template<typename eT >
static void **Convolution** (const arma::Cube< eT > &input, const arma::Cube< eT > &filter, arma::Cube< eT > &output)
- template<typename eT >
static void **Convolution** (const arma::Mat< eT > &input, const arma::Cube< eT > &filter, arma::Cube< eT > &output)
- template<typename eT >
static void **Convolution** (const arma::Cube< eT > &input, const arma::Mat< eT > &filter, arma::Cube< eT > &output)

39.68.1 Detailed Description

```
template<typename BorderMode = FullConvolution, const bool padLastDim = false>
class mlpack::ann::FFTConvolution< BorderMode, padLastDim >
```

Computes the two-dimensional convolution through fft.

This class allows specification of the type of the border type. The convolution can be computed with the valid border type or the full border type (default).

FullConvolution (p. 714): returns the full two-dimensional convolution. **ValidConvolution** (p. 967): returns only those parts of the convolution that are computed without the zero-padded edges.

Template Parameters

<i>BorderMode</i>	Type of the border mode (FullConvolution (p. 714) or ValidConvolution (p. 967)).
<i>padLastDim</i>	Pad the last dimension of the input to to turn it from odd to even.

Definition at line 37 of file `fft_convolution.hpp`.

39.68.2 Member Function Documentation

39.68.2.1 Convolution() [1/5]

```
static std::enable_if< std::is_same<Border, ValidConvolution>::value, void>::type Convolution
(
    const arma::Mat< eT > & input,
    const arma::Mat< eT > & filter,
    arma::Mat< eT > & output ) [inline], [static]
```

Definition at line 54 of file `fft_convolution.hpp`.

Referenced by `SVDCConvolution< BorderMode >::Convolution()`, and `FFTConvolution< BorderMode, padLastDim >::Convolution()`.

39.68.2.2 Convolution() [2/5]

```
static std::enable_if< std::is_same<Border, FullConvolution>::value, void>::type Convolution (
    const arma::Mat< eT > & input,
    const arma::Mat< eT > & filter,
    arma::Mat< eT > & output ) [inline], [static]
```

Definition at line 89 of file `fft_convolution.hpp`.

39.69 FlexibleReLU< InputDataType, OutputDataType > Class Template Reference

The **FlexibleReLU** (p. 707) activation function, defined by.

Public Member Functions

- **FlexibleReLU** (const double alpha=0)
*Create the **FlexibleReLU** (p. 707) object using the specified parameters.*
- double const & **Alpha** () const
Get the parameter controlling the range of the relu function.
- double & **Alpha** ()
Modify the parameter controlling the range of the relu function.
- template<typename DataType >
void **Backward** (const DataType &&input, DataType &&gy, DataType &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()

Modify the delta.

- `template<typename InputType , typename OutputType >`
`void Forward (const InputType &&input, OutputType &&output)`
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- `template<typename eT >`
`void Gradient (const arma::Mat< eT > &&input, arma::Mat< eT > &&error, arma::Mat< eT > &&gradient)`
Calculate the gradient using the output delta and the input activation.
- `OutputDataType const & Gradient () const`
Get the gradient.
- `OutputDataType & Gradient ()`
Modify the gradient.
- `OutputDataType const & OutputParameter () const`
Get the output parameter.
- `OutputDataType & OutputParameter ()`
Modify the output parameter.
- `OutputDataType const & Parameters () const`
Get the parameters.
- `OutputDataType & Parameters ()`
Modify the parameters.
- `void Reset ()`
Reset the layer parameter.
- `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialize the layer.

39.69.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::FlexibleReLU< InputDataType, OutputDataType >
```

The **FlexibleReLU** (p. 707) activation function, defined by.

$$f(x) = \max(0, x) + \alpha$$

$$f'(x) = \begin{cases} 1 & : x > 0 \\ 0 & : x \leq 0 \end{cases}$$

For more information, read the following paper:

```
@article{Qiu2018,
  author = {Suo Qiu, Xiangmin Xu and Bolun Cai},
  title = {FReLU: Flexible Rectified Linear Units for Improving
    Convolutional Neural Networks}
  journal = {arxiv preprint},
  URL = {https://arxiv.org/abs/1706.08098},
  year = {2018}
}
```

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mar, arma::sp_mat or arma::cube)
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube)

Definition at line 59 of file flexible_relu.hpp.

39.69.2 Constructor & Destructor Documentation

39.69.2.1 FlexibleReLU()

```
FlexibleReLU (  
    const double alpha = 0 )
```

Create the **FlexibleReLU** (p. 707) object using the specified parameters.

The non zero parameter can be adjusted by specifying the parameter alpha which controls the range of the relu function. (Default alpha = 0) This parameter is trainable.

Parameters

<i>alpha</i>	Parameter for adjusting the range of the relu function.
--------------	---

39.69.3 Member Function Documentation

39.69.3.1 Alpha() [1/2]

```
double const& Alpha ( ) const [inline]
```

Get the parameter controlling the range of the relu function.

Definition at line 134 of file flexible_relu.hpp.

39.69.3.2 Alpha() [2/2]

```
double& Alpha ( ) [inline]
```

Modify the parameter controlling the range of the relu function.

Definition at line 136 of file flexible_relu.hpp.

References FlexibleReLU< InputDataType, OutputDataType >::serialize().

39.69.3.3 Backward()

```
void Backward (
    const DataType && input,
    DataType && gy,
    DataType && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.69.3.4 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 124 of file flexible_relu.hpp.

39.69.3.5 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 126 of file flexible_relu.hpp.

39.69.3.6 Forward()

```
void Forward (
    const InputType && input,
    OutputType && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.69.3.7 Gradient() [1/3]

```
void Gradient (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient )
```

Calculate the gradient using the output delta and the input activation.

Parameters

<i>input</i>	The input parameter used for calculating the gradient.
<i>error</i>	The calculated error.
<i>gradient</i>	The calculated gradient.

39.69.3.8 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 129 of file flexible_relu.hpp.

39.69.3.9 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 131 of file flexible_relu.hpp.

39.69.3.10 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 119 of file flexible_relu.hpp.

39.69.3.11 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 121 of file flexible_relu.hpp.

39.69.3.12 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 114 of file flexible_relu.hpp.

39.69.3.13 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 116 of file flexible_relu.hpp.

39.69.3.14 Reset()

```
void Reset ( )
```

Reset the layer parameter.

39.69.3.15 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by FlexibleReLU< InputDataType, OutputDataType >::Alpha().

39.70 ForwardVisitor Class Reference

ForwardVisitor (p. 713) executes the Forward() function given the input and output parameter.

Inheritance diagram for ForwardVisitor:

**Public Member Functions**

- **ForwardVisitor** (arma::mat &&input, arma::mat &&output)
Execute the Foward() function given the input and output parameter.
- template<typename LayerType >
void **operator()** (LayerType *layer) const
Execute the Foward() function.

39.70.1 Detailed Description

ForwardVisitor (p. 713) executes the Forward() function given the input and output parameter.

Definition at line 28 of file forward_visitor.hpp.

39.70.2 Constructor & Destructor Documentation

39.70.2.1 ForwardVisitor()

```
ForwardVisitor (  
    arma::mat && input,  
    arma::mat && output )
```

Execute the Foward() function given the input and output parameter.

39.70.3 Member Function Documentation

39.70.3.1 operator()()

```
void operator() (  
    LayerType * layer ) const
```

Execute the Foward() function.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **forward_visitor.hpp**

39.71 FullConvolution Class Reference

39.71.1 Detailed Description

Definition at line 22 of file border_modes.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/convolution_rules/ **border_modes.hpp**

39.72 GaussianInitialization Class Reference

This class is used to initialize weight matrix with a gaussian.

Public Member Functions

- **GaussianInitialization** (const double mean=0, const double variance=1)
Initialize the gaussian with the given mean and variance.
- template<typename eT >
void **Initialize** (arma::Mat< eT > &W, const size_t rows, const size_t cols)
Initialize the elements weight matrix using a Gaussian Distribution.
- template<typename eT >
void **Initialize** (arma::Cube< eT > &W, const size_t rows, const size_t cols, const size_t slices)
Initialize randomly the elements of the specified weight 3rd order tensor.

39.72.1 Detailed Description

This class is used to initialize weight matrix with a gaussian.

Definition at line 28 of file gaussian_init.hpp.

39.72.2 Constructor & Destructor Documentation

39.72.2.1 GaussianInitialization()

```
GaussianInitialization (  
    const double mean = 0,  
    const double variance = 1 ) [inline]
```

Initialize the gaussian with the given mean and variance.

Parameters

<i>mean</i>	Mean of the gaussian.
<i>variance</i>	Variance of the gaussian.

Definition at line 37 of file gaussian_init.hpp.

39.72.3 Member Function Documentation

39.72.3.1 Initialize() [1/2]

```
void Initialize (
    arma::Mat< eT > & W,
    const size_t rows,
    const size_t cols ) [inline]
```

Initialize the elements weight matrix using a Gaussian Distribution.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.

Definition at line 51 of file gaussian_init.hpp.

References `mlpack::math::RandNormal()`.

Referenced by `GlorotInitializationType< Uniform >::Initialize()`.

39.72.3.2 Initialize() [2/2]

```
void Initialize (
    arma::Cube< eT > & W,
    const size_t rows,
    const size_t cols,
    const size_t slices ) [inline]
```

Initialize randomly the elements of the specified weight 3rd order tensor.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.
<i>slice</i>	Numbers of slices.

Definition at line 71 of file gaussian_init.hpp.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/ gaussian_init.hpp`

39.73 Glimpse< InputDataType, OutputDataType > Class Template Reference

The glimpse layer returns a retina-like representation (down-scaled cropped images) of increasing scale around a given location in a given image.

Public Member Functions

- **Glimpse** (const size_t inSize=0, const size_t size=0, const size_t depth=3, const size_t scale=2, const size_t inputWidth=0, const size_t inputHeight=0)
Create the GlimpseLayer object using the specified ratio and rescale parameter.
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of the glimpse layer.
- OutputDataType & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- bool **Deterministic** () const
Get the value of the deterministic parameter.
- bool & **Deterministic** ()
Modify the value of the deterministic parameter.
- template<typename eT >
void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Ordinary feed forward pass of the glimpse layer.
- size_t const & **InputHeight** () const
Get the input height.
- size_t & **InputHeight** ()
Modify the input height.
- size_t const & **InputWidth** () const
Get the input width.
- size_t & **InputWidth** ()
Modify input the width.
- void **Location** (const arma::mat &location)
Set the location the x and y coordinate of the center of the output glimpse.
- size_t const & **OutputHeight** () const
Get the output height.
- size_t & **OutputHeight** ()
Modify the output height.
- OutputDataType & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- size_t const & **OutputWidth** () const
Get the output width.
- size_t & **OutputWidth** ()
Modify the output width.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.73.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::Glimpse< InputDataType, OutputDataType >
```

The glimpse layer returns a retina-like representation (down-scaled cropped images) of increasing scale around a given location in a given image.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 87 of file glimpse.hpp.

39.73.2 Constructor & Destructor Documentation

39.73.2.1 Glimpse()

```
Glimpse (
    const size_t inSize = 0,
    const size_t size = 0,
    const size_t depth = 3,
    const size_t scale = 2,
    const size_t inputWidth = 0,
    const size_t inputHeight = 0 )
```

Create the GlimpseLayer object using the specified ratio and rescale parameter.

Parameters

<i>inSize</i>	The size of the input units.
<i>size</i>	The used glimpse size (height = width).
<i>depth</i>	The number of patches to crop per glimpse.
<i>scale</i>	The scaling factor used to create the increasing retina-like representation.
<i>inputWidth</i>	The input width of the given input data.
<i>inputHeight</i>	The input height of the given input data.

39.73.3 Member Function Documentation

39.73.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of the glimpse layer.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.73.3.2 Delta() [1/2]

```
OutputDataType& Delta ( ) const [inline]
```

Get the delta.

Definition at line 136 of file glimpse.hpp.

39.73.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 138 of file glimpse.hpp.

39.73.3.4 Deterministic() [1/2]

```
bool Deterministic ( ) const [inline]
```

Get the value of the deterministic parameter.

Definition at line 168 of file glimpse.hpp.

39.73.3.5 Deterministic() [2/2]

```
bool& Deterministic ( ) [inline]
```

Modify the value of the deterministic parameter.

Definition at line 170 of file glimpse.hpp.

References `MeanPoolingRule::Pooling()`, and `MeanPoolingRule::Unpooling()`.

39.73.3.6 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of the glimpse layer.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.73.3.7 InputHeight() [1/2]

```
size_t const& InputHeight ( ) const [inline]
```

Get the input height.

Definition at line 153 of file glimpse.hpp.

39.73.3.8 InputHeight() [2/2]

```
size_t& InputHeight ( ) [inline]
```

Modify the input height.

Definition at line 155 of file glimpse.hpp.

39.73.3.9 InputWidth() [1/2]

```
size_t const& InputWidth ( ) const [inline]
```

Get the input width.

Definition at line 148 of file glimpse.hpp.

39.73.3.10 InputWidth() [2/2]

```
size_t& InputWidth ( ) [inline]
```

Modify input the width.

Definition at line 150 of file glimpse.hpp.

39.73.3.11 Location()

```
void Location (
    const arma::mat & location ) [inline]
```

Set the locationthe x and y coordinate of the center of the output glimpse.

Definition at line 142 of file glimpse.hpp.

39.73.3.12 OutputHeight() [1/2]

```
size_t const& OutputHeight ( ) const [inline]
```

Get the output height.

Definition at line 163 of file glimpse.hpp.

39.73.3.13 OutputHeight() [2/2]

```
size_t& OutputHeight ( ) [inline]
```

Modify the output height.

Definition at line 165 of file glimpse.hpp.

39.73.3.14 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 131 of file `glimpse.hpp`.

39.73.3.15 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 133 of file `glimpse.hpp`.

39.73.3.16 OutputWidth() [1/2]

```
size_t const& OutputWidth ( ) const [inline]
```

Get the output width.

Definition at line 158 of file `glimpse.hpp`.

39.73.3.17 OutputWidth() [2/2]

```
size_t& OutputWidth ( ) [inline]
```

Modify the output width.

Definition at line 160 of file `glimpse.hpp`.

39.73.3.18 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ glimpse.hpp`

39.74 GlorotInitializationType< Uniform > Class Template Reference

This class is used to initialize the weight matrix with the Glorot Initialization method.

Public Member Functions

- **GlorotInitializationType** ()
Initialize the Glorot initialization object.
- template<typename eT >
void **Initialize** (arma::Mat< eT > &W, const size_t rows, const size_t cols)
Initialize the elements weight matrix with glorot initialization method.
- template<typename eT >
void **Initialize** (arma::Cube< eT > &W, const size_t rows, const size_t cols, const size_t slices)
Initialize the elements of the specified weight 3rd order tensor with glorot initialization method.
- template<>
void **Initialize** (arma::Mat< eT > &W, const size_t rows, const size_t cols)
- template<>
void **Initialize** (arma::Mat< eT > &W, const size_t rows, const size_t cols)

39.74.1 Detailed Description

```
template<bool Uniform = true>
class mlpack::ann::GlorotInitializationType< Uniform >
```

This class is used to initialize the weight matrix with the Glorot Initialization method.

The method is defined by

$$\text{Var}[w_i] = \frac{2}{n_i + n_{i+1}}$$

$$w_i \sim \text{U}\left[-\frac{\sqrt{6}}{\sqrt{n_i + n_{i+1}}}, \frac{\sqrt{6}}{\sqrt{n_i + n_{i+1}}}\right]$$

where n_{i+1} is the number of neurons in the outgoing layer, n_i represents the number of neurons in the ingoing layer. Here Normal Distribution may also be used if needed

For more information, see the following paper.

```

  title      = {Understanding the difficulty of training
               deep feedforward neural networks},
  author     = {Xavier Glorot and Yoshua Bengio},
  booktitle  = {Proceedings of the Thirteenth International Conference
               on Artificial Intelligence and Statistics},
  year      = {2010}
}
```

Definition at line 55 of file glorot_init.hpp.

39.74.2 Constructor & Destructor Documentation

39.74.2.1 GlorotInitializationType()

```
GlorotInitializationType ( ) [inline]
```

Initialize the Glorot initialization object.

Definition at line 61 of file `glorot_init.hpp`.

39.74.3 Member Function Documentation

39.74.3.1 Initialize() [1/4]

```
void Initialize (
    arma::Mat< eT > & W,
    const size_t rows,
    const size_t cols )
```

Initialize the elements weight matrix with glorot initialization method.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.

39.74.3.2 Initialize() [2/4]

```
void Initialize (
    arma::Cube< eT > & W,
    const size_t rows,
    const size_t cols,
    const size_t slices ) [inline]
```

Initialize the elements of the specified weight 3rd order tensor with glorot initialization method.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.
<i>slice</i>	Numbers of slices.

Definition at line 125 of file `glorot_init.hpp`.

39.74.3.3 Initialize() [3/4]

```
void Initialize (
    arma::Mat< eT > & W,
    const size_t rows,
    const size_t cols ) [inline]
```

Definition at line 96 of file `glorot_init.hpp`.

References `GaussianInitialization::Initialize()`.

39.74.3.4 Initialize() [4/4]

```
void Initialize (
    arma::Mat< eT > & W,
    const size_t rows,
    const size_t cols ) [inline]
```

Definition at line 110 of file `glorot_init.hpp`.

References `RandomInitialization::Initialize()`.

39.75 GradientSetVisitor Class Reference

GradientSetVisitor (p. 725) update the gradient parameter given the gradient set.

Inheritance diagram for GradientSetVisitor:

Public Member Functions

- **GradientSetVisitor** (arma::mat &&gradient, size_t offset=0)
Update the gradient parameter given the gradient set.
- template<typename LayerType >
size_t **operator()** (LayerType *layer) const
Update the gradient parameter.

39.75.1 Detailed Description

GradientSetVisitor (p. 725) update the gradient parameter given the gradient set.

Definition at line 26 of file gradient_set_visitor.hpp.

39.75.2 Constructor & Destructor Documentation

39.75.2.1 GradientSetVisitor()

```
GradientSetVisitor (
    arma::mat && gradient,
    size_t offset = 0 )
```

Update the gradient parameter given the gradient set.

39.75.3 Member Function Documentation

39.75.3.1 operator()

```
size_t operator() (
    LayerType * layer ) const
```

Update the gradient parameter.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **gradient_set_visitor.hpp**

39.76 GradientUpdateVisitor Class Reference

GradientUpdateVisitor (p. 727) update the gradient parameter given the gradient set.

Inheritance diagram for GradientUpdateVisitor:

Public Member Functions

- **GradientUpdateVisitor** (arma::mat &&gradient, size_t offset=0)
Update the gradient parameter given the gradient set.
- template<typename LayerType >
 size_t **operator()** (LayerType *layer) const
Update the gradient parameter.

39.76.1 Detailed Description

GradientUpdateVisitor (p. 727) update the gradient parameter given the gradient set.

Definition at line 26 of file gradient_update_visitor.hpp.

39.76.2 Constructor & Destructor Documentation

39.76.2.1 GradientUpdateVisitor()

```

GradientUpdateVisitor (
    arma::mat && gradient,
    size_t offset = 0 )
  
```

Update the gradient parameter given the gradient set.

39.76.3 Member Function Documentation

39.76.3.1 operator()

```
size_t operator() (
    LayerType * layer ) const
```

Update the gradient parameter.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **gradient_update_visitor.hpp**

39.77 GradientVisitor Class Reference

SearchModeVisitor executes the Gradient() method of the given module using the input and delta parameter.

Inheritance diagram for GradientVisitor:

Public Member Functions

- **GradientVisitor** (arma::mat &&input, arma::mat &&delta)
Executes the Gradient() method of the given module using the input and delta parameter.
- **GradientVisitor** (arma::mat &&input, arma::mat &&delta, const size_t index)
Executes the Gradient() method for the layer with the specified index.
- template<typename LayerType >
void **operator()** (LayerType *layer) const
Executes the Gradient() method.

39.77.1 Detailed Description

SearchModeVisitor executes the Gradient() method of the given module using the input and delta parameter.

Definition at line 28 of file gradient_visitor.hpp.

39.77.2 Constructor & Destructor Documentation

39.77.2.1 GradientVisitor() [1/2]

```
GradientVisitor (  
    arma::mat && input,  
    arma::mat && delta )
```

Executes the Gradient() method of the given module using the input and delta parameter.

39.77.2.2 GradientVisitor() [2/2]

```
GradientVisitor (  
    arma::mat && input,  
    arma::mat && delta,  
    const size_t index )
```

Executes the Gradient() method for the layer with the specified index.

39.77.3 Member Function Documentation

39.77.3.1 operator()()

```
void operator() (  
    LayerType * layer ) const
```

Executes the Gradient() method.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **gradient_visitor.hpp**

39.78 GradientZeroVisitor Class Reference

Inheritance diagram for GradientZeroVisitor:

Public Member Functions

- **GradientZeroVisitor ()**
Set the gradient to zero for the given module.
- template<typename LayerType >
void **operator()** (LayerType *layer) const
Set the gradient to zero.

39.78.1 Detailed Description

Definition at line 27 of file gradient_zero_visitor.hpp.

39.78.2 Constructor & Destructor Documentation

39.78.2.1 GradientZeroVisitor()

```
GradientZeroVisitor ( )
```

Set the gradient to zero for the given module.

39.78.3 Member Function Documentation

39.78.3.1 operator>()

```
void operator() (
    LayerType * layer ) const
```

Set the gradient to zero.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **gradient_zero_visitor.hpp**

39.79 GRU< InputDataType, OutputDataType > Class Template Reference

An implementation of a gru network layer.

Public Member Functions

- **GRU** ()
*Create the **GRU** (p. 731) object.*
- **GRU** (const size_t inSize, const size_t outSize, const size_t rho=std::numeric_limits< size_t >::max())
*Create the **GRU** (p. 731) layer object using the specified parameters.*
- **~GRU** ()
*Delete the **GRU** (p. 731) and the layers it holds.*
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of a neural network, calculating the function f(x) by propagating x backwards trough f.
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- bool **Deterministic** () const
The value of the deterministic parameter.
- bool & **Deterministic** ()
Modify the value of the deterministic parameter.
- template<typename eT >
void **Forward** (arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Ordinary feed forward pass of a neural network, evaluating the function f(x) by propagating the activity forward through f.
- template<typename eT >
void **Gradient** (arma::Mat< eT > &&input, arma::Mat< eT > &&, arma::Mat< eT > &&)
Ordinary feed forward pass of a neural network, evaluating the function f(x) by propagating the activity forward through f.
- OutputDataType const & **Gradient** () const
Get the gradient.
- OutputDataType & **Gradient** ()
Modify the gradient.
- std::vector< **LayerTypes**<> > & **Model** ()
Get the model modules.

- OutputDataType const & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- OutputDataType const & **Parameters** () const
Get the parameters.
- OutputDataType & **Parameters** ()
Modify the parameters.
- void **ResetCell** (const size_t size)
- size_t **Rho** () const
Get the maximum number of steps to backpropagate through time (BPTT).
- size_t & **Rho** ()
Modify the maximum number of steps to backpropagate through time (BPTT).
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.79.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::GRU< InputDataType, OutputDataType >
```

An implementation of a gru network layer.

This cell can be used in **RNN** (p. 911) networks.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 57 of file gru.hpp.

39.79.2 Constructor & Destructor Documentation

39.79.2.1 GRU() [1/2]

```
GRU ( )
```

Create the **GRU** (p. 731) object.

39.79.2.2 GRU() [2/2]

```
GRU (
    const size_t inSize,
    const size_t outSize,
    const size_t rho = std::numeric_limits< size_t >::max() )
```

Create the **GRU** (p. 731) layer object using the specified parameters.

Parameters

<i>inSize</i>	The number of input units.
<i>outSize</i>	The number of output units.
<i>rho</i>	Maximum number of steps to backpropagate through time (BPTT).

39.79.2.3 ~GRU()

```
~ GRU ( )
```

Delete the **GRU** (p. 731) and the layers it holds.

39.79.3 Member Function Documentation

39.79.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.79.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 144 of file gru.hpp.

39.79.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 146 of file gru.hpp.

39.79.3.4 Deterministic() [1/2]

```
bool Deterministic ( ) const [inline]
```

The value of the deterministic parameter.

Definition at line 124 of file gru.hpp.

39.79.3.5 Deterministic() [2/2]

```
bool& Deterministic ( ) [inline]
```

Modify the value of the deterministic parameter.

Definition at line 126 of file gru.hpp.

39.79.3.6 Forward()

```
void Forward (
    arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.79.3.7 Gradient() [1/3]

```
void Gradient (
    arma::Mat< eT > && input,
    arma::Mat< eT > && ,
    arma::Mat< eT > && )
```

39.79.3.8 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 149 of file gru.hpp.

39.79.3.9 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 151 of file gru.hpp.

39.79.3.10 Model()

```
std::vector< LayerTypes<> >& Model ( ) [inline]
```

Get the model modules.

Definition at line 154 of file gru.hpp.

References GRU< InputDataType, OutputDataType >::serialize().

39.79.3.11 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 139 of file gru.hpp.

39.79.3.12 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 141 of file gru.hpp.

39.79.3.13 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 134 of file gru.hpp.

39.79.3.14 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 136 of file gru.hpp.

39.79.3.15 ResetCell()

```
void ResetCell (
    const size_t size )
```

39.79.3.16 Rho() [1/2]

```
size_t Rho ( ) const [inline]
```

Get the maximum number of steps to backpropagate through time (BPTT).

Definition at line 129 of file gru.hpp.

39.79.3.17 Rho() [2/2]

```
size_t& Rho ( ) [inline]
```

Modify the maximum number of steps to backpropagate through time (BPTT).

Definition at line 131 of file gru.hpp.

39.79.3.18 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by GRU< InputDataType, OutputDataType >::Model().

The documentation for this class was generated from the following file:

39.80 HardSigmoidFunction Class Reference

The hard sigmoid function, defined by.

Static Public Member Functions

- static double **Deriv** (const double y)
Computes the first derivatives of hard sigmoid function.
- template<typename InputVecType , typename OutputVecType >
static void **Deriv** (const InputVecType &y, OutputVecType &x)
Computes the first derivatives of the hard sigmoid function.
- static double **Fn** (const double x)
Computes the hard sigmoid function.
- template<typename InputVecType , typename OutputVecType >
static void **Fn** (const InputVecType &x, OutputVecType &y)
Computes the hard sigmoid function.

39.80.1 Detailed Description

The hard sigmoid function, defined by.

$$\begin{aligned} f(x) &= \min(1, \max(0, 0.2 * x + 0.5)) \\ f'(x) &= \begin{cases} 0.0 & : x = 0, 1 \\ 0.2 & \end{cases} \end{aligned}$$

Definition at line 34 of file `hard_sigmoid_function.hpp`.

39.80.2 Member Function Documentation

39.80.2.1 `Deriv()` [1/2]

```
static double Deriv (  
    const double y ) [inline], [static]
```

Computes the first derivatives of hard sigmoid function.

Parameters

<i>y</i>	Input data.
----------	-------------

Returns

$f'(x)$

Definition at line 69 of file `hard_sigmoid_function.hpp`.

Referenced by `HardSigmoidFunction::Deriv()`.

39.80.2.2 `Deriv()` [2/2]

```
static void Deriv (  
    const InputVecType & y,  
    OutputVecType & x ) [inline], [static]
```

Computes the first derivatives of the hard sigmoid function.

Parameters

<i>y</i>	Input activations.
<i>x</i>	The resulting derivatives.

Definition at line 85 of file `hard_sigmoid_function.hpp`.

References `HardSigmoidFunction::Deriv()`.

39.80.2.3 Fn() [1/2]

```
static double Fn (  
    const double x ) [inline], [static]
```

Computes the hard sigmoid function.

Parameters

<i>x</i>	Input data.
----------	-------------

Returns

$f(x)$.

Definition at line 43 of file `hard_sigmoid_function.hpp`.

Referenced by `HardSigmoidFunction::Fn()`.

39.80.2.4 Fn() [2/2]

```
static void Fn (  
    const InputVecType & x,  
    OutputVecType & y ) [inline], [static]
```

Computes the hard sigmoid function.

Parameters

<i>x</i>	Input data.
<i>y</i>	The resulting output activations.

Definition at line 55 of file `hard_sigmoid_function.hpp`.

References `HardSigmoidFunction::Fn()`.

The documentation for this class was generated from the following file:

hpp`

39.81 `HardTanH< InputDataType, OutputDataType >` Class Template Reference

The Hard Tanh activation function, defined by.

Public Member Functions

- **HardTanH** (const double maxValue=1, const double minValue=-1)
*Create the **HardTanH** (p. 740) object using the specified parameters.*
- `template<typename DataType >`
`void Backward (const DataType &&input, DataType &&gy, DataType &&g)`
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- `OutputDataType const & Delta () const`
Get the delta.
- `OutputDataType & Delta ()`
Modify the delta.
- `template<typename InputType, typename OutputType >`
`void Forward (const InputType &&input, OutputType &&output)`
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- `double const & MaxValue () const`
Get the maximum value.
- `double & MaxValue ()`
Modify the maximum value.
- `double const & MinValue () const`
Get the minimum value.
- `double & MinValue ()`
Modify the minimum value.
- `OutputDataType const & OutputParameter () const`
Get the output parameter.
- `OutputDataType & OutputParameter ()`
Modify the output parameter.
- `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialize the layer.

39.81.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::HardTanH< InputDataType, OutputDataType >
```

The Hard Tanh activation function, defined by.

$$f(x) = \begin{cases} \max & : x > \maxValue \\ \min & : x \leq \minValue \\ x & : otherwise \end{cases}$$

$$f'(x) = \begin{cases} 0 & : x > \maxValue \\ 0 & : x \leq \minValue \\ 1 & : otherwise \end{cases}$$

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 49 of file hard_tanh.hpp.

39.81.2 Constructor & Destructor Documentation

39.81.2.1 HardTanH()

```
HardTanH (
    const double maxValue = 1,
    const double minValue = -1 )
```

Create the **HardTanH** (p. 740) object using the specified parameters.

The range of the linear region can be adjusted by specifying the `maxValue` and `minValue`. Default (`maxValue = 1`, `minValue = -1`).

Parameters

<i>maxValue</i>	Range of the linear region maximum value.
<i>minValue</i>	Range of the linear region minimum value.

39.81.3 Member Function Documentation

39.81.3.1 Backward()

```
void Backward (
    const DataType && input,
    DataType && gy,
    DataType && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.81.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 92 of file `hard_tanh.hpp`.

39.81.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 94 of file `hard_tanh.hpp`.

39.81.3.4 Forward()

```
void Forward (
    const InputType && input,
    OutputType && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.81.3.5 MaxValue() [1/2]

```
double const& MaxValue ( ) const [inline]
```

Get the maximum value.

Definition at line 97 of file hard_tanh.hpp.

39.81.3.6 MaxValue() [2/2]

```
double& MaxValue ( ) [inline]
```

Modify the maximum value.

Definition at line 99 of file hard_tanh.hpp.

39.81.3.7 MinValue() [1/2]

```
double const& MinValue ( ) const [inline]
```

Get the minimum value.

Definition at line 102 of file hard_tanh.hpp.

39.81.3.8 MinValue() [2/2]

```
double& MinValue ( ) [inline]
```

Modify the minimum value.

Definition at line 104 of file hard_tanh.hpp.

References HardTanH< InputDataType, OutputDataType >::serialize().

39.81.3.9 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 87 of file `hard_tanh.hpp`.

39.81.3.10 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 89 of file `hard_tanh.hpp`.

39.81.3.11 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by `HardTanH< InputDataType, OutputDataType >::MinValue()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ hard_tanh.hpp`

39.82 HeInitialization Class Reference

This class is used to initialize weight matrix with the He initialization rule given by He et.

Public Member Functions

- **HeInitialization ()**
*Initialize the **HeInitialization** (p. 744) object.*
- void **Initialize** (arma::mat &W, const size_t rows, const size_t cols)
Initialize the elements of the weight matrix with the He initialization rule.
- void **Initialize** (arma::cube &W, const size_t rows, const size_t cols, const size_t slices)
Initialize the elements of the specified weight 3rd order tensor with He initialization rule.

39.82.1 Detailed Description

This class is used to initialize weight matrix with the He initialization rule given by He et.

al. for neural networks. The He initialization initializes weights of the neural network to better suit the rectified activation units.

For more information, the following paper can be referred to:

```

}
```

Definition at line 45 of file he_init.hpp.

39.82.2 Constructor & Destructor Documentation

39.82.2.1 HeInitialization()

```
HeInitialization ( ) [inline]
```

Initialize the **HeInitialization** (p. 744) object.

Definition at line 51 of file he_init.hpp.

39.82.3 Member Function Documentation

39.82.3.1 Initialize() [1/2]

```
void Initialize (
    arma::mat & W,
    const size_t rows,
    const size_t cols ) [inline]
```

Initialize the elements of the weight matrix with the He initialization rule.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.

Definition at line 64 of file `he_init.hpp`.

Referenced by `HeInitialization::Initialize()`.

39.82.3.2 Initialize() [2/2]

```
void Initialize (
    arma::cube & W,
    const size_t rows,
    const size_t cols,
    const size_t slices ) [inline]
```

Initialize the elements of the specified weight 3rd order tensor with He initialization rule.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.
<i>slice</i>	Numbers of slices.

Definition at line 90 of file `he_init.hpp`.

References `HeInitialization::Initialize()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/ he_init.hpp`

39.83 IdentityFunction Class Reference

The identity function, defined by.

Static Public Member Functions

- static double **Deriv** (const double)
Computes the first derivative of the identity function.
- template<typename InputVecType , typename OutputVecType >
static void **Deriv** (const InputVecType &y, OutputVecType &x)
Computes the first derivatives of the identity function.
- template<typename eT >
static void **Deriv** (const arma::Cube< eT > &y, arma::Cube< eT > &x)
Computes the first derivatives of the identity function using a 3rd order tensor as input.
- static double **Fn** (const double x)
Computes the identity function.
- template<typename InputVecType , typename OutputVecType >
static void **Fn** (const InputVecType &x, OutputVecType &y)
Computes the identity function.

39.83.1 Detailed Description

The identity function, defined by.

$$\begin{aligned} f(x) &= x \\ f'(x) &= 1 \end{aligned}$$

Definition at line 28 of file identity_function.hpp.

39.83.2 Member Function Documentation

39.83.2.1 Deriv() [1/3]

```
static double Deriv (
    const double ) [inline], [static]
```

Computes the first derivative of the identity function.

Parameters

x	Input data.
---	-------------

Returns $f'(x)$

Definition at line 60 of file identity_function.hpp.

39.83.2.2 Deriv() [2/3]

```
static void Deriv (
    const InputVecType & y,
    OutputVecType & x ) [inline], [static]
```

Computes the first derivatives of the identity function.

Parameters

<i>y</i>	Input activations.
<i>x</i>	The resulting derivatives.

Definition at line 72 of file identity_function.hpp.

39.83.2.3 Deriv() [3/3]

```
static void Deriv (
    const arma::Cube< eT > & y,
    arma::Cube< eT > & x ) [inline], [static]
```

Computes the first derivatives of the identity function using a 3rd order tensor as input.

Parameters

<i>y</i>	Input activations.
<i>x</i>	The resulting derivatives.

Definition at line 85 of file identity_function.hpp.

39.83.2.4 Fn() [1/2]

```
static double Fn (
    const double x ) [inline], [static]
```

Computes the identity function.

Parameters

<i>x</i>	Input data.
----------	-------------

Returns

$f(x)$.

Definition at line 37 of file `identity_function.hpp`.

39.83.2.5 Fn() [2/2]

```
static void Fn (
    const InputVecType & x,
    OutputVecType & y ) [inline], [static]
```

Computes the identity function.

Parameters

<i>x</i>	Input data.
<i>y</i>	The resulting output activation.

Definition at line 49 of file `identity_function.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/activation_functions/ identity_function.hpp`

39.84 InitTraits< InitRuleType > Class Template Reference

This is a template class that can provide information about various initialization methods.

Static Public Attributes

- static const bool **UseLayer** = true

This is true if the initialization method is used for a single layer.

39.84.1 Detailed Description

```
template<typename InitRuleType>
class mlpack::ann::InitTraits< InitRuleType >
```

This is a template class that can provide information about various initialization methods.

By default, this class will provide the weakest possible assumptions on the initialization method, and each initialization method should override values as necessary. If a initialization method doesn't need to override a value, then there's no need to write a **InitTraits** (p. 750) specialization for that class.

Definition at line 28 of file `init_rules_traits.hpp`.

39.84.2 Member Data Documentation

39.84.2.1 UseLayer

```
const bool UseLayer = true [static]
```

This is true if the initialization method is used for a single layer.

Definition at line 34 of file `init_rules_traits.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/ init_rules_traits.hpp`

39.85 InitTraits< KathirvalavakumarSubavathInitialization > Class Template Reference

Initialization traits of the kathirvalavakumar subavath initialization rule.

Static Public Attributes

- static const bool **UseLayer** = false
The kathirvalavakumar subavath initialization rule is applied over the entire network.

39.85.1 Detailed Description

```
template<>
class mlpack::ann::InitTraits< KathirvalavakumarSubavathInitialization >
```

Initialization traits of the kathirvalavakumar subavath initialization rule.

Definition at line 123 of file `kathirvalavakumar_subavathi_init.hpp`.

39.85.2 Member Data Documentation

39.85.2.1 UseLayer

```
const bool UseLayer = false [static]
```

The kathirvalavakumar subavath initialization rule is applied over the entire network.

Definition at line 128 of file kathirvalavakumar_subavathi_init.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/ **kathirvalavakumar_subavathi_↔
init.hpp**

39.86 InitTraits< NguyenWidrowInitialization > Class Template Reference

Initialization traits of the Nguyen-Widrow initialization rule.

Static Public Attributes

- static const bool **UseLayer** = false
The Nguyen-Widrow initialization rule is applied over the entire network.

39.86.1 Detailed Description

```
template<>
class mlpack::ann::InitTraits< NguyenWidrowInitialization >
```

Initialization traits of the Nguyen-Widrow initialization rule.

Definition at line 116 of file nguyen_widrow_init.hpp.

39.86.2 Member Data Documentation

39.86.2.1 UseLayer

```
const bool UseLayer = false [static]
```

The Nguyen-Widrow initialization rule is applied over the entire network.

Definition at line 120 of file `nguyen_widrow_init.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/ nguyen_widrow_init.hpp`

39.87 Join< InputDataType, OutputDataType > Class Template Reference

Implementation of the **Join** (p. 753) module class.

Public Member Functions

- **Join** ()
*Create the **Join** (p. 753) object.*
- `template<typename eT >`
`void Backward (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)`
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- `OutputDataType const & Delta () const`
Get the delta.
- `OutputDataType & Delta ()`
Modify the delta.
- `template<typename InputType, typename OutputType >`
`void Forward (const InputType &&input, OutputType &&output)`
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- `OutputDataType const & OutputParameter () const`
Get the output parameter.
- `OutputDataType & OutputParameter ()`
Modify the output parameter.
- `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialize the layer.

39.87.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::Join< InputDataType, OutputDataType >
```

Implementation of the **Join** (p. 753) module class.

The **Join** (p. 753) class accumulates the output of various modules.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 33 of file join.hpp.

39.87.2 Constructor & Destructor Documentation

39.87.2.1 Join()

```
Join ( )
```

Create the **Join** (p. 753) object.

39.87.3 Member Function Documentation

39.87.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.87.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 69 of file join.hpp.

39.87.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 71 of file join.hpp.

References Join< InputDataType, OutputDataType >::serialize().

39.87.3.4 Forward()

```
void Forward (
    const InputType && input,
    OutputType && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.87.3.5 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 64 of file join.hpp.

39.87.3.6 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 66 of file join.hpp.

39.87.3.7 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by Join< InputDataType, OutputDataType >::Delta().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ **join.hpp**

39.88 KathirvalavakumarSubavathilInitialization Class Reference

This class is used to initialize the weight matrix with the method proposed by T.

Public Member Functions

- template<typename eT >
KathirvalavakumarSubavathilInitialization (const arma::Mat< eT > &data, const double s)
Initialize the random initialization rule with the given values.
- template<typename eT >
void **Initialize** (arma::Mat< eT > &W, const size_t rows, const size_t cols)
Initialize the elements of the specified weight matrix with the Kathirvalavakumar-Subavathi method.
- template<typename eT >
void **Initialize** (arma::Cube< eT > &W, const size_t rows, const size_t cols, const size_t slices)
Initialize the elements of the specified weight 3rd order tensor with the Kathirvalavakumar-Subavathi method.

39.88.1 Detailed Description

This class is used to initialize the weight matrix with the method proposed by T.

Kathirvalavakumar and S. Subavathi. The method is based on sensitivity analysis using using cauchy's inequality. The method is defined by

$$\begin{aligned}\bar{s} &= f^{-1}(t) \\ \Theta_p^1 &\leq \bar{s} \sqrt{\frac{3}{I \sum_{i=1}^I (x_{ip}^2)}} \\ \Theta^1 &= \min(\Theta_p^1); p = 1, 2, \dots, P \\ -\Theta^1 &\leq w_i^1 \leq \Theta^1\end{aligned}$$

where I is the number of inputs including the bias, p refers the pattern considered in training, f is the transfer function and $\{s\}$ is the active region in which the derivative of the activation function is greater than 4% of the maximum derivatives.

Definition at line 60 of file kathirvalavakumar_subavathi_init.hpp.

39.88.2 Constructor & Destructor Documentation

39.88.2.1 KathirvalavakumarSubavathiInitialization()

```
KathirvalavakumarSubavathiInitialization (
    const arma::Mat< eT > & data,
    const double s ) [inline]
```

Initialize the random initialization rule with the given values.

Parameters

<i>data</i>	The input patterns.
<i>s</i>	Parameter that defines the active region.

Definition at line 70 of file kathirvalavakumar_subavathi_init.hpp.

39.88.3 Member Function Documentation

39.88.3.1 Initialize() [1/2]

```
void Initialize (
    arma::Mat< eT > & W,
    const size_t rows,
    const size_t cols ) [inline]
```

Initialize the elements of the specified weight matrix with the Kathirvalavakumar-Subavathi method.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.

Definition at line 85 of file `kathirvalavakumar_subavathi_init.hpp`.

References `RandomInitialization::Initialize()`.

Referenced by `KathirvalavakumarSubavathiInitialization::Initialize()`.

39.88.3.2 Initialize() [2/2]

```
void Initialize (
    arma::Cube< eT > & W,
    const size_t rows,
    const size_t cols,
    const size_t slices ) [inline]
```

Initialize the elements of the specified weight 3rd order tensor with the Kathirvalavakumar-Subavathi method.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.

Definition at line 102 of file `kathirvalavakumar_subavathi_init.hpp`.

References `KathirvalavakumarSubavathiInitialization::Initialize()`.

39.89 KLDivergence< InputDataType, OutputDataType > Class Template Reference

The Kullback–Leibler divergence is often used for continuous distributions (direct regression).

Public Member Functions

- **KLDivergence** (const bool takeMean=false)
Create the Kullback–Leibler Divergence object with the specified parameters.
- template<typename InputType , typename TargetType , typename OutputType >
void **Backward** (const InputType &&input, const TargetType &&target, OutputType &&output)
Ordinary feed backward pass of a neural network.
- template<typename InputType , typename TargetType >
double **Forward** (const InputType &&input, const TargetType &&target)
Computes the Kullback–Leibler divergence error function.
- OutputDataType & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the loss function.
- bool **TakeMean** () const
Get the value of takeMean.
- bool & **TakeMean** ()
Modify the value of takeMean.

39.89.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::KLDivergence< InputDataType, OutputDataType >
```

The Kullback–Leibler divergence is often used for continuous distributions (direct regression).

For more information, see the following paper.

```
article{Kullback1951,
  title   = {On Information and Sufficiency},
  author  = {S. Kullback, R.A. Leibler},

  year    = {1951}
}
```

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 45 of file kl_divergence.hpp.

39.89.2 Constructor & Destructor Documentation

39.89.2.1 KLDivergence()

```
KLDivergence (  
    const bool takeMean = false )
```

Create the Kullback–Leibler Divergence object with the specified parameters.

Parameters

<i>takeMean</i>	Boolean variable to specify whether to take mean or not.
-----------------	--

39.89.3 Member Function Documentation

39.89.3.1 Backward()

```
void Backward (  
    const InputType && input,  
    const TargetType && target,  
    OutputType && output )
```

Ordinary feed backward pass of a neural network.

Parameters

<i>input</i>	The propagated input activation.
<i>target</i>	The target vector.
<i>output</i>	The calculated error.

39.89.3.2 Forward()

```
double Forward (  
    const InputType && input,  
    const TargetType && target )
```

Computes the Kullback–Leibler divergence error function.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>target</i>	Target data to compare with.

39.89.3.3 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 78 of file kl_divergence.hpp.

39.89.3.4 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 80 of file kl_divergence.hpp.

39.89.3.5 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the loss function.

Referenced by KLDivergence< InputDataType, OutputDataType >::TakeMean().

39.89.3.6 TakeMean() [1/2]

```
bool TakeMean ( ) const [inline]
```

Get the value of takeMean.

Definition at line 83 of file kl_divergence.hpp.

39.89.3.7 TakeMean() [2/2]

```
bool& TakeMean ( ) [inline]
```

Modify the value of takeMean.

Definition at line 85 of file kl_divergence.hpp.

References KLDivergence< InputDataType, OutputDataType >::serialize().

39.90 LayerNorm< InputDataType, OutputDataType > Class Template Reference

Declaration of the Layer Normalization class.

Public Member Functions

- **LayerNorm** ()
*Create the **LayerNorm** (p. 762) object.*
- **LayerNorm** (const size_t size, const double eps=1e-8)
*Create the **LayerNorm** (p. 762) object for a specified number of input units.*
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Backward pass through the layer.
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename eT >
void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Forward pass of Layer Normalization.
- template<typename eT >
void **Gradient** (const arma::Mat< eT > &&input, arma::Mat< eT > &&error, arma::Mat< eT > &&gradient)
Calculate the gradient using the output delta and the input activations.
- OutputDataType const & **Gradient** () const
Get the gradient.
- OutputDataType & **Gradient** ()
Modify the gradient.
- OutputDataType **Mean** ()
Get the mean across single training data.
- OutputDataType const & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()

Modify the output parameter.

- OutputDataType const & **Parameters** () const

Get the parameters.

- OutputDataType & **Parameters** ()

Modify the parameters.

- void **Reset** ()

Reset the layer parameters.

- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)

Serialize the layer.

- OutputDataType **Variance** ()

Get the variance across single training data.

39.90.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::LayerNorm< InputDataType, OutputDataType >
```

Declaration of the Layer Normalization class.

The layer transforms the input data into zero mean and unit variance and then scales and shifts the data by parameters, gamma and beta respectively over a single training data. These parameters are learnt by the network. Layer Normalization is different from Batch Normalization in the way that normalization is done for individual training cases, and the mean and standard deviations are computed across the layer dimensions, as opposed to across the batch.

For more information, refer to the following papers,

```

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 65 of file layer_norm.hpp.

39.90.2 Constructor & Destructor Documentation

39.90.2.1 LayerNorm() [1/2]

```
LayerNorm ( )
```

Create the **LayerNorm** (p. 762) object.

39.90.2.2 LayerNorm() [2/2]

```
LayerNorm (
    const size_t size,
    const double eps = 1e-8 )
```

Create the **LayerNorm** (p. 762) object for a specified number of input units.

Parameters

<i>size</i>	The number of input units.
<i>eps</i>	The epsilon added to variance to ensure numerical stability.

39.90.3 Member Function Documentation

39.90.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Backward pass through the layer.

Parameters

<i>input</i>	The input activations.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.90.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 130 of file layer_norm.hpp.

39.90.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 132 of file layer_norm.hpp.

39.90.3.4 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Forward pass of Layer Normalization.

Transforms the input data into zero mean and unit variance, scales the data by a factor gamma and shifts it by beta.

Parameters

<i>input</i>	Input data for the layer.
<i>output</i>	Resulting output activations.

39.90.3.5 Gradient() [1/3]

```
void Gradient (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient )
```

Calculate the gradient using the output delta and the input activations.

Parameters

<i>input</i>	The input activations.
<i>error</i>	The calculated error.
<i>gradient</i>	The calculated gradient.

39.90.3.6 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 135 of file layer_norm.hpp.

39.90.3.7 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 137 of file layer_norm.hpp.

39.90.3.8 Mean()

```
OutputDataType Mean ( ) [inline]
```

Get the mean across single training data.

Definition at line 140 of file layer_norm.hpp.

39.90.3.9 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 125 of file layer_norm.hpp.

39.90.3.10 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 127 of file layer_norm.hpp.

39.90.3.11 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 120 of file layer_norm.hpp.

39.90.3.12 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 122 of file layer_norm.hpp.

39.90.3.13 Reset()

```
void Reset ( )
```

Reset the layer parameters.

39.90.3.14 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by LayerNorm< InputDataType, OutputDataType >::Variance().

39.90.3.15 Variance()

```
OutputDataType Variance ( ) [inline]
```

Get the variance across single training data.

Definition at line 143 of file layer_norm.hpp.

References LayerNorm< InputDataType, OutputDataType >::serialize().

39.91 LayerTraits< LayerType > Class Template Reference

This is a template class that can provide information about various layers.

Static Public Attributes

- static const bool **IsBiasLayer** = false
This is true if the layer is a bias layer.
- static const bool **IsBinary** = false
This is true if the layer is a binary layer.
- static const bool **IsConnection** = false
- static const bool **IsLSTMLayer** = false
- static const bool **IsOutputLayer** = false
This is true if the layer is an output layer.

39.91.1 Detailed Description

```
template<typename LayerType>  
class mlpack::ann::LayerTraits< LayerType >
```

This is a template class that can provide information about various layers.

By default, this class will provide the weakest possible assumptions on layer, and each layer should override values as necessary. If a layer doesn't need to override a value, then there's no need to write a **LayerTraits** (p. 769) specialization for that class.

Definition at line 29 of file layer_traits.hpp.

39.91.2 Member Data Documentation

39.91.2.1 IsBiasLayer

```
const bool IsBiasLayer = false [static]
```

This is true if the layer is a bias layer.

Definition at line 45 of file layer_traits.hpp.

39.91.2.2 IsBinary

```
const bool IsBinary = false [static]
```

This is true if the layer is a binary layer.

Definition at line 35 of file layer_traits.hpp.

39.91.2.3 IsConnection

```
const bool IsConnection = false [static]
```

Definition at line 55 of file layer_traits.hpp.

39.91.2.4 IsLSTMLayer

```
const bool IsLSTMLayer = false [static]
```

Definition at line 50 of file layer_traits.hpp.

39.91.2.5 IsOutputLayer

```
const bool IsOutputLayer = false [static]
```

This is true if the layer is an output layer.

Definition at line 40 of file layer_traits.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ **layer_traits.hpp**

39.92 LeakyReLU< InputDataType, OutputDataType > Class Template Reference

The **LeakyReLU** (p. 771) activation function, defined by.

Public Member Functions

- **LeakyReLU** (const double alpha=0.03)
*Create the **LeakyReLU** (p. 771) object using the specified parameters.*
- double const & **Alpha** () const
Get the non zero gradient.
- double & **Alpha** ()
Modify the non zero gradient.
- template<typename DataType >
void **Backward** (const DataType &&input, DataType &&gy, DataType &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename InputType , typename OutputType >
void **Forward** (const InputType &&input, OutputType &&output)
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- OutputDataType const & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.92.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::LeakyReLU< InputDataType, OutputDataType >
```

The **LeakyReLU** (p. 771) activation function, defined by.

$$f(x) = \max(x, \alpha * x)$$

$$f'(x) = \begin{cases} 1 & : x > 0 \\ \alpha & : x \leq 0 \end{cases}$$

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 44 of file leaky_relu.hpp.

39.92.2 Constructor & Destructor Documentation

39.92.2.1 LeakyReLU()

```
LeakyReLU (
    const double alpha = 0.03 )
```

Create the **LeakyReLU** (p. 771) object using the specified parameters.

The non zero gradient can be adjusted by specifying the parameter alpha in the range 0 to 1. Default (alpha = 0.03)

Parameters

<i>alpha</i>	Non zero gradient
--------------	-------------------

39.92.3 Member Function Documentation

39.92.3.1 Alpha() [1/2]

```
double const& Alpha ( ) const [inline]
```

Get the non zero gradient.

Definition at line 89 of file leaky_relu.hpp.

39.92.3.2 Alpha() [2/2]

```
double& Alpha ( ) [inline]
```

Modify the non zero gradient.

Definition at line 91 of file leaky_relu.hpp.

References `LeakyReLU< InputDataType, OutputDataType >::serialize()`.

39.92.3.3 Backward()

```
void Backward (
    const DataType && input,
    DataType && gy,
    DataType && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.92.3.4 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 84 of file leaky_relu.hpp.

39.92.3.5 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 86 of file leaky_relu.hpp.

39.92.3.6 Forward()

```
void Forward (
    const InputType && input,
    OutputType && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.92.3.7 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 79 of file leaky_relu.hpp.

39.92.3.8 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 81 of file leaky_relu.hpp.

39.92.3.9 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by LeakyReLU< InputDataType, OutputDataType >::Alpha().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ **leaky_relu.hpp**

39.93 LecunNormalInitialization Class Reference

This class is used to initialize weight matrix with the Lecun Normalization initialization rule.

Public Member Functions

- **LecunNormalInitialization** ()
*Initialize the **LecunNormalInitialization** (p. 774) object.*
- void **Initialize** (arma::mat &W, const size_t rows, const size_t cols)
Initialize the elements of the weight matrix with the Lecun Normal initialization rule.
- void **Initialize** (arma::cube &W, const size_t rows, const size_t cols, const size_t slices)
Initialize the elements of the specified weight 3rd order tensor with Lecun Normal initialization rule.

39.93.1 Detailed Description

This class is used to initialize weight matrix with the Lecun Normalization initialization rule.

For more information, the following papers can be referred to:

39.93.2 Constructor & Destructor Documentation

39.93.2.1 LecunNormalInitialization()

```
LecunNormalInitialization ( ) [inline]
```

Initialize the **LecunNormalInitialization** (p. 774) object.

Definition at line 55 of file lecun_normal_init.hpp.

39.93.3 Member Function Documentation

39.93.3.1 Initialize() [1/2]

```
void Initialize (
    arma::mat & W,
    const size_t rows,
    const size_t cols ) [inline]
```

Initialize the elements of the weight matrix with the Lecun Normal initialization rule.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.

Definition at line 68 of file `lecun_normal_init.hpp`.

Referenced by `LecunNormalInitialization::Initialize()`.

39.93.3.2 Initialize() [2/2]

```
void Initialize (
    arma::cube & W,
    const size_t rows,
    const size_t cols,
    const size_t slices ) [inline]
```

Initialize the elements of the specified weight 3rd order tensor with Lecun Normal initialization rule.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.
<i>slice</i>	Numbers of slices.

Definition at line 96 of file `lecun_normal_init.hpp`.

39.94.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::Linear< InputDataType, OutputDataType >
```

Implementation of the **Linear** (p. 776) layer class.

The **Linear** (p. 776) class represents a single layer of a neural network.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 59 of file layer_types.hpp.

39.94.2 Constructor & Destructor Documentation

39.94.2.1 Linear() [1/2]

```
Linear ( )
```

Create the **Linear** (p. 776) object.

39.94.2.2 Linear() [2/2]

```
Linear (
    const size_t inSize,
    const size_t outSize )
```

Create the **Linear** (p. 776) layer object using the specified number of units.

Parameters

<i>inSize</i>	The number of input units.
<i>outSize</i>	The number of output units.

39.94.3 Member Function Documentation

39.94.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
```

```
arma::Mat< eT > && gy,
arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.94.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 107 of file linear.hpp.

39.94.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 109 of file linear.hpp.

39.94.3.4 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.94.3.5 Gradient() [1/3]

```
void Gradient (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient )
```

39.94.3.6 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 112 of file linear.hpp.

39.94.3.7 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 114 of file linear.hpp.

References `Linear< InputDataType, OutputDataType >::serialize()`.

39.94.3.8 InputParameter() [1/2]

```
InputDataType const& InputParameter ( ) const [inline]
```

Get the input parameter.

Definition at line 97 of file linear.hpp.

39.94.3.9 InputParameter() [2/2]

```
InputDataType& InputParameter ( ) [inline]
```

Modify the input parameter.

Definition at line 99 of file linear.hpp.

39.94.3.10 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 102 of file linear.hpp.

39.94.3.11 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 104 of file linear.hpp.

39.94.3.12 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 92 of file linear.hpp.

39.94.3.13 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 94 of file linear.hpp.

39.94.3.14 Reset()

```
void Reset ( )
```

39.94.3.15 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

- Serialize the layer.*

39.95.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::LinearNoBias< InputDataType, OutputDataType >
```

Implementation of the **LinearNoBias** (p. 782) class.

The **LinearNoBias** (p. 782) class represents a single layer of a neural network.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 60 of file layer_types.hpp.

39.95.2 Constructor & Destructor Documentation

39.95.2.1 LinearNoBias() [1/2]

```
LinearNoBias ( )
```

Create the **LinearNoBias** (p. 782) object.

39.95.2.2 LinearNoBias() [2/2]

```
LinearNoBias (  
    const size_t inSize,  
    const size_t outSize )
```

Create the **LinearNoBias** (p. 782) object using the specified number of units.

Parameters

<i>inSize</i>	The number of input units.
<i>outSize</i>	The number of output units.

39.95.3 Member Function Documentation

39.95.3.1 Backward()

```
void Backward (  
    const arma::Mat< eT > && ,  
    arma::Mat< eT > && gy,  
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.95.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 106 of file linear_no_bias.hpp.

39.95.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 108 of file linear_no_bias.hpp.

39.95.3.4 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.95.3.5 Gradient() [1/3]

```
void Gradient (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient )
```

39.95.3.6 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 111 of file linear_no_bias.hpp.

39.95.3.7 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 113 of file linear_no_bias.hpp.

References LinearNoBias< InputDataType, OutputDataType >::serialize().

39.95.3.8 InputParameter() [1/2]

```
InputDataType const& InputParameter ( ) const [inline]
```

Get the input parameter.

Definition at line 96 of file linear_no_bias.hpp.

39.95.3.9 InputParameter() [2/2]

```
InputDataType& InputParameter ( ) [inline]
```

Modify the input parameter.

Definition at line 98 of file linear_no_bias.hpp.

39.95.3.10 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 101 of file linear_no_bias.hpp.

39.95.3.11 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 103 of file linear_no_bias.hpp.

39.95.3.12 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 91 of file linear_no_bias.hpp.

39.95.3.13 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 93 of file linear_no_bias.hpp.

39.95.3.14 Reset()

```
void Reset ( )
```

39.95.3.15 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by LinearNoBias< InputDataType, OutputDataType >::Gradient().

39.96 LoadOutputParameterVisitor Class Reference

LoadOutputParameterVisitor (p. 788) restores the output parameter using the given parameter set.

Inheritance diagram for LoadOutputParameterVisitor:

Public Member Functions

- **LoadOutputParameterVisitor** (std::vector< arma::mat > &¶meter)
Restore the output parameter given a parameter set.
- template<typename LayerType >
 void **operator()** (LayerType *layer) const
Restore the output parameter.

39.96.1 Detailed Description

LoadOutputParameterVisitor (p. 788) restores the output parameter using the given parameter set.

Definition at line 28 of file load_output_parameter_visitor.hpp.

39.96.2 Constructor & Destructor Documentation

39.96.2.1 LoadOutputParameterVisitor()

```

LoadOutputParameterVisitor (
    std::vector< arma::mat > && parameter )
  
```

Restore the output parameter given a parameter set.

39.96.3 Member Function Documentation

39.96.3.1 operator>()

```
void operator() (
    LayerType * layer ) const
```

Restore the output parameter.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **load_output_parameter_visitor.hpp**

39.97 LogisticFunction Class Reference

The logistic function, defined by.

Static Public Member Functions

- static double **Deriv** (const double y)
Computes the first derivative of the logistic function.
- template<typename InputVecType , typename OutputVecType >
static void **Deriv** (const InputVecType &y, OutputVecType &x)
Computes the first derivatives of the logistic function.
- template<typename eT >
static double **Fn** (const eT x)
Computes the logistic function.
- template<typename InputVecType , typename OutputVecType >
static void **Fn** (const InputVecType &x, OutputVecType &y)
Computes the logistic function.
- static double **Inv** (const double y)
Computes the inverse of the logistic function.
- template<typename InputVecType , typename OutputVecType >
static void **Inv** (const InputVecType &y, OutputVecType &x)
Computes the inverse of the logistic function.

39.97.1 Detailed Description

The logistic function, defined by.

$$\begin{aligned} f(x) &= \frac{1}{1 + e^{-x}} \\ f'(x) &= f(x) * (1 - f(x)) \\ f^{-1}(y) &= \ln\left(\frac{y}{1 - y}\right) \end{aligned}$$

Definition at line 29 of file logistic_function.hpp.

39.97.2 Member Function Documentation

39.97.2.1 Deriv() [1/2]

```
static double Deriv (  
    const double y ) [inline], [static]
```

Computes the first derivative of the logistic function.

Parameters

<i>x</i>	Input data.
----------	-------------

Returns

$f'(x)$

Definition at line 70 of file logistic_function.hpp.

39.97.2.2 Deriv() [2/2]

```
static void Deriv (  
    const InputVecType & y,  
    OutputVecType & x ) [inline], [static]
```

Computes the first derivatives of the logistic function.

Parameters

<i>y</i>	Input activations.
<i>x</i>	The resulting derivatives.

Definition at line 82 of file logistic_function.hpp.

39.97.2.3 Fn() [1/2]

```
static double Fn (  
    const eT x ) [inline], [static]
```

Computes the logistic function.

Parameters

<i>x</i>	Input data.
----------	-------------

Returns

$f(x)$.

Definition at line 39 of file logistic_function.hpp.

39.97.2.4 Fn() [2/2]

```
static void Fn (  
    const InputVecType & x,  
    OutputVecType & y ) [inline], [static]
```

Computes the logistic function.

Parameters

<i>x</i>	Input data.
<i>y</i>	The resulting output activation.

Definition at line 59 of file logistic_function.hpp.

39.97.2.5 Inv() [1/2]

```
static double Inv (  
    const double y ) [inline], [static]
```

Computes the inverse of the logistic function.

Parameters

<i>y</i>	Input data.
----------	-------------

Returns

$f^{-1}(y)$

Definition at line 93 of file logistic_function.hpp.

39.97.2.6 Inv() [2/2]

```
static void Inv (
    const InputVecType & y,
    OutputVecType & x ) [inline], [static]
```

Computes the inverse of the logistic function.

Parameters

<i>y</i>	Input data.
----------	-------------

Returns

x The resulting inverse of the input data.

Definition at line 105 of file `logistic_function.hpp`.

39.98 LogSoftMax< InputDataType, OutputDataType > Class Template Reference

Implementation of the log softmax layer.

Public Member Functions

- **LogSoftMax** ()
Create the LogSoftmax object.
- `template<typename eT >`
`void Backward (const arma::Mat< eT > &&input, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)`
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- `InputDataType & Delta () const`
Get the delta.
- `InputDataType & Delta ()`
Modify the delta.
- `template<typename InputType , typename OutputType >`
`void Forward (const InputType &&input, OutputType &&output)`
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- `OutputDataType & OutputParameter () const`
Get the output parameter.
- `OutputDataType & OutputParameter ()`
Modify the output parameter.
- `template<typename Archive >`
`void serialize (Archive &, const unsigned int)`
Serialize the layer.

39.98.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::LogSoftMax< InputDataType, OutputDataType >
```

Implementation of the log softmax layer.

The log softmax loss layer computes the multinomial logistic loss of the softmax of its inputs. This layer is meant to be used in combination with the negative log likelihood layer (NegativeLogLikelihoodLayer), which expects that the input contains log-probabilities for each class.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 36 of file log_softmax.hpp.

39.98.2 Constructor & Destructor Documentation

39.98.2.1 LogSoftMax()

```
LogSoftMax ( )
```

Create the LogSoftmax object.

39.98.3 Member Function Documentation

39.98.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.98.3.2 Delta() [1/2]

```
InputDataType& Delta ( ) const [inline]
```

Get the delta.

Definition at line 74 of file log_softmax.hpp.

39.98.3.3 Delta() [2/2]

```
InputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 76 of file log_softmax.hpp.

References `LogSoftMax< InputDataType, OutputDataType >::serialize()`.

39.98.3.4 Forward()

```
void Forward (
    const InputType && input,
    OutputType && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.98.3.5 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 69 of file log_softmax.hpp.

39.98.3.6 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 71 of file log_softmax.hpp.

39.98.3.7 serialize()

```
void serialize (
    Archive & ,
    const unsigned int )
```

Serialize the layer.

Referenced by LogSoftMax< InputDataType, OutputDataType >::Delta().

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ log_softmax.hpp

39.99 Lookup< InputDataType, OutputDataType > Class Template Reference

Implementation of the **Lookup** (p. 795) class.

Public Member Functions

- **Lookup** (const size_t inSize=0, const size_t outSize=0)
*Create the **Lookup** (p. 795) object using the specified number of input and output units.*
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&, const arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename eT >
void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- template<typename eT >
void **Gradient** (const arma::Mat< eT > &&input, arma::Mat< eT > &&error, arma::Mat< eT > &&gradient)
Get the gradient.
- OutputDataType const & **Gradient** () const
Get the gradient.
- OutputDataType & **Gradient** ()
Modify the gradient.
- OutputDataType const & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- OutputDataType const & **Parameters** () const
Get the parameters.
- OutputDataType & **Parameters** ()
Modify the parameters.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.99.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::Lookup< InputDataType, OutputDataType >
```

Implementation of the **Lookup** (p. 795) class.

The **Lookup** (p. 795) class is a particular convolution, where the width of the convolution is 1.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 35 of file lookup.hpp.

39.99.2 Constructor & Destructor Documentation

39.99.2.1 Lookup()

```
Lookup (  
    const size_t inSize = 0,  
    const size_t outSize = 0 )
```

Create the **Lookup** (p. 795) object using the specified number of input and output units.

Parameters

<i>inSize</i>	The number of input units.
<i>outSize</i>	The number of output units.

39.99.3 Member Function Documentation

39.99.3.1 Backward()

```
void Backward (  
    const arma::Mat< eT > && ,  
    const arma::Mat< eT > && gy,  
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.99.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 94 of file lookup.hpp.

39.99.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 96 of file lookup.hpp.

39.99.3.4 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.99.3.5 Gradient() [1/3]

```
void Gradient (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient )
```

39.99.3.6 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 99 of file lookup.hpp.

39.99.3.7 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 101 of file lookup.hpp.

References Lookup< InputDataType, OutputDataType >::serialize().

39.99.3.8 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 89 of file lookup.hpp.

39.99.3.9 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 91 of file lookup.hpp.

39.99.3.10 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 84 of file lookup.hpp.

39.99.3.11 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 86 of file lookup.hpp.

39.99.3.12 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by `Lookup< InputDataType, OutputDataType >::Gradient()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ lookup.hpp`

39.100 LossVisitor Class Reference

LossVisitor (p. 800) exposes the `Loss()` method of the given module.

Inheritance diagram for LossVisitor:

**Public Member Functions**

- `template<typename LayerType >`
`double operator() (LayerType *layer) const`
Return the Loss.

39.100.1 Detailed Description

LossVisitor (p. 800) exposes the Loss() method of the given module.

Definition at line 26 of file loss_visitor.hpp.

39.100.2 Member Function Documentation

39.100.2.1 operator>()

```
double operator() (
    LayerType * layer ) const
```

Return the Loss.

The documentation for this class was generated from the following file:

39.101 LSTM< InputDataType, OutputDataType > Class Template Reference

Implementation of the **LSTM** (p. 801) module class.

Public Member Functions

- **LSTM** ()
*Create the **LSTM** (p. 801) object.*
- **LSTM** (const size_t inSize, const size_t outSize, const size_t rho=std::numeric_limits< size_t >::max())
*Create the **LSTM** (p. 801) layer object using the specified parameters.*
- template<typename InputType , typename ErrorType , typename GradientType >
void **Backward** (const InputType &&input, ErrorType &&gy, GradientType &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename InputType , typename OutputType >
void **Forward** (InputType &&input, OutputType &&output)
Ordinary feed-forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- template<typename InputType , typename OutputType >
void **Forward** (InputType &&input, OutputType &&output, OutputType &&cellState, bool useCellState=false)

Ordinary feed-forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

- `template<typename InputType , typename ErrorType , typename GradientType >`
`void Gradient (InputType &&input, ErrorType &&error, GradientType &&gradient)`
- `OutputDataType const & Gradient () const`
Get the gradient.
- `OutputDataType & Gradient ()`
Modify the gradient.
- `OutputDataType const & OutputParameter () const`
Get the output parameter.
- `OutputDataType & OutputParameter ()`
Modify the output parameter.
- `OutputDataType const & Parameters () const`
Get the parameters.
- `OutputDataType & Parameters ()`
Modify the parameters.
- `void Reset ()`
- `void ResetCell (const size_t size)`
- `size_t Rho () const`
Get the maximum number of steps to backpropagate through time (BPTT).
- `size_t & Rho ()`
Modify the maximum number of steps to backpropagate through time (BPTT).
- `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialize the layer.

39.101.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::LSTM< InputDataType, OutputDataType >
```

Implementation of the **LSTM** (p. 801) module class.

The implementation corresponds to the following algorithm:

$$i = \text{sigmoid}(W \cdot x + W \cdot h + W \cdot c + b) \quad (39.7)$$

$$f = \text{sigmoid}(W \cdot x + W \cdot h + W \cdot c + b) \quad (39.8)$$

$$z = \tanh(W \cdot x + W \cdot h + b) \quad (39.9)$$

$$c = f \cdot c + i \cdot z \quad (39.10)$$

$$o = \text{sigmoid}(W \cdot x + W \cdot h + W \cdot c + b) \quad (39.11)$$

$$h = o \cdot \tanh(c) \quad (39.12)$$

For more information, see the following.

}
```

See also

FastLSTM (p. 685) for a faster **LSTM** (p. 801) version which combines the calculation of the input, forget, output gates and hidden state in a single step.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 61 of file layer_types.hpp.

39.101.2 Constructor & Destructor Documentation

39.101.2.1 LSTM() ^[1/2]

LSTM ()

Create the **LSTM** (p. 801) object.

39.101.2.2 LSTM() ^[2/2]

```
LSTM (
    const size_t inSize,
    const size_t outSize,
    const size_t rho = std::numeric_limits< size_t >::max() )
```

Create the **LSTM** (p. 801) layer object using the specified parameters.

Parameters

<i>inSize</i>	The number of input units.
<i>outSize</i>	The number of output units.
<i>rho</i>	Maximum number of steps to backpropagate through time (BPTT).

39.101.3 Member Function Documentation

39.101.3.1 Backward()

```
void Backward (
    const InputType && input,
    ErrorType && gy,
    GradientType && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.101.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 155 of file `Istm.hpp`.

39.101.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 157 of file `Istm.hpp`.

39.101.3.4 Forward() [1/2]

```
void Forward (
    InputType && input,
    OutputType && output )
```

Ordinary feed-forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.101.3.5 Forward() [2/2]

```
void Forward (
    InputType && input,
    OutputType && output,
    OutputType && cellState,
    bool useCellState = false )
```

Ordinary feed-forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.
<i>cellState</i>	Cell state of the LSTM (p. 801).
<i>useCellState</i>	Use the cellState passed in the LSTM (p. 801) cell.

39.101.3.6 Gradient() [1/3]

```
void Gradient (
    InputType && input,
    ErrorType && error,
    GradientType && gradient )
```

39.101.3.7 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 160 of file lstm.hpp.

39.101.3.8 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 162 of file lstm.hpp.

References LSTM< InputDataType, OutputDataType >::serialize().

39.101.3.9 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 150 of file lstm.hpp.

39.101.3.10 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 152 of file lstm.hpp.

39.101.3.11 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 145 of file lstm.hpp.

39.101.3.12 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 147 of file lstm.hpp.

39.101.3.13 Reset()

```
void Reset ( )
```

39.101.3.14 ResetCell()

```
void ResetCell (
    const size_t size )
```

39.101.3.15 Rho() [1/2]

```
size_t Rho ( ) const [inline]
```

Get the maximum number of steps to backpropagate through time (BPTT).

Definition at line 140 of file `Istm.hpp`.

39.101.3.16 Rho() [2/2]

```
size_t& Rho ( ) [inline]
```

Modify the maximum number of steps to backpropagate through time (BPTT).

Definition at line 142 of file `Istm.hpp`.

39.101.3.17 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by LSTM< InputDataType, OutputDataType >::Gradient().

The documentation for this class was generated from the following files:

39.102 MaxPooling< InputDataType, OutputDataType > Class Template Reference

Implementation of the **MaxPooling** (p. 808) layer.

Public Member Functions

- **MaxPooling** ()
*Create the **MaxPooling** (p. 808) object.*
- **MaxPooling** (const size_t kW, const size_t kH, const size_t dW=1, const size_t dH=1, const bool floor=true)
*Create the **MaxPooling** (p. 808) object using the specified number of units.*
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of a neural network, using 3rd-order tensors as input, calculating the function f(x) by propagating x backwards through f.
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- bool **Deterministic** () const
Get the value of the deterministic parameter.
- bool & **Deterministic** ()
Modify the value of the deterministic parameter.
- template<typename eT >
void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Ordinary feed forward pass of a neural network, evaluating the function f(x) by propagating the activity forward through f.
- size_t const & **InputHeight** () const
Get the height.
- size_t & **InputHeight** ()
Modify the height.
- size_t const & **InputWidth** () const
Get the width.
- size_t & **InputWidth** ()
Modify the width.
- size_t const & **OutputHeight** () const
Get the height.
- size_t & **OutputHeight** ()
Modify the height.
- OutputDataType const & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- size_t const & **OutputWidth** () const
Get the width.
- size_t & **OutputWidth** ()
Modify the width.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.102.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::MaxPooling< InputDataType, OutputDataType >
```

Implementation of the **MaxPooling** (p. 808) layer.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 52 of file max_pooling.hpp.

39.102.2 Constructor & Destructor Documentation

39.102.2.1 MaxPooling() [1/2]

```
MaxPooling ( )
```

Create the **MaxPooling** (p. 808) object.

39.102.2.2 MaxPooling() [2/2]

```
MaxPooling (
    const size_t kW,
    const size_t kH,
    const size_t dW = 1,
    const size_t dH = 1,
    const bool floor = true )
```

Create the **MaxPooling** (p. 808) object using the specified number of units.

Parameters

<i>kW</i>	Width of the pooling window.
<i>kH</i>	Height of the pooling window.
<i>dW</i>	Width of the stride operation.
<i>dH</i>	Width of the stride operation.
<i>floor</i>	Rounding operator (floor or ceil).

39.102.3 Member Function Documentation

39.102.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, using 3rd-order tensors as input, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.102.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 103 of file max_pooling.hpp.

39.102.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 105 of file max_pooling.hpp.

39.102.3.4 Deterministic() [1/2]

```
bool Deterministic ( ) const [inline]
```

Get the value of the deterministic parameter.

Definition at line 128 of file max_pooling.hpp.

39.102.3.5 Deterministic() [2/2]

```
bool& Deterministic ( ) [inline]
```

Modify the value of the deterministic parameter.

Definition at line 130 of file max_pooling.hpp.

39.102.3.6 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.102.3.7 InputHeight() [1/2]

```
size_t const& InputHeight ( ) const [inline]
```

Get the height.

Definition at line 113 of file max_pooling.hpp.

39.102.3.8 InputHeight() [2/2]

```
size_t& InputHeight ( ) [inline]
```

Modify the height.

Definition at line 115 of file max_pooling.hpp.

39.102.3.9 InputWidth() [1/2]

```
size_t const& InputWidth ( ) const [inline]
```

Get the width.

Definition at line 108 of file max_pooling.hpp.

39.102.3.10 InputWidth() [2/2]

```
size_t& InputWidth ( ) [inline]
```

Modify the width.

Definition at line 110 of file max_pooling.hpp.

39.102.3.11 OutputHeight() [1/2]

```
size_t const& OutputHeight ( ) const [inline]
```

Get the height.

Definition at line 123 of file max_pooling.hpp.

39.102.3.12 OutputHeight() [2/2]

```
size_t& OutputHeight ( ) [inline]
```

Modify the height.

Definition at line 125 of file max_pooling.hpp.

39.102.3.13 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 98 of file max_pooling.hpp.

39.102.3.14 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 100 of file max_pooling.hpp.

39.102.3.15 OutputWidth() [1/2]

```
size_t const& OutputWidth ( ) const [inline]
```

Get the width.

Definition at line 118 of file max_pooling.hpp.

39.102.3.16 OutputWidth() [2/2]

```
size_t& OutputWidth ( ) [inline]
```

Modify the width.

Definition at line 120 of file max_pooling.hpp.

39.102.3.17 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

39.104.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>  
class mlpack::ann::MeanPooling< InputDataType, OutputDataType >
```

Implementation of the **MeanPooling** (p. 814).

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 33 of file mean_pooling.hpp.

39.104.2 Constructor & Destructor Documentation

39.104.2.1 MeanPooling() [1/2]

```
MeanPooling ( )
```

Create the **MeanPooling** (p. 814) object.

39.104.2.2 MeanPooling() [2/2]

```
MeanPooling (
    const size_t kW,
    const size_t kH,
    const size_t dW = 1,
    const size_t dH = 1,
    const bool floor = true )
```

Create the **MeanPooling** (p. 814) object using the specified number of units.

Parameters

<i>kW</i>	Width of the pooling window.
<i>kH</i>	Height of the pooling window.
<i>dW</i>	Width of the stride operation.
<i>dH</i>	Width of the stride operation.

39.104.3 Member Function Documentation

39.104.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, using 3rd-order tensors as input, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.104.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 83 of file mean_pooling.hpp.

39.104.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 85 of file mean_pooling.hpp.

39.104.3.4 Deterministic() [1/2]

```
bool Deterministic ( ) const [inline]
```

Get the value of the deterministic parameter.

Definition at line 108 of file mean_pooling.hpp.

39.104.3.5 Deterministic() [2/2]

```
bool& Deterministic ( ) [inline]
```

Modify the value of the deterministic parameter.

Definition at line 110 of file mean_pooling.hpp.

References MeanPooling< InputDataType, OutputDataType >::serialize().

39.104.3.6 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.104.3.7 InputHeight() [1/2]

```
size_t const& InputHeight ( ) const [inline]
```

Get the height.

Definition at line 93 of file mean_pooling.hpp.

39.104.3.8 InputHeight() [2/2]

```
size_t& InputHeight ( ) [inline]
```

Modify the height.

Definition at line 95 of file mean_pooling.hpp.

39.104.3.9 InputWidth() [1/2]

39.106 MeanSquaredError< InputDataType, OutputDataType > Class Template Reference

The mean squared error performance function measures the network's performance according to the mean of squared errors.

Public Member Functions

- **MeanSquaredError** ()
*Create the **MeanSquaredError** (p. 823) object.*
- template<typename InputType , typename TargetType , typename OutputType >
void **Backward** (const InputType &&input, const TargetType &&target, OutputType &&output)
Ordinary feed backward pass of a neural network.
- template<typename InputType , typename TargetType >
double **Forward** (const InputType &&input, const TargetType &&target)
Computes the mean squared error function.
- OutputDataType & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.106.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::MeanSquaredError< InputDataType, OutputDataType >
```

The mean squared error performance function measures the network's performance according to the mean of squared errors.

Template Parameters

<i>ActivationFunction</i>	Activation function used for the embedding layer.
<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 34 of file mean_squared_error.hpp.

39.106.2 Constructor & Destructor Documentation

39.106.2.1 MeanSquaredError()

MeanSquaredError ()

Create the **MeanSquaredError** (p. 823) object.

39.106.3 Member Function Documentation

39.106.3.1 Backward()

```
void Backward (
    const InputType && input,
    const TargetType && target,
    OutputType && output )
```

Ordinary feed backward pass of a neural network.

Parameters

<i>input</i>	The propagated input activation.
<i>target</i>	The target vector.
<i>output</i>	The calculated error.

39.106.3.2 Forward()

```
double Forward (
    const InputType && input,
    const TargetType && target )
```

Computes the mean squared error function.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>target</i>	The target vector.

39.106.3.3 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 63 of file mean_squared_error.hpp.

39.106.3.4 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 65 of file mean_squared_error.hpp.

References MeanSquaredError< InputDataType, OutputDataType >::serialize().

39.106.3.5 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by MeanSquaredError< InputDataType, OutputDataType >::OutputParameter().

39.107 MultiplyConstant< InputDataType, OutputDataType > Class Template Reference

Implementation of the multiply constant layer.

Public Member Functions

- **MultiplyConstant** (const double scalar=1.0)
*Create the **MultiplyConstant** (p. 825) object.*
- template<typename DataType >
void **Backward** (const DataType &&, DataType &&gy, DataType &&g)
Ordinary feed backward pass of a neural network.
- OutputDataType & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename InputType , typename OutputType >
void **Forward** (const InputType &&input, OutputType &&output)
Ordinary feed forward pass of a neural network.
- OutputDataType & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.107.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::MultiplyConstant< InputDataType, OutputDataType >
```

Implementation of the multiply constant layer.

The multiply constant layer multiplies the input by a (non-learnable) constant.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 34 of file multiply_constant.hpp.

39.107.2 Constructor & Destructor Documentation

39.107.2.1 MultiplyConstant()

```
MultiplyConstant (
    const double scalar = 1.0 )
```

Create the **MultiplyConstant** (p. 825) object.

39.107.3 Member Function Documentation

39.107.3.1 Backward()

```
void Backward (
    const DataType && ,
    DataType && gy,
    DataType && g )
```

Ordinary feed backward pass of a neural network.

The backward pass multiplies the error with the specified constant scalar value.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.107.3.2 Delta() [1/2]

```
OutputDataType& Delta ( ) const [inline]
```

Get the delta.

Definition at line 69 of file multiply_constant.hpp.

39.107.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 71 of file multiply_constant.hpp.

References `MultiplyConstant< InputDataType, OutputDataType >::serialize()`.

39.107.3.4 Forward()

```
void Forward (
    const InputType && input,
    OutputType && output )
```

Ordinary feed forward pass of a neural network.

Multiply the input with the specified constant scalar value.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.107.3.5 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 64 of file multiply_constant.hpp.

39.107.3.6 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 66 of file multiply_constant.hpp.

39.107.3.7 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by `MultiplyConstant< InputDataType, OutputDataType >::Delta()`.

- *Serialize the layer.*

39.108.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat, typename... CustomLayers>
class mlpack::ann::MultiplyMerge< InputDataType, OutputDataType, CustomLayers >
```

Implementation of the **MultiplyMerge** (p. 829) module class.

The **MultiplyMerge** (p. 829) class multiplies the output of various modules element-wise.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>CustomLayers</i>	Additional custom layers that can be added.

Definition at line 141 of file layer_types.hpp.

39.108.2 Constructor & Destructor Documentation

39.108.2.1 MultiplyMerge()

```
MultiplyMerge (
    const bool model = false,
    const bool run = true )
```

Create the **MultiplyMerge** (p. 829) object using the specified parameters.

Parameters

<i>model</i>	Expose all the network modules.
<i>run</i>	Call the Forward/Backward method before the output is merged.

39.108.2.2 ~MultiplyMerge()

```
~ MultiplyMerge ( )
```

Destructor to release allocated memory.

39.108.3 Member Function Documentation

39.108.3.1 Add() [1/2]

```
void Add (
    Args... args ) [inline]
```

Definition at line 98 of file multiply_merge.hpp.

39.108.3.2 Add() [2/2]

```
void Add (
    LayerTypes< CustomLayers... > layer ) [inline]
```

Definition at line 105 of file multiply_merge.hpp.

39.108.3.3 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f , using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.108.3.4 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 113 of file multiply_merge.hpp.

39.108.3.5 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 115 of file multiply_merge.hpp.

39.108.3.6 Forward()

```
void Forward (
    InputType && ,
    OutputType && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.108.3.7 Gradient() [1/3]

```
void Gradient (
    arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient )
```

39.108.3.8 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 118 of file multiply_merge.hpp.

39.108.3.9 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 120 of file multiply_merge.hpp.

39.108.3.10 Model()

```
std::vector< LayerTypes<CustomLayers...> >& Model ( ) [inline]
```

Return the model modules.

Definition at line 123 of file multiply_merge.hpp.

39.108.3.11 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 108 of file multiply_merge.hpp.

39.108.3.12 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 110 of file multiply_merge.hpp.

39.108.3.13 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 134 of file multiply_merge.hpp.

39.108.3.14 Parameters() [2/2]

OutputDataType& Parameters () [inline]

Modify the parameters.

Definition at line 136 of file multiply_merge.hpp.

References MultiplyMerge< InputDataType, OutputDataType, CustomLayers >::serialize().

39.108.3.15 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

39.109.1 Detailed Description

```
template<typename BorderMode = FullConvolution>
class mlpack::ann::NaiveConvolution< BorderMode >
```

Computes the two-dimensional convolution.

This class allows specification of the type of the border type. The convolution can be compute with the valid border type of the full border type (default).

FullConvolution (p. 714): returns the full two-dimensional convolution. **ValidConvolution** (p. 967): returns only those parts of the convolution that are computed without the zero-padded edges.

Template Parameters

<i>BorderMode</i>	Type of the border mode (FullConvolution (p. 714) or ValidConvolution (p. 967)).
-------------------	---

Definition at line 35 of file naive_convolution.hpp.

39.109.2 Member Function Documentation

39.110 NegativeLogLikelihood< InputDataType, OutputDataType > Class Template Reference

Implementation of the negative log likelihood layer.

Public Member Functions

- **NegativeLogLikelihood** ()
Create the NegativeLogLikelihoodLayer object.
- template<typename InputType , typename TargetType , typename OutputType >
void **Backward** (const InputType &&input, const TargetType &&target, OutputType &&output)
Ordinary feed backward pass of a neural network.
- OutputDataType & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename InputType , typename TargetType >
double **Forward** (const InputType &&input, TargetType &&target)
Computes the Negative log likelihood.
- InputDataType & **InputParameter** () const
Get the input parameter.
- InputDataType & **InputParameter** ()
Modify the input parameter.
- OutputDataType & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialize the layer.

39.110.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::NegativeLogLikelihood< InputDataType, OutputDataType >
```

Implementation of the negative log likelihood layer.

The negative log likelihood layer expects that the input contains log-probabilities for each class. The layer also expects a class index, in the range between 1 and the number of classes, as target when calling the Forward function.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 35 of file negative_log_likelihood.hpp.

39.110.2 Constructor & Destructor Documentation

39.110.2.1 NegativeLogLikelihood()

```
NegativeLogLikelihood ( )
```

Create the NegativeLogLikelihoodLayer object.

39.110.3 Member Function Documentation

39.110.3.1 Backward()

```
void Backward (
    const InputType && input,
    const TargetType && target,
    OutputType && output )
```

Ordinary feed backward pass of a neural network.

The negative log likelihood layer expects that the input contains log-probabilities for each class. The layer also expects a class index, in the range between 1 and the number of classes, as target when calling the Forward function.

Parameters

<i>input</i>	The propagated input activation.
<i>target</i>	The target vector, that contains the class index in the range between 1 and the number of classes.
<i>output</i>	The calculated error.

39.110.3.2 Delta() [1/2]

```
OutputDataType& Delta ( ) const [inline]
```

Get the delta.

Definition at line 80 of file `negative_log_likelihood.hpp`.

39.110.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 82 of file `negative_log_likelihood.hpp`.

References `NegativeLogLikelihood< InputDataType, OutputDataType >::serialize()`.

39.110.3.4 Forward()

```
double Forward (
    const InputType && input,
    TargetType && target )
```

Computes the Negative log likelihood.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>target</i>	The target vector, that contains the class index in the range between 1 and the number of classes.

39.110.3.5 InputParameter() [1/2]

```
InputDataType& InputParameter ( ) const [inline]
```

Get the input parameter.

Definition at line 70 of file `negative_log_likelihood.hpp`.

39.110.3.6 InputParameter() [2/2]

```
InputDataType& InputParameter ( ) [inline]
```

Modify the input parameter.

Definition at line 72 of file `negative_log_likelihood.hpp`.

39.110.3.7 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 75 of file `negative_log_likelihood.hpp`.

39.110.3.8 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 77 of file `negative_log_likelihood.hpp`.

39.110.3.9 serialize()

```
void serialize (
    Archive & ,
    const unsigned int )
```

Serialize the layer.

Referenced by `NegativeLogLikelihood< InputDataType, OutputDataType >::Delta()`.

The documentation for this class was generated from the following file:

39.111 NetworkInitialization< InitializationRuleType, CustomLayers > Class Template Reference

This class is used to initialize the network with the given initialization rule.

Public Member Functions

- **NetworkInitialization** (const InitializationRuleType &initializeRule=InitializationRuleType())
Use the given initialization rule to initialize the specified network.
- void **Initialize** (const std::vector< **LayerTypes**< CustomLayers... > > &network, arma::mat ¶meter, size_t parameterOffset=0)
Initialize the specified network and store the results in the given parameter.

39.111.1 Detailed Description

```
template<typename InitializationRuleType, typename... CustomLayers>
class mlpack::ann::NetworkInitialization< InitializationRuleType, CustomLayers >
```

This class is used to initialize the network with the given initialization rule.

Definition at line 33 of file network_init.hpp.

39.111.2 Constructor & Destructor Documentation

39.111.2.1 NetworkInitialization()

```
NetworkInitialization (
    const InitializationRuleType & initializeRule = InitializationRuleType() ) [inline]
```

Use the given initialization rule to initialize the specified network.

Parameters

<i>initializeRule</i>	Rule to initialize the given network.
-----------------------	---------------------------------------

Definition at line 41 of file network_init.hpp.

39.111.3 Member Function Documentation

39.111.3.1 Initialize()

```
void Initialize (
    const std::vector< LayerTypes< CustomLayers... > > & network,
    arma::mat & parameter,
    size_t parameterOffset = 0 ) [inline]
```

Initialize the specified network and store the results in the given parameter.

Parameters

<i>network</i>	Network that should be initialized.
<i>parameter</i>	The network parameter.

Definition at line 55 of file network_init.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/ **network_init.hpp**

39.112 NguyenWidrowInitialization Class Reference

This class is used to initialize the weight matrix with the Nguyen-Widrow method.

Public Member Functions

- **NguyenWidrowInitialization** (const double lowerBound=-0.5, const double upperBound=0.5)
Initialize the random initialization rule with the given lower bound and upper bound.
- template<typename eT >
void **Initialize** (arma::Mat< eT > &W, const size_t rows, const size_t cols)
Initialize the elements of the specified weight matrix with the Nguyen-Widrow method.
- template<typename eT >
void **Initialize** (arma::Cube< eT > &W, const size_t rows, const size_t cols, const size_t slices)
Initialize the elements of the specified weight 3rd order tensor with the Nguyen-Widrow method.

39.112.1 Detailed Description

This class is used to initialize the weight matrix with the Nguyen-Widrow method.

The method is defined by

$$\begin{aligned} \gamma &\leq w_i \leq \gamma \\ \beta &= 0.7H^{\frac{1}{2}} \\ n &= \sqrt{\sum_{i=0} Iw_i^2} \\ w_i &= \frac{\beta w_i}{n} \end{aligned}$$

Where H is the number of neurons in the outgoing layer, I represents the number of neurons in the ingoing layer and gamma defines the random interval that is used to initialize the weights with a random value in a specific range.

Definition at line 53 of file `nguyen_widrow_init.hpp`.

39.112.2 Constructor & Destructor Documentation

39.112.2.1 NguyenWidrowInitialization()

```
NguyenWidrowInitialization (
    const double lowerBound = -0.5,
    const double upperBound = 0.5 ) [inline]
```

Initialize the random initialization rule with the given lower bound and upper bound.

Parameters

<i>lowerBound</i>	The number used as lower bound.
<i>upperBound</i>	The number used as upper bound.

Definition at line 63 of file `nguyen_widrow_init.hpp`.

39.112.3 Member Function Documentation

39.112.3.1 Initialize() [1/2]

```
void Initialize (
    arma::Mat< eT > & W,
    const size_t rows,
    const size_t cols ) [inline]
```

Initialize the elements of the specified weight matrix with the Nguyen-Widrow method.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.

Definition at line 76 of file `nguyen_widrow_init.hpp`.

References `RandomInitialization::Initialize()`.

Referenced by `NguyenWidrowInitialization::Initialize()`.

39.112.3.2 Initialize() [2/2]

```
void Initialize (
    arma::Cube< eT > & W,
    const size_t rows,
    const size_t cols,
    const size_t slices ) [inline]
```

Initialize the elements of the specified weight 3rd order tensor with the Nguyen-Widrow method.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.
<i>slices</i>	Number of slices.

Definition at line 95 of file `nguyen_widrow_init.hpp`.

References `NguyenWidrowInitialization::Initialize()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/ nguyen_widrow_init.hpp`

39.113 OivsInitialization< ActivationFunction > Class Template Reference

This class is used to initialize the weight matrix with the oivs method.

Public Member Functions

- **OivsInitialization** (const double epsilon=0.1, const int k=5, const double gamma=0.9)
Initialize the random initialization rule with the given values.
- template<typename eT >
void **Initialize** (arma::Mat< eT > &W, const size_t rows, const size_t cols)
Initialize the elements of the specified weight matrix with the oivs method.
- template<typename eT >
void **Initialize** (arma::Cube< eT > &W, const size_t rows, const size_t cols, const size_t slices)
Initialize the elements of the specified weight 3rd order tensor with the oivs method.

39.113.1 Detailed Description

```
template<class ActivationFunction = LogisticFunction>
class mlpack::ann::OivsInitialization< ActivationFunction >
```

This class is used to initialize the weight matrix with the oivs method.

The method is based on the equations representing the characteristics of the information transformation mechanism of a node. The method is defined by

$$\begin{aligned}
 b &= |F^{-1}(1 - \epsilon) - f^{-1}(\epsilon)| \\
 \hat{w} &= \frac{b}{k \cdot n} \\
 \gamma &\leq a_i \leq \gamma \\
 w_i &= \hat{w} \cdot \sqrt{a_i + 1}
 \end{aligned}$$

Where f is the transfer function epsilon, k custom parameters, n the number of neurons in the outgoing layer and gamma a parameter that defines the random interval.

Template Parameters

<i>ActivationFunction</i>	The activation function used for the oivs method.
---------------------------	---

Definition at line 59 of file oivs_init.hpp.

39.113.2 Constructor & Destructor Documentation

39.113.2.1 OivsInitialization()

```
OivsInitialization (
    const double epsilon = 0.1,
```

```
const int k = 5,
const double gamma = 0.9 ) [inline]
```

Initialize the random initialization rule with the given values.

Parameters

<i>epsilon</i>	Parameter to control the activation region.
<i>k</i>	Parameter to control the activation region width.
<i>gamma</i>	Parameter to define the uniform random range.

Definition at line 69 of file oivs_init.hpp.

39.113.3 Member Function Documentation

39.113.3.1 Initialize() [1/2]

```
void Initialize (
    arma::Mat< eT > & W,
    const size_t rows,
    const size_t cols ) [inline]
```

Initialize the elements of the specified weight matrix with the oivs method.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.

Definition at line 86 of file oivs_init.hpp.

References RandomInitialization::Initialize().

Referenced by OivsInitialization< ActivationFunction >::Initialize().

39.113.3.2 Initialize() [2/2]

```
void Initialize (
    arma::Cube< eT > & W,
    const size_t rows,
```

```
const size_t cols,  
const size_t slices ) [inline]
```

Initialize the elements of the specified weight 3rd order tensor with the oivs method.

Parameters

<i>W</i>	3rd order tensor to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.
<i>slices</i>	Number of slices.

Definition at line 104 of file oivs_init.hpp.

References `OivsInitialization< ActivationFunction >::Initialize()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/ oivs_init.hpp`

39.114 OrthogonalInitialization Class Reference

This class is used to initialize the weight matrix with the orthogonal matrix initialization.

Public Member Functions

- **OrthogonalInitialization** (const double gain=1.0)
Initialize the orthogonal matrix initialization rule with the given gain.
- `template<typename eT >`
`void Initialize (arma::Mat< eT > &W, const size_t rows, const size_t cols)`
Initialize the elements of the specified weight matrix with the orthogonal matrix initialization method.
- `template<typename eT >`
`void Initialize (arma::Cube< eT > &W, const size_t rows, const size_t cols, const size_t slices)`
Initialize the elements of the specified weight 3rd order tensor with the orthogonal matrix initialization method.

39.114.1 Detailed Description

This class is used to initialize the weight matrix with the orthogonal matrix initialization.

Definition at line 24 of file orthogonal_init.hpp.

39.114.2 Constructor & Destructor Documentation

39.114.2.1 OrthogonalInitialization()

```
OrthogonalInitialization (  
    const double gain = 1.0 ) [inline]
```

Initialize the orthogonal matrix initialization rule with the given gain.

Parameters

<i>gain</i>	The gain value.
-------------	-----------------

Definition at line 32 of file orthogonal_init.hpp.

39.114.3 Member Function Documentation

39.114.3.1 Initialize() [1/2]

```
void Initialize (
    arma::Mat< eT > & W,
    const size_t rows,
    const size_t cols ) [inline]
```

Initialize the elements of the specified weight matrix with the orthogonal matrix initialization method.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.

Definition at line 43 of file orthogonal_init.hpp.

Referenced by OrthogonalInitialization::Initialize().

39.114.3.2 Initialize() [2/2]

```
void Initialize (
    arma::Cube< eT > & W,
    const size_t rows,
    const size_t cols,
    const size_t slices ) [inline]
```

Initialize the elements of the specified weight 3rd order tensor with the orthogonal matrix initialization method.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.
<i>slices</i>	Number of slices.

Definition at line 62 of file orthogonal_init.hpp.

References OrthogonalInitialization::Initialize().

39.115 OutputHeightVisitor Class Reference

OutputHeightVisitor (p. 850) exposes the OutputHeight() method of the given module.

Inheritance diagram for OutputHeightVisitor:

Public Member Functions

- template<typename LayerType >
size_t **operator()** (LayerType *layer) const
Return the output height.

39.115.1 Detailed Description

OutputHeightVisitor (p. 850) exposes the OutputHeight() method of the given module.

Definition at line 27 of file output_height_visitor.hpp.

39.115.2 Member Function Documentation

39.115.2.1 operator()

```
size_t operator() (
    LayerType * layer ) const
```

Return the output height.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **output_height_visitor.hpp**

39.116 OutputParameterVisitor Class Reference

OutputParameterVisitor (p. 851) exposes the output parameter of the given module.

Inheritance diagram for OutputParameterVisitor:

Public Member Functions

- template<typename LayerType >
arma::mat & **operator()** (LayerType *layer) const
Return the output parameter set.

39.116.1 Detailed Description

OutputParameterVisitor (p. 851) exposes the output parameter of the given module.

Definition at line 27 of file output_parameter_visitor.hpp.

39.116.2 Member Function Documentation

39.116.2.1 operator()

```
arma::mat& operator() (
    LayerType * layer ) const
```

Return the output parameter set.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **output_parameter_visitor.hpp**

39.117 OutputWidthVisitor Class Reference

OutputWidthVisitor (p. 852) exposes the OutputWidth() method of the given module.

Inheritance diagram for OutputWidthVisitor:

Public Member Functions

- template<typename LayerType >
size_t **operator()** (LayerType *layer) const
Return the output width.

39.117.1 Detailed Description

OutputWidthVisitor (p. 852) exposes the OutputWidth() method of the given module.

Definition at line 27 of file output_width_visitor.hpp.

39.117.2 Member Function Documentation

39.117.2.1 operator()()

```
size_t operator() (
    LayerType * layer ) const
```

Return the output width.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **output_width_visitor.hpp**

39.118 ParametersSetVisitor Class Reference

ParametersSetVisitor (p. 853) update the parameters set using the given matrix.

Inheritance diagram for ParametersSetVisitor:

Public Member Functions

- **ParametersSetVisitor** (arma::mat &¶meters)
Update the parameters set given the parameters matrix.
- template<typename LayerType >
void **operator()** (LayerType *layer) const
Update the parameters set.

39.118.1 Detailed Description

ParametersSetVisitor (p. 853) update the parameters set using the given matrix.

Definition at line 27 of file parameters_set_visitor.hpp.

39.118.2 Constructor & Destructor Documentation

39.118.2.1 ParametersSetVisitor()

```
ParametersSetVisitor (
    arma::mat && parameters )
```

Update the parameters set given the parameters matrix.

39.118.3 Member Function Documentation

39.118.3.1 operator()()

```
void operator() (
    LayerType * layer ) const
```

Update the parameters set.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **parameters_set_visitor.hpp**

39.119 ParametersVisitor Class Reference

ParametersVisitor (p. 854) exposes the parameters set of the given module and stores the parameters set into the given matrix.

Inheritance diagram for ParametersVisitor:

Public Member Functions

- **ParametersVisitor** (arma::mat &¶meters)
Store the parameters set into the given parameters matrix.
- template<typename LayerType >
 void **operator()** (LayerType *layer) const
Set the parameters set.

39.119.1 Detailed Description

ParametersVisitor (p. 854) exposes the parameters set of the given module and stores the parameters set into the given matrix.

Definition at line 28 of file parameters_visitor.hpp.

39.119.2 Constructor & Destructor Documentation

39.119.2.1 ParametersVisitor()

```
ParametersVisitor (  
    arma::mat && parameters )
```

Store the parameters set into the given parameters matrix.

39.119.3 Member Function Documentation

39.119.3.1 operator>()

```
void operator() (  
    LayerType * layer ) const
```

Set the parameters set.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **parameters_visitor.hpp**

39.120 PReLU< InputDataType, OutputDataType > Class Template Reference

The **PReLU** (p. 855) activation function, defined by (where alpha is trainable)

Public Member Functions

- **PReLU** (const double userAlpha=0.03)
*Create the **PReLU** (p. 855) object using the specified parameters.*
 - double const & **Alpha** () const
Get the non zero gradient.
 - double & **Alpha** ()
Modify the non zero gradient.
 - template<typename DataType >
void **Backward** (const DataType &&input, DataType &&gy, DataType &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
 - OutputDataType const & **Delta** () const
Get the delta.
 - OutputDataType & **Delta** ()
Modify the delta.
 - template<typename InputType , typename OutputType >
void **Forward** (const InputType &&input, OutputType &&output)
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
 - template<typename eT >
void **Gradient** (const arma::Mat< eT > &&input, arma::Mat< eT > &&error, arma::Mat< eT > &&gradient)
Calculate the gradient using the output delta and the input activation.
 - OutputDataType const & **Gradient** () const
Get the gradient.
 - OutputDataType & **Gradient** ()
Modify the gradient.
 - OutputDataType const & **OutputParameter** () const
Get the output parameter.
 - OutputDataType & **OutputParameter** ()
Modify the output parameter.
 - OutputDataType const & **Parameters** () const
Get the parameters.
 - OutputDataType & **Parameters** ()
Modify the parameters.
 - void **Reset** ()
 - template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
- Serialize the layer.*

39.120.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::PReLU< InputDataType, OutputDataType >
```

The **PReLU** (p. 855) activation function, defined by (where alpha is trainable)

$$f(x) = \max(x, \alpha * x)$$

$$f'(x) = \begin{cases} 1 & : x > 0 \\ \alpha & : x \leq 0 \end{cases}$$

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 45 of file parametric_relu.hpp.

39.120.2 Constructor & Destructor Documentation

39.120.2.1 PReLU()

```
PReLU (  
    const double userAlpha = 0.03 )
```

Create the **PReLU** (p. 855) object using the specified parameters.

The non zero gradient can be adjusted by specifying the parameter alpha in the range 0 to 1. Default (alpha = 0.03). This parameter is trainable.

Parameters

<i>alpha</i>	Non zero gradient
--------------	-------------------

39.120.3 Member Function Documentation

39.120.3.1 Alpha() [1/2]

```
double const& Alpha ( ) const [inline]
```

Get the non zero gradient.

Definition at line 118 of file parametric_relu.hpp.

39.120.3.2 Alpha() [2/2]

```
double& Alpha ( ) [inline]
```

Modify the non zero gradient.

Definition at line 120 of file parametric_relu.hpp.

References PReLU< InputDataType, OutputDataType >::serialize().

39.120.3.3 Backward()

```
void Backward (
    const DataType && input,
    DataType && gy,
    DataType && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.120.3.4 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 108 of file parametric_relu.hpp.

39.120.3.5 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 110 of file parametric_relu.hpp.

39.120.3.6 Forward()

```
void Forward (
    const InputType && input,
    OutputType && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.120.3.7 Gradient() [1/3]

```
void Gradient (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient )
```

Calculate the gradient using the output delta and the input activation.

Parameters

<i>input</i>	The input parameter used for calculating the gradient.
<i>error</i>	The calculated error.
<i>gradient</i>	The calculated gradient.

39.120.3.8 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 113 of file parametric_relu.hpp.

39.120.3.9 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 115 of file parametric_relu.hpp.

39.120.3.10 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 103 of file parametric_relu.hpp.

39.120.3.11 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 105 of file parametric_relu.hpp.

39.120.3.12 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 98 of file parametric_relu.hpp.

39.120.3.13 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 100 of file parametric_relu.hpp.

39.120.3.14 Reset()

```
void Reset ( )
```

39.120.3.15 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by PReLU< InputDataType, OutputDataType >::Alpha().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ **parametric_relu.hpp**

39.121 RandomInitialization Class Reference

This class is used to initialize randomly the weight matrix.

Public Member Functions

- **RandomInitialization** (const double lowerBound=-1, const double upperBound=1)
Initialize the random initialization rule with the given lower bound and upper bound.
- **RandomInitialization** (const double bound)
Initialize the random initialization rule with the given bound.
- template<typename eT >
void **Initialize** (arma::Mat< eT > &W, const size_t rows, const size_t cols)
Initialize randomly the elements of the specified weight matrix.
- template<typename eT >
void **Initialize** (arma::Cube< eT > &W, const size_t rows, const size_t cols, const size_t slices)
Initialize randomly the elements of the specified weight 3rd order tensor.

39.121.1 Detailed Description

This class is used to initialize randomly the weight matrix.

Definition at line 24 of file random_init.hpp.

39.121.2 Constructor & Destructor Documentation

39.121.2.1 RandomInitialization() [1/2]

```
RandomInitialization (  
    const double lowerBound = -1,  
    const double upperBound = 1 ) [inline]
```

Initialize the random initialization rule with the given lower bound and upper bound.

Parameters

<i>lowerBound</i>	The number used as lower bound.
<i>upperBound</i>	The number used as upper bound.

Definition at line 34 of file random_init.hpp.

39.121.2.2 RandomInitialization() [2/2]

```
RandomInitialization (
    const double bound ) [inline]
```

Initialize the random initialization rule with the given bound.

Using the negative of the bound as lower bound and the positive bound as upper bound.

Parameters

<i>bound</i>	The number used as lower bound
--------------	--------------------------------

Definition at line 45 of file random_init.hpp.

39.121.3 Member Function Documentation

39.121.3.1 Initialize() [1/2]

```
void Initialize (
    arma::Mat< eT > & W,
    const size_t rows,
    const size_t cols ) [inline]
```

Initialize randomly the elements of the specified weight matrix.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.

Definition at line 56 of file random_init.hpp.

Referenced by `RandomInitialization::Initialize()`, `NguyenWidrowInitialization::Initialize()`, `KathirvalavakumarSubavathiInitialization::Initialize()`, `OivsInitialization< ActivationFunction >::Initialize()`, `GlorotInitializationType< Uniform >::Initialize()`, and `JacobianTest()`.

39.121.3.2 Initialize() [2/2]

```
void Initialize (
    arma::Cube< eT > & W,
    const size_t rows,
    const size_t cols,
    const size_t slices ) [inline]
```

Initialize randomly the elements of the specified weight 3rd order tensor.

Parameters

<i>W</i>	Weight matrix to initialize.
<i>rows</i>	Number of rows.
<i>cols</i>	Number of columns.

Definition at line 70 of file `random_init.hpp`.

References `RandomInitialization::Initialize()`.

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/ random_init.hpp`

39.122 RBM< InitializationRuleType, DataType, PolicyType > Class Template Reference

The implementation of the **RBM** (p. 864) module.

Public Types

- `typedef DataType::elem_type ElemType`
- `using NetworkType = RBM< InitializationRuleType, DataType, PolicyType >`

Public Member Functions

- **RBM** (arma::Mat< **ElemType** > predictors, InitializationRuleType initializeRule, const size_t visibleSize, const size_t hiddenSize, const size_t batchSize=1, const size_t numSteps=1, const size_t negSteps=1, const size_t poolSize=2, const **ElemType** slabPenalty=8, const **ElemType** radius=1, const bool persistence=false)
Initialize all the parameters of the network using initializeRule.
- double **Evaluate** (const arma::Mat< **ElemType** > ¶meters, const size_t i, const size_t batchSize)
*Evaluate the **RBM** (p. 864) network with the given parameters.*
- template<typename Policy = PolicyType>
std::enable_if< std::is_same< Policy, **BinaryRBM** >::value, double >::type **FreeEnergy** (arma::Mat< **ElemType** > &&input)
*This function calculates the free energy of the **BinaryRBM** (p. 609).*
- template<typename Policy = PolicyType>
std::enable_if< std::is_same< Policy, **SpikeSlabRBM** >::value, double >::type **FreeEnergy** (arma::Mat< **ElemType** > &&input)
*This function calculates the free energy of the **SpikeSlabRBM** (p. 947).*
- void **Gibbs** (arma::Mat< **ElemType** > &&input, arma::Mat< **ElemType** > &&output, const size_t steps=SIZE_MAX)
This function does the k-step Gibbs Sampling.
- void **Gradient** (const arma::Mat< **ElemType** > ¶meters, const size_t i, arma::Mat< **ElemType** > &gradient, const size_t batchSize)
*Calculates the gradients for the **RBM** (p. 864) network.*
- DataType const & **HiddenBias** () const
Return the hidden bias of the network.
- DataType & **HiddenBias** ()
Modify the hidden bias of the network.
- template<typename Policy = PolicyType>
std::enable_if< std::is_same< Policy, **BinaryRBM** >::value, void >::type **HiddenMean** (DataType &&input, DataType &&output)
The function calculates the mean for the hidden layer.
- template<typename Policy = PolicyType>
std::enable_if< std::is_same< Policy, **SpikeSlabRBM** >::value, void >::type **HiddenMean** (DataType &&input, DataType &&output)
The function calculates the mean of the Normal distribution of $P(s|v, h)$.
- size_t const & **HiddenSize** () const
Get the hidden size.
- size_t **NumFunctions** () const
Return the number of separable functions (the number of predictor points).
- size_t **NumSteps** () const
Return the number of steps of Gibbs Sampling.
- const arma::Mat< **ElemType** > & **Parameters** () const
Return the parameters of the network.
- arma::Mat< **ElemType** > & **Parameters** ()
Modify the parameters of the network.
- template<typename Policy = PolicyType>
std::enable_if< std::is_same< Policy, **BinaryRBM** >::value, void >::type **Phase** (DataType &&input, DataType &&gradient)
*Calculates the gradient of the **RBM** (p. 864) network on the provided input.*

- `template<typename Policy = PolicyType>`
`std::enable_if< std::is_same< Policy, SpikeSlabRBM >::value, void >::type Phase (DataType &&input, Data←`
`Type &&gradient)`
*Calculates the gradient of the **RBM** (p. 864) network on the provided input.*
- `size_t const & PoolSize () const`
Get the pool size.
- `template<typename Policy = PolicyType>`
`std::enable_if< std::is_same< Policy, BinaryRBM >::value, void >::type Reset ()`
- `template<typename Policy = PolicyType>`
`std::enable_if< std::is_same< Policy, SpikeSlabRBM >::value, void >::type Reset ()`
- `template<typename Policy = PolicyType>`
`std::enable_if< std::is_same< Policy, BinaryRBM >::value, void >::type SampleHidden (arma::Mat< Elem←`
`Type > &&input, arma::Mat< ElemType > &&output)`
This function samples the hidden layer given the visible layer using Bernoulli function.
- `template<typename Policy = PolicyType>`
`std::enable_if< std::is_same< Policy, SpikeSlabRBM >::value, void >::type SampleHidden (arma::Mat<`
`ElemType > &&input, arma::Mat< ElemType > &&output)`
*This function samples the slab outputs from the Normal distribution with mean given by: $h_i \wedge \{-1\} * W_i^T * v$ and variance: σ_i^2 .*
- `template<typename Policy = PolicyType>`
`std::enable_if< std::is_same< Policy, SpikeSlabRBM >::value, void >::type SampleSlab (DataType &&slab←`
`Mean, DataType &&slab)`
*The function samples from the Normal distribution of $P(s|v, h)$, where the mean is given by: $h_i \wedge \{-1\} * W_i^T * v$ and variance is given by: σ_i^2 .*
- `template<typename Policy = PolicyType>`
`std::enable_if< std::is_same< Policy, SpikeSlabRBM >::value, void >::type SampleSpike (DataType`
`&&spikeMean, DataType &&spike)`
The function samples the spike function using Bernoulli distribution.
- `template<typename Policy = PolicyType>`
`std::enable_if< std::is_same< Policy, BinaryRBM >::value, void >::type SampleVisible (arma::Mat< Elem←`
`Type > &&input, arma::Mat< ElemType > &&output)`
This function samples the visible layer given the hidden layer using Bernoulli function.
- `template<typename Policy = PolicyType>`
`std::enable_if< std::is_same< Policy, SpikeSlabRBM >::value, void >::type SampleVisible (arma::Mat<`
`ElemType > &&input, arma::Mat< ElemType > &&output)`
*Sample Hidden function samples the slab outputs from the Normal distribution with mean given by: $h_i \wedge \{-1\} * W_i^T * v$ and variance: σ_i^2 .*
- `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialize the model.
- `void Shuffle ()`
Shuffle the order of function visitation.
- `template<typename Policy = PolicyType>`
`std::enable_if< std::is_same< Policy, SpikeSlabRBM >::value, void >::type SlabMean (DataType &&visible,`
`DataType &&spike, DataType &&slabMean)`
*The function calculates the mean of Normal distribution of $P(s|v, h)$, where the mean is given by: $h_i \wedge \{-1\} * W_i^T * v$.*
- `ElemType const & SlabPenalty () const`
Get the regularizer associated with slab variables.
- `DataType const & SpikeBias () const`
Get the regularizer associated with spike variables.

- **DataType & SpikeBias ()**
Modify the regularizer associated with spike variables.
- `template<typename Policy = PolicyType>`
`std::enable_if< std::is_same< Policy, SpikeSlabRBM >::value, void >::type SpikeMean (DataType &&visible,`
`DataType &&spikeMean)`
The function calculates the mean of the distribution $P(h|v)$, where mean is given by: $\sum_i (v^T W_i - 1) W_i^T v + b_i$.
- `template<typename OptimizerType >`
`double Train (OptimizerType &optimizer)`
*Train the **RBM** (p. 864) on the given input data.*
- **DataType const & VisibleBias () const**
Return the visible bias of the network.
- **DataType & VisibleBias ()**
Modify the visible bias of the network.
- `template<typename Policy = PolicyType>`
`std::enable_if< std::is_same< Policy, BinaryRBM >::value, void >::type VisibleMean (DataType &&input,`
`DataType &&output)`
The function calculates the mean for the visible layer.
- `template<typename Policy = PolicyType>`
`std::enable_if< std::is_same< Policy, SpikeSlabRBM >::value, void >::type VisibleMean (DataType &&input,`
`DataType &&output)`
The function calculates the mean of the Normal distribution of $P(v|s, h)$.
- **DataType const & VisiblePenalty () const**
Get the regularizer associated with visible variables.
- **DataType & VisiblePenalty ()**
Modify the regularizer associated with visible variables.
- **size_t const & VisibleSize () const**
Get the visible size.
- `arma::Cube< ElemType > const & Weight () const`
Get the weights of the network.
- `arma::Cube< ElemType > & Weight ()`
Modify the weights of the network.

39.122.1 Detailed Description

```
template<typename InitializationRuleType, typename DataType = arma::mat, typename PolicyType = BinaryRBM>
class mlpack::ann::RBM< InitializationRuleType, DataType, PolicyType >
```

The implementation of the **RBM** (p. 864) module.

A Restricted Boltzmann Machines (**RBM** (p. 864)) is a generative stochastic artificial neural network that can learn a probability distribution over its set of inputs. RBMs have found applications in dimensionality reduction, classification, collaborative filtering, feature learning and topic modelling. They can be trained in either supervised or unsupervised ways, depending on the task. They are a variant of Boltzmann machines, with the restriction that the neurons must form a bipartite graph.

Template Parameters

<i>InitializationRuleType</i>	Rule used to initialize the network.
<i>DataType</i>	The type of matrix to be used.
<i>PolicyType</i>	The RBM (p. 864) variant to be used (BinaryRBM (p. 609) or SpikeSlabRBM (p. 947)).

Definition at line 38 of file `rbm.hpp`.

39.122.2 Member Typedef Documentation

39.122.2.1 ElemType

```
typedef DataType::elem_type ElemType
```

Definition at line 42 of file `rbm.hpp`.

39.122.2.2 NetworkType

```
using NetworkType = RBM<InitializationRuleType, DataType, PolicyType>
```

Definition at line 41 of file `rbm.hpp`.

39.122.3 Constructor & Destructor Documentation

39.122.3.1 RBM()

```
RBM (
    arma::Mat< ElemType > predictors,
    InitializationRuleType initializeRule,
    const size_t visibleSize,
    const size_t hiddenSize,
    const size_t batchSize = 1,
    const size_t numSteps = 1,
    const size_t negSteps = 1,
    const size_t poolSize = 2,
    const ElemType slabPenalty = 8,
    const ElemType radius = 1,
    const bool persistence = false )
```

Initialize all the parameters of the network using `initializeRule`.

Parameters

<i>predictors</i>	Training data to be used.
<i>initializeRule</i>	InitializationRule object for initializing the network parameter.
<i>visibleSize</i>	Number of visible neurons.
<i>hiddenSize</i>	Number of hidden neurons.
<i>batchSize</i>	Batch size to be used for training.
<i>numSteps</i>	Number of Gibbs Sampling steps.
<i>negSteps</i>	Number of negative samples to average negative gradient.
<i>poolSize</i>	Number of hidden neurons to pool together.
<i>slabPenalty</i>	Regulariser of slab variables.
<i>radius</i>	Feasible regions for visible layer samples.
<i>persistence</i>	Indicates whether to use Persistent CD or not.

39.122.4 Member Function Documentation

39.122.4.1 Evaluate()

```
double Evaluate (
    const arma::Mat< ElemType > & parameters,
    const size_t i,
    const size_t batchSize )
```

Evaluate the **RB**M (p. 864) network with the given parameters.

The function is needed for monitoring the progress of the network.

Parameters

<i>parameters</i>	Matrix model parameters.
<i>i</i>	Index of the data point.
<i>batchSize</i>	Variable to store the present number of inputs.

39.122.4.2 FreeEnergy() [1/2]

```
std::enable_if<std::is_same<Policy, BinaryRBM>::value, double>::type FreeEnergy (
    arma::Mat< ElemType > && input )
```

This function calculates the free energy of the **BinaryRBM** (p. 609).

The free energy is given by: $-b^T v - \sum_{i=1}^M \log(1 + e^{c_j + v^T W_j})$.

Parameters

<i>input</i>	The visible neurons.
--------------	----------------------

39.122.4.3 FreeEnergy() [2/2]

```
std::enable_if<std::is_same<Policy, SpikeSlabRBM>::value, double>::type FreeEnergy (
    arma::Mat< ElemType > && input )
```

This function calculates the free energy of the **SpikeSlabRBM** (p. 947).

The free energy is given by:
$$- \sum_{i=1}^N \left(\sum_{m=1}^K \log \left(\sum_{j=1}^M \exp \left(w_{ij} + b_i + \sum_{m=1}^K a_m \cdot \text{sign}(w_{ij}) \right) \right) \right)$$

Parameters

<i>input</i>	The visible layer neurons.
--------------	----------------------------

39.122.4.4 Gibbs()

```
void Gibbs (
    arma::Mat< ElemType > && input,
    arma::Mat< ElemType > && output,
    const size_t steps = SIZE_MAX )
```

This function does the k-step Gibbs Sampling.

Parameters

<i>input</i>	Input to the Gibbs function.
<i>output</i>	Used for storing the negative sample.
<i>steps</i>	Number of Gibbs Sampling steps taken.

39.122.4.5 Gradient()

```
void Gradient (
    const arma::Mat< ElemType > & parameters,
    const size_t i,
```

```
arma::Mat< ElemType > & gradient,
const size_t batchSize )
```

Calculates the gradients for the **RBM** (p. 864) network.

Parameters

<i>parameters</i>	The current parameters of the network.
<i>i</i>	Index of the data point.
<i>gradient</i>	Variable to store the present gradient.
<i>batchSize</i>	Variable to store the present number of inputs.

39.122.4.6 HiddenBias() [1/2]

```
DataType const& HiddenBias ( ) const [inline]
```

Return the hidden bias of the network.

Definition at line 349 of file rbm.hpp.

39.122.4.7 HiddenBias() [2/2]

```
DataType& HiddenBias ( ) [inline]
```

Modify the hidden bias of the network.

Definition at line 351 of file rbm.hpp.

39.122.4.8 HiddenMean() [1/2]

```
std::enable_if<std::is_same<Policy, BinaryRBM>::value, void>::type HiddenMean (
    DataType && input,
    DataType && output )
```

The function calculates the mean for the hidden layer.

Parameters

<i>input</i>	Visible neurons.
<i>output</i>	Hidden neuron activations.

39.122.4.9 HiddenMean() [2/2]

```
std::enable_if<std::is_same<Policy, SpikeSlabRBM>::value, void>::type HiddenMean (
    DataType && input,
    DataType && output )
```

The function calculates the mean of the Normal distribution of $P(s|v, h)$.

The mean is given by: $h_i \cdot \{-1\} \cdot W_i^T \cdot v$ The variance is given by: $\{-1\}$

Parameters

<i>input</i>	Visible layer neurons.
<i>output</i>	Consists of both the spike samples and slab samples.

39.122.4.10 HiddenSize()

```
size_t const& HiddenSize ( ) const [inline]
```

Get the hidden size.

Definition at line 369 of file rbm.hpp.

39.122.4.11 NumFunctions()

```
size_t NumFunctions ( ) const [inline]
```

Return the number of separable functions (the number of predictor points).

Definition at line 328 of file rbm.hpp.

39.122.4.12 NumSteps()

```
size_t NumSteps ( ) const [inline]
```

Return the number of steps of Gibbs Sampling.

Definition at line 331 of file rbm.hpp.

39.122.4.13 Parameters() [1/2]

```
const arma::Mat< ElemType>& Parameters ( ) const [inline]
```

Return the parameters of the network.

Definition at line 334 of file rbm.hpp.

39.122.4.14 Parameters() [2/2]

```
arma::Mat< ElemType>& Parameters ( ) [inline]
```

Modify the parameters of the network.

Definition at line 336 of file rbm.hpp.

39.122.4.15 Phase() [1/2]

```
std::enable_if<std::is_same<Policy, BinaryRBM>::value, void>::type Phase (
    DataType && input,
    DataType && gradient )
```

Calculates the gradient of the **RBM** (p. 864) network on the provided input.

Parameters

<i>input</i>	The provided input data.
<i>gradient</i>	Stores the gradient of the RBM (p. 864) network.

39.122.4.16 Phase() [2/2]

```
std::enable_if<std::is_same<Policy, SpikeSlabRBM>::value, void>::type Phase (
    DataType && input,
    DataType && gradient )
```

Calculates the gradient of the **RBM** (p. 864) network on the provided input.

Parameters

<i>input</i>	The provided input data.
<i>gradient</i>	Stores the gradient of the RBM (p. 864) network.

39.122.4.17 PoolSize()

```
size_t const& PoolSize ( ) const [inline]
```

Get the pool size.

Definition at line 371 of file `rbm.hpp`.

References `RBM< InitializationRuleType, DataType, PolicyType >::serialize()`.

39.122.4.18 Reset() [1/2]

```
std::enable_if<std::is_same<Policy, BinaryRBM>::value, void>::type Reset ( )
```

39.122.4.19 Reset() [2/2]

```
std::enable_if<std::is_same<Policy, SpikeSlabRBM>::value, void>::type Reset ( )
```

39.122.4.20 SampleHidden() [1/2]

```
std::enable_if<std::is_same<Policy, BinaryRBM>::value, void>::type SampleHidden (
    arma::Mat< ElemType > && input,
    arma::Mat< ElemType > && output )
```

This function samples the hidden layer given the visible layer using Bernoulli function.

Parameters

<i>input</i>	Visible layer input.
<i>output</i>	The sampled hidden layer.

39.122.4.21 SampleHidden() [2/2]

```
std::enable_if<std::is_same<Policy, SpikeSlabRBM>::value, void>::type SampleHidden (
```

```
arma::Mat< ElemType > && input,
arma::Mat< ElemType > && output )
```

This function samples the slab outputs from the Normal distribution with mean given by: $\mathbf{h}_i^{*-1} * \mathbf{W}_i^T * \mathbf{v}$ and variance: σ_i^{-1} .

Parameters

<i>input</i>	Consists of both visible and spike variables.
<i>output</i>	Sampled slab neurons.

39.122.4.22 SampleSlab()

```
std::enable_if<std::is_same<Policy, SpikeSlabRBM>::value, void>::type SampleSlab (
    DataType && slabMean,
    DataType && slab )
```

The function samples from the Normal distribution of $P(\mathbf{s}|\mathbf{v}, \mathbf{h})$, where the mean is given by: $\mathbf{h}_i^{*-1} * \mathbf{W}_i^T * \mathbf{v}$ and variance is given by: σ_i^{-1} .

Parameters

<i>slabMean</i>	Mean of the Normal distribution of the slab neurons.
<i>slab</i>	Sampled slab variable from the Normal distribution.

39.122.4.23 SampleSpike()

```
std::enable_if<std::is_same<Policy, SpikeSlabRBM>::value, void>::type SampleSpike (
    DataType && spikeMean,
    DataType && spike )
```

The function samples the spike function using Bernoulli distribution.

Parameters

<i>spikeMean</i>	Indicates $P(\mathbf{h} \mathbf{v})$.
<i>spike</i>	Sampled binary spike variables.

39.122.4.24 SampleVisible() [1/2]

```
std::enable_if<std::is_same<Policy, BinaryRBM>::value, void>::type SampleVisible (
    arma::Mat< ElemType > && input,
    arma::Mat< ElemType > && output )
```

This function samples the visible layer given the hidden layer using Bernoulli function.

Parameters

<i>input</i>	Hidden layer of the network.
<i>output</i>	The sampled visible layer.

39.122.4.25 SampleVisible() [2/2]

```
std::enable_if<std::is_same<Policy, SpikeSlabRBM>::value, void>::type SampleVisible (
    arma::Mat< ElemType > && input,
    arma::Mat< ElemType > && output )
```

Sample Hidden function samples the slab outputs from the Normal distribution with mean given by: $\mathbf{h}_i^{\leftarrow -1} * \mathbf{W}_i^{\leftarrow} \mathbf{T} * \mathbf{v}$ and variance: $\mathbf{\Sigma}^{\leftarrow -1}$.

Parameters

<i>input</i>	Hidden layer of the network.
<i>output</i>	The sampled visible layer.

39.122.4.26 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the model.

Referenced by `RBM< InitializationRuleType, DataType, PolicyType >::PoolSize()`.

39.122.4.27 Shuffle()

```
void Shuffle ( )
```

Shuffle the order of function visitation.

This may be called by the optimizer.

39.122.4.28 SlabMean()

```
std::enable_if<std::is_same<Policy, SpikeSlabRBM>::value, void>::type SlabMean (
    DataType && visible,
    DataType && spike,
    DataType && slabMean )
```

The function calculates the mean of Normal distribution of $P(s|v, h)$, where the mean is given by: $h_i^{-1} * W_i^T * v$.

Parameters

<i>visible</i>	The visible layer neurons.
<i>spike</i>	The spike variables from hidden layer.
<i>slabMean</i>	The mean of the Normal distribution of slab neurons.

39.122.4.29 SlabPenalty()

```
ElemType const& SlabPenalty ( ) const [inline]
```

Get the regularizer associated with slab variables.

Definition at line 359 of file rbm.hpp.

39.122.4.30 SpikeBias() [1/2]

```
DataType const& SpikeBias ( ) const [inline]
```

Get the regularizer associated with spike variables.

Definition at line 354 of file rbm.hpp.

39.122.4.31 SpikeBias() [2/2]

```
DataType& SpikeBias ( ) [inline]
```

Modify the regularizer associated with spike variables.

Definition at line 356 of file rbm.hpp.

39.122.4.32 SpikeMean()

```
std::enable_if<std::is_same<Policy, SpikeSlabRBM>::value, void>::type SpikeMean (
    DataType && visible,
    DataType && spikeMean )
```

The function calculates the mean of the distribution $P(h|v)$, where mean is given by: $\text{sigm}(v^T * W_i^{-1} * W_i^T * v + b_i)$.

Parameters

<i>visible</i>	The visible layer neurons.
<i>spikeMean</i>	Indicates $P(h v)$.

39.122.4.33 Train()

```
double Train (
    OptimizerType & optimizer )
```

Train the **RBM** (p. 864) on the given input data.

This will use the existing model parameters as a starting point for the optimization. If this is not what you want, then you should access the parameters vector directly with **Parameters()** (p. 873) and modify it as desired.

Parameters

<i>optimizer</i>	Optimizer type.
------------------	-----------------

Returns

The final objective of the trained model (NaN or Inf on error).

39.122.4.34 VisibleBias() [1/2]

```
DataType const& VisibleBias ( ) const [inline]
```

Return the visible bias of the network.

Definition at line 344 of file rbm.hpp.

39.122.4.35 VisibleBias() [2/2]

```
DataType& VisibleBias ( ) [inline]
```

Modify the visible bias of the network.

Definition at line 346 of file rbm.hpp.

39.122.4.36 VisibleMean() [1/2]

```
std::enable_if<std::is_same<Policy, BinaryRBM>::value, void>::type VisibleMean (
    DataType && input,
    DataType && output )
```

The function calculates the mean for the visible layer.

Parameters

<i>input</i>	Hidden neurons from the hidden layer of the network.
<i>output</i>	Visible neuron activations.

39.122.4.37 VisibleMean() [2/2]

```
std::enable_if<std::is_same<Policy, SpikeSlabRBM>::value, void>::type VisibleMean (
    DataType && input,
    DataType && output )
```

The function calculates the mean of the Normal distribution of $P(v|s, h)$.

The mean is given by: $\sum_{i=1}^N W_i * s_i * h_i$

Parameters

<i>input</i>	Consists of both the spike and slab variables.
<i>output</i>	Mean of the of the Normal distribution.

39.122.4.38 VisiblePenalty() [1/2]

```
DataType const& VisiblePenalty ( ) const [inline]
```

Get the regularizer associated with visible variables.

Definition at line 362 of file `rbm.hpp`.

39.122.4.39 VisiblePenalty() [2/2]

```
DataType& VisiblePenalty ( ) [inline]
```

Modify the regularizer associated with visible variables.

Definition at line 364 of file `rbm.hpp`.

39.122.4.40 VisibleSize()

```
size_t const& VisibleSize ( ) const [inline]
```

Get the visible size.

Definition at line 367 of file `rbm.hpp`.

39.122.4.41 Weight() [1/2]

```
arma::Cube< ElemType> const& Weight ( ) const [inline]
```

Get the weights of the network.

Definition at line 339 of file `rbm.hpp`.

39.122.4.42 Weight() [2/2]

```
arma::Cube< ElemType>& Weight ( ) [inline]
```

Modify the weights of the network.

Definition at line 341 of file `rbm.hpp`.

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/rbm/ rbm.hpp`

39.123 ReconstructionLoss< InputDataType, OutputDataType, DistType > Class Template Reference

The reconstruction loss performance function measures the network's performance equal to the negative log probability of the target with the input distribution.

Public Member Functions

- **ReconstructionLoss** ()
*Create the **ReconstructionLoss** (p. 880) object.*
 - template<typename InputType , typename TargetType , typename OutputType >
void **Backward** (const InputType &&input, const TargetType &&target, OutputType &&output)
Ordinary feed backward pass of a neural network.
 - template<typename InputType , typename TargetType >
double **Forward** (const InputType &&input, const TargetType &&target)
Computes the reconstruction loss.
 - OutputDataType & **OutputParameter** () const
Get the output parameter.
 - OutputDataType & **OutputParameter** ()
Modify the output parameter.
 - template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
- Serialize the layer.*

39.123.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat, typename DistType = BernoulliDistribution<InputDataType>>>
class mlpack::ann::ReconstructionLoss< InputDataType, OutputDataType, DistType >
```

The reconstruction loss performance function measures the network's performance equal to the negative log probability of the target with the input distribution.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>DistType</i>	The type of distribution parametrized by the input.

Definition at line 37 of file reconstruction_loss.hpp.

39.123.2 Constructor & Destructor Documentation

39.123.2.1 ReconstructionLoss()

```
ReconstructionLoss ( )
```

Create the **ReconstructionLoss** (p. 880) object.

39.123.3 Member Function Documentation

39.123.3.1 Backward()

```
void Backward (
    const InputType && input,
    const TargetType && target,
    OutputType && output )
```

Ordinary feed backward pass of a neural network.

Parameters

<i>input</i>	The propagated input activation.
<i>target</i>	The target matrix.
<i>output</i>	The calculated error.

39.123.3.2 Forward()

```
double Forward (
    const InputType && input,
    const TargetType && target )
```

Computes the reconstruction loss.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>target</i>	The target matrix.

39.123.3.3 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 67 of file reconstruction_loss.hpp.

39.123.3.4 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 69 of file reconstruction_loss.hpp.

References ReconstructionLoss< InputDataType, OutputDataType, DistType >::serialize().

39.123.3.5 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by ReconstructionLoss< InputDataType, OutputDataType, DistType >::OutputParameter().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/loss_functions/ **reconstruction_loss.hpp**

39.124 RectifierFunction Class Reference

The rectifier function, defined by.

Static Public Member Functions

- static double **Deriv** (const double y)
Computes the first derivative of the rectifier function.
- template<typename InputType , typename OutputType >
static void **Deriv** (const InputType &y, OutputType &x)
Computes the first derivatives of the rectifier function.
- static double **Fn** (const double x)
Computes the rectifier function.
- template<typename eT >
static void **Fn** (const arma::Mat< eT > &x, arma::Mat< eT > &y)
Computes the rectifier function using a dense matrix as input.
- template<typename eT >
static void **Fn** (const arma::Cube< eT > &x, arma::Cube< eT > &y)
Computes the rectifier function using a 3rd-order tensor as input.

39.124.1 Detailed Description

The rectifier function, defined by.

$$\begin{aligned} f(x) &= \max(0, x) \\ f'(x) &= \begin{cases} 1 & : x > 0 \\ 0 & : x \leq 0 \end{cases} \end{aligned}$$

Definition at line 45 of file rectifier_function.hpp.

39.124.2 Member Function Documentation

39.124.2.1 Deriv() [1/2]

```
static double Deriv (  
    const double y ) [inline], [static]
```

Computes the first derivative of the rectifier function.

Parameters

x	Input data.
---	-------------

Returns

$f'(x)$

Definition at line 91 of file rectifier_function.hpp.

Referenced by RectifierFunction::Deriv().

39.124.2.2 Deriv() [2/2]

```
static void Deriv (  
    const InputType & y,  
    OutputType & x ) [inline], [static]
```

Computes the first derivatives of the rectifier function.

Parameters

<i>y</i>	Input activations.
<i>x</i>	The resulting derivatives.

Definition at line 103 of file rectifier_function.hpp.

References RectifierFunction::Deriv().

39.124.2.3 Fn() [1/3]

```
static double Fn (  
    const double x ) [inline], [static]
```

Computes the rectifier function.

Parameters

<i>x</i>	Input data.
----------	-------------

Returns

$f(x)$.

Definition at line 54 of file rectifier_function.hpp.

39.124.2.4 Fn() [2/3]

```
static void Fn (  
    const arma::Mat< eT > & x,  
    arma::Mat< eT > & y ) [inline], [static]
```

Computes the rectifier function using a dense matrix as input.

Parameters

<i>x</i>	Input data.
<i>y</i>	The resulting output activation.

Definition at line 66 of file rectifier_function.hpp.

39.124.2.5 Fn() [3/3]

```
static void Fn (
    const arma::Cube< eT > & x,
    arma::Cube< eT > & y ) [inline], [static]
```

Computes the rectifier function using a 3rd-order tensor as input.

Parameters

<i>x</i>	Input data.
<i>y</i>	The resulting output activation.

Definition at line 79 of file rectifier_function.hpp.

The documentation for this class was generated from the following file:

39.125 Recurrent< InputDataType, OutputDataType, CustomLayers > Class Template Reference

Implementation of the RecurrentLayer class.

Public Member Functions

- **Recurrent** ()
*Default constructor—this will create a **Recurrent** (p. 886) object that can't be used, so be careful! Make sure to set all the parameters before use.*
- **Recurrent** (const **Recurrent** &)
Copy constructor.
- template<typename StartModuleType, typename InputModuleType, typename FeedbackModuleType, typename TransferModuleType >
Recurrent (const StartModuleType &start, const InputModuleType &input, const FeedbackModuleType &feedback, const TransferModuleType &transfer, const size_t rho)
*Create the **Recurrent** (p. 886) object using the specified modules.*
- ~**Recurrent** ()
Destructor to release allocated memory.
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- bool **Deterministic** () const

- The value of the deterministic parameter.*

 - bool & **Deterministic** ()

Modify the value of the deterministic parameter.
- template<typename eT >
void **Forward** (arma::Mat< eT > &&input, arma::Mat< eT > &&output)

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- template<typename eT >
void **Gradient** (arma::Mat< eT > &&input, arma::Mat< eT > &&error, arma::Mat< eT > &&)
- OutputDataType const & **Gradient** () const

Get the gradient.
- OutputDataType & **Gradient** ()

Modify the gradient.
- std::vector< **LayerTypes**< CustomLayers... > > & **Model** ()

Get the model modules.
- OutputDataType const & **OutputParameter** () const

Get the output parameter.
- OutputDataType & **OutputParameter** ()

Modify the output parameter.
- OutputDataType const & **Parameters** () const

Get the parameters.
- OutputDataType & **Parameters** ()

Modify the parameters.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)

Serialize the layer.

39.125.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat, typename... CustomLayers>
class mlpack::ann::Recurrent< InputDataType, OutputDataType, CustomLayers >
```

Implementation of the RecurrentLayer class.

Recurrent (p. 886) layers can be used similarly to feed-forward layers.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 89 of file layer_types.hpp.

39.125.2 Constructor & Destructor Documentation

39.125.2.1 **Recurrent()** [1/3]

```
Recurrent ( )
```

Default constructor—this will create a **Recurrent** (p. 886) object that can't be used, so be careful! Make sure to set all the parameters before use.

39.125.2.2 **~Recurrent()**

```
~ Recurrent ( )
```

Destructor to release allocated memory.

39.125.2.3 **Recurrent()** [2/3]

```
Recurrent (
    const Recurrent< InputDataType, OutputDataType, CustomLayers > & )
```

Copy constructor.

39.125.2.4 **Recurrent()** [3/3]

```
Recurrent (
    const StartModuleType & start,
    const InputModuleType & input,
    const FeedbackModuleType & feedback,
    const TransferModuleType & transfer,
    const size_t rho )
```

Create the **Recurrent** (p. 886) object using the specified modules.

Parameters

<i>start</i>	The start module.
<i>input</i>	The input module.
<i>feedback</i>	The feedback module.
<i>transfer</i>	The transfer module.
<i>rho</i>	Maximum number of steps to backpropagate through time (BPTT).

39.125.3 Member Function Documentation

39.125.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.125.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 133 of file recurrent.hpp.

39.125.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 135 of file recurrent.hpp.

39.125.3.4 Deterministic() [1/2]

```
bool Deterministic ( ) const [inline]
```

The value of the deterministic parameter.

Definition at line 118 of file recurrent.hpp.

39.125.3.5 Deterministic() [2/2]

```
bool& Deterministic ( ) [inline]
```

Modify the value of the deterministic parameter.

Definition at line 120 of file recurrent.hpp.

39.125.3.6 Forward()

```
void Forward (
    arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.125.3.7 Gradient() [1/3]

```
void Gradient (
    arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && )
```

39.125.3.8 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 138 of file recurrent.hpp.

39.125.3.9 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 140 of file recurrent.hpp.

References Recurrent< InputDataType, OutputDataType, CustomLayers >::serialize().

39.125.3.10 Model()

```
std::vector< LayerTypes<CustomLayers...> >& Model ( ) [inline]
```

Get the model modules.

Definition at line 115 of file recurrent.hpp.

39.125.3.11 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 128 of file recurrent.hpp.

39.125.3.12 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 130 of file recurrent.hpp.

39.125.3.13 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 123 of file recurrent.hpp.

39.125.3.14 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 125 of file recurrent.hpp.

39.125.3.15 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by Recurrent< InputDataType, OutputDataType, CustomLayers >::Gradient().

The documentation for this class was generated from the following files:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ **layer_types.hpp**

39.126 RecurrentAttention< InputDataType, OutputDataType > Class Template Reference

This class implements the **Recurrent** (p. 886) Model for Visual Attention, using a variety of possible layer implementations.

Public Member Functions

- **RecurrentAttention** ()

*Default constructor: this will not give a usable **RecurrentAttention** (p. 892) object, so be sure to set all the parameters before use.*

- template<typename RNNModuleType, typename ActionModuleType >

RecurrentAttention (const size_t outSize, const RNNModuleType &rnn, const ActionModuleType &action, const size_t rho)

*Create the **RecurrentAttention** (p. 892) object using the specified modules.*

- template<typename eT >

void **Backward** (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

- OutputDataType const & **Delta** () const

Get the delta.

- OutputDataType & **Delta** ()

Modify the delta.

- bool **Deterministic** () const

The value of the deterministic parameter.

- bool & **Deterministic** ()

Modify the value of the deterministic parameter.

- template<typename eT >

void **Forward** (arma::Mat< eT > &&input, arma::Mat< eT > &&output)

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

- template<typename eT >

void **Gradient** (arma::Mat< eT > &&, arma::Mat< eT > &&, arma::Mat< eT > &&)

- OutputDataType const & **Gradient** () const

Get the gradient.

- OutputDataType & **Gradient** ()

Modify the gradient.

- std::vector< **LayerTypes**<> > & **Model** ()

Get the model modules.

- OutputDataType const & **OutputParameter** () const

Get the output parameter.

- OutputDataType & **OutputParameter** ()

Modify the output parameter.

- OutputDataType const & **Parameters** () const

Get the parameters.

- OutputDataType & **Parameters** ()

Modify the parameters.

- template<typename Archive >

void **serialize** (Archive &ar, const unsigned int)

Serialize the layer.

39.126.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::RecurrentAttention< InputDataType, OutputDataType >
```

This class implements the **Recurrent** (p. 886) Model for Visual Attention, using a variety of possible layer implementations.

For more information, see the following paper.

```
@article{MnihHGK14,
  title={Recurrent Models of Visual Attention},
  author={Volodymyr Mnih, Nicolas Heess, Alex Graves, Koray Kavukcuoglu},
  journal={CoRR},
  volume={abs/1406.6247},
  year={2014}
}
```

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 135 of file layer_types.hpp.

39.126.2 Constructor & Destructor Documentation

39.126.2.1 RecurrentAttention() [1/2]

```
RecurrentAttention ( )
```

Default constructor: this will not give a usable **RecurrentAttention** (p. 892) object, so be sure to set all the parameters before use.

39.126.2.2 RecurrentAttention() [2/2]

```
RecurrentAttention (
  const size_t outSize,
  const RNNModuleType & rnn,
  const ActionModuleType & action,
  const size_t rho )
```

Create the **RecurrentAttention** (p. 892) object using the specified modules.

Parameters

<i>start</i>	The module output size.
<i>start</i>	The recurrent neural network module.
<i>start</i>	The action module.
<i>rho</i>	Maximum number of steps to backpropagate through time (BPTT).

39.126.3 Member Function Documentation

39.126.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.126.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 133 of file recurrent_attention.hpp.

39.126.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 135 of file recurrent_attention.hpp.

39.126.3.4 Deterministic() [1/2]

```
bool Deterministic ( ) const [inline]
```

The value of the deterministic parameter.

Definition at line 118 of file recurrent_attention.hpp.

39.126.3.5 Deterministic() [2/2]

```
bool& Deterministic ( ) [inline]
```

Modify the value of the deterministic parameter.

Definition at line 120 of file recurrent_attention.hpp.

39.126.3.6 Forward()

```
void Forward (
    arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.126.3.7 Gradient() [1/3]

```
void Gradient (
    arma::Mat< eT > && ,
    arma::Mat< eT > && ,
    arma::Mat< eT > && )
```

39.126.3.8 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 138 of file recurrent_attention.hpp.

39.126.3.9 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 140 of file recurrent_attention.hpp.

References RecurrentAttention< InputDataType, OutputDataType >::serialize().

39.126.3.10 Model()

```
std::vector< LayerTypes<> >& Model ( ) [inline]
```

Get the model modules.

Definition at line 115 of file recurrent_attention.hpp.

39.126.3.11 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 128 of file recurrent_attention.hpp.

39.126.3.12 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 130 of file recurrent_attention.hpp.

39.126.3.13 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 123 of file recurrent_attention.hpp.

39.126.3.14 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 125 of file recurrent_attention.hpp.

39.126.3.15 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by RecurrentAttention< InputDataType, OutputDataType >::Gradient().

The documentation for this class was generated from the following files:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ **layer_types.hpp**

39.127 ReinforceNormal< InputDataType, OutputDataType > Class Template Reference

Implementation of the reinforce normal layer.

Public Member Functions

- **ReinforceNormal** (const double stdev=1.0)
*Create the **ReinforceNormal** (p. 898) object.*
- template<typename DataType >
void **Backward** (const DataType &&input, DataType &&, DataType &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- bool **Deterministic** () const
Get the value of the deterministic parameter.
- bool & **Deterministic** ()
Modify the value of the deterministic parameter.
- template<typename eT >
void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- OutputDataType & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- double **Reward** () const
Get the value of the reward parameter.
- double & **Reward** ()
Modify the value of the deterministic parameter.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialize the layer.

39.127.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::ReinforceNormal< InputDataType, OutputDataType >
```

Implementation of the reinforce normal layer.

The reinforce normal layer implements the REINFORCE algorithm for the normal distribution.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 34 of file reinforce_normal.hpp.

39.127.2 Constructor & Destructor Documentation

39.127.2.1 ReinforceNormal()

```
ReinforceNormal (
    const double stdev = 1.0 )
```

Create the **ReinforceNormal** (p. 898) object.

Parameters

<i>stdev</i>	Standard deviation used during the forward and backward pass.
--------------	---

39.127.3 Member Function Documentation

39.127.3.1 Backward()

```
void Backward (
    const DataType && input,
    DataType && ,
    DataType && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.127.3.2 Delta() [1/2]

```
OutputDataType& Delta ( ) const [inline]
```

Get the delta.

Definition at line 72 of file reinforce_normal.hpp.

39.127.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 74 of file reinforce_normal.hpp.

39.127.3.4 Deterministic() [1/2]

```
bool Deterministic ( ) const [inline]
```

Get the value of the deterministic parameter.

Definition at line 77 of file reinforce_normal.hpp.

39.127.3.5 Deterministic() [2/2]

```
bool& Deterministic ( ) [inline]
```

Modify the value of the deterministic parameter.

Definition at line 79 of file reinforce_normal.hpp.

39.127.3.6 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.127.3.7 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 67 of file reinforce_normal.hpp.

39.127.3.8 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 69 of file reinforce_normal.hpp.

39.127.3.9 Reward() [1/2]

```
double Reward ( ) const [inline]
```

Get the value of the reward parameter.

Definition at line 82 of file reinforce_normal.hpp.

39.127.3.10 Reward() [2/2]

```
double& Reward ( ) [inline]
```

Modify the value of the deterministic parameter.

Definition at line 84 of file reinforce_normal.hpp.

References ReinforceNormal< InputDataType, OutputDataType >::serialize().

39.127.3.11 serialize()

```
void serialize (
    Archive & ,
    const unsigned int )
```

Serialize the layer.

Referenced by ReinforceNormal< InputDataType, OutputDataType >::Reward().

39.128 Reparametrization< InputDataType, OutputDataType > Class Template Reference

Implementation of the **Reparametrization** (p. 903) layer class.

Public Member Functions

- **Reparametrization** ()
*Create the **Reparametrization** (p. 903) object.*
- **Reparametrization** (const size_t latentSize, const bool stochastic=true, const bool includeKl=true, const double beta=1)
*Create the **Reparametrization** (p. 903) layer object using the specified sample vector size.*
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of a neural network, calculating the function f(x) by propagating x backwards through f.
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename eT >
void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Ordinary feed forward pass of a neural network, evaluating the function f(x) by propagating the activity forward through f.
- double **Loss** ()
Get the KL divergence with standard normal.
- OutputDataType const & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- size_t const & **OutputSize** () const
Get the output size.
- size_t & **OutputSize** ()
Modify the output size.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.128.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::Reparametrization< InputDataType, OutputDataType >
```

Implementation of the **Reparametrization** (p. 903) layer class.

This layer samples from the given parameters of a normal distribution.

This class also supports beta-VAE, a state-of-the-art framework for automated discovery of interpretable factorised latent representations from raw image data in a completely unsupervised manner.

For more information, refer the following paper.

```
@article{ICLR2017,
  title   = {beta-VAE: Learning basic visual concepts with a constrained
            variational framework},
  author  = {Irina Higgins, Loic Matthey, Arka Pal, Christopher Burgess,
            Xavier Glorot, Matthew Botvinick, Shakir Mohamed and
            Alexander Lerchner | Google DeepMind},
  journal = {2017 International Conference on Learning Representations (ICLR)},
  year    = {2017}
}
```

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 70 of file layer_types.hpp.

39.128.2 Constructor & Destructor Documentation

39.128.2.1 Reparametrization() [1/2]

```
Reparametrization ( )
```

Create the **Reparametrization** (p. 903) object.

39.128.2.2 Reparametrization() [2/2]

```
Reparametrization (
    const size_t latentSize,
    const bool stochastic = true,
    const bool includeKl = true,
    const double beta = 1 )
```

Create the **Reparametrization** (p. 903) layer object using the specified sample vector size.

Parameters

<i>latentSize</i>	The number of output latent units.
<i>stochastic</i>	Whether we want random sample or constant.
<i>includeKl</i>	Whether we want to include KL loss in backward function.
<i>beta</i>	The beta (hyper)parameter for beta-VAE mentioned above.

39.128.3 Member Function Documentation

39.128.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards trough f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.128.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 104 of file reparametrization.hpp.

39.128.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 106 of file reparametrization.hpp.

39.128.3.4 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.128.3.5 Loss()

```
double Loss ( ) [inline]
```

Get the KL divergence with standard normal.

Definition at line 114 of file reparametrization.hpp.

References `Reparametrization< InputDataType, OutputDataType >::serialize()`.

39.128.3.6 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 99 of file reparametrization.hpp.

39.128.3.7 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 101 of file reparametrization.hpp.

39.128.3.8 OutputSize() [1/2]

```
size_t const& OutputSize ( ) const [inline]
```

Get the output size.

Definition at line 109 of file reparametrization.hpp.

39.128.3.9 OutputSize() [2/2]

```
size_t& OutputSize ( ) [inline]
```

Modify the output size.

Definition at line 111 of file reparametrization.hpp.

39.128.3.10 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by Reparametrization< InputDataType, OutputDataType >::Loss().

39.129 ResetCellVisitor Class Reference

ResetCellVisitor (p. 907) executes the ResetCell() function.

Inheritance diagram for ResetCellVisitor:

Public Member Functions

- **ResetCellVisitor** (const size_t size)
Reset the cell using the given size.
- template<typename LayerType >
void **operator()** (LayerType *layer) const
Execute the ResetCell() function.

39.129.1 Detailed Description

ResetCellVisitor (p. 907) executes the ResetCell() function.

Definition at line 26 of file reset_cell_visitor.hpp.

39.129.2 Constructor & Destructor Documentation

39.129.2.1 ResetCellVisitor()

```
ResetCellVisitor (  
    const size_t size )
```

Reset the cell using the given size.

39.129.3 Member Function Documentation

39.129.3.1 operator()

```
void operator() (  
    LayerType * layer ) const
```

Execute the ResetCell() function.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **reset_cell_visitor.hpp**

39.130 ResetVisitor Class Reference

ResetVisitor (p. 909) executes the `Reset()` function.

Inheritance diagram for `ResetVisitor`:

Public Member Functions

- `template<typename LayerType >`
`void operator() (LayerType *layer) const`
Execute the `Reset()` function.

39.130.1 Detailed Description

ResetVisitor (p. 909) executes the `Reset()` function.

Definition at line 26 of file `reset_visitor.hpp`.

39.130.2 Member Function Documentation

39.130.2.1 `operator()`

```
void operator() (  
    LayerType * layer ) const
```

Execute the `Reset()` function.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ reset_visitor.hpp`

39.131 RewardSetVisitor Class Reference

RewardSetVisitor (p. 910) set the reward parameter given the reward value.

Inheritance diagram for RewardSetVisitor:

Public Member Functions

- **RewardSetVisitor** (const double reward)
Set the reward parameter given the reward value.
- template<typename LayerType >
void **operator()** (LayerType *layer) const
Set the reward parameter.

39.131.1 Detailed Description

RewardSetVisitor (p. 910) set the reward parameter given the reward value.

Definition at line 26 of file reward_set_visitor.hpp.

39.131.2 Constructor & Destructor Documentation

39.131.2.1 RewardSetVisitor()

```

RewardSetVisitor (
    const double reward )
  
```

Set the reward parameter given the reward value.

39.131.3 Member Function Documentation

39.131.3.1 operator()

```
void operator() (
    LayerType * layer ) const
```

Set the reward parameter.

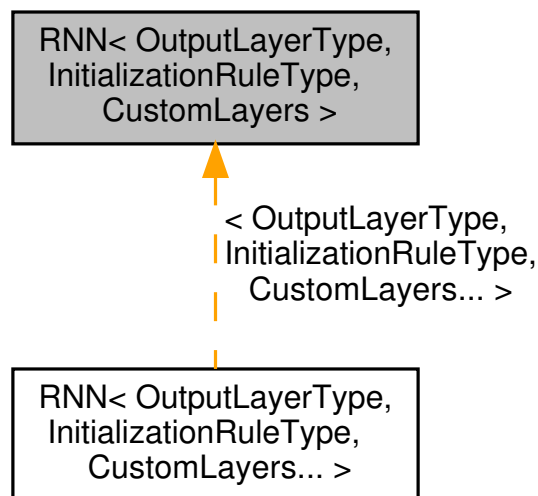

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **reward_set_visitor.hpp**

39.132 RNN< OutputLayerType, InitializationRuleType, CustomLayers > Class Template Reference

Implementation of a standard recurrent neural network container.

Inheritance diagram for RNN< OutputLayerType, InitializationRuleType, CustomLayers >:

Public Types

- using **NetworkType** = `RNN< OutputLayerType, InitializationRuleType, CustomLayers... >`
Convenience typedef for the internal model construction.

Public Member Functions

- **RNN** (const size_t rho, const bool single=false, OutputLayerType outputLayer=OutputLayerType(), InitializationRuleType initializeRule=InitializationRuleType())
*Create the **RNN** (p. 911) object.*
- **~RNN** ()
Destructor to release allocated memory.
- template<class LayerType , class... Args>
void **Add** (Args... args)
- void **Add** (**LayerTypes**< CustomLayers... > layer)
- double **Evaluate** (const arma::mat ¶meters, const size_t begin, const size_t batchSize, const bool deterministic)
Evaluate the recurrent neural network with the given parameters.
- double **Evaluate** (const arma::mat ¶meters, const size_t begin, const size_t batchSize)
Evaluate the recurrent neural network with the given parameters.
- template<typename GradType >
double **EvaluateWithGradient** (const arma::mat ¶meters, const size_t begin, GradType &gradient, const size_t batchSize)
Evaluate the recurrent neural network with the given parameters.
- void **Gradient** (const arma::mat ¶meters, const size_t begin, arma::mat &gradient, const size_t batchSize)
Evaluate the gradient of the recurrent neural network with the given parameters, and with respect to only one point in the dataset.
- size_t **NumFunctions** () const
Return the number of separable functions (the number of predictor points).
- const arma::mat & **Parameters** () const
Return the initial point for the optimization.
- arma::mat & **Parameters** ()
Modify the initial point for the optimization.
- void **Predict** (arma::cube predictors, arma::cube &results, const size_t batchSize=256)
Predict the responses to a given set of predictors.
- const arma::cube & **Predictors** () const
Get the matrix of data points (predictors).
- arma::cube & **Predictors** ()
Modify the matrix of data points (predictors).
- void **Reset** ()
Reset the state of the network.
- void **ResetParameters** ()
Reset the module information (weights/parameters).
- const arma::cube & **Responses** () const
Get the matrix of responses to the input data points.
- arma::cube & **Responses** ()
Modify the matrix of responses to the input data points.
- const size_t & **Rho** () const
Return the maximum length of backpropagation through time.
- size_t & **Rho** ()
Modify the maximum length of backpropagation through time.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)

- Serialize the model.*
 - void **Shuffle** ()

39.132.1 Detailed Description

```
template<typename OutputLayerType = NegativeLogLikelihood<>, typename InitializationRuleType = RandomInitialization, type-
name... CustomLayers>
class mlpack::ann::RNN< OutputLayerType, InitializationRuleType, CustomLayers >
```

Implementation of a standard recurrent neural network container.

Template Parameters

<i>OutputLayerType</i>	The output layer type used to evaluate the network.
<i>InitializationRuleType</i>	Rule used to initialize the weight matrix.

Definition at line 44 of file rnn.hpp.

39.132.2 Member Typedef Documentation

39.132.2.1 NetworkType

```
using NetworkType = RNN<OutputLayerType, InitializationRuleType, CustomLayers...>
```

Convenience typedef for the internal model construction.

Definition at line 50 of file rnn.hpp.

39.132.3 Constructor & Destructor Documentation

39.132.3.1 RNN()

```

RNN (
    const size_t rho,
    const bool single = false,
    OutputLayerType outputLayer = OutputLayerType(),
    InitializationRuleType initializeRule = InitializationRuleType() )

```

Create the **RNN** (p. 911) object.

Optionally, specify which initialize rule and performance function should be used.

If you want to pass in a parameter and discard the original parameter object, be sure to use `std::move` to avoid unnecessary copy.

Parameters

<i>rho</i>	Maximum number of steps to backpropagate through time (BPTT).
<i>single</i>	Predict only the last element of the input sequence.
<i>outputLayer</i>	Output layer used to evaluate the network.
<i>initializeRule</i>	Optional instantiated InitializationRule object for initializing the network parameter.

39.132.3.2 ~RNN()

```
~ RNN ( )
```

Destructor to release allocated memory.

39.132.4 Member Function Documentation

39.132.4.1 Add() [1/2]

```

void Add (
    Args... args ) [inline]

```

Definition at line 233 of file rnn.hpp.

39.132.4.2 Add() [2/2]

```
void Add (
    LayerTypes< CustomLayers... > layer ) [inline]
```

Definition at line 240 of file rnn.hpp.

39.132.4.3 Evaluate() [1/2]

```
double Evaluate (
    const arma::mat & parameters,
    const size_t begin,
    const size_t batchSize,
    const bool deterministic )
```

Evaluate the recurrent neural network with the given parameters.

This function is usually called by the optimizer to train the model.

Parameters

<i>parameters</i>	Matrix model parameters.
<i>begin</i>	Index of the starting point to use for objective function evaluation.
<i>batchSize</i>	Number of points to be passed at a time to use for objective function evaluation.
<i>deterministic</i>	Whether or not to train or test the model. Note some layer act differently in training or testing mode.

39.132.4.4 Evaluate() [2/2]

```
double Evaluate (
    const arma::mat & parameters,
    const size_t begin,
    const size_t batchSize )
```

Evaluate the recurrent neural network with the given parameters.

This function is usually called by the optimizer to train the model. This just calls the other overload of **Evaluate()** (p. 915) with `deterministic = true`.

Parameters

<i>parameters</i>	Matrix model parameters.
<i>begin</i>	Index of the starting point to use for objective function evaluation.
<i>batchSize</i>	Number of points to be passed at a time to use for objective function evaluation.

39.132.4.5 EvaluateWithGradient()

```
double EvaluateWithGradient (
    const arma::mat & parameters,
    const size_t begin,
    GradType & gradient,
    const size_t batchSize )
```

Evaluate the recurrent neural network with the given parameters.

This function is usually called by the optimizer to train the model.

Parameters

<i>parameters</i>	Matrix model parameters.
<i>begin</i>	Index of the starting point to use for objective function evaluation.
<i>gradient</i>	Matrix to output gradient into.
<i>batchSize</i>	Number of points to be passed at a time to use for objective function evaluation.

39.132.4.6 Gradient()

```
void Gradient (
    const arma::mat & parameters,
    const size_t begin,
    arma::mat & gradient,
    const size_t batchSize )
```

Evaluate the gradient of the recurrent neural network with the given parameters, and with respect to only one point in the dataset.

This is useful for optimizers such as SGD, which require a separable objective function.

Parameters

<i>parameters</i>	Matrix of the model parameters to be optimized.
<i>begin</i>	Index of the starting point to use for objective function gradient evaluation.
<i>gradient</i>	Matrix to output gradient into.
<i>batchSize</i>	Number of points to be processed as a batch for objective function gradient evaluation.

Referenced by RNN< OutputLayerType, InitializationRuleType, CustomLayers... >::Predictors().

39.132.4.7 NumFunctions()

```
size_t NumFunctions ( ) const [inline]
```

Return the number of separable functions (the number of predictor points).

Definition at line 243 of file rnn.hpp.

39.132.4.8 Parameters() [1/2]

```
const arma::mat& Parameters ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 246 of file rnn.hpp.

39.132.4.9 Parameters() [2/2]

```
arma::mat& Parameters ( ) [inline]
```

Modify the initial point for the optimization.

Definition at line 248 of file rnn.hpp.

39.132.4.10 Predict()

```
void Predict (
    arma::cube predictors,
    arma::cube & results,
    const size_t batchSize = 256 )
```

Predict the responses to a given set of predictors.

The responses will reflect the output of the given output layer as returned by the output layer function.

If you want to pass in a parameter and discard the original parameter object, be sure to use `std::move` to avoid unnecessary copy.

The format of the data should be as follows:

- each slice should correspond to a time step
- each column should correspond to a data point
- each row should correspond to a dimension So, e.g., `predictors(i, j, k)` is the *i*'th dimension of the *j*'th data point at time slice *k*. The responses will be in the same format.

Parameters

<i>predictors</i>	Input predictors.
<i>results</i>	Matrix to put output predictions of responses into.
<i>batchSize</i>	Number of points to predict at once.

39.132.4.11 Predictors() [1/2]

```
const arma::cube& Predictors ( ) const [inline]
```

Get the matrix of data points (predictors).

Definition at line 261 of file rnn.hpp.

39.132.4.12 Predictors() [2/2]

```
arma::cube& Predictors ( ) [inline]
```

Modify the matrix of data points (predictors).

Definition at line 263 of file rnn.hpp.

39.132.4.13 Reset()

```
void Reset ( )
```

Reset the state of the network.

This ensures that all internally-held gradients are set to 0, all memory cells are reset, and the parameters matrix is the right size.

Referenced by `RNN< OutputLayerType, InitializationRuleType, CustomLayers... >::Predictors()`.

39.132.4.14 ResetParameters()

```
void ResetParameters ( )
```

Reset the module information (weights/parameters).

Referenced by `RNN< OutputLayerType, InitializationRuleType, CustomLayers... >::Predictors()`.

39.132.4.15 Responses() [1/2]

```
const arma::cube& Responses ( ) const [inline]
```

Get the matrix of responses to the input data points.

Definition at line 256 of file rnn.hpp.

39.132.4.16 Responses() [2/2]

```
arma::cube& Responses ( ) [inline]
```

Modify the matrix of responses to the input data points.

Definition at line 258 of file rnn.hpp.

39.132.4.17 Rho() [1/2]

```
const size_t& Rho ( ) const [inline]
```

Return the maximum length of backpropagation through time.

Definition at line 251 of file rnn.hpp.

39.132.4.18 Rho() [2/2]

```
size_t& Rho ( ) [inline]
```

Modify the maximum length of backpropagation through time.

Definition at line 253 of file rnn.hpp.

39.132.4.19 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the model.

Referenced by RNN< OutputLayerType, InitializationRuleType, CustomLayers... >::Predictors().

39.132.4.20 Shuffle()

```
void Shuffle ( )
```

Shuffle the order of function visitation.

This may be called by the optimizer.

39.132.4.21 Train() [1/2]

```
double Train (
    arma::cube predictors,
    arma::cube responses,
    OptimizerType & optimizer )
```

Train the recurrent neural network on the given input data using the given optimizer.

This will use the existing model parameters as a starting point for the optimization. If this is not what you want, then you should access the parameters vector directly with **Parameters()** (p. 917) and modify it as desired.

If you want to pass in a parameter and discard the original parameter object, be sure to use `std::move` to avoid unnecessary copy.

The format of the data should be as follows:

- each slice should correspond to a time step
- each column should correspond to a data point
- each row should correspond to a dimension So, e.g., `predictors(i, j, k)` is the *i*'th dimension of the *j*'th data point at time slice *k*.

Template Parameters

<i>OptimizerType</i>	Type of optimizer to use to train the model.
----------------------	--

Parameters

<i>predictors</i>	Input training variables.
<i>responses</i>	Outputs results from input training variables.
<i>optimizer</i>	Instantiated optimizer used to train the model.

Returns

The final objective of the trained model (NaN or Inf on error).

39.132.4.22 Train() [2/2]

```
double Train (
    arma::cube predictors,
    arma::cube responses )
```

Train the recurrent neural network on the given input data.

By default, the SGD optimization algorithm is used, but others can be specified (such as `ens::RMSprop`).

This will use the existing model parameters as a starting point for the optimization. If this is not what you want, then you should access the parameters vector directly with **Parameters()** (p. 917) and modify it as desired.

If you want to pass in a parameter and discard the original parameter object, be sure to use `std::move` to avoid unnecessary copy.

The format of the data should be as follows:

- each slice should correspond to a time step
- each column should correspond to a data point
- each row should correspond to a dimension So, e.g., `predictors(i, j, k)` is the *i*'th dimension of the *j*'th data point at time slice *k*.

Template Parameters

<i>OptimizerType</i>	Type of optimizer to use to train the model.
----------------------	--

Parameters

<i>predictors</i>	Input training variables.
<i>responses</i>	Outputs results from input training variables.

Returns

The final objective of the trained model (NaN or Inf on error).

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/ rnn.hpp`

39.133 RunSetVisitor Class Reference

RunSetVisitor (p. 921) set the run parameter given the run value.

Inheritance diagram for RunSetVisitor:

Public Member Functions

- **RunSetVisitor** (const bool run=true)
Set the run parameter given the current run value.
- template<typename LayerType >
 void **operator()** (LayerType *layer) const
Set the run parameter.

39.133.1 Detailed Description

RunSetVisitor (p. 921) set the run parameter given the run value.

Definition at line 28 of file run_set_visitor.hpp.

39.133.2 Constructor & Destructor Documentation

39.133.2.1 RunSetVisitor()

```

RunSetVisitor (
    const bool run = true )
  
```

Set the run parameter given the current run value.

39.133.3 Member Function Documentation

39.133.3.1 operator()

```
void operator() (
    LayerType * layer ) const
```

Set the run parameter.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **run_set_visitor.hpp**

39.134 SaveOutputParameterVisitor Class Reference

SaveOutputParameterVisitor (p. 923) saves the output parameter into the given parameter set.

Inheritance diagram for SaveOutputParameterVisitor:

Public Member Functions

- **SaveOutputParameterVisitor** (std::vector< arma::mat > &¶meter)
Save the output parameter into the given parameter set.
- template<typename LayerType >
 void **operator()** (LayerType *layer) const
Save the output parameter.

39.134.1 Detailed Description

SaveOutputParameterVisitor (p. 923) saves the output parameter into the given parameter set.

Definition at line 27 of file save_output_parameter_visitor.hpp.

39.134.2 Constructor & Destructor Documentation

39.134.2.1 SaveOutputParameterVisitor()

```
SaveOutputParameterVisitor (
    std::vector< arma::mat > && parameter )
```

Save the output parameter into the given parameter set.

39.134.3 Member Function Documentation

39.134.3.1 operator>()

```
void operator() (
    LayerType * layer ) const
```

Save the output parameter.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **save_output_parameter_visitor.hpp**

39.135 Select< InputDataType, OutputDataType > Class Template Reference

The select module selects the specified column from a given input matrix.

Public Member Functions

- **Select** (const size_t index=0, const size_t elements=0)
*Create the **Select** (p. 924) object.*
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename eT >
void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- OutputDataType & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.135.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::Select< InputDataType, OutputDataType >
```

The select module selects the specified column from a given input matrix.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 32 of file select.hpp.

39.135.2 Constructor & Destructor Documentation

39.135.2.1 Select()

```
Select (
    const size_t index = 0,
    const size_t elements = 0 )
```

Create the **Select** (p. 924) object.

Parameters

<i>index</i>	The column which should be extracted from the given input.
<i>elements</i>	The number of elements that should be used.

39.135.3 Member Function Documentation

39.135.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function f(x) by propagating x backwards through f.

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.135.3.2 Delta() [1/2]

```
OutputDataType& Delta ( ) const [inline]
```

Get the delta.

Definition at line 73 of file select.hpp.

39.135.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 75 of file select.hpp.

References `Select< InputDataType, OutputDataType >::serialize()`.

39.135.3.4 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.135.3.5 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 68 of file select.hpp.

39.135.3.6 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 70 of file select.hpp.

39.135.3.7 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by `Select< InputDataType, OutputDataType >::Delta()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ select.hpp`

39.136 Sequential< InputDataType, OutputDataType, Residual, CustomLayers > Class Template Reference

Implementation of the **Sequential** (p. 927) class.

Public Member Functions

- **Sequential** (const bool model=true)
*Create the **Sequential** (p. 927) object using the specified parameters.*
- **~Sequential** ()
*Destroy the **Sequential** (p. 927) object.*
- template<class LayerType , class... Args>
void **Add** (Args... args)
- void **Add** (**LayerTypes**< CustomLayers... > layer)
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of a neural network, using 3rd-order tensors as input, calculating the function $f(x)$ by propagating x backwards through f .
- void **DeleteModules** ()
- arma::mat const & **Delta** () const
Get the delta.
- arma::mat & **Delta** ()
Modify the delta.
- template<typename eT >
void **Forward** (arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- template<typename eT >
void **Gradient** (arma::Mat< eT > &&input, arma::Mat< eT > &&error, arma::Mat< eT > &&)
- arma::mat const & **Gradient** () const
Get the gradient.
- arma::mat & **Gradient** ()
Modify the gradient.
- arma::mat const & **InputParameter** () const
Get the input parameter.
- arma::mat & **InputParameter** ()
Modify the input parameter.
- std::vector< **LayerTypes**< CustomLayers... > > & **Model** ()
Return the model modules.
- arma::mat const & **OutputParameter** () const
Get the output parameter.
- arma::mat & **OutputParameter** ()
Modify the output parameter.
- const arma::mat & **Parameters** () const
Return the initial point for the optimization.
- arma::mat & **Parameters** ()
Modify the initial point for the optimization.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
- *Serialize the layer.*

39.136.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat, bool Residual = false, typename... CustomLayers>
class mlpack::ann::Sequential< InputDataType, OutputDataType, Residual, CustomLayers >
```

Implementation of the **Sequential** (p. 927) class.

The sequential class works as a feed-forward fully connected network container which plugs various layers together.

This class can also be used as a container for a residual block. In that case, the sizes of the input and output matrices of this class should be equal. A typedef has been added for use as a Residual<> class.

For more information, refer the following paper.

```
@article{He15,
  author    = {Kaiming He, Xiangyu Zhang, Shaoqing Ren, Jian Sun},
  title     = {Deep Residual Learning for Image Recognition},
  year      = {2015},
  url       = {https://arxiv.org/abs/1512.03385},
  eprint    = {1512.03385},
}
```

Note: If this class is used as the first layer of a network, it should be preceded by IdentityLayer<>.

Note: This class should at least have two layers for a call to its **Gradient()** (p. 932) function.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>Residual</i>	If true, use the object as a Residual block.

Definition at line 83 of file layer_types.hpp.

39.136.2 Constructor & Destructor Documentation

39.136.2.1 Sequential()

```
Sequential (
    const bool model = true )
```

Create the **Sequential** (p. 927) object using the specified parameters.

Parameters

<i>model</i>	Expose the all network modules.
--------------	---------------------------------

39.136.2.2 ~Sequential()

~ **Sequential** ()

Destroy the **Sequential** (p. 927) object.

39.136.3 Member Function Documentation

39.136.3.1 Add() [1/2]

```
void Add (
    Args... args ) [inline]
```

Definition at line 126 of file sequential.hpp.

39.136.3.2 Add() [2/2]

```
void Add (
    LayerTypes< CustomLayers... > layer ) [inline]
```

Definition at line 133 of file sequential.hpp.

References Sequential< InputDataType, OutputDataType, Residual, CustomLayers >::DeleteModules().

39.136.3.3 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, using 3rd-order tensors as input, calculating the function f(x) by propagating x backwards through f.

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.136.3.4 DeleteModules()

```
void DeleteModules ( )
```

Referenced by Sequential< InputDataType, OutputDataType, Residual, CustomLayers >::Add().

39.136.3.5 Delta() [1/2]

```
arma::mat const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 167 of file sequential.hpp.

39.136.3.6 Delta() [2/2]

```
arma::mat& Delta ( ) [inline]
```

Modify the delta.

Definition at line 169 of file sequential.hpp.

39.136.3.7 Forward()

```
void Forward (
    arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.136.3.8 Gradient() [1/3]

```
void Gradient (
    arma::Mat< eT > && input,
    arma::Mat< eT > && error,
    arma::Mat< eT > && )
```

39.136.3.9 Gradient() [2/3]

```
arma::mat const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 172 of file sequential.hpp.

39.136.3.10 Gradient() [3/3]

```
arma::mat& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 174 of file sequential.hpp.

References Sequential< InputDataType, OutputDataType, Residual, CustomLayers >::serialize().

39.136.3.11 InputParameter() [1/2]

```
arma::mat const& InputParameter ( ) const [inline]
```

Get the input parameter.

Definition at line 157 of file sequential.hpp.

39.136.3.12 InputParameter() [2/2]

```
arma::mat& InputParameter ( ) [inline]
```

Modify the input parameter.

Definition at line 159 of file sequential.hpp.

39.136.3.13 Model()

```
std::vector< LayerTypes<CustomLayers...> >& Model ( ) [inline]
```

Return the model modules.

Definition at line 141 of file sequential.hpp.

39.136.3.14 OutputParameter() [1/2]

```
arma::mat const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 162 of file sequential.hpp.

39.136.3.15 OutputParameter() [2/2]

```
arma::mat& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 164 of file sequential.hpp.

39.136.3.16 Parameters() [1/2]

```
const arma::mat& Parameters ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 152 of file sequential.hpp.

39.136.3.17 Parameters() [2/2]

```
arma::mat& Parameters ( ) [inline]
```

Modify the initial point for the optimization.

Definition at line 154 of file sequential.hpp.

39.136.3.18 serialize()

```
void serialize (
    Archive & ,
    const unsigned int )
```

Serialize the layer.

Referenced by Sequential< InputDataType, OutputDataType, Residual, CustomLayers >::Gradient().

39.137 SetInputHeightVisitor Class Reference

SetInputHeightVisitor (p. 934) updates the input height parameter with the given input height.

Inheritance diagram for SetInputHeightVisitor:

**Public Member Functions**

- **SetInputHeightVisitor** (const size_t inputHeight=0, const bool reset=false)
Update the input height parameter with the given input height.
- template<typename LayerType >
 bool **operator()** (LayerType *layer) const
Update the input height parameter.

39.137.1 Detailed Description

SetInputHeightVisitor (p. 934) updates the input height parameter with the given input height.

Definition at line 27 of file `set_input_height_visitor.hpp`.

39.137.2 Constructor & Destructor Documentation

39.137.2.1 SetInputHeightVisitor()

```
SetInputHeightVisitor (  
    const size_t inputHeight = 0,  
    const bool reset = false )
```

Update the input height parameter with the given input height.

39.137.3 Member Function Documentation

39.137.3.1 operator()()

```
bool operator() (  
    LayerType * layer ) const
```

Update the input height parameter.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ set_input_height_visitor.hpp`

39.138 SetInputWidthVisitor Class Reference

SetInputWidthVisitor (p. 935) updates the input width parameter with the given input width.

Inheritance diagram for SetInputWidthVisitor:

Public Member Functions

- **SetInputWidthVisitor** (const size_t inputWidth=0, const bool reset=false)
Update the input width parameter with the given input width.
- template<typename LayerType >
 bool **operator()** (LayerType *layer) const
Update the input width parameter.

39.138.1 Detailed Description

SetInputWidthVisitor (p. 935) updates the input width parameter with the given input width.

Definition at line 27 of file set_input_width_visitor.hpp.

39.138.2 Constructor & Destructor Documentation

39.138.2.1 SetInputWidthVisitor()

```
SetInputWidthVisitor (
    const size_t inputWidth = 0,
    const bool reset = false )
```

Update the input width parameter with the given input width.

39.138.3 Member Function Documentation

39.138.3.1 operator()()

```
bool operator() (
    LayerType * layer ) const
```

Update the input width parameter.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **set_input_width_visitor.hpp**

39.139 SigmoidCrossEntropyError< InputDataType, OutputDataType > Class Template Reference

The **SigmoidCrossEntropyError** (p. 937) performance function measures the network's performance according to the cross-entropy function between the input and target distributions.

Public Member Functions

- **SigmoidCrossEntropyError** ()
*Create the **SigmoidCrossEntropyError** (p. 937) object.*
- template<typename InputType , typename TargetType , typename OutputType >
void **Backward** (const InputType &&input, const TargetType &&target, OutputType &&output)
Ordinary feed backward pass of a neural network.
- template<typename InputType , typename TargetType >
double **Forward** (const InputType &&input, const TargetType &&target)
Computes the Sigmoid CrossEntropy Error functions.
- OutputDataType & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.139.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::SigmoidCrossEntropyError< InputDataType, OutputDataType >
```

The **SigmoidCrossEntropyError** (p. 937) performance function measures the network's performance according to the cross-entropy function between the input and target distributions.

This function calculates the cross entropy given the real values instead of providing the sigmoid activations. The function uses this equivalent formulation: $\max(x, 0) - x * z + \log(1 + e^{-|x|})$ where x = input and z = target.

For more information, see the following paper.

```
@article{Janocha2017
  title   = {On Loss Functions for Deep Neural Networks in Classification},
  author  = {Katarzyna Janocha, Wojciech Marian Czarnecki},

  journal = {CoRR},
  eprint  = {arXiv:1702.05659},
  year    = {2017}
}
```

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 52 of file sigmoid_cross_entropy_error.hpp.

39.139.2 Constructor & Destructor Documentation

39.139.2.1 SigmoidCrossEntropyError()

```
SigmoidCrossEntropyError ( )
```

Create the **SigmoidCrossEntropyError** (p. 937) object.

39.139.3 Member Function Documentation

39.139.3.1 Backward()

```
void Backward (
    const InputType && input,
    const TargetType && target,
    OutputType && output ) [inline]
```

Ordinary feed backward pass of a neural network.

Parameters

<i>input</i>	The propagated input activation.
<i>target</i>	The target vector.
<i>output</i>	The calculated error.

39.139.3.2 Forward()

```
double Forward (
```

```
const InputType && input,
const TargetType && target ) [inline]
```

Computes the Sigmoid CrossEntropy Error functions.

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>target</i>	The target vector.

39.139.3.3 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 82 of file sigmoid_cross_entropy_error.hpp.

39.139.3.4 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 84 of file sigmoid_cross_entropy_error.hpp.

References SigmoidCrossEntropyError< InputDataType, OutputDataType >::serialize().

39.139.3.5 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by SigmoidCrossEntropyError< InputDataType, OutputDataType >::OutputParameter().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/loss_functions/ **sigmoid_cross_entropy_error.hpp**

39.140 SoftplusFunction Class Reference

The softplus function, defined by.

Static Public Member Functions

- static double **Deriv** (const double y)
Computes the first derivative of the softplus function.
- template<typename InputType , typename OutputType >
static void **Deriv** (const InputType &y, OutputType &x)
Computes the first derivatives of the softplus function.
- static double **Fn** (const double x)
Computes the softplus function.
- template<typename InputType , typename OutputType >
static void **Fn** (const InputType &x, OutputType &y)
Computes the softplus function.
- static double **Inv** (const double y)
Computes the inverse of the softplus function.
- template<typename InputType , typename OutputType >
static void **Inv** (const InputType &y, OutputType &x)
Computes the inverse of the softplus function.

39.140.1 Detailed Description

The softplus function, defined by.

$$\begin{aligned} f(x) &= \ln(1 + e^x) \\ f'(x) &= \frac{1}{1 + e^{-x}} \\ f^{-1}(y) &= \ln(e^y - 1) \end{aligned}$$

Definition at line 43 of file softplus_function.hpp.

39.140.2 Member Function Documentation

39.140.2.1 Deriv() [1/2]

```
static double Deriv (
    const double y ) [inline], [static]
```

Computes the first derivative of the softplus function.

Parameters

y	Input data.
-----	-------------

Returns $f'(x)$

Definition at line 80 of file softplus_function.hpp.

39.140.2.2 Deriv() [2/2]

```
static void Deriv (  
    const InputType & y,  
    OutputType & x ) [inline], [static]
```

Computes the first derivatives of the softplus function.

Parameters

y	Input activations.
x	The resulting derivatives.

Definition at line 92 of file softplus_function.hpp.

39.140.2.3 Fn() [1/2]

```
static double Fn (  
    const double x ) [inline], [static]
```

Computes the softplus function.

Parameters

x	Input data.
-----	-------------

Returns $f(x)$.

Definition at line 52 of file softplus_function.hpp.

Referenced by SoftplusFunction::Fn().

39.140.2.4 Fn() [2/2]

```
static void Fn (
    const InputType & x,
    OutputType & y ) [inline], [static]
```

Computes the softplus function.

Parameters

x	Input data.
y	The resulting output activation.

Definition at line 66 of file softplus_function.hpp.

References SoftplusFunction::Fn().

39.140.2.5 Inv() [1/2]

```
static double Inv (
    const double y ) [inline], [static]
```

Computes the inverse of the softplus function.

Parameters

y	Input data.
-----	-------------

Returns

$f^{\{-1\}}(y)$

Definition at line 103 of file softplus_function.hpp.

Referenced by SoftplusFunction::Inv().

39.140.2.6 Inv() [2/2]

```
static void Inv (
    const InputType & y,
    OutputType & x ) [inline], [static]
```

Computes the inverse of the softplus function.

Parameters

<i>y</i>	Input data.
<i>x</i>	The resulting inverse of the input data.

Definition at line 115 of file softplus_function.hpp.

References SoftplusFunction::Inv().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/activation_functions/ **softplus_function.hpp**

39.141 SoftsignFunction Class Reference

The softsign function, defined by.

Static Public Member Functions

- static double **Deriv** (const double y)
Computes the first derivative of the softsign function.
- template<typename InputVecType , typename OutputVecType >
static void **Deriv** (const InputVecType &y, OutputVecType &x)
Computes the first derivatives of the softsign function.
- static double **Fn** (const double x)
Computes the softsign function.
- template<typename InputVecType , typename OutputVecType >
static void **Fn** (const InputVecType &x, OutputVecType &y)
Computes the softsign function.
- static double **Inv** (const double y)
Computes the inverse of the softsign function.
- template<typename InputVecType , typename OutputVecType >
static void **Inv** (const InputVecType &y, OutputVecType &x)
Computes the inverse of the softsign function.

39.141.1 Detailed Description

The softsign function, defined by.

$$\begin{aligned} f(x) &= \frac{x}{1 + |x|} \\ f'(x) &= (1 - |x|)^2 \\ f(x) &= \begin{cases} -\frac{y}{y-1} & : x > 0 \\ \frac{x}{1+x} & : x \leq 0 \end{cases} \end{aligned}$$

Definition at line 47 of file softsign_function.hpp.

39.141.2 Member Function Documentation

39.141.2.1 Deriv() [1/2]

```
static double Deriv (
    const double y ) [inline], [static]
```

Computes the first derivative of the softsign function.

Parameters

<i>y</i>	Input data.
----------	-------------

Returns

$f'(x)$

Definition at line 84 of file softsign_function.hpp.

39.141.2.2 Deriv() [2/2]

```
static void Deriv (
    const InputVecType & y,
    OutputVecType & x ) [inline], [static]
```

Computes the first derivatives of the softsign function.

Parameters

<i>y</i>	Input activations.
<i>x</i>	The resulting derivatives.

Definition at line 96 of file softsign_function.hpp.

39.141.2.3 Fn() [1/2]

```
static double Fn (  
    const double x ) [inline], [static]
```

Computes the softsign function.

Parameters

<i>x</i>	Input data.
----------	-------------

Returns

$f(x)$.

Definition at line 56 of file softsign_function.hpp.

Referenced by SoftsignFunction::Fn().

39.141.2.4 Fn() [2/2]

```
static void Fn (  
    const InputVecType & x,  
    OutputVecType & y ) [inline], [static]
```

Computes the softsign function.

Parameters

<i>x</i>	Input data.
<i>y</i>	The resulting output activation.

Definition at line 70 of file softsign_function.hpp.

References SoftsignFunction::Fn().

39.141.2.5 Inv() [1/2]

```
static double Inv (
    const double y ) [inline], [static]
```

Computes the inverse of the softsign function.

Parameters

<i>y</i>	Input data.
----------	-------------

Returns

$f^{\{-1\}}(y)$

Definition at line 107 of file softsign_function.hpp.

Referenced by SoftsignFunction::Inv().

39.141.2.6 Inv() [2/2]

```
static void Inv (
    const InputVecType & y,
    OutputVecType & x ) [inline], [static]
```

Computes the inverse of the softsign function.

Parameters

<i>y</i>	Input data.
<i>x</i>	The resulting inverse of the input data.

Definition at line 122 of file softsign_function.hpp.

References SoftsignFunction::Inv().

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/activation_functions/ **softsign_function.hpp**

39.142 SpikeSlabRBM Class Reference

For more information, see the following paper:

39.142.1 Detailed Description

For more information, see the following paper:

```
@article{Courville11,
  author = {Aaron Courville, James Bergstra and Yoshua Bengio},
  title  = {A Spike and Slab Restricted Boltzmann Machine},
  year   = {2011},
  url    = {http://proceedings.mlr.press/v15/courville11a/courville11a.pdf}
}
```

Definition at line 44 of file rbm_policies.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/rbm/ **rbm_policies.hpp**

39.143 Subview< InputDataType, OutputDataType > Class Template Reference

Implementation of the subview layer.

Public Member Functions

- **Subview** (const size_t inSize=1, const size_t beginRow=0, const size_t endRow=0, const size_t beginCol=0, const size_t endCol=0)
*Create the **Subview** (p. 947) layer object using the specified range of input to accept.*
- template<typename eT >
void **Backward** (arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename InputType, typename OutputType >
void **Forward** (InputType &&input, OutputType &&output)
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- OutputDataType const & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the layer.

39.143.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::Subview< InputDataType, OutputDataType >
```

Implementation of the subview layer.

The subview layer modifies the input to a submatrix of required size.

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 34 of file subview.hpp.

39.143.2 Constructor & Destructor Documentation

39.143.2.1 Subview()

```
Subview (
    const size_t inSize = 1,
    const size_t beginRow = 0,
    const size_t endRow = 0,
    const size_t beginCol = 0,
    const size_t endCol = 0 ) [inline]
```

Create the **Subview** (p. 947) layer object using the specified range of input to accept.

Parameters

<i>inSize</i>	Width of sample.
<i>beginRow</i>	Starting row index.
<i>endRow</i>	Ending row index.
<i>beginCol</i>	Starting column index.
<i>endCol</i>	Ending column index.

Definition at line 47 of file subview.hpp.

39.143.3 Member Function Documentation

39.143.3.1 Backward()

```
void Backward (
    arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g ) [inline]
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

Definition at line 115 of file subview.hpp.

39.143.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 128 of file subview.hpp.

39.143.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 130 of file subview.hpp.

39.143.3.4 Forward()

```
void Forward (
    InputType && input,
    OutputType && output ) [inline]
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

Definition at line 69 of file subview.hpp.

39.143.3.5 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 123 of file subview.hpp.

39.143.3.6 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 125 of file subview.hpp.

39.143.3.7 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the layer.

Definition at line 136 of file subview.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/ **subview.hpp**

39.144 SVDConvolution< BorderMode > Class Template Reference

Computes the two-dimensional convolution using singular value decomposition.

Static Public Member Functions

- template<typename eT >
static void **Convolution** (const arma::Mat< eT > &input, const arma::Mat< eT > &filter, arma::Mat< eT > &output)
- template<typename eT >
static void **Convolution** (const arma::Cube< eT > &input, const arma::Cube< eT > &filter, arma::Cube< eT > &output)
- template<typename eT >
static void **Convolution** (const arma::Mat< eT > &input, const arma::Cube< eT > &filter, arma::Cube< eT > &output)
- template<typename eT >
static void **Convolution** (const arma::Cube< eT > &input, const arma::Mat< eT > &filter, arma::Cube< eT > &output)

39.144.1 Detailed Description

```
template<typename BorderMode = FullConvolution>
class mlpack::ann::SVDConvolution< BorderMode >
```

Computes the two-dimensional convolution using singular value decomposition.

This class allows specification of the type of the border type. The convolution can be computed with the valid border type of the full border type (default).

FullConvolution (p. 714): returns the full two-dimensional convolution. **ValidConvolution** (p. 967): returns only those parts of the convolution that are computed without the zero-padded edges.

Template Parameters

<i>BorderMode</i>	Type of the border mode (FullConvolution (p. 714) or ValidConvolution (p. 967)).
-------------------	---

Definition at line 38 of file svd_convolution.hpp.

39.144.2 Member Function Documentation

39.144.2.1 Convolution() [1/4]

```
static void Convolution (
    const arma::Mat< eT > & input,
    const arma::Mat< eT > & filter,
    arma::Mat< eT > & output ) [inline], [static]
```

Definition at line 56 of file svd_convolution.hpp.

References NaiveConvolution< BorderMode >::Convolution(), and FFTConvolution< BorderMode, padLastDim >::Convolution().

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/convolution_rules/ **svd_convolution.hpp**

39.145 SwishFunction Class Reference

The swish function, defined by.

Static Public Member Functions

- static double **Deriv** (const double y)
Computes the first derivative of the swish function.
- template<typename InputVecType , typename OutputVecType >
static void **Deriv** (const InputVecType &y, OutputVecType &x)
Computes the first derivatives of the swish function.
- static double **Fn** (const double x)
Computes the swish function.
- template<typename eT >
static void **Fn** (const arma::Mat< eT > &x, arma::Mat< eT > &y)
Computes the swish function using a matrix as input.
- template<typename InputVecType , typename OutputVecType >
static void **Fn** (const InputVecType &x, OutputVecType &y)
Computes the swish function.

39.145.1 Detailed Description

The swish function, defined by.

$$\begin{aligned} f(x) &= x \cdot \sigma(x) \\ f'(x) &= f(x) + \sigma(x)(1 - f(x)) \\ \sigma(x) &= \frac{1}{1 + e^{-x}} \end{aligned}$$

Definition at line 30 of file swish_function.hpp.

39.145.2 Member Function Documentation

39.145.2.1 Deriv() [1/2]

```
static double Deriv (
    const double y ) [inline], [static]
```

Computes the first derivative of the swish function.

Parameters

y	Input data.
-----	-------------

Returns $f'(x)$

Definition at line 77 of file swish_function.hpp.

39.145.2.2 Deriv() [2/2]

```
static void Deriv (  
    const InputVecType & y,  
    OutputVecType & x ) [inline], [static]
```

Computes the first derivatives of the swish function.

Parameters

y	Input activations.
x	The resulting derivatives.

Definition at line 90 of file swish_function.hpp.

39.145.2.3 Fn() [1/3]

```
static double Fn (  
    const double x ) [inline], [static]
```

Computes the swish function.

Parameters

x	Input data.
-----	-------------

Returns $f(x)$.

Definition at line 39 of file swish_function.hpp.

Referenced by SwishFunction::Fn().

39.145.2.4 Fn() [2/3]

```
static void Fn (  
    const arma::Mat< eT > & x,  
    arma::Mat< eT > & y ) [inline], [static]
```

Computes the swish function using a matrix as input.

Parameters

<i>x</i>	Input data.
<i>y</i>	The resulting output activation.

Definition at line 51 of file swish_function.hpp.

39.145.2.5 Fn() [3/3]

```
static void Fn (  
    const InputVecType & x,  
    OutputVecType & y ) [inline], [static]
```

Computes the swish function.

Parameters

<i>x</i>	Input data.
<i>y</i>	The resulting output activation.

Definition at line 63 of file swish_function.hpp.

References SwishFunction::Fn().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/activation_functions/ **swish_function.hpp**

39.146 TanhFunction Class Reference

The tanh function, defined by.

Static Public Member Functions

- static double **Deriv** (const double y)
Computes the first derivative of the tanh function.
- template<typename InputVecType , typename OutputVecType >
static void **Deriv** (const InputVecType &y, OutputVecType &x)
Computes the first derivatives of the tanh function.
- static double **Fn** (const double x)
Computes the tanh function.
- template<typename InputVecType , typename OutputVecType >
static void **Fn** (const InputVecType &x, OutputVecType &y)
Computes the tanh function.
- static double **Inv** (const double y)
Computes the inverse of the tanh function.
- template<typename InputVecType , typename OutputVecType >
static void **Inv** (const InputVecType &y, OutputVecType &x)
Computes the inverse of the tanh function.

39.146.1 Detailed Description

The tanh function, defined by.

$$\begin{aligned} f(x) &= \frac{e^x - e^{-x}}{e^x + e^{-x}} \\ f'(x) &= 1 - \tanh^2(x) \\ f^{-1}(x) &= \arctan(x) \end{aligned}$$

Definition at line 29 of file tanh_function.hpp.

39.146.2 Member Function Documentation

39.146.2.1 Deriv() [1/2]

```
static double Deriv (
    const double y ) [inline], [static]
```

Computes the first derivative of the tanh function.

Parameters

<i>y</i>	Input data.
----------	-------------

Returns $f'(x)$

Definition at line 61 of file tanh_function.hpp.

39.146.2.2 Deriv() [2/2]

```
static void Deriv (  
    const InputVecType & y,  
    OutputVecType & x ) [inline], [static]
```

Computes the first derivatives of the tanh function.

Parameters

y	Input data.
x	The resulting derivatives.

Definition at line 73 of file tanh_function.hpp.

39.146.2.3 Fn() [1/2]

```
static double Fn (  
    const double x ) [inline], [static]
```

Computes the tanh function.

Parameters

x	Input data.
---	-------------

Returns $f(x)$.

Definition at line 38 of file tanh_function.hpp.

39.146.2.4 Fn() [2/2]

```
static void Fn (
    const InputVecType & x,
    OutputVecType & y ) [inline], [static]
```

Computes the tanh function.

Parameters

<i>x</i>	Input data.
<i>y</i>	The resulting output activation.

Definition at line 50 of file tanh_function.hpp.

39.146.2.5 Inv() [1/2]

```
static double Inv (
    const double y ) [inline], [static]
```

Computes the inverse of the tanh function.

Parameters

<i>y</i>	Input data.
----------	-------------

Returns

$f^{-1}(x)$

Definition at line 84 of file tanh_function.hpp.

39.146.2.6 Inv() [2/2]

```
static void Inv (
    const InputVecType & y,
    OutputVecType & x ) [inline], [static]
```

Computes the inverse of the tanh function.

Parameters

y	Input data.
x	The resulting inverse of the input data.

Definition at line 96 of file tanh_function.hpp.

The documentation for this class was generated from the following file:

39.147 TransposedConvolution< ForwardConvolutionRule, BackwardConvolutionRule, GradientConvolutionRule, InputDataType, OutputDataType > Class Template Reference

Implementation of the Transposed **Convolution** (p. 643) class.

Public Member Functions

- **TransposedConvolution** ()
*Create the Transposed **Convolution** (p. 643) object.*
- **TransposedConvolution** (const size_t inSize, const size_t outSize, const size_t kW, const size_t kH, const size_t dW=1, const size_t dH=1, const size_t padW=0, const size_t padH=0, const size_t inputWidth=0, const size_t inputHeight=0)
*Create the Transposed **Convolution** (p. 643) object using the specified number of input maps, output maps, filter size, stride and padding parameter.*
- template<typename eT >
void **Backward** (const arma::Mat< eT > &&, arma::Mat< eT > &&gy, arma::Mat< eT > &&g)
Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .
- OutputDataType const & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.
- template<typename eT >
void **Forward** (const arma::Mat< eT > &&input, arma::Mat< eT > &&output)
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- template<typename eT >
void **Gradient** (const arma::Mat< eT > &&, arma::Mat< eT > &&error, arma::Mat< eT > &&gradient)
Get the gradient.
- OutputDataType const & **Gradient** () const
Modify the gradient.
- size_t const & **InputHeight** () const
Get the input height.

- `size_t & InputHeight ()`
Modify the input height.
- `InputDataType const & InputParameter () const`
Get the input parameter.
- `InputDataType & InputParameter ()`
Modify the input parameter.
- `size_t const & InputWidth () const`
Get the input width.
- `size_t & InputWidth ()`
Modify input the width.
- `size_t const & OutputHeight () const`
Get the output height.
- `size_t & OutputHeight ()`
Modify the output height.
- `OutputDataType const & OutputParameter () const`
Get the output parameter.
- `OutputDataType & OutputParameter ()`
Modify the output parameter.
- `size_t const & OutputWidth () const`
Get the output width.
- `size_t & OutputWidth ()`
Modify the output width.
- `OutputDataType const & Parameters () const`
Get the parameters.
- `OutputDataType & Parameters ()`
Modify the parameters.
- `void Reset ()`
- `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialize the layer.

39.147.1 Detailed Description

```
template<typename ForwardConvolutionRule = NaiveConvolution<ValidConvolution>, typename BackwardConvolutionRule =
NaiveConvolution<FullConvolution>, typename GradientConvolutionRule = NaiveConvolution<ValidConvolution>, typename
InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::TransposedConvolution< ForwardConvolutionRule, BackwardConvolutionRule, GradientConvolutionRule, Input<↔
DataType, OutputDataType >
```

Implementation of the Transposed **Convolution** (p. 643) class.

The Transposed **Convolution** (p. 643) class represents a single layer of a neural network.

Template Parameters

<i>ForwardConvolutionRule</i>	Convolution (p. 643) to perform forward process.
<i>BackwardConvolutionRule</i>	Convolution (p. 643) to perform backward process.
<i>GradientConvolutionRule</i>	Convolution (p. 643) to calculate gradient.
<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 120 of file layer_types.hpp.

39.147.2 Constructor & Destructor Documentation

39.147.2.1 TransposedConvolution() [1/2]

TransposedConvolution ()

Create the Transposed **Convolution** (p. 643) object.

39.147.2.2 TransposedConvolution() [2/2]

```
TransposedConvolution (
    const size_t inSize,
    const size_t outSize,
    const size_t kW,
    const size_t kH,
    const size_t dW = 1,
    const size_t dH = 1,
    const size_t padW = 0,
    const size_t padH = 0,
    const size_t inputWidth = 0,
    const size_t inputHeight = 0 )
```

Create the Transposed **Convolution** (p. 643) object using the specified number of input maps, output maps, filter size, stride and padding parameter.

Parameters

<i>inSize</i>	The number of input maps.
<i>outSize</i>	The number of output maps.
<i>kW</i>	Width of the filter/kernel.
<i>kH</i>	Height of the filter/kernel.
<i>dW</i>	Stride of filter application in the x direction.
<i>dH</i>	Stride of filter application in the y direction.
<i>padW</i>	Padding width of the input.
<i>padH</i>	Padding height of the input.
<i>inputWidth</i>	The width of the input data.
<i>inputHeight</i>	The height of the input data.

39.147.3 Member Function Documentation

39.147.3.1 Backward()

```
void Backward (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && gy,
    arma::Mat< eT > && g )
```

Ordinary feed backward pass of a neural network, calculating the function $f(x)$ by propagating x backwards through f .

Using the results from the feed forward pass.

Parameters

<i>input</i>	The propagated input activation.
<i>gy</i>	The backpropagated error.
<i>g</i>	The calculated gradient.

39.147.3.2 Delta() [1/2]

```
OutputDataType const& Delta ( ) const [inline]
```

Get the delta.

Definition at line 136 of file `transposed_convolution.hpp`.

39.147.3.3 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 138 of file `transposed_convolution.hpp`.

39.147.3.4 Forward()

```
void Forward (
    const arma::Mat< eT > && input,
    arma::Mat< eT > && output )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data used for evaluating the specified function.
<i>output</i>	Resulting output activation.

39.147.3.5 Gradient() [1/3]

```
void Gradient (
    const arma::Mat< eT > && ,
    arma::Mat< eT > && error,
    arma::Mat< eT > && gradient )
```

39.147.3.6 Gradient() [2/3]

```
OutputDataType const& Gradient ( ) const [inline]
```

Get the gradient.

Definition at line 141 of file `transposed_convolution.hpp`.

39.147.3.7 Gradient() [3/3]

```
OutputDataType& Gradient ( ) [inline]
```

Modify the gradient.

Definition at line 143 of file `transposed_convolution.hpp`.

39.147.3.8 InputHeight() [1/2]

```
size_t const& InputHeight ( ) const [inline]
```

Get the input height.

Definition at line 151 of file `transposed_convolution.hpp`.

39.147.3.9 InputHeight() [2/2]

```
size_t& InputHeight ( ) [inline]
```

Modify the input height.

Definition at line 153 of file `transposed_convolution.hpp`.

39.147.3.10 InputParameter() [1/2]

```
InputDataType const& InputParameter ( ) const [inline]
```

Get the input parameter.

Definition at line 126 of file `transposed_convolution.hpp`.

39.147.3.11 InputParameter() [2/2]

```
InputDataType& InputParameter ( ) [inline]
```

Modify the input parameter.

Definition at line 128 of file `transposed_convolution.hpp`.

39.147.3.12 InputWidth() [1/2]

```
size_t const& InputWidth ( ) const [inline]
```

Get the input width.

Definition at line 146 of file `transposed_convolution.hpp`.

39.147.3.13 InputWidth() [2/2]

```
size_t& InputWidth ( ) [inline]
```

Modify input the width.

Definition at line 148 of file `transposed_convolution.hpp`.

39.147.3.14 OutputHeight() [1/2]

```
size_t const& OutputHeight ( ) const [inline]
```

Get the output height.

Definition at line 161 of file `transposed_convolution.hpp`.

39.147.3.15 OutputHeight() [2/2]

```
size_t& OutputHeight ( ) [inline]
```

Modify the output height.

Definition at line 163 of file `transposed_convolution.hpp`.

References `TransposedConvolution< ForwardConvolutionRule, BackwardConvolutionRule, GradientConvolutionRule, InputDataType, OutputDataType >::serialize()`.

39.147.3.16 OutputParameter() [1/2]

```
OutputDataType const& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 131 of file `transposed_convolution.hpp`.

39.147.3.17 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 133 of file `transposed_convolution.hpp`.

39.147.3.18 OutputWidth() [1/2]

```
size_t const& OutputWidth ( ) const [inline]
```

Get the output width.

Definition at line 156 of file `transposed_convolution.hpp`.

39.147.3.19 OutputWidth() [2/2]

```
size_t& OutputWidth ( ) [inline]
```

Modify the output width.

Definition at line 158 of file `transposed_convolution.hpp`.

39.147.3.20 Parameters() [1/2]

```
OutputDataType const& Parameters ( ) const [inline]
```

Get the parameters.

Definition at line 121 of file `transposed_convolution.hpp`.

39.147.3.21 Parameters() [2/2]

```
OutputDataType& Parameters ( ) [inline]
```

Modify the parameters.

Definition at line 123 of file `transposed_convolution.hpp`.

39.147.3.22 Reset()

```
void Reset ( )
```

39.147.3.23 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the layer.

Referenced by TransposedConvolution< ForwardConvolutionRule, BackwardConvolutionRule, GradientConvolutionRule, InputDataType, OutputDataType >::OutputHeight().

39.149 VRClassReward< InputDataType, OutputDataType > Class Template Reference

Implementation of the variance reduced classification reinforcement layer.

Public Member Functions

- **VRClassReward** (const double scale=1, const bool sizeAverage=true)
*Create the **VRClassReward** (p. 967) object.*
- template<class LayerType, class... Args>
void **Add** (Args... args)
- void **Add** (**LayerTypes**<> layer)
- template<typename InputType, typename TargetType, typename OutputType >
void **Backward** (const InputType &&input, const TargetType &&target, OutputType &&output)
Ordinary feed backward pass of a neural network.
- OutputDataType & **Delta** () const
Get the delta.
- OutputDataType & **Delta** ()
Modify the delta.

- bool **Deterministic** () const
Get the value of the deterministic parameter.
- bool & **Deterministic** ()
Modify the value of the deterministic parameter.
- template<typename InputType , typename TargetType >
double **Forward** (const InputType &&input, const TargetType &&target)
Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .
- OutputDataType & **OutputParameter** () const
Get the output parameter.
- OutputDataType & **OutputParameter** ()
Modify the output parameter.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialize the layer.

39.149.1 Detailed Description

```
template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat>
class mlpack::ann::VRClassReward< InputDataType, OutputDataType >
```

Implementation of the variance reduced classification reinforcement layer.

This layer is meant to be used in combination with the reinforce normal layer (ReinforceNormalLayer), which expects that an reward: (1 for success, 0 otherwise).

Template Parameters

<i>InputDataType</i>	Type of the input data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).
<i>OutputDataType</i>	Type of the output data (arma::colvec, arma::mat, arma::sp_mat or arma::cube).

Definition at line 64 of file layer_types.hpp.

39.149.2 Constructor & Destructor Documentation

39.149.2.1 VRClassReward()

```
VRClassReward (
    const double scale = 1,
    const bool sizeAverage = true )
```

Create the **VRClassReward** (p. 967) object.

Parameters

<i>scale</i>	Parameter used to scale the reward.
<i>sizeAverage</i>	Take the average over all batches.

39.149.3 Member Function Documentation

39.149.3.1 Add() [1/2]

```
void Add (
    Args... args ) [inline]
```

Definition at line 97 of file vr_class_reward.hpp.

39.149.3.2 Add() [2/2]

```
void Add (
    LayerTypes<> layer ) [inline]
```

Definition at line 104 of file vr_class_reward.hpp.

References VRClassReward< InputDataType, OutputDataType >::serialize().

39.149.3.3 Backward()

```
void Backward (
    const InputType && input,
    const TargetType && target,
    OutputType && output )
```

Ordinary feed backward pass of a neural network.

The negative log likelihood layer expects that the input contains log-probabilities for each class. The layer also expects a class index, in the range between 1 and the number of classes, as target when calling the Forward function.

Parameters

<i>input</i>	The propagated input activation.
<i>target</i>	The target vector, that contains the class index in the range between 1 and the number of classes.
<i>output</i>	The calculated error.

39.149.3.4 Delta() [1/2]

```
OutputDataType& Delta ( ) const [inline]
```

Get the delta.

Definition at line 82 of file `vr_class_reward.hpp`.

39.149.3.5 Delta() [2/2]

```
OutputDataType& Delta ( ) [inline]
```

Modify the delta.

Definition at line 84 of file `vr_class_reward.hpp`.

39.149.3.6 Deterministic() [1/2]

```
bool Deterministic ( ) const [inline]
```

Get the value of the deterministic parameter.

Definition at line 87 of file `vr_class_reward.hpp`.

39.149.3.7 Deterministic() [2/2]

```
bool& Deterministic ( ) [inline]
```

Modify the value of the deterministic parameter.

Definition at line 89 of file `vr_class_reward.hpp`.

39.149.3.8 Forward()

```
double Forward (
    const InputType && input,
    const TargetType && target )
```

Ordinary feed forward pass of a neural network, evaluating the function $f(x)$ by propagating the activity forward through f .

Parameters

<i>input</i>	Input data that contains the log-probabilities for each class.
<i>target</i>	The target vector, that contains the class index in the range between 1 and the number of classes.

39.149.3.9 OutputParameter() [1/2]

```
OutputDataType& OutputParameter ( ) const [inline]
```

Get the output parameter.

Definition at line 77 of file vr_class_reward.hpp.

39.149.3.10 OutputParameter() [2/2]

```
OutputDataType& OutputParameter ( ) [inline]
```

Modify the output parameter.

Definition at line 79 of file vr_class_reward.hpp.

39.149.3.11 serialize()

```
void serialize (
    Archive & ,
    const unsigned int )
```

Serialize the layer.

Referenced by VRClassReward< InputDataType, OutputDataType >::Add().

39.150 WeightSetVisitor Class Reference

WeightSetVisitor (p. 972) update the module parameters given the parameters set.

Inheritance diagram for WeightSetVisitor:

Public Member Functions

- **WeightSetVisitor** (arma::mat &&weight, const size_t offset=0)
Update the parameters given the parameters set and offset.
- template<typename LayerType >
size_t **operator()** (LayerType *layer) const
Update the parameters set.

39.150.1 Detailed Description

WeightSetVisitor (p. 972) update the module parameters given the parameters set.

Definition at line 26 of file weight_set_visitor.hpp.

39.150.2 Constructor & Destructor Documentation

39.150.2.1 WeightSetVisitor()

```

WeightSetVisitor (
    arma::mat && weight,
    const size_t offset = 0 )
  
```

Update the parameters given the parameters set and offset.

39.150.3 Member Function Documentation

39.150.3.1 operator()()

```
size_t operator() (
    LayerType * layer ) const
```

Update the parameters set.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **weight_set_visitor.hpp**

39.151 WeightSizeVisitor Class Reference

WeightSizeVisitor (p. 973) returns the number of weights of the given module.

Inheritance diagram for WeightSizeVisitor:

Public Member Functions

- template<typename LayerType >
size_t **operator()** (LayerType *layer) const
Return the number of weights.

39.151.1 Detailed Description

WeightSizeVisitor (p. 973) returns the number of weights of the given module.

Definition at line 27 of file weight_size_visitor.hpp.

39.151.2 Member Function Documentation

39.151.2.1 operator()()

```
size_t operator() (
    LayerType * layer ) const
```

Return the number of weights.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/ **weight_size_visitor.hpp**

39.152 Backtrace Class Reference

Provides a backtrace.

Public Member Functions

- **Backtrace** ()
Constructor initialize fields and call `GetAddress` to retrieve addresses for each frame of backtrace.
- std::string **ToString** ()
Returns string of backtrace.

39.152.1 Detailed Description

Provides a backtrace.

The **Backtrace** (p. 974) class retrieve addresses of each called function from the stack and decode file name, function & line number. Retrieved information can be printed in form:

```
[b]: (count) /directory/to/file.cpp:function(args):line_number
```

Backtrace (p. 974) is printed always when **Log::Assert** (p. 1539) failed. An example is given below.

```
if (!someImportantCondition())
{
    Log::Fatal << "someImportantCondition() is not satisfied! Terminating.";
    Log::Fatal << std::endl;
}
```

Note

Log::Assert (p. 1539) will not be shown when compiling in non-debug mode.

See also

PrefixOutStream, **Log** (p. 1538)

Definition at line 46 of file backtrace.hpp.

39.152.2 Constructor & Destructor Documentation

39.152.2.1 Backtrace()

Backtrace ()

Constructor initialize fields and call GetAddress to retrieve addresses for each frame of backtrace.

Parameters

<i>maxDepth</i>	Maximum depth of backtrace. Default 32 steps.
-----------------	---

39.152.3 Member Function Documentation

39.152.3.1 ToString()

`std::string ToString ()`

Returns string of backtrace.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/util/ **backtrace.hpp**

39.153 CLIOption< N > Class Template Reference

A static object whose constructor registers a parameter with the **CLI** (p. 1117) class.

Public Member Functions

- **CLIOption** (const N defaultValue, const std::string &identifier, const std::string &description, const std::string &alias, const std::string &cppName, const bool required=false, const bool input=true, const bool noTranspose=false, const std::string &="")

Construct an Option object.

39.153.1 Detailed Description

```
template<typename N>
class mlpack::bindings::cli::CLIOption< N >
```

A static object whose constructor registers a parameter with the **CLI** (p. 1117) class.

This should not be used outside of **CLI** (p. 1117) itself, and you should use the **PARAM_FLAG()** (p. 301), **PARAM_DOUBLE()**, **PARAM_INT()**, **PARAM_STRING()**, or other similar macros to declare these objects instead of declaring them directly.

See also

core/util/cli.hpp (p. 2694), **mlpack::CLI** (p. 1117)

Definition at line 47 of file cli_option.hpp.

39.153.2 Constructor & Destructor Documentation

39.153.2.1 CLIOption()

```
CLIOption (
    const N defaultValue,
    const std::string & identifier,
    const std::string & description,
    const std::string & alias,
    const std::string & cppName,
    const bool required = false,
    const bool input = true,
    const bool noTranspose = false,
    const std::string & testName ) [inline]
```

Construct an Option object.

When constructed, it will register itself with **CLI** (p. 1117).

Parameters

<i>defaultValue</i>	Default value this parameter will be initialized to (for flags, this should be false, for instance).
<i>identifier</i>	The name of the option (no dashes in front; for <code>-help</code> , we would pass "help").
<i>description</i>	A short string describing the option.
<i>alias</i>	Short name of the parameter. "" for no alias.
<i>cppName</i>	Name of the C++ type of this parameter (i.e. "int").
<i>required</i>	Whether or not the option is required at runtime.
<i>input</i>	Whether or not the option is an input option.
<i>noTranspose</i>	If the parameter is a matrix and this is true, then the matrix will not be transposed on loading.
<i>testName</i>	Is not used and added for compatibility reasons.

Definition at line 67 of file `cli_option.hpp`.

39.154 `ParameterType< T >` Struct Template Reference

Utility struct to return the type that `boost::program_options` should accept for a given input type.

Public Types

- typedef `ParameterTypeDeducer< data::HasSerialize< T >::value, T >:: type type`

39.154.1 Detailed Description

```
template<typename T>
struct mlpack::bindings::cli::ParameterType< T >
```

Utility struct to return the type that `boost::program_options` should accept for a given input type.

In general, there is no change from the input type, but in some cases this may be another type.

Definition at line 42 of file `parameter_type.hpp`.

39.154.2 Member Typedef Documentation

39.154.2.1 `type`

```
typedef ParameterTypeDeducer< data::HasSerialize<T>::value, T>:: type type
```

Definition at line 45 of file `parameter_type.hpp`.

The documentation for this struct was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/ parameter_type.hpp`

39.155 `ParameterType< arma::Col< eT > >` Struct Template Reference

For vector types, `boost::program_options` will accept a `std::string`, not an `arma::Col<eT>` (since it is not clear how to specify a vector on the command-line).

Public Types

- `typedef std::string type`

39.155.1 Detailed Description

```
template<typename eT>
struct mlpack::bindings::cli::ParameterType< arma::Col< eT > >
```

For vector types, `boost::program_options` will accept a `std::string`, not an `arma::Col<eT>` (since it is not clear how to specify a vector on the command-line).

Definition at line 54 of file `parameter_type.hpp`.

39.155.2 Member Typedef Documentation

39.155.2.1 `type`

```
typedef std::string type
```

Definition at line 56 of file `parameter_type.hpp`.

The documentation for this struct was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/parameter_type.hpp`

39.156 `ParameterType< arma::Mat< eT > >` Struct Template Reference

For matrix types, `boost::program_options` will accept a `std::string`, not an `arma::mat` (since it is not clear how to specify a matrix on the command-line).

Public Types

- `typedef std::string type`

39.156.1 Detailed Description

```
template<typename eT>
struct mlpack::bindings::cli::ParameterType< arma::Mat< eT > >
```

For matrix types, `boost::program_options` will accept a `std::string`, not an `arma::mat` (since it is not clear how to specify a matrix on the command-line).

Definition at line 77 of file `parameter_type.hpp`.

39.156.2 Member Typedef Documentation

39.156.2.1 `type`

```
typedef std::string type
```

Definition at line 79 of file `parameter_type.hpp`.

The documentation for this struct was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/parameter_type.hpp`

39.157 `ParameterType< arma::Row< eT > >` Struct Template Reference

For row vector types, `boost::program_options` will accept a `std::string`, not an `arma::Row<eT>` (since it is not clear how to specify a vector on the command-line).

Public Types

- `typedef std::string type`

39.157.1 Detailed Description

```
template<typename eT>
struct mlpack::bindings::cli::ParameterType< arma::Row< eT > >
```

For row vector types, `boost::program_options` will accept a `std::string`, not an `arma::Row<eT>` (since it is not clear how to specify a vector on the command-line).

Definition at line 66 of file `parameter_type.hpp`.

39.157.2 Member Typedef Documentation

39.157.2.1 type

```
typedef std::string type
```

Definition at line 68 of file parameter_type.hpp.

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/ **parameter_type.hpp**

39.158 **ParameterType**< std::tuple< mlpack::data::DatasetMapper< PolicyType, std::string >, arma::Mat< eT > > > **Struct Template Reference**

For matrix+dataset info types, we should accept a std::string.

Public Types

- typedef std::string **type**

39.158.1 Detailed Description

```
template<typename eT, typename PolicyType>
struct mlpack::bindings::cli::ParameterType< std::tuple< mlpack::data::DatasetMapper< PolicyType, std::string >, arma::Mat< eT > > >
> > >
```

For matrix+dataset info types, we should accept a std::string.

Definition at line 86 of file parameter_type.hpp.

39.158.2 Member Typedef Documentation

39.158.2.1 type

```
typedef std::string type
```

Definition at line 89 of file parameter_type.hpp.

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/ **parameter_type.hpp**

39.159 ParameterTypeDeducer< HasSerialize, T > Struct Template Reference

Public Types

- typedef T **type**

39.159.1 Detailed Description

```
template<bool HasSerialize, typename T>  
struct mlpack::bindings::cli::ParameterTypeDeducer< HasSerialize, T >
```

Definition at line 24 of file parameter_type.hpp.

39.159.2 Member Typedef Documentation

39.159.2.1 type

```
typedef T type
```

Definition at line 26 of file parameter_type.hpp.

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/ **parameter_type.hpp**

39.160 ParameterTypeDeducer< true, T > Struct Template Reference

Public Types

- typedef std::string **type**

39.160.1 Detailed Description

```
template<typename T>
struct mlpack::bindings::cli::ParameterTypeDeducer< true, T >
```

Definition at line 31 of file parameter_type.hpp.

39.160.2 Member Typedef Documentation

39.160.2.1 type

```
typedef std::string  type
```

Definition at line 33 of file parameter_type.hpp.

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/ **parameter_type.hpp**

39.161 ProgramDoc Class Reference

A static object whose constructor registers program documentation with the **CLI** (p. 1117) class.

Public Member Functions

- **ProgramDoc** (const std::string & **programName**, const std::string & **documentation**)
*Construct a **ProgramDoc** (p. 982) object.*

Public Attributes

- std::string **documentation**
Documentation for what the program does.
- std::string **programName**
The name of the program.

39.161.1 Detailed Description

A static object whose constructor registers program documentation with the **CLI** (p. 1117) class.

This should not be used outside of **CLI** (p. 1117) itself, and you should use the **PROGRAM_INFO()** (p. 2733) macro to declare these objects. Only one **ProgramDoc** (p. 982) object should ever exist.

See also

core/util/cli.hpp (p. 2694), **mlpack::CLI** (p. 1117)

Definition at line 174 of file cli_option.hpp.

39.161.2 Constructor & Destructor Documentation

39.161.2.1 ProgramDoc()

```
ProgramDoc (
    const std::string & programName,
    const std::string & documentation )
```

Construct a **ProgramDoc** (p. 982) object.

When constructed, it will register itself with **CLI** (p. 1117).

Parameters

<i>programName</i>	Short string representing the name of the program.
<i>documentation</i>	Long string containing documentation on how to use the program and what it is. No newline characters are necessary; this is taken care of by CLI (p. 1117) later.

39.161.3 Member Data Documentation

39.161.3.1 documentation

```
std::string documentation
```

Documentation for what the program does.

Definition at line 192 of file cli_option.hpp.

39.161.3.2 `programName`

```
std::string programName
```

The name of the program.

Definition at line 190 of file `cli_option.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/ cli_option.hpp`

39.162 `BindingInfo` Class Reference

The **`BindingInfo`** (p. 984) class is used by the Markdown documentation generator to store multiple `ProgramDoc` objects, indexed by both the binding name (i.e.

Static Public Member Functions

- static **`util::ProgramDoc & GetProgramDoc`** (const std::string &bindingName)
Return a `ProgramDoc` object for a given `bindingName`.
- static std::string & **`Language`** ()
Get or modify the current language (don't set it to something invalid!).
- static void **`RegisterProgramDoc`** (const std::string &bindingName, const **`util::ProgramDoc`** &programDoc)
Register a `ProgramDoc` object with the given `bindingName`.

39.162.1 Detailed Description

The **`BindingInfo`** (p. 984) class is used by the Markdown documentation generator to store multiple `ProgramDoc` objects, indexed by both the binding name (i.e.

"knn") and the language (i.e. "cli").

Definition at line 30 of file `binding_info.hpp`.

39.162.2 Member Function Documentation

39.162.2.1 GetProgramDoc()

```
static util::ProgramDoc& GetProgramDoc (
    const std::string & bindingName ) [static]
```

Return a ProgramDoc object for a given bindingName.

39.162.2.2 Language()

```
static std::string& Language ( ) [static]
```

Get or modify the current language (don't set it to something invalid!).

Referenced by `mlpack::bindings::markdown::DefaultParam()`, `mlpack::bindings::markdown::GetPrintableType()`, and `mlpack::bindings::markdown::PrintTypeDoc()`.

39.162.2.3 RegisterProgramDoc()

```
static void RegisterProgramDoc (
    const std::string & bindingName,
    const util::ProgramDoc & programDoc ) [static]
```

Register a ProgramDoc object with the given bindingName.

Referenced by `ProgramDocWrapper::ProgramDocWrapper()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/markdown/ binding_info.hpp`

39.163 MDOption< T > Class Template Reference

The Markdown option class.

Public Member Functions

- **MDOption** (const T defaultValue, const std::string &identifier, const std::string &description, const std::string &alias, const std::string &cppName, const bool required=false, const bool input=true, const bool noTranspose=false, const std::string &bindingName="")

Construct an **MDOption** (p. 985) object.

39.163.1 Detailed Description

```
template<typename T>
class mlpack::bindings::markdown::MDOption< T >
```

The Markdown option class.

Definition at line 33 of file md_option.hpp.

39.163.2 Constructor & Destructor Documentation

39.163.2.1 MDOption()

```
MDOption (
    const T defaultValue,
    const std::string & identifier,
    const std::string & description,
    const std::string & alias,
    const std::string & cppName,
    const bool required = false,
    const bool input = true,
    const bool noTranspose = false,
    const std::string & bindingName = "" ) [inline]
```

Construct an **MDOption** (p. 985) object.

When constructed, it will register itself with **CLI** (p. 1117). The testName parameter is not used and added for compatibility reasons.

Definition at line 41 of file md_option.hpp.

References CLI::Add(), ParamData::alias, CLI::ClearSettings(), ParamData::cppType, ParamData::desc, CLI::function↵Map, CLI::GetSingleton(), ParamData::input, ParamData::loaded, ParamData::name, ParamData::noTranspose, ParamData::persistent, ParamData::required, CLI::RestoreSettings(), CLI::StoreSettings(), ParamData::tname, T↵YPENAME, ParamData::value, and ParamData::wasPassed.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/markdown/ **md_option.hpp**

39.164 ProgramDocWrapper Class Reference

Public Member Functions

- **ProgramDocWrapper** (const std::string &bindingName, const std::string &programName, const std::string &shortDocumentation, const std::function< std::string()> &documentation, const std::vector< std::pair< std::↵string, std::string >> &seeAlso)

Construct a ProgramDoc object and register it with **BindingInfo::RegisterProgramDoc()** (p. 985).

39.164.1 Detailed Description

Definition at line 22 of file program_doc_wrapper.hpp.

39.164.2 Constructor & Destructor Documentation

39.164.2.1 ProgramDocWrapper()

```
ProgramDocWrapper (
    const std::string & bindingName,
    const std::string & programName,
    const std::string & shortDocumentation,
    const std::function< std::string()> & documentation,
    const std::vector< std::pair< std::string, std::string >> & seeAlso ) [inline]
```

Construct a ProgramDoc object and register it with **BindingInfo::RegisterProgramDoc()** (p. 985).

Definition at line 29 of file program_doc_wrapper.hpp.

References BindingInfo::RegisterProgramDoc().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/markdown/ **program_doc_wrapper.hpp**

39.165 PyOption< T > Class Template Reference

The Python option class.

Public Member Functions

- **PyOption** (const T defaultValue, const std::string &identifier, const std::string &description, const std::string &alias, const std::string &cppName, const bool required=false, const bool input=true, const bool noTranspose=false, const std::string &="")

Construct a **PyOption** (p. 987) object.

39.165.1 Detailed Description

```
template<typename T>
class mlpack::bindings::python::PyOption< T >
```

The Python option class.

Definition at line 37 of file py_option.hpp.

39.165.2 Constructor & Destructor Documentation

39.165.2.1 PyOption()

```
PyOption (
    const T defaultValue,
    const std::string & identifier,
    const std::string & description,
    const std::string & alias,
    const std::string & cppName,
    const bool required = false,
    const bool input = true,
    const bool noTranspose = false,
    const std::string & testName = "" ) [inline]
```

Construct a **PyOption** (p. 987) object.

When constructed, it will register itself with **CLI** (p. 1117). The `testName` parameter is not used and added for compatibility reasons.

Definition at line 45 of file `py_option.hpp`.

References `CLI::Add()`, `ParamData::alias`, `CLI::ClearSettings()`, `ParamData::cppType`, `ParamData::desc`, `CLI::function↵Map`, `CLI::GetSingleton()`, `ParamData::input`, `ParamData::loaded`, `ParamData::name`, `ParamData::noTranspose`, `ParamData::persistent`, `ParamData::required`, `CLI::RestoreSettings()`, `CLI::StoreSettings()`, `ParamData::tname`, `T↵YPENAME`, `ParamData::value`, and `ParamData::wasPassed`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/python/ py_option.hpp`

39.166 ProgramDoc Class Reference

A static object whose constructor registers program documentation with the **CLI** (p. 1117) class.

Public Member Functions

- **ProgramDoc** (const std::string & **programName**, const std::string & **documentation**)
*Construct a **ProgramDoc** (p. 988) object.*

Public Attributes

- std::string **documentation**
Documentation for what the program does.
- std::string **programName**
The name of the program.

39.166.1 Detailed Description

A static object whose constructor registers program documentation with the **CLI** (p. 1117) class.

This should not be used outside of **CLI** (p. 1117) itself, and you should use the **PROGRAM_INFO()** (p. 2733) macro to declare these objects. Only one **ProgramDoc** (p. 988) object should ever exist.

See also

core/util/cli.hpp (p. 2694), **mlpack::CLI** (p. 1117)

Definition at line 119 of file test_option.hpp.

39.166.2 Constructor & Destructor Documentation

39.166.2.1 ProgramDoc()

```
ProgramDoc (  
    const std::string & programName,  
    const std::string & documentation )
```

Construct a **ProgramDoc** (p. 988) object.

When constructed, it will register itself with **CLI** (p. 1117).

Parameters

<i>programName</i>	Short string representing the name of the program.
<i>documentation</i>	Long string containing documentation on how to use the program and what it is. No newline characters are necessary; this is taken care of by CLI (p. 1117) later.

39.166.3 Member Data Documentation

39.166.3.1 documentation

```
std::string documentation
```

Documentation for what the program does.

Definition at line 137 of file test_option.hpp.

39.166.3.2 `programName`

```
std::string programName
```

The name of the program.

Definition at line 135 of file `test_option.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/tests/ test_option.hpp`

39.167 `TestOption< N >` Class Template Reference

A static object whose constructor registers a parameter with the **CLI** (p. 1117) class.

Public Member Functions

- **TestOption** (const N defaultValue, const std::string &identifier, const std::string &description, const std::string &alias, const std::string &cppName, const bool required=false, const bool input=true, const bool noTranspose=false, const std::string &testName="")

Construct an Option object.

39.167.1 Detailed Description

```
template<typename N>
class mlpack::bindings::tests::TestOption< N >
```

A static object whose constructor registers a parameter with the **CLI** (p. 1117) class.

This should not be used outside of **CLI** (p. 1117) itself, and you should use the **PARAM_FLAG()** (p. 2710), **PARAM_DOUBLE()**, **PARAM_INT()**, **PARAM_STRING()**, or other similar macros to declare these objects instead of declaring them directly.

See also

core/util/cli.hpp (p. 2694), **mlpack::CLI** (p. 1117)

Definition at line 40 of file `test_option.hpp`.

39.167.2 Constructor & Destructor Documentation

39.167.2.1 TestOption()

```

TestOption (
    const N defaultValue,
    const std::string & identifier,
    const std::string & description,
    const std::string & alias,
    const std::string & cppName,
    const bool required = false,
    const bool input = true,
    const bool noTranspose = false,
    const std::string & testName = "" ) [inline]

```

Construct an Option object.

When constructed, it will register itself with **CLI** (p. 1117).

Parameters

<i>defaultValue</i>	Default value this parameter will be initialized to (for flags, this should be false, for instance).
<i>identifier</i>	The name of the option (no dashes in front; for <code>-help</code> , we would pass "help").
<i>description</i>	A short string describing the option.
<i>alias</i>	Short name of the parameter. "" for no alias.
<i>cppName</i>	Name of the C++ type of this parameter (i.e. "int").
<i>required</i>	Whether or not the option is required at runtime.
<i>input</i>	Whether or not the option is an input option.
<i>noTranspose</i>	If the parameter is a matrix and this is true, then the matrix will not be transposed on loading.
<i>testName</i>	Name of the test (used for identifying which binding test this option belongs to)

Definition at line 61 of file `test_option.hpp`.

References `CLI::Add()`, `ParamData::alias`, `CLI::ClearSettings()`, `ParamData::cppType`, `ParamData::desc`, `CLI::function↔Map`, `CLI::GetSingleton()`, `ParamData::input`, `ParamData::loaded`, `ParamData::name`, `ParamData::noTranspose`, `ParamData::persistent`, `ParamData::required`, `CLI::RestoreSettings()`, `CLI::SetPassed()`, `CLI::StoreSettings()`, `Param↔Data::tname`, `YPENAME`, `ParamData::value`, and `ParamData::wasPassed`.

The documentation for this class was generated from the following file:

39.168 BallBound< MetricType, VecType > Class Template Reference

Ball bound encloses a set of points at a specific distance (radius) from a specific point (center).

Public Types

- `typedef VecType::elem_type ElemType`
The underlying data type.
- `typedef VecType Vec`
A public version of the vector type.

Public Member Functions

- **BallBound** ()
Empty Constructor.
- **BallBound** (const size_t dimension)
Create the ball bound with the specified dimensionality.
- **BallBound** (const **ElemType** radius, const VecType ¢er)
Create the ball bound with the specified radius and center.
- **BallBound** (const **BallBound** &other)
Copy constructor. To prevent memory leaks.
- **BallBound** (**BallBound** &&other)
Move constructor: take possession of another bound.
- **~BallBound** ()
Destructor to release allocated memory.
- const VecType & **Center** () const
Get the center point of the ball.
- VecType & **Center** ()
Modify the center point of the ball.
- void **Center** (VecType ¢er) const
*Place the center of **BallBound** (p. 991) into the given vector.*
- bool **Contains** (const VecType &point) const
Determines if a point is within this bound.
- **ElemType Diameter** () const
Returns the diameter of the ballbound.
- size_t **Dim** () const
Get the dimensionality of the ball.
- template<typename OtherVecType >
ElemType MaxDistance (const OtherVecType &point, typename **std::enable_if_t**< **IsVector**< OtherVecType >::value > * = 0) const
Computes maximum distance.
- **ElemType MaxDistance** (const **BallBound** &other) const
Computes maximum distance.
- const MetricType & **Metric** () const
Returns the distance metric used in this bound.
- MetricType & **Metric** ()
Modify the distance metric used in this bound.
- template<typename OtherVecType >
ElemType MinDistance (const OtherVecType &point, typename **std::enable_if_t**< **IsVector**< OtherVecType >::value > * = 0) const
Calculates minimum bound-to-point squared distance.

- **ElemType MinDistance** (const **BallBound** &other) const
Calculates minimum bound-to-bound squared distance.
- **ElemType MinWidth** () const
Get the minimum width of the bound (this is same as the diameter).
- **BallBound & operator=** (const **BallBound** &other)
For the same reason as the copy constructor: to prevent memory leaks.
- **math::RangeType< ElemType > operator[]** (const size_t i) const
Get the range in a certain dimension.
- const **BallBound & operator|=** (const **BallBound** &other)
Expand the bound to include the given node.
- template<typename MatType >
const **BallBound & operator|=** (const MatType &data)
Expand the bound to include the given point.
- **ElemType Radius** () const
Get the radius of the ball.
- **ElemType & Radius** ()
Modify the radius of the ball.
- template<typename OtherVecType >
math::RangeType< ElemType > RangeDistance (const OtherVecType &other, typename **std::enable_if_t< IsVector< OtherVecType >::value > !=0**) const
Calculates minimum and maximum bound-to-point distance.
- **math::RangeType< ElemType > RangeDistance** (const **BallBound** &other) const
Calculates minimum and maximum bound-to-bound distance.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int version)
Serialize the bound.

39.168.1 Detailed Description

```
template<typename MetricType = metric::LMetric<2, true>, typename VecType = arma::vec>
class mlpack::bound::BallBound< MetricType, VecType >
```

Ball bound encloses a set of points at a specific distance (radius) from a specific point (center).

MetricType is the custom metric type that defaults to the Euclidean (L2) distance.

Template Parameters

<i>MetricType</i>	metric type used in the distance measure.
<i>VecType</i>	Type of vector (arma::vec or arma::sp_vec or similar).

Definition at line 32 of file ballbound.hpp.

39.168.2 Member Typedef Documentation

39.168.2.1 ElemType

```
typedef VecType::elem_type ElemType
```

The underlying data type.

Definition at line 36 of file ballbound.hpp.

39.168.2.2 Vec

```
typedef VecType Vec
```

A public version of the vector type.

Definition at line 38 of file ballbound.hpp.

39.168.3 Constructor & Destructor Documentation

39.168.3.1 BallBound() [1/5]

```
BallBound ( )
```

Empty Constructor.

39.168.3.2 BallBound() [2/5]

```
BallBound (  
    const size_t dimension )
```

Create the ball bound with the specified dimensionality.

Parameters

<i>dimension</i>	Dimensionality of ball bound.
------------------	-------------------------------

39.168.3.3 BallBound() [3/5]

```
BallBound (
    const ElemType radius,
    const VecType & center )
```

Create the ball bound with the specified radius and center.

Parameters

<i>radius</i>	Radius of ball bound.
<i>center</i>	Center of ball bound.

39.168.3.4 BallBound() [4/5]

```
BallBound (
    const BallBound< MetricType, VecType > & other )
```

Copy constructor. To prevent memory leaks.

39.168.3.5 BallBound() [5/5]

```
BallBound (
    BallBound< MetricType, VecType > && other )
```

Move constructor: take possession of another bound.

39.168.3.6 ~BallBound()

```
~ BallBound ( )
```

Destructor to release allocated memory.

39.168.4 Member Function Documentation

39.168.4.1 Center() [1/3]

```
const VecType& Center ( ) const [inline]
```

Get the center point of the ball.

Definition at line 93 of file ballbound.hpp.

Referenced by ProjVector::Project().

39.168.4.2 Center() [2/3]

```
VecType& Center ( ) [inline]
```

Modify the center point of the ball.

Definition at line 95 of file ballbound.hpp.

39.168.4.3 Center() [3/3]

```
void Center (
    VecType & center ) const [inline]
```

Place the center of **BallBound** (p. 991) into the given vector.

Parameters

<i>center</i>	Vector which the centroid will be written to.
---------------	---

Definition at line 121 of file ballbound.hpp.

References BallBound< MetricType, VecType >::MaxDistance(), BallBound< MetricType, VecType >::MinDistance(), BallBound< MetricType, VecType >::operator|=(), and BallBound< MetricType, VecType >::RangeDistance().

39.168.4.4 Contains()

```
bool Contains (
    const VecType & point ) const
```

Determines if a point is within this bound.

Parameters

<i>point</i>	Point to check the condition.
--------------	-------------------------------

Referenced by BallBound< MetricType, VecType >::MinWidth().

39.168.4.5 Diameter()

```
ElemType Diameter ( ) const [inline]
```

Returns the diameter of the ballbound.

Definition at line 197 of file ballbound.hpp.

39.168.4.6 Dim()

```
size_t Dim ( ) const [inline]
```

Get the dimensionality of the ball.

Definition at line 98 of file ballbound.hpp.

39.168.4.7 MaxDistance() [1/2]

```
ElemType MaxDistance (
    const OtherVecType & point,
    typename std::enable_if_t< IsVector< OtherVecType >::value > * = 0 ) const
```

Computes maximum distance.

Parameters

<i>point</i>	Point to which the maximum distance is requested.
--------------	---

Referenced by BallBound< MetricType, VecType >::Center().

39.168.4.8 MaxDistance() [2/2]

```
ElemType MaxDistance (
    const BallBound< MetricType, VecType > & other ) const
```

Computes maximum distance.

Parameters

<i>other</i>	Bound to which the maximum distance is requested.
--------------	---

39.168.4.9 Metric() [1/2]

```
const MetricType& Metric ( ) const [inline]
```

Returns the distance metric used in this bound.

Definition at line 200 of file ballbound.hpp.

39.168.4.10 Metric() [2/2]

```
MetricType& Metric ( ) [inline]
```

Modify the distance metric used in this bound.

Definition at line 202 of file ballbound.hpp.

References `BallBound< MetricType, VecType >::serialize()`.

39.168.4.11 MinDistance() [1/2]

```
ElemType MinDistance (
    const OtherVecType & point,
    typename std::enable_if_t< IsVector< OtherVecType >::value > * = 0 ) const
```

Calculates minimum bound-to-point squared distance.

Parameters

<i>point</i>	Point to which the minimum distance is requested.
--------------	---

Referenced by BallBound< MetricType, VecType >::Center().

39.168.4.12 MinDistance() [2/2]

```
ElemType MinDistance (
    const BallBound< MetricType, VecType > & other ) const
```

Calculates minimum bound-to-bound squared distance.

Parameters

<i>other</i>	Bound to which the minimum distance is requested.
--------------	---

39.168.4.13 MinWidth()

```
ElemType MinWidth ( ) const [inline]
```

Get the minimum width of the bound (this is same as the diameter).

For ball bounds, width along all dimensions remain same.

Definition at line 104 of file ballbound.hpp.

References BallBound< MetricType, VecType >::Contains(), and BallBound< MetricType, VecType >::operator[]().

39.168.4.14 operator=()

```
BallBound& operator= (
    const BallBound< MetricType, VecType > & other )
```

For the same reason as the copy constructor: to prevent memory leaks.

39.168.4.15 operator[]()

```
math::RangeType< ElemType> operator[] (
    const size_t i ) const
```

Get the range in a certain dimension.

Referenced by BallBound< MetricType, VecType >::MinWidth().

39.168.4.16 `operator" |=()` [1/2]

```
const BallBound& operator|= (
    const BallBound< MetricType, VecType > & other )
```

Expand the bound to include the given node.

Referenced by `BallBound< MetricType, VecType >::Center()`.

39.168.4.17 `operator" |=()` [2/2]

```
const BallBound& operator|= (
    const MatType & data )
```

Expand the bound to include the given point.

The centroid is recalculated to be the center of all of the given points.

Template Parameters

<i>MatType</i>	Type of matrix; could be <code>arma::mat</code> , <code>arma::spmat</code> , or a vector.
<i>data</i>	Data points to add.

39.168.4.18 `Radius()` [1/2]

```
ElemType Radius ( ) const [inline]
```

Get the radius of the ball.

Definition at line 88 of file `ballbound.hpp`.

Referenced by `ProjVector::Project()`.

39.168.4.19 `Radius()` [2/2]

```
ElemType& Radius ( ) [inline]
```

Modify the radius of the ball.

Definition at line 90 of file `ballbound.hpp`.

39.168.4.20 RangeDistance() [1/2]

```
math::RangeType< ElemType> RangeDistance (
    const OtherVecType & other,
    typename std::enable_if_t< IsVector< OtherVecType >::value > * = 0 ) const
```

Calculates minimum and maximum bound-to-point distance.

Parameters

<i>point</i>	Point to which the minimum and maximum distances are requested.
--------------	---

Referenced by BallBound< MetricType, VecType >::Center().

39.168.4.21 RangeDistance() [2/2]

```
math::RangeType< ElemType> RangeDistance (
    const BallBound< MetricType, VecType > & other ) const
```

Calculates minimum and maximum bound-to-bound distance.

Example: bound1.MinDistanceSq(other) for minimum distance.

Parameters

<i>other</i>	Bound to which the minimum and maximum distances are requested.
--------------	---

39.168.4.22 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int version )
```

Serialize the bound.

Referenced by BallBound< MetricType, VecType >::Metric().

39.169 BoundTraits< BoundType > Struct Template Reference

A class to obtain compile-time traits about BoundType classes.

Static Public Attributes

- static const bool **HasTightBounds** = false
If true, then the bounds for each dimension are tight.

39.169.1 Detailed Description

```
template<typename BoundType>
struct mlpack::bound::BoundTraits< BoundType >
```

A class to obtain compile-time traits about BoundType classes.

If you are writing your own BoundType class, you should make a template specialization in order to set the values correctly.

See also

TreeTraits, KernelTraits

Definition at line 26 of file bound_traits.hpp.

39.169.2 Member Data Documentation

39.169.2.1 HasTightBounds

```
const bool HasTightBounds = false [static]
```

If true, then the bounds for each dimension are tight.

If false, then the bounds for each dimension may be looser than the range of all points held in the bound. This defaults to false.

Definition at line 31 of file bound_traits.hpp.

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/ **bound_traits.hpp**

39.170 BoundTraits< BallBound< MetricType, VecType > > Struct Template Reference

A specialization of **BoundTraits** (p. 1002) for this bound type.

Static Public Attributes

- static const bool **HasTightBounds** = false
These bounds are potentially loose in some dimensions.

39.170.1 Detailed Description

```
template<typename MetricType, typename VecType>
struct mpack::bound::BoundTraits< BallBound< MetricType, VecType > >
```

A specialization of **BoundTraits** (p. 1002) for this bound type.

Definition at line 211 of file ballbound.hpp.

39.170.2 Member Data Documentation

39.170.2.1 HasTightBounds

```
const bool HasTightBounds = false [static]
```

39.174 `CellBound< MetricType, ElemType >` Class Template Reference

The **CellBound** (p. 1006) class describes a bound that consists of a number of hyperrectangles.

39.174.1 Detailed Description

```
template<typename MetricType = metric::LMetric<2, true>, typename ElemType = double>
class mlpack::bound::CellBound< MetricType, ElemType >
```

The **CellBound** (p. 1006) class describes a bound that consists of a number of hyperrectangles.

These hyperrectangles do not overlap each other. The bound is limited by an outer hyperrectangle and two addresses, the lower address and the high address. Thus, the bound contains all points included between the lower and the high addresses. The class caches the minimum bounding rectangle, the lower and the high addresses and the hyperrectangles that are described by the addresses.

The notion of addresses is described in the following paper.

```

39.175 `HollowBallBound< TMetricType, ElemType >` Class Template Reference

Hollow ball bound encloses a set of points at a specific distance (radius) from a specific point (center) except points at a specific distance from another point (the center of the hole).

Public Types

- typedef `TMetricType` **MetricType**
A public version of the metric type.

Public Member Functions

- **HollowBallBound** ()
Empty Constructor.
- **HollowBallBound** (const size_t dimension)
Create the ball bound with the specified dimensionality.
- template<typename VecType >
HollowBallBound (const ElemType innerRadius, const ElemType outerRadius, const VecType ¢er)
Create the ball bound with the specified radius and center.
- **HollowBallBound** (const **HollowBallBound** &other)
Copy constructor. To prevent memory leaks.
- **HollowBallBound** (**HollowBallBound** &&other)
Move constructor: take possession of another bound.
- **~HollowBallBound** ()
Destructor to release allocated memory.
- const arma::Col< ElemType > & **Center** () const
Get the center point of the ball.
- arma::Col< ElemType > & **Center** ()
Modify the center point of the ball.
- template<typename VecType >
void **Center** (VecType ¢er) const
*Place the center of **BallBound** (p. 991) into the given vector.*
- template<typename VecType >
bool **Contains** (const VecType &point) const
Determines if a point is within this bound.
- bool **Contains** (const **HollowBallBound** &other) const
Determines if another bound is within this bound.
- ElemType **Diameter** () const
Returns the diameter of the ballbound.
- size_t **Dim** () const
Get the dimensionality of the ball.
- const arma::Col< ElemType > & **HollowCenter** () const
Get the center point of the hollow.
- arma::Col< ElemType > & **HollowCenter** ()
Modify the center point of the hollow.
- ElemType **InnerRadius** () const
Get the innner radius of the ball.
- ElemType & **InnerRadius** ()
Modify the inner radius of the ball.
- template<typename VecType >
ElemType **MaxDistance** (const VecType &point, typename std::enable_if_t< IsVector< VecType >::value > !=0) const
Computes maximum distance.
- ElemType **MaxDistance** (const **HollowBallBound** &other) const
Computes maximum distance.
- const **MetricType** & **Metric** () const
Returns the distance metric used in this bound.
- **MetricType** & **Metric** ()

- Modify the distance metric used in this bound.*

 - `template<typename VecType >`
`ElemType MinDistance (const VecType &point, typename std::enable_if_t< IsVector< VecType >::value > * = 0) const`
Calculates minimum bound-to-point squared distance
 - `ElemType MinDistance (const HollowBallBound &other) const`
Calculates minimum bound-to-bound squared distance.
 - `ElemType MinWidth () const`
Get the minimum width of the bound (this is same as the diameter).
 - `HollowBallBound & operator= (const HollowBallBound &other)`
For the same reason as the copy constructor: to prevent memory leaks.
 - `math::RangeType< ElemType > operator[] (const size_t i) const`
Get the range in a certain dimension.
 - `template<typename MatType >`
`const HollowBallBound & operator|= (const MatType &data)`
Expand the bound to include the given point.
 - `const HollowBallBound & operator|= (const HollowBallBound &other)`
Expand the bound to include the given bound.
 - `ElemType OuterRadius () const`
Get the outer radius of the ball.
 - `ElemType & OuterRadius ()`
Modify the outer radius of the ball.
 - `template<typename VecType >`
`math::RangeType< ElemType > RangeDistance (const VecType &other, typename std::enable_if_t< IsVector< VecType >::value > * = 0) const`
Calculates minimum and maximum bound-to-point distance.
 - `math::RangeType< ElemType > RangeDistance (const HollowBallBound &other) const`
Calculates minimum and maximum bound-to-bound distance.
 - `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int version)`
Serialize the bound.

39.175.1 Detailed Description

```
template<typename TMetricType = metric::LMetric<2, true>, typename ElemType = double>
class mpack::bound::HollowBallBound< TMetricType, ElemType >
```

Hollow ball bound encloses a set of points at a specific distance (radius) from a specific point (center) except points at a specific distance from another point (the center of the hole).

MetricType is the custom metric type that defaults to the Euclidean (L2) distance.

Template Parameters

<i>TMetricType</i>	metric type used in the distance measure.
<i>ElemType</i>	Type of element (float or double or similar).

Definition at line 33 of file hollow_ball_bound.hpp.

39.175.2 Member Typedef Documentation

39.175.2.1 MetricType

```
typedef TMetricType MetricType
```

A public version of the metric type.

Definition at line 37 of file hollow_ball_bound.hpp.

39.175.3 Constructor & Destructor Documentation

39.175.3.1 HollowBallBound() [1/5]

```
HollowBallBound ( )
```

Empty Constructor.

39.175.3.2 HollowBallBound() [2/5]

```
HollowBallBound (  
    const size_t dimension )
```

Create the ball bound with the specified dimensionality.

Parameters

<i>dimension</i>	Dimensionality of ball bound.
------------------	-------------------------------

39.175.3.3 HollowBallBound() [3/5]

```
HollowBallBound (  

```

```
const ElemType innerRadius,
const ElemType outerRadius,
const VecType & center )
```

Create the ball bound with the specified radius and center.

Parameters

<i>innerRadius</i>	Inner radius of ball bound.
<i>outerRadius</i>	Outer radius of ball bound.
<i>center</i>	Center of ball bound.

39.175.3.4 HollowBallBound() [4/5]

```
HollowBallBound (
    const HollowBallBound< TMetricType, ElemType > & other )
```

Copy constructor. To prevent memory leaks.

39.175.3.5 HollowBallBound() [5/5]

```
HollowBallBound (
    HollowBallBound< TMetricType, ElemType > && other )
```

Move constructor: take possession of another bound.

39.175.3.6 ~HollowBallBound()

```
~ HollowBallBound ( )
```

Destructor to release allocated memory.

39.175.4 Member Function Documentation

39.175.4.1 Center() [1/3]

```
const arma::Col<ElemType>& Center ( ) const [inline]
```

Get the center point of the ball.

Definition at line 103 of file hollow_ball_bound.hpp.

39.175.4.2 Center() [2/3]

```
arma::Col<ElemType>& Center ( ) [inline]
```

Modify the center point of the ball.

Definition at line 105 of file hollow_ball_bound.hpp.

39.175.4.3 Center() [3/3]

```
void Center (
    VecType & center ) const [inline]
```

Place the center of **BallBound** (p. 991) into the given vector.

Parameters

<i>center</i>	Vector which the centroid will be written to.
---------------	---

Definition at line 145 of file hollow_ball_bound.hpp.

References `HollowBallBound< TMetricType, ElemType >::MaxDistance()`, `HollowBallBound< TMetricType, ElemType >::MinDistance()`, `HollowBallBound< TMetricType, ElemType >::operator|=(())`, and `HollowBallBound< TMetricType, ElemType >::RangeDistance()`.

39.175.4.4 Contains() [1/2]

```
bool Contains (
    const VecType & point ) const
```

Determines if a point is within this bound.

Parameters

<i>point</i>	Point to check the condition.
--------------	-------------------------------

Referenced by `HollowBallBound< TMetricType, ElemType >::MinWidth()`.

39.175.4.5 Contains() [2/2]

```
bool Contains (
    const HollowBallBound< TMetricType, ElemType > & other ) const
```

Determines if another bound is within this bound.

Parameters

<i>other</i>	Bound to check the condition.
--------------	-------------------------------

39.175.4.6 Diameter()

```
ElemType Diameter ( ) const [inline]
```

Returns the diameter of the ballbound.

Definition at line 226 of file `hollow_ball_bound.hpp`.

References `RangeType< T >::Hi()`.

39.175.4.7 Dim()

```
size_t Dim ( ) const [inline]
```

Get the dimensionality of the ball.

Definition at line 113 of file `hollow_ball_bound.hpp`.

39.175.4.8 HollowCenter() [1/2]

```
const arma::Col<ElemType>& HollowCenter ( ) const [inline]
```

Get the center point of the hollow.

Definition at line 108 of file hollow_ball_bound.hpp.

39.175.4.9 HollowCenter() [2/2]

```
arma::Col<ElemType>& HollowCenter ( ) [inline]
```

Modify the center point of the hollow.

Definition at line 110 of file hollow_ball_bound.hpp.

39.175.4.10 InnerRadius() [1/2]

```
ElemType InnerRadius ( ) const [inline]
```

Get the innner radius of the ball.

Definition at line 98 of file hollow_ball_bound.hpp.

References `RangeType< T >::Lo()`.

39.175.4.11 InnerRadius() [2/2]

```
ElemType& InnerRadius ( ) [inline]
```

Modify the inner radius of the ball.

Definition at line 100 of file hollow_ball_bound.hpp.

References `RangeType< T >::Lo()`.

39.175.4.12 MaxDistance() [1/2]

```
ElemType MaxDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const
```

Computes maximum distance.

Parameters

<i>point</i>	Point to which the maximum distance is requested.
--------------	---

Referenced by `HollowBallBound< TMetricType, ElemType >::Center()`.

39.175.4.13 MaxDistance() [2/2]

```
ElemType MaxDistance (
    const HollowBallBound< TMetricType, ElemType > & other ) const
```

Computes maximum distance.

Parameters

<i>other</i>	Bound to which the maximum distance is requested.
--------------	---

39.175.4.14 Metric() [1/2]

```
const MetricType& Metric ( ) const [inline]
```

Returns the distance metric used in this bound.

Definition at line 229 of file `hollow_ball_bound.hpp`.

39.175.4.15 Metric() [2/2]

```
MetricType& Metric ( ) [inline]
```

Modify the distance metric used in this bound.

Definition at line 231 of file `hollow_ball_bound.hpp`.

References `HollowBallBound< TMetricType, ElemType >::serialize()`.

39.175.4.16 MinDistance() [1/2]

```
ElemType MinDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const
```

Calculates minimum bound-to-point squared distance

Parameters

<i>point</i>	Point to which the minimum distance is requested.
--------------	---

Referenced by `HollowBallBound< TMetricType, ElemType >::Center()`.

39.175.4.17 MinDistance() [2/2]

```
ElemType MinDistance (
    const HollowBallBound< TMetricType, ElemType > & other ) const
```

Calculates minimum bound-to-bound squared distance.

Parameters

<i>other</i>	Bound to which the minimum distance is requested.
--------------	---

39.175.4.18 MinWidth()

```
ElemType MinWidth ( ) const [inline]
```

Get the minimum width of the bound (this is same as the diameter).

For ball bounds, width along all dimensions remain same.

Definition at line 119 of file `hollow_ball_bound.hpp`.

References `HollowBallBound< TMetricType, ElemType >::Contains()`, `RangeType< T >::Hi()`, and `HollowBallBound< TMetricType, ElemType >::operator[]()`.

39.175.4.19 operator=()

```
HollowBallBound& operator= (
    const HollowBallBound< TMetricType, ElemType > & other )
```

For the same reason as the copy constructor: to prevent memory leaks.

39.175.4.20 `operator[]()`

```
math::RangeType<ElemType> operator[] (
    const size_t i ) const
```

Get the range in a certain dimension.

Referenced by `HollowBallBound< TMetricType, ElemType >::MinWidth()`.

39.175.4.21 `operator" |=()` [1/2]

```
const HollowBallBound& operator|= (
    const MatType & data )
```

Expand the bound to include the given point.

The centroid will not be moved.

Template Parameters

<i>MatType</i>	Type of matrix; could be <code>arma::mat</code> , <code>arma::spmat</code> , or a vector.
<i>data</i>	Data points to add.

Referenced by `HollowBallBound< TMetricType, ElemType >::Center()`.

39.175.4.22 `operator" |=()` [2/2]

```
const HollowBallBound& operator|= (
    const HollowBallBound< TMetricType, ElemType > & other )
```

Expand the bound to include the given bound.

The centroid will not be moved.

Template Parameters

<i>MatType</i>	Type of matrix; could be <code>arma::mat</code> , <code>arma::spmat</code> , or a vector.
<i>data</i>	Data points to add.

39.175.4.23 OuterRadius() [1/2]

```
ElemType OuterRadius ( ) const [inline]
```

Get the outer radius of the ball.

Definition at line 93 of file hollow_ball_bound.hpp.

References `RangeType< T >::Hi()`.

39.175.4.24 OuterRadius() [2/2]

```
ElemType& OuterRadius ( ) [inline]
```

Modify the outer radius of the ball.

Definition at line 95 of file hollow_ball_bound.hpp.

References `RangeType< T >::Hi()`.

39.175.4.25 RangeDistance() [1/2]

```
math::RangeType<ElemType> RangeDistance (
    const VecType & other,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const
```

Calculates minimum and maximum bound-to-point distance.

Parameters

<i>point</i>	Point to which the minimum and maximum distances are requested.
--------------	---

Referenced by `HollowBallBound< TMetricType, ElemType >::Center()`.

39.175.4.26 RangeDistance() [2/2]

```
math::RangeType<ElemType> RangeDistance (
    const HollowBallBound< TMetricType, ElemType > & other ) const
```

Calculates minimum and maximum bound-to-bound distance.

Example: `bound1.MinDistanceSq(other)` for minimum distance.

Parameters

<i>other</i>	Bound to which the minimum and maximum distances are requested.
--------------	---

39.175.4.27 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int version )
```

Serialize the bound.

Referenced by `HollowBallBound< TMetricType, ElemType >::Metric()`.

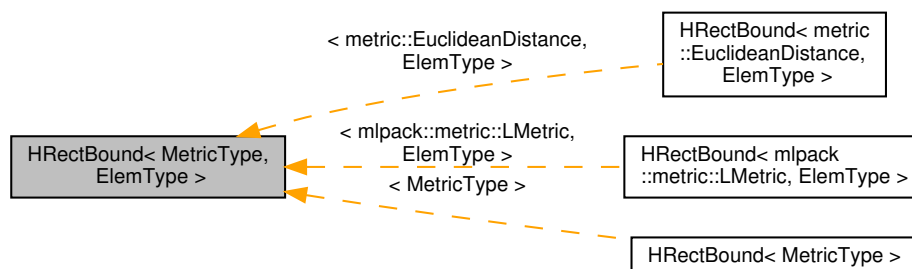

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/ hollow_ball_bound.hpp`

39.176 `HRectBound< MetricType, ElemType >` Class Template Reference

Hyper-rectangle bound for an L-metric.

Inheritance diagram for `HRectBound< MetricType, ElemType >`:

Public Member Functions

- **HRectBound** ()
Empty constructor; creates a bound of dimensionality 0.
- **HRectBound** (const size_t dimension)
Initializes to specified dimensionality with each dimension the empty set.
- **HRectBound** (const **HRectBound** &other)
Copy constructor; necessary to prevent memory leaks.
- **HRectBound** (**HRectBound** &&other)
Move constructor: take possession of another bound's information.
- **~HRectBound** ()
Destructor: clean up memory.
- void **Center** (arma::Col< ElemType > ¢er) const
Calculates the center of the range, placing it into the given vector.
- void **Clear** ()
Resets all dimensions to the empty set (so that this bound contains nothing).
- template<typename VecType >
bool **Contains** (const VecType &point) const
Determines if a point is within this bound.
- bool **Contains** (const **HRectBound** &bound) const
Determines if this bound partially contains a bound.
- ElemType **Diameter** () const
Returns the diameter of the hyperrectangle (that is, the longest diagonal).
- size_t **Dim** () const
Gets the dimensionality.
- template<typename VecType >
ElemType **MaxDistance** (const VecType &point, typename std::enable_if_t< IsVector< VecType >::value >*=0) const
Calculates maximum bound-to-point squared distance.
- ElemType **MaxDistance** (const **HRectBound** &other) const
Computes maximum distance.
- const MetricType & **Metric** () const
Get the instantiated metric associated with the bound.
- MetricType & **Metric** ()
Modify the instantiated metric associated with the bound.
- template<typename VecType >
ElemType **MinDistance** (const VecType &point, typename std::enable_if_t< IsVector< VecType >::value >*=0) const
Calculates minimum bound-to-point distance.
- ElemType **MinDistance** (const **HRectBound** &other) const
Calculates minimum bound-to-bound distance.
- ElemType **MinWidth** () const
Get the minimum width of the bound.
- ElemType & **MinWidth** ()
Modify the minimum width of the bound.
- **HRectBound** **operator &** (const **HRectBound** &bound) const
Returns the intersection of this bound and another.
- **HRectBound** & **operator &=** (const **HRectBound** &bound)

- Intersects this bound with another.*
- **HRectBound & operator=** (const **HRectBound** &other)
Same as copy constructor; necessary to prevent memory leaks.
- **math::RangeType**< ElemType > & **operator[]** (const size_t i)
Get the range for a particular dimension.
- const **math::RangeType**< ElemType > & **operator[]** (const size_t i) const
Modify the range for a particular dimension. No bounds checking.
- template<typename MatType >
HRectBound & operator|= (const MatType &data)
Expands this region to include new points.
- **HRectBound & operator|=** (const **HRectBound** &other)
Expands this region to encompass another bound.
- ElemType **Overlap** (const **HRectBound** &bound) const
Returns the volume of overlap of this bound and another.
- **math::RangeType**< ElemType > **RangeDistance** (const **HRectBound** &other) const
Calculates minimum and maximum bound-to-bound distance.
- template<typename VecType >
math::RangeType< ElemType > **RangeDistance** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0) const
Calculates minimum and maximum bound-to-point distance.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int version)
Serialize the bound object.
- ElemType **Volume** () const
Calculate the volume of the hyperrectangle.

39.176.1 Detailed Description

```
template<typename MetricType = metric::LMetric<2, true>, typename ElemType = double>
class mlpack::bound::HRectBound< MetricType, ElemType >
```

Hyper-rectangle bound for an L-metric.

This should be used in conjunction with the LMetric class. Be sure to use the same template parameters for LMetric as you do for **HRectBound** (p. 1018) – otherwise odd results may occur.

Template Parameters

<i>MetricType</i>	Type of metric to use; must be of type LMetric.
<i>ElemType</i>	Element type (double/float/int/etc.).

Definition at line 54 of file hrectbound.hpp.

39.176.2 Constructor & Destructor Documentation

39.176.2.1 HRectBound() [1/4]

```
HRectBound ( )
```

Empty constructor; creates a bound of dimensionality 0.

39.176.2.2 HRectBound() [2/4]

```
HRectBound (
    const size_t dimension )
```

Initializes to specified dimensionality with each dimension the empty set.

Parameters

<i>dimension</i>	Dimensionality of bound.
------------------	--------------------------

39.176.2.3 HRectBound() [3/4]

```
HRectBound (
    const HRectBound< MetricType, ElemType > & other )
```

Copy constructor; necessary to prevent memory leaks.

39.176.2.4 HRectBound() [4/4]

```
HRectBound (
    HRectBound< MetricType, ElemType > && other )
```

Move constructor: take possession of another bound's information.

39.176.2.5 ~HRectBound()

```
~ HRectBound ( )
```

Destructor: clean up memory.

39.176.3 Member Function Documentation

39.176.3.1 Center()

```
void Center (
    arma::Col< ElemType > & center ) const
```

Calculates the center of the range, placing it into the given vector.

Parameters

<i>center</i>	Vector which the center will be written to.
---------------	---

Referenced by `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::Center()`, and `Octree< MetricType, StatisticType, MatType >::Center()`.

39.176.3.2 Clear()

```
void Clear ( )
```

Resets all dimensions to the empty set (so that this bound contains nothing).

39.176.3.3 Contains() [1/2]

```
bool Contains (
    const VecType & point ) const
```

Determines if a point is within this bound.

Parameters

<i>point</i>	Point to check the condition.
--------------	-------------------------------

39.176.3.4 Contains() [2/2]

```
bool Contains (
    const HRectBound< MetricType, ElemType > & bound ) const
```

Determines if this bound partially contains a bound.

Parameters

<i>other</i>	Bound to check the condition.
--------------	-------------------------------

39.176.3.5 Diameter()

```
ElemType Diameter ( ) const
```

Returns the diameter of the hyperrectangle (that is, the longest diagonal).

39.176.3.6 Dim()

```
size_t Dim ( ) const [inline]
```

Gets the dimensionality.

Definition at line 92 of file hrectbound.hpp.

39.176.3.7 MaxDistance() [1/2]

```
ElemType MaxDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const
```

Calculates maximum bound-to-point squared distance.

Parameters

<i>point</i>	Point to which the maximum distance is requested.
--------------	---

Referenced by RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::MaxDistance().

39.176.3.8 MaxDistance() [2/2]

```
ElemType MaxDistance (
    const HRectBound< MetricType, ElemType > & other ) const
```

Computes maximum distance.

Parameters

<i>other</i>	Bound to which the maximum distance is requested.
--------------	---

39.176.3.9 Metric() [1/2]

```
const MetricType& Metric ( ) const [inline]
```

Get the instantiated metric associated with the bound.

Definition at line 107 of file hrectbound.hpp.

39.176.3.10 Metric() [2/2]

```
MetricType& Metric ( ) [inline]
```

Modify the instantiated metric associated with the bound.

Definition at line 109 of file hrectbound.hpp.

39.176.3.11 MinDistance() [1/2]

```
ElemType MinDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const
```

Calculates minimum bound-to-point distance.

Parameters

<i>point</i>	Point to which the minimum distance is requested.
--------------	---

Referenced by RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::MinDistance().

39.176.3.12 MinDistance() [2/2]

```
ElemType MinDistance (
    const HRectBound< MetricType, ElemType > & other ) const
```

Calculates minimum bound-to-bound distance.

Parameters

<i>other</i>	Bound to which the minimum distance is requested.
--------------	---

39.176.3.13 MinWidth() [1/2]

```
ElemType MinWidth ( ) const [inline]
```

Get the minimum width of the bound.

Definition at line 102 of file hrectbound.hpp.

Referenced by RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::MinimumBoundDistance().

39.176.3.14 MinWidth() [2/2]

```
ElemType& MinWidth ( ) [inline]
```

Modify the minimum width of the bound.

Definition at line 104 of file hrectbound.hpp.

39.176.3.15 operator &()

```
HRectBound operator& (
    const HRectBound< MetricType, ElemType > & bound ) const
```

Returns the intersection of this bound and another.

39.176.3.16 operator &=()

```
HRectBound& operator&= (
    const HRectBound< MetricType, ElemType > & bound )
```

Intersects this bound with another.

39.176.3.17 operator=()

```
HRectBound& operator= (
    const HRectBound< MetricType, ElemType > & other )
```

Same as copy constructor; necessary to prevent memory leaks.

39.176.3.18 operator[]() [1/2]

```
math::RangeType<ElemType>& operator[] (
    const size_t i ) [inline]
```

Get the range for a particular dimension.

No bounds checking. Be careful: this may make **MinWidth()** (p. 1025) invalid.

Definition at line 96 of file hrectbound.hpp.

39.176.3.19 operator[]() [2/2]

```
const math::RangeType<ElemType>& operator[] (
    const size_t i ) const [inline]
```

Modify the range for a particular dimension. No bounds checking.

Definition at line 98 of file hrectbound.hpp.

39.176.3.20 operator" |=() [1/2]

```
HRectBound& operator|= (
    const MatType & data )
```

Expands this region to include new points.

Template Parameters

<i>MatType</i>	Type of matrix; could be Mat, SpMat, a subview, or just a vector.
----------------	---

Parameters

<i>data</i>	Data points to expand this region to include.
-------------	---

39.176.3.21 operator" |=() [2/2]

```
HRectBound& operator|= (
    const HRectBound< MetricType, ElemType > & other )
```

Expands this region to encompass another bound.

39.176.3.22 Overlap()

```
ElemType Overlap (
    const HRectBound< MetricType, ElemType > & bound ) const
```

Returns the volume of overlap of this bound and another.

39.176.3.23 RangeDistance() [1/2]

```
math::RangeType<ElemType> RangeDistance (
    const HRectBound< MetricType, ElemType > & other ) const
```

Calculates minimum and maximum bound-to-bound distance.

Parameters

<i>other</i>	Bound to which the minimum and maximum distances are requested.
--------------	---

Referenced by RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::RangeDistance().

39.176.3.24 RangeDistance() [2/2]

```

math::RangeType<ElemType> RangeDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const

```

Calculates minimum and maximum bound-to-point distance.

Parameters

<i>point</i>	Point to which the minimum and maximum distances are requested.
--------------	---

39.176.3.25 serialize()

```

void serialize (
    Archive & ar,
    const unsigned int version )

```

Serialize the bound object.

39.176.3.26 Volume()

```
ElemType Volume ( ) const
```

Calculate the volume of the hyperrectangle.

Returns

Volume of the hyperrectangle.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/ **hrectbound.hpp**

39.177 IsLMetric< MetricType > Struct Template Reference

Utility struct where Value is true if and only if the argument is of type LMetric.

Static Public Attributes

- static const bool **Value** = false

39.177.1 Detailed Description

```
template<typename MetricType>
struct mpack::bound::meta::IsLMetric< MetricType >
```

Utility struct where Value is true if and only if the argument is of type LMetric.

Definition at line 30 of file hrectbound.hpp.

39.177.2 Member Data Documentation

39.177.2.1 Value

```
const bool Value = false [static]
```

Definition at line 32 of file hrectbound.hpp.

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/ **hrectbound.hpp**

39.178 IsLMetric< metric::LMetric< Power, TakeRoot > > Struct Template Reference

Specialization for **IsLMetric** (p. 1028) when the argument is of type LMetric.

Static Public Attributes

- static const bool **Value** = true

39.178.1 Detailed Description

```
template<int Power, bool TakeRoot>
struct mpack::bound::meta::IsLMetric< metric::LMetric< Power, TakeRoot > >
```

Specialization for **IsLMetric** (p. 1028) when the argument is of type LMetric.

Definition at line 37 of file hrectbound.hpp.

39.178.2 Member Data Documentation

39.178.2.1 Value

```
const bool Value = true [static]
```

Definition at line 39 of file hrectbound.hpp.

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/ **hrectbound.hpp**

39.179 AverageInterpolation Class Reference

This class performs average interpolation to generate interpolation weights for neighborhood-based collaborative filtering.

Public Member Functions

- **AverageInterpolation** ()
- **AverageInterpolation** (const arma::sp_mat &)

This constructor is needed for interface consistency.
- template<typename VectorType , typename DecompositionPolicy >
 void **GetWeights** (VectorType &&weights, const DecompositionPolicy &, const size_t, const arma::Col< size_t > &neighbors, const arma::vec &, const arma::sp_mat &)

Interpolation weights are identical and sum up to one.

39.179.1 Detailed Description

This class performs average interpolation to generate interpolation weights for neighborhood-based collaborative filtering.

An example of how to use **AverageInterpolation** (p. 1030) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CFType<> cf(data);

// Generate 10 recommendations for all users.
cf.template GetRecommendations<EuclideanSearch,
    AverageInterpolation>(10, recommendations);
```

Definition at line 39 of file average_interpolation.hpp.

39.179.2 Constructor & Destructor Documentation

39.179.2.1 AverageInterpolation() [1/2]

```
AverageInterpolation ( ) [inline]
```

Definition at line 43 of file `average_interpolation.hpp`.

39.179.2.2 AverageInterpolation() [2/2]

```
AverageInterpolation (
    const arma::sp_mat & ) [inline]
```

This constructor is needed for interface consistency.

Definition at line 48 of file `average_interpolation.hpp`.

39.179.3 Member Function Documentation

39.179.3.1 GetWeights()

```
void GetWeights (
    VectorType && weights,
    const DecompositionPolicy & ,
    const size_t ,
    const arma::Col< size_t > & neighbors,
    const arma::vec & ,
    const arma::sp_mat & ) [inline]
```

Interpolation weights are identical and sum up to one.

After getting the weights, CF algorithm multiplies each neighbor's rating by its corresponding weight and sums them to get predicted rating.

Parameters

<i>weights</i>	Resulting interpolation weights. The size of weights should be set to the number of neighbors before calling GetWeights() (p. 1031).
<i>decomposition</i>	Decomposition object.
<i>queryUser</i>	Queried user.
<i>neighbors</i>	Neighbors of queried user.
<i>similarities</i>	Similarities between query user and neighbors.
<i>cleanedData</i>	Sparse rating matrix.

Definition at line 65 of file average_interpolation.hpp.

References Log::Fatal.

39.180 BatchSVDPolicy Class Reference

Implementation of the Batch SVD policy to act as a wrapper when accessing Batch SVD from within **CFTYPE** (p. 1045).

Public Member Functions

- template<typename MatType >
void **Apply** (const MatType &, const arma::sp_mat &cleanedData, const size_t rank, const size_t maxIterations, const double minResidue, const bool mit)
Apply Collaborative Filtering to the provided data set using the batch SVD method.
- template<typename NeighborSearchPolicy >
void **GetNeighborhood** (const arma::Col< size_t > &users, const size_t numUsersForSimilarity, arma::Mat< size_t > &neighborhood, arma::mat &similarities) const
Get the neighborhood and corresponding similarities for a set of users.
- double **GetRating** (const size_t user, const size_t item) const
Return predicted rating given user ID and item ID.
- void **GetRatingOfUser** (const size_t user, arma::vec &rating) const
Get predicted ratings for a user.
- const arma::mat & **H** () const
Get the User Matrix.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialization.
- const arma::mat & **W** () const
Get the Item Matrix.

39.180.1 Detailed Description

Implementation of the Batch SVD policy to act as a wrapper when accessing Batch SVD from within **CFTYPE** (p. 1045).

An example of how to use **BatchSVDPolicy** (p. 1032) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CFTYPE<BatchSVDPolicy> cf(data);

// Generate 10 recommendations for all users.
cf.GetRecommendations(10, recommendations);
```

Definition at line 43 of file batch_svd_method.hpp.

39.180.2 Member Function Documentation

39.180.2.1 Apply()

```
void Apply (
    const MatType & ,
    const arma::sp_mat & cleanedData,
    const size_t rank,
    const size_t maxIterations,
    const double minResidue,
    const bool mit ) [inline]
```

Apply Collaborative Filtering to the provided data set using the batch SVD method.

Parameters

<i>data</i>	Data matrix: dense matrix (coordinate lists) or sparse matrix(cleaned).
<i>cleanedData</i>	item user table in form of sparse matrix.
<i>rank</i>	Rank parameter for matrix factorization.
<i>maxIterations</i>	Maximum number of iterations.
<i>minResidue</i>	Residue required to terminate.
<i>mit</i>	Whether to terminate only when maxIterations is reached.

Definition at line 59 of file batch_svd_method.hpp.

References `AMF< TerminationPolicyType, InitializationRuleType, UpdateRuleType >::Apply()`.

39.180.2.2 GetNeighborhood()

```
void GetNeighborhood (
    const arma::Col< size_t > & users,
    const size_t numUsersForSimilarity,
    arma::Mat< size_t > & neighborhood,
    arma::mat & similarities ) const [inline]
```

Get the neighborhood and corresponding similarities for a set of users.

Template Parameters

<i>NeighborSearchPolicy</i>	The policy to perform neighbor search.
-----------------------------	--

Parameters

<i>users</i>	Users whose neighborhood is to be computed.
<i>numUsersForSimilarity</i>	The number of neighbors returned for each user.
<i>neighborhood</i>	Neighbors represented by user IDs.
<i>similarities</i>	Similarity between each user and each of its neighbors.

Definition at line 123 of file batch_svd_method.hpp.

39.180.2.3 GetRating()

```
double GetRating (
    const size_t user,
    const size_t item ) const [inline]
```

Return predicted rating given user ID and item ID.

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.

Definition at line 93 of file batch_svd_method.hpp.

39.180.2.4 GetRatingOfUser()

```
void GetRatingOfUser (
    const size_t user,
    arma::vec & rating ) const [inline]
```

Get predicted ratings for a user.

Parameters

<i>user</i>	User ID.
<i>rating</i>	Resulting rating vector.

Definition at line 105 of file batch_svd_method.hpp.

39.180.2.5 H()

```
const arma::mat& H ( ) const [inline]
```

Get the User Matrix.

Definition at line 152 of file `batch_svd_method.hpp`.

39.180.2.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialization.

Definition at line 158 of file `batch_svd_method.hpp`.

39.180.2.7 W()

```
const arma::mat& W ( ) const [inline]
```

Get the Item Matrix.

Definition at line 150 of file `batch_svd_method.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/decomposition_policies/ batch_svd_method.hpp`

39.181 BiasSVDPolicy Class Reference

Implementation of the Bias SVD policy to act as a wrapper when accessing Bias SVD from within **CFTYPE** (p. 1045).

Public Member Functions

- **BiasSVDPolicy** (const size_t maxIterations=10, const double alpha=0.02, const double lambda=0.05)
Use Bias SVD method to perform collaborative filtering.
- double **Alpha** () const
Get learning rate.
- double & **Alpha** ()
Modify learning rate.
- void **Apply** (const arma::mat &data, const arma::sp_mat &, const size_t rank, const size_t maxIterations, const double, const bool)
Apply Collaborative Filtering to the provided data set using the bias SVD.
- template<typename NeighborSearchPolicy >
void **GetNeighborhood** (const arma::Col< size_t > &users, const size_t numUsersForSimilarity, arma::Mat< size_t > &neighborhood, arma::mat &similarities) const
Get the neighborhood and corresponding similarities for a set of users.
- double **GetRating** (const size_t user, const size_t item) const
Return predicted rating given user ID and item ID.
- void **GetRatingOfUser** (const size_t user, arma::vec &rating) const
Get predicted ratings for a user.
- const arma::mat & **H** () const
Get the User Matrix.
- double **Lambda** () const
Get regularization parameter.
- double & **Lambda** ()
Modify regularization parameter.
- size_t **MaxIterations** () const
Get the number of iterations.
- size_t & **MaxIterations** ()
Modify the number of iterations.
- const arma::vec & **P** () const
Get the Item Bias Vector.
- const arma::vec & **Q** () const
Get the User Bias Vector.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialization.
- const arma::mat & **W** () const
Get the Item Matrix.

39.181.1 Detailed Description

Implementation of the Bias SVD policy to act as a wrapper when accessing Bias SVD from within **CFTYPE** (p. 1045).

An example of how to use **BiasSVDPolicy** (p. 1035) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CType<BiasSVDPolicy> cf(data);

// Generate 10 recommendations for all users.
cf.GetRecommendations(10, recommendations);
```

Definition at line 41 of file bias_svd_method.hpp.

39.181.2 Constructor & Destructor Documentation

39.181.2.1 BiasSVDPolicy()

```
BiasSVDPolicy (
    const size_t maxIterations = 10,
    const double alpha = 0.02,
    const double lambda = 0.05 ) [inline]
```

Use Bias SVD method to perform collaborative filtering.

Parameters

<i>maxIterations</i>	Number of iterations.
<i>alpha</i>	Learning rate for optimization.
<i>Regularization</i>	parameter for optimization.

Definition at line 51 of file bias_svd_method.hpp.

39.181.3 Member Function Documentation

39.181.3.1 Alpha() ^[1/2]

```
double Alpha ( ) const [inline]
```

Get learning rate.

Definition at line 154 of file bias_svd_method.hpp.

39.181.3.2 Alpha() [2/2]

```
double& Alpha ( ) [inline]
```

Modify learning rate.

Definition at line 156 of file `bias_svd_method.hpp`.

39.181.3.3 Apply()

```
void Apply (
    const arma::mat & data,
    const arma::sp_mat & ,
    const size_t rank,
    const size_t maxIterations,
    const double ,
    const bool ) [inline]
```

Apply Collaborative Filtering to the provided data set using the bias SVD.

Parameters

<i>data</i>	Data matrix: dense matrix (coordinate lists) or sparse matrix(cleaned).
<i>cleanedData</i>	item user table in form of sparse matrix.
<i>rank</i>	Rank parameter for matrix factorization.
<i>maxIterations</i>	Maximum number of iterations.
<i>minResidue</i>	Residue required to terminate.
<i>mit</i>	Whether to terminate only when maxIterations is reached.

Definition at line 73 of file `bias_svd_method.hpp`.

References `BiasSVD< OptimizerType >::Apply()`.

39.181.3.4 GetNeighborhood()

```
void GetNeighborhood (
    const arma::Col< size_t > & users,
    const size_t numUsersForSimilarity,
    arma::Mat< size_t > & neighborhood,
    arma::mat & similarities ) const [inline]
```

Get the neighborhood and corresponding similarities for a set of users.

Template Parameters

<i>NeighborSearchPolicy</i>	The policy to perform neighbor search.
-----------------------------	--

Parameters

<i>users</i>	Users whose neighborhood is to be computed.
<i>numUsersForSimilarity</i>	The number of neighbors returned for each user.
<i>neighborhood</i>	Neighbors represented by user IDs.
<i>similarities</i>	Similarity between each user and each of its neighbors.

Definition at line 122 of file `bias_svd_method.hpp`.

39.181.3.5 GetRating()

```
double GetRating (
    const size_t user,
    const size_t item ) const [inline]
```

Return predicted rating given user ID and item ID.

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.

Definition at line 91 of file `bias_svd_method.hpp`.

39.181.3.6 GetRatingOfUser()

```
void GetRatingOfUser (
    const size_t user,
    arma::vec & rating ) const [inline]
```

Get predicted ratings for a user.

Parameters

<i>user</i>	User ID.
<i>rating</i>	Resulting rating vector.

Definition at line 104 of file bias_svd_method.hpp.

39.181.3.7 H()

```
const arma::mat& H ( ) const [inline]
```

Get the User Matrix.

Definition at line 142 of file bias_svd_method.hpp.

39.181.3.8 Lambda() [1/2]

```
double Lambda ( ) const [inline]
```

Get regularization parameter.

Definition at line 159 of file bias_svd_method.hpp.

39.181.3.9 Lambda() [2/2]

```
double& Lambda ( ) [inline]
```

Modify regularization parameter.

Definition at line 161 of file bias_svd_method.hpp.

39.181.3.10 MaxIterations() [1/2]

```
size_t MaxIterations ( ) const [inline]
```

Get the number of iterations.

Definition at line 149 of file bias_svd_method.hpp.

39.181.3.11 MaxIterations() [2/2]

```
size_t& MaxIterations ( ) [inline]
```

Modify the number of iterations.

Definition at line 151 of file bias_svd_method.hpp.

39.181.3.12 P()

```
const arma::vec& P ( ) const [inline]
```

Get the Item Bias Vector.

Definition at line 146 of file bias_svd_method.hpp.

39.181.3.13 Q()

```
const arma::vec& Q ( ) const [inline]
```

Get the User Bias Vector.

Definition at line 144 of file bias_svd_method.hpp.

39.181.3.14 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialization.

Definition at line 167 of file bias_svd_method.hpp.

39.181.3.15 W()

```
const arma::mat& W ( ) const [inline]
```

Get the Item Matrix.

Definition at line 140 of file bias_svd_method.hpp.

39.182 CFModel Class Reference

The model to save to disk.

Public Member Functions

- **CFModel** ()
Create an empty CF model.
- **~CFModel** ()
Clean up memory.
- template<typename DecompositionPolicy >
const **CFTYPE**< DecompositionPolicy > * **CFPtr** () const
Get the pointer to CFTYPE<> object.
- template<typename NeighborSearchPolicy , typename InterpolationPolicy >
void **GetRecommendations** (const size_t numRecs, arma::Mat< size_t > &recommendations, const arma::Mat< size_t > &users)
Compute recommendations for query users.
- template<typename NeighborSearchPolicy , typename InterpolationPolicy >
void **GetRecommendations** (const size_t numRecs, arma::Mat< size_t > &recommendations)
Compute recommendations for all users.
- template<typename NeighborSearchPolicy , typename InterpolationPolicy >
void **Predict** (const arma::Mat< size_t > &combinations, arma::vec &predictions)
Make predictions.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the model.
- template<typename DecompositionPolicy , typename MatType >
void **Train** (const MatType &data, const size_t numUsersForSimilarity, const size_t rank, const size_t maxIterations, const double minResidue, const bool mit)
Train the model.

39.182.1 Detailed Description

The model to save to disk.

Definition at line 110 of file cf_model.hpp.

39.182.2 Constructor & Destructor Documentation

39.182.2.1 CFModel()

```
CFModel ( ) [inline]
```

Create an empty CF model.

Definition at line 129 of file cf_model.hpp.

39.182.2.2 ~CFModel()

```
~ CFModel ( )
```

Clean up memory.

39.182.3 Member Function Documentation

39.182.3.1 CFPtr()

```
const CFTYPE<DecompositionPolicy>* CFPtr ( ) const
```

Get the pointer to CType<> object.

39.182.3.2 GetRecommendations() [1/2]

```
void GetRecommendations (
    const size_t numRecs,
    arma::Mat< size_t > & recommendations,
    const arma::Col< size_t > & users )
```

Compute recommendations for query users.

39.182.3.3 GetRecommendations() [2/2]

```
void GetRecommendations (
    const size_t numRecs,
    arma::Mat< size_t > & recommendations )
```

Compute recommendations for all users.

39.182.3.4 Predict()

```
void Predict (
    const arma::Mat< size_t > & combinations,
    arma::vec & predictions )
```

Make predictions.

39.182.3.5 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the model.

39.182.3.6 Train()

```
void Train (
    const MatType & data,
    const size_t numUsersForSimilarity,
    const size_t rank,
    const size_t maxIterations,
    const double minResidue,
    const bool mit )
```

Train the model.

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/ **cf_model.hpp**

39.183 CType< DecompositionPolicy, NormalizationType > Class Template Reference

This class implements Collaborative Filtering (CF).

Public Member Functions

- **CType** (const size_t numUsersForSimilarity=5, const size_t rank=0)
*Initialize the **CType** (p. 1045) object without performing any factorization.*
- template<typename MatType >
CType (const MatType &data, const DecompositionPolicy &decomposition=DecompositionPolicy(), const size_t numUsersForSimilarity=5, const size_t rank=0, const size_t maxIterations=1000, const double minResidue=1e-5, const bool mit=false)
*Initialize the **CType** (p. 1045) object using any decomposition method, immediately factorizing the given data to create a model.*
- const arma::sp_mat & **CleanedData** () const
Get the cleaned data matrix.
- const DecompositionPolicy & **Decomposition** () const
Gets decomposition object.
- template<typename NeighborSearchPolicy = EuclideanSearch, typename InterpolationPolicy = AverageInterpolation>
void **GetRecommendations** (const size_t numRecs, arma::Mat< size_t > &recommendations)
Generates the given number of recommendations for all users.
- template<typename NeighborSearchPolicy = EuclideanSearch, typename InterpolationPolicy = AverageInterpolation>
void **GetRecommendations** (const size_t numRecs, arma::Mat< size_t > &recommendations, const arma::Col< size_t > &users)
Generates the given number of recommendations for the specified users.
- const NormalizationType & **Normalization** () const
Get the normalization object.
- void **NumUsersForSimilarity** (const size_t num)
Sets number of users for calculating similarity.
- size_t **NumUsersForSimilarity** () const

Gets number of users for calculating similarity.

- template<typename NeighborSearchPolicy = EuclideanSearch, typename InterpolationPolicy = AverageInterpolation>
double **Predict** (const size_t user, const size_t item) const

Predict the rating of an item by a particular user.

- template<typename NeighborSearchPolicy = EuclideanSearch, typename InterpolationPolicy = AverageInterpolation>
void **Predict** (const arma::Mat< size_t > &combinations, arma::vec &predictions) const

Predict ratings for each user-item combination in the given coordinate list matrix.

- void **Rank** (const size_t rankValue)

Sets rank parameter for matrix factorization.

- size_t **Rank** () const

Gets rank parameter for matrix factorization.

- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)

*Serialize the **CFTYPE** (p. 1045) model to the given archive.*

- void **Train** (const arma::mat &data, const DecompositionPolicy &decomposition, const size_t maxIterations=1000, const double minResidue=1e-5, const bool mit=false)

*Train the **CFTYPE** (p. 1045) model (i.e.*

- void **Train** (const arma::sp_mat &data, const DecompositionPolicy &decomposition, const size_t maxIterations=1000, const double minResidue=1e-5, const bool mit=false)

*Train the **CFTYPE** (p. 1045) model (i.e.*

Static Public Member Functions

- static void **CleanData** (const arma::mat &data, arma::sp_mat &cleanedData)

Converts the User, Item, Value Matrix to User-Item Table.

39.183.1 Detailed Description

```
template<typename DecompositionPolicy = NMFPolicy, typename NormalizationType = NoNormalization>
class mlpack::cf::CFTYPE< DecompositionPolicy, NormalizationType >
```

This class implements Collaborative Filtering (CF).

This implementation presently supports Alternating Least Squares (ALS) for collaborative filtering.

A simple example of how to run Collaborative Filtering is shown below.

```
extern arma::mat data; // (user, item, rating) table
extern arma::Col<size_t> users; // users seeking recommendations
arma::Mat<size_t> recommendations; // Recommendations

CFTYPE<> cf(data); // Default options.

// Generate 10 recommendations for all users.
cf.GetRecommendations(10, recommendations);

// Generate 10 recommendations for specified users.
cf.GetRecommendations(10, recommendations, users);
```

The data matrix is a (user, item, rating) table. Each column in the matrix should have three rows. The first represents the user; the second represents the item; and the third represents the rating. The user and item, while they are in a matrix that holds doubles, should hold integer (or size_t) values. The user and item indices are assumed to start at 0.

Template Parameters

<i>DecompositionPolicy</i>	The policy used to decompose the rating matrix. It also provides methods to compute prediction and neighborhood.
<i>NormalizationType</i>	The type of normalization performed on raw data. Data is normalized before calling Train() (p. 1052) method. Predicted rating is denormalized before return.

Definition at line 70 of file cf.hpp.

39.183.2 Constructor & Destructor Documentation

39.183.2.1 CType() [1/2]

```
CType (
    const size_t numUsersForSimilarity = 5,
    const size_t rank = 0 )
```

Initialize the **CType** (p. 1045) object without performing any factorization.

Be sure to call **Train()** (p. 1052) before calling **GetRecommendations()** (p. 1048) or any other functions!

39.183.2.2 CType() [2/2]

```
CType (
    const MatType & data,
    const DecompositionPolicy & decomposition = DecompositionPolicy(),
    const size_t numUsersForSimilarity = 5,
    const size_t rank = 0,
    const size_t maxIterations = 1000,
    const double minResidue = 1e-5,
    const bool mit = false )
```

Initialize the **CType** (p. 1045) object using any decomposition method, immediately factorizing the given data to create a model.

There are parameters that can be set; default values are provided for each of them. If the rank is left unset (or is set to 0), a simple density-based heuristic will be used to choose a rank.

The provided dataset can be a coordinate list; that is, a 3-row matrix where each column corresponds to a (user, item, rating) entry in the matrix or a sparse matrix representing (user, item) table.

Template Parameters

<i>MatType</i>	The type of input matrix, which is expected to be either arma::mat (table of (user, item, rating)) or arma::sp_mat (sparse rating matrix where row is item and column is user).
----------------	---

Parameters

<i>data</i>	Data matrix: dense matrix (coordinate lists) or sparse matrix(cleaned).
<i>decomposition</i>	Instantiated DecompositionPolicy object.
<i>numUsersForSimilarity</i>	Size of the neighborhood.
<i>rank</i>	Rank parameter for matrix factorization.
<i>maxIterations</i>	Maximum number of iterations.
<i>minResidue</i>	Residue required to terminate.
<i>mit</i>	Whether to terminate only when maxIterations is reached.

39.183.3 Member Function Documentation

39.183.3.1 CleanData()

```
static void CleanData (
    const arma::mat & data,
    arma::sp_mat & cleanedData ) [static]
```

Converts the User, Item, Value Matrix to User-Item Table.

Referenced by CFTYPE< DecompositionPolicy, NormalizationType >::Normalization().

39.183.3.2 CleanedData()

```
const arma::sp_mat& CleanedData ( ) const [inline]
```

Get the cleaned data matrix.

Definition at line 180 of file cf.hpp.

39.183.3.3 Decomposition()

```
const DecompositionPolicy& Decomposition ( ) const [inline]
```

Gets decomposition object.

Definition at line 177 of file cf.hpp.

39.183.3.4 GetRecommendations() [1/2]

```
void GetRecommendations (
    const size_t numRecs,
    arma::Mat< size_t > & recommendations )
```

Generates the given number of recommendations for all users.

Template Parameters

<i>NeighborSearchPolicy</i>	The policy used to search neighbors of query set in referece set.
<i>InterpolationPolicy</i>	The policy used to calculate interpolation weights.

Parameters

<i>numRecs</i>	Number of Recommendations.
<i>recommendations</i>	Matrix to save recommendations into.

Referenced by CType< DecompositionPolicy, NormalizationType >::Normalization().

39.183.3.5 GetRecommendations() [2/2]

```
void GetRecommendations (
    const size_t numRecs,
    arma::Mat< size_t > & recommendations,
    const arma::Col< size_t > & users )
```

Generates the given number of recommendations for the specified users.

Template Parameters

<i>NeighborSearchPolicy</i>	The policy used to search neighbors of query set in referece set.
<i>InterpolationPolicy</i>	The policy used to calculate interpolation weights.

Parameters

<i>numRecs</i>	Number of Recommendations.
<i>recommendations</i>	Matrix to save recommendations.
<i>users</i>	Users for which recommendations are to be generated.

39.183.3.6 Normalization()

```
const NormalizationType& Normalization ( ) const [inline]
```

Get the normalization object.

Definition at line 183 of file cf.hpp.

References CType< DecompositionPolicy, NormalizationType >::CleanData(), CType< DecompositionPolicy, NormalizationType >::GetRecommendations(), CType< DecompositionPolicy, NormalizationType >::Predict(), and CType< DecompositionPolicy, NormalizationType >::serialize().

39.183.3.7 NumUsersForSimilarity() [1/2]

```
void NumUsersForSimilarity (
    const size_t num ) [inline]
```

Sets number of users for calculating similarity.

Definition at line 147 of file cf.hpp.

References Log::Warn.

39.183.3.8 NumUsersForSimilarity() [2/2]

```
size_t NumUsersForSimilarity ( ) const [inline]
```

Gets number of users for calculating similarity.

Definition at line 159 of file cf.hpp.

39.183.3.9 Predict() [1/2]

```
double Predict (
    const size_t user,
    const size_t item ) const
```

Predict the rating of an item by a particular user.

Template Parameters

<i>NeighborSearchPolicy</i>	The policy used to search neighbors of query set in referece set.
<i>InterpolationPolicy</i>	The policy used to calculate interpolation weights.

Parameters

<i>user</i>	User to predict for.
<i>item</i>	Item to predict for.

Referenced by CType< DecompositionPolicy, NormalizationType >::Normalization().

39.183.3.10 Predict() [2/2]

```
void Predict (
    const arma::Mat< size_t > & combinations,
    arma::vec & predictions ) const
```

Predict ratings for each user-item combination in the given coordinate list matrix.

The matrix 'combinations' should have two rows and number of columns equal to the number of desired predictions. The first element of each column corresponds to the user index, and the second element of each column corresponds to the item index. The output vector 'predictions' will have length equal to combinations.n_cols, and predictions[i] will be equal to the prediction for the user/item combination in combinations.col(i).

Template Parameters

<i>NeighborSearchPolicy</i>	The policy used to search neighbors of query set in referece set.
<i>InterpolationPolicy</i>	The policy used to calculate interpolation weights.

Parameters

<i>combinations</i>	User/item combinations to predict.
<i>predictions</i>	Predicted ratings for each user/item combination.

39.183.3.11 Rank() [1/2]

```
void Rank (
    const size_t rankValue ) [inline]
```

Sets rank parameter for matrix factorization.

Definition at line 165 of file cf.hpp.

39.183.3.12 Rank() [2/2]

```
size_t Rank ( ) const [inline]
```

Gets rank parameter for matrix factorization.

Definition at line 171 of file cf.hpp.

39.183.3.13 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the **CFTYPE** (p. 1045) model to the given archive.

Referenced by `CFTYPE< DecompositionPolicy, NormalizationType >::Normalization()`.

39.183.3.14 `Train()` [1/2]

```
void Train (
    const arma::mat & data,
    const DecompositionPolicy & decomposition,
    const size_t maxIterations = 1000,
    const double minResidue = 1e-5,
    const bool mit = false )
```

Train the **CFTYPE** (p. 1045) model (i.e.

factorize the input matrix) using the parameters that have already been set for the model (specifically, the rank parameter), and optionally, using the given `DecompositionPolicy`.

Parameters

<i>data</i>	Input dataset; dense matrix (coordinate lists).
<i>decomposition</i>	Instantiated <code>DecompositionPolicy</code> object.
<i>maxIterations</i>	Maximum number of iterations.
<i>minResidue</i>	Residue required to terminate.
<i>mit</i>	Whether to terminate only when maxIterations is reached.

39.183.3.15 `Train()` [2/2]

```
void Train (
    const arma::sp_mat & data,
    const DecompositionPolicy & decomposition,
    const size_t maxIterations = 1000,
    const double minResidue = 1e-5,
    const bool mit = false )
```

Train the **CFTYPE** (p. 1045) model (i.e.

factorize the input matrix) using the parameters that have already been set for the model (specifically, the rank parameter), and optionally, using the given `DecompositionPolicy`.

Parameters

<i>data</i>	Input dataset; sparse matrix (user item table).
<i>decomposition</i>	Instantiated DecompositionPolicy object.
<i>maxIterations</i>	Maximum number of iterations.
<i>minResidue</i>	Residue required to terminate.
<i>mit</i>	Whether to terminate only when maxIterations is reached.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/ **cf.hpp**

39.184 CombinedNormalization< NormalizationTypes > Class Template Reference

This normalization class performs a sequence of normalization methods on raw ratings.

Public Types

- using **TupleType** = std::tuple< NormalizationTypes... >

Public Member Functions

- **CombinedNormalization** ()
- double **Denormalize** (const size_t user, const size_t item, const double rating) const
*Denormalize rating by calling **Denormalize()** (p. 1054) in each normalization object.*
- void **Denormalize** (const arma::Mat< size_t > &combinations, arma::vec &predictions) const
*Denormalize rating by calling **Denormalize()** (p. 1054) in each normalization object.*
- const **TupleType** & **Normalizations** () const
Return normalizations tuple.
- template<typename MatType >
void **Normalize** (MatType &data)
*Normalize the data by calling **Normalize()** (p. 1056) in each normalization object.*
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int version)
Serialization.

39.184.1 Detailed Description

```
template<typename... NormalizationTypes>
class mlpack::cf::CombinedNormalization< NormalizationTypes >
```

This normalization class performs a sequence of normalization methods on raw ratings.

An example of how to use **CombinedNormalization** (p. 1053) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CFTYPE<NMFPolicy,
    CombinedNormalization<
        OverallMeanNormalization,
        UserMeanNormalization,
        ItemMeanNormalization>> cf(data);

// Generate 10 recommendations for all users.
cf.GetRecommendations(10, recommendations);
```

Definition at line 44 of file combined_normalization.hpp.

39.184.2 Member Typedef Documentation

39.184.2.1 TupleType

```
using TupleType = std::tuple<NormalizationTypes...>
```

Definition at line 47 of file combined_normalization.hpp.

39.184.3 Constructor & Destructor Documentation

39.184.3.1 CombinedNormalization()

```
CombinedNormalization ( ) [inline]
```

Definition at line 50 of file combined_normalization.hpp.

39.184.4 Member Function Documentation

39.184.4.1 Denormalize() [1/2]

```
double Denormalize (
    const size_t user,
    const size_t item,
    const double rating ) const [inline]
```

Denormalize rating by calling **Denormalize()** (p. 1054) in each normalization object.

Note that the order of objects calling **Denormalize()** (p. 1054) should be the reversed order of objects calling **Normalize()** (p. 1056).

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.
<i>rating</i>	Computed rating before denormalization.

Definition at line 72 of file combined_normalization.hpp.

Referenced by CombinedNormalization< NormalizationTypes >::serialize().

39.184.4.2 Denormalize() [2/2]

```
void Denormalize (
    const arma::Mat< size_t > & combinations,
    arma::vec & predictions ) const [inline]
```

Denormalize rating by calling **Denormalize()** (p. 1054) in each normalization object.

Note that the order of objects calling **Denormalize()** (p. 1054) should be the reversed order of objects calling **Normalize()** (p. 1056).

Parameters

<i>combinations</i>	User/Item combinations.
<i>predictions</i>	Predicted ratings for each user/item combination.

Definition at line 87 of file combined_normalization.hpp.

39.184.4.3 Normalizations()

```
const TupleType& Normalizations ( ) const [inline]
```

Return normalizations tuple.

Definition at line 96 of file combined_normalization.hpp.

39.184.4.4 Normalize()

```
void Normalize (
    MatType & data ) [inline]
```

Normalize the data by calling **Normalize()** (p. 1056) in each normalization object.

Parameters

<i>data</i>	Input dataset.
-------------	----------------

Definition at line 58 of file combined_normalization.hpp.

Referenced by CombinedNormalization< NormalizationTypes >::serialize().

39.184.4.5 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int version ) [inline]
```

Serialization.

Definition at line 105 of file combined_normalization.hpp.

References CombinedNormalization< NormalizationTypes >::Denormalize(), and CombinedNormalization< NormalizationTypes >::Normalize().

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/normalization/ **combined_normalization.hpp**

39.185 CosineSearch Class Reference

Nearest neighbor search with cosine distance.

Public Member Functions

- **CosineSearch** (const arma::mat &referenceSet)
Constructor with reference set.
- void **Search** (const arma::mat &query, const size_t k, arma::Mat< size_t > &neighbors, arma::mat &similarities)
Given a set of query points, find the nearest k neighbors, and return similarities.

39.185.1 Detailed Description

Nearest neighbor search with cosine distance.

Note that, with normalized vectors, neighbor search with cosine distance is equivalent to neighbor search with Euclidean distance. Therefore, instead of performing neighbor search directly with cosine distance, we first normalize all vectors to unit length, and then use **neighbor::KNN** (p. 432) (i.e. NeighborSearch with Euclidean distance, KDTree). Cosine similarities are calculated from Euclidean distance.

An example of how to use **CosineSearch** (p. 1056) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CFType<> cf(data);

// Generate 10 recommendations for all users.
cf.template GetRecommendations<CosineSearch>(10, recommendations);
```

Definition at line 44 of file cosine_search.hpp.

39.185.2 Constructor & Destructor Documentation

39.185.2.1 CosineSearch()

```
CosineSearch (
    const arma::mat & referenceSet ) [inline]
```

Constructor with reference set.

All vectors in reference set are normalized to unit length.

Parameters

Set	of reference points.
-----	----------------------

Definition at line 53 of file cosine_search.hpp.

References NeighborSearch< SortPolicy, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTreeTraversalType >::Train().

39.185.3 Member Function Documentation

39.185.3.1 Search()

```
void Search (
    const arma::mat & query,
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & similarities ) [inline]
```

Given a set of query points, find the nearest k neighbors, and return similarities.

Similarities are non-negative and no larger than one.

Parameters

<i>query</i>	A set of query points.
<i>k</i>	Number of neighbors to search.
<i>neighbors</i>	Nearest neighbors.
<i>similarites</i>	Similarities between query point and its neighbors.

Definition at line 70 of file cosine_search.hpp.

References NeighborSearch< SortPolicy, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTreeTraversalType >::Search().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/neighbor_search_policies/ **cosine_search.hpp**

39.186 DeleteVisitor Class Reference

DeleteVisitor (p. 1058) deletes the CFTYPE<> object which is pointed to by the variable cf in class **CFModel** (p. 1042).

Inheritance diagram for DeleteVisitor:

Public Member Functions

- `template<typename DecompositionPolicy >`
`void operator() (CType< DecompositionPolicy > *c) const`
*Delete **CType** (p. 1045) object.*

39.186.1 Detailed Description

DeleteVisitor (p. 1058) deletes the `CType<>` object which is pointed to by the variable `cf` in class **CFModel** (p. 1042).

Definition at line 34 of file `cf_model.hpp`.

39.186.2 Member Function Documentation

39.186.2.1 `operator()`

```
void operator() (
    CType< DecompositionPolicy > * c ) const
```

Delete **CType** (p. 1045) object.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/ cf_model.hpp`

39.187 DummyClass Class Reference

This class acts as a dummy class for passing as template parameter.

39.187.1 Detailed Description

This class acts as a dummy class for passing as template parameter.

Passing this class as a template parameter to class **SVDWrapper** (p. 1108) will force **SVDWrapper** (p. 1108) to use Armadillo's SVD implementation.

Definition at line 27 of file `svd_wrapper.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/ svd_wrapper.hpp`

39.188 GetValueVisitor Class Reference

GetValueVisitor (p. 1060) returns the pointer which points to the **CType** (p. 1045) object.

Inheritance diagram for GetValueVisitor:

Public Member Functions

- `template<typename DecompositionPolicy >`
`void * operator() (CType< DecompositionPolicy > *c) const`
Return stored pointer as void type.*

39.188.1 Detailed Description

GetValueVisitor (p. 1060) returns the pointer which points to the **CType** (p. 1045) object.

Definition at line 45 of file `cf_model.hpp`.

39.188.2 Member Function Documentation

39.188.2.1 operator()()

```
void* operator() (
    CFType< DecompositionPolicy > * c ) const
```

Return stored pointer as void* type.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/ **cf_model.hpp**

39.189 ItemMeanNormalization Class Reference

This normalization class performs item mean normalization on raw ratings.

Public Member Functions

- **ItemMeanNormalization** ()
- double **Denormalize** (const size_t, const size_t item, const double rating) const
Denormalize computed rating by adding item mean.
- void **Denormalize** (const arma::Mat< size_t > &combinations, arma::vec &predictions) const
Denormalize computed rating by adding item mean.
- const arma::vec & **Mean** () const
Return item mean.
- void **Normalize** (arma::mat &data)
Normalize the data by subtracting item mean from each of existing ratings.
- void **Normalize** (arma::sp_mat &cleanedData)
Normalize the data by subtracting item mean from each of existing ratings.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialization.

39.189.1 Detailed Description

This normalization class performs item mean normalization on raw ratings.

An example of how to use **ItemMeanNormalization** (p. 1061) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

// Use ItemMeanNormalization as normalization method.
CFType<NMFPolicy, ItemMeanNormalization> cf(data);

// Generate 10 recommendations for all users.
cf.GetRecommendations(10, recommendations);
```

Definition at line 39 of file item_mean_normalization.hpp.

39.189.2 Constructor & Destructor Documentation

39.189.2.1 ItemMeanNormalization()

```
ItemMeanNormalization ( ) [inline]
```

Definition at line 43 of file item_mean_normalization.hpp.

39.189.3 Member Function Documentation

39.189.3.1 Denormalize() [1/2]

```
double Denormalize (
    const size_t ,
    const size_t item,
    const double rating ) const [inline]
```

Denormalize computed rating by adding item mean.

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.
<i>rating</i>	Computed rating before denormalization.

Definition at line 127 of file item_mean_normalization.hpp.

39.189.3.2 Denormalize() [2/2]

```
void Denormalize (
    const arma::Mat< size_t > & combinations,
    arma::vec & predictions ) const [inline]
```

Denormalize computed rating by adding item mean.

Parameters

<i>combinations</i>	User/Item combinations.
<i>predictions</i>	Predicted ratings for each user/item combination.

Definition at line 140 of file `item_mean_normalization.hpp`.

39.189.3.3 Mean()

```
const arma::vec& Mean ( ) const [inline]
```

Return item mean.

Definition at line 153 of file `item_mean_normalization.hpp`.

39.189.3.4 Normalize() [1/2]

```
void Normalize (
    arma::mat & data ) [inline]
```

Normalize the data by subtracting item mean from each of existing ratings.

Parameters

<i>data</i>	Input dataset in the form of coordinate list.
-------------	---

Definition at line 50 of file `item_mean_normalization.hpp`.

39.189.3.5 Normalize() [2/2]

```
void Normalize (
    arma::sp_mat & cleanedData ) [inline]
```

Normalize the data by subtracting item mean from each of existing ratings.

Parameters

<i>cleanedData</i>	Input data as a sparse matrix.
--------------------	--------------------------------

Definition at line 90 of file `item_mean_normalization.hpp`.

39.189.3.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialization.

Definition at line 159 of file `item_mean_normalization.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/normalization/ item_mean_normalization.hpp`

39.190 LMetricSearch< TPower > Class Template Reference

Nearest neighbor search with L_p distance.

Public Types

- using **NeighborSearchType** = `neighbor::NeighborSearch< neighbor::NearestNeighborSort, metric::L \leftarrow Metric< TPower, true > >`

Public Member Functions

- **LMetricSearch** (const arma::mat &referenceSet)
- void **Search** (const arma::mat &query, const size_t k, arma::Mat< size_t > &neighbors, arma::mat &similarities)
Given a set of query points, find the nearest k neighbors, and return similarites.

39.190.1 Detailed Description

```
template<int TPower>
class mlpack::cf::LMetricSearch< TPower >
```

Nearest neighbor search with L_p distance.

An example of how to use **LMetricSearch** (p. 1064) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CFType<> cf(data);

// Generate 10 recommendations for all users.
cf.template GetRecommendations<LMetricSearch<2>>>(10, recommendations);
```

Template Parameters

<i>TPower</i>	Power of metric.
---------------	------------------

Definition at line 42 of file lmetric_search.hpp.

39.190.2 Member Typedef Documentation

39.190.2.1 NeighborSearchType

```
using NeighborSearchType = neighbor::NeighborSearch< neighbor::NearestNeighborSort, metric::↔
LMetric<TPower, true> >
```

Definition at line 47 of file lmetric_search.hpp.

39.190.3 Constructor & Destructor Documentation

39.190.3.1 LMetricSearch()

```
LMetricSearch (
    const arma::mat & referenceSet ) [inline]
```

Parameters

<i>Set</i>	of reference points.
------------	----------------------

Definition at line 52 of file lmetric_search.hpp.

39.190.4 Member Function Documentation

39.190.4.1 Search()

```
void Search (
    const arma::mat & query,
```

```
const size_t k,
arma::Mat< size_t > & neighbors,
arma::mat & similarities ) [inline]
```

Given a set of query points, find the nearest k neighbors, and return similarities.

Similarities are non-negative and no larger than one.

Parameters

<i>query</i>	A set of query points.
<i>k</i>	Number of neighbors to search.
<i>neighbors</i>	Nearest neighbors.
<i>similarities</i>	Similarities between query point and its neighbors.

Definition at line 64 of file `lmetric_search.hpp`.

References `NeighborSearch< SortPolicy, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTreeTraversalType >::Search()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/neighbor_search_policies/ lmetric_search.hpp`

39.191 NMFPolicy Class Reference

Implementation of the NMF policy to act as a wrapper when accessing NMF from within **CType** (p. 1045).

Public Member Functions

- `template<typename MatType >`
void **Apply** (const MatType &, const arma::sp_mat &cleanedData, const size_t rank, const size_t maxIterations, const double minResidue, const bool mit)
Apply Collaborative Filtering to the provided dataset using NMF method.
- `template<typename NeighborSearchPolicy >`
void **GetNeighborhood** (const arma::Col< size_t > &users, const size_t numUsersForSimilarity, arma::Mat< size_t > &neighborhood, arma::mat &similarities) const
Get the neighborhood and corresponding similarities for a set of users.
- double **GetRating** (const size_t user, const size_t item) const
Return predicted rating given user ID and item ID.
- void **GetRatingOfUser** (const size_t user, arma::vec &rating) const
Get predicted ratings for a user.
- const arma::mat & **H** () const
Get the User Matrix.
- `template<typename Archive >`
void **serialize** (Archive &ar, const unsigned int)
Serialization.
- const arma::mat & **W** () const
Get the Item Matrix.

39.191.1 Detailed Description

Implementation of the NMF policy to act as a wrapper when accessing NMF from within **CType** (p. 1045).

An example of how to use **NMFPolicy** (p. 1066) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CType<NMFPolicy> cf(data);

// Generate 10 recommendations for all users.
cf.GetRecommendations(10, recommendations);
```

Definition at line 43 of file nmf_method.hpp.

39.191.2 Member Function Documentation

39.191.2.1 Apply()

```
void Apply (
    const MatType & ,
    const arma::sp_mat & cleanedData,
    const size_t rank,
    const size_t maxIterations,
    const double minResidue,
    const bool mit ) [inline]
```

Apply Collaborative Filtering to the provided dataset using NMF method.

Parameters

<i>data</i>	Data matrix: dense matrix (coordinate lists) or sparse matrix(cleaned).
<i>cleanedData</i>	item user table in form of sparse matrix.
<i>rank</i>	Rank parameter for matrix factorization.
<i>maxIterations</i>	Maximum number of iterations.
<i>minResidue</i>	Residue required to terminate.
<i>mit</i>	Whether to terminate only when maxIterations is reached.

Definition at line 58 of file nmf_method.hpp.

References `AMF< TerminationPolicyType, InitializationRuleType, UpdateRuleType >::Apply()`.

39.191.2.2 GetNeighborhood()

```
void GetNeighborhood (
    const arma::Col< size_t > & users,
    const size_t numUsersForSimilarity,
    arma::Mat< size_t > & neighborhood,
    arma::mat & similarities ) const [inline]
```

Get the neighborhood and corresponding similarities for a set of users.

Template Parameters

<i>NeighborSearchPolicy</i>	The policy to perform neighbor search.
-----------------------------	--

Parameters

<i>users</i>	Users whose neighborhood is to be computed.
<i>numUsersForSimilarity</i>	The number of neighbors returned for each user.
<i>neighborhood</i>	Neighbors represented by user IDs.
<i>similarities</i>	Similarity between each user and each of its neighbors.

Definition at line 120 of file nmf_method.hpp.

39.191.2.3 GetRating()

```
double GetRating (
    const size_t user,
    const size_t item ) const [inline]
```

Return predicted rating given user ID and item ID.

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.

Definition at line 90 of file nmf_method.hpp.

39.191.2.4 GetRatingOfUser()

```
void GetRatingOfUser (
    const size_t user,
    arma::vec & rating ) const [inline]
```

Get predicted ratings for a user.

Parameters

<i>user</i>	User ID.
<i>rating</i>	Resulting rating vector.

Definition at line 102 of file nmf_method.hpp.

39.191.2.5 H()

```
const arma::mat& H ( ) const [inline]
```

Get the User Matrix.

Definition at line 149 of file nmf_method.hpp.

39.191.2.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialization.

Definition at line 155 of file nmf_method.hpp.

39.191.2.7 W()

```
const arma::mat& W ( ) const [inline]
```

Get the Item Matrix.

Definition at line 147 of file nmf_method.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/decomposition_policies/ **nmf_method.hpp**

39.192 NoNormalization Class Reference

This normalization class doesn't perform any normalization.

Public Member Functions

- **NoNormalization** ()
- double **Denormalize** (const size_t, const size_t, const double rating) const
Do nothing.
- void **Denormalize** (const arma::Mat< size_t > &, const arma::vec &) const
Do nothing.
- template<typename MatType >
void **Normalize** (const MatType &) const
Do nothing.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialization.

39.192.1 Detailed Description

This normalization class doesn't perform any normalization.

It is the default normalization type for CF class.

Definition at line 25 of file no_normalization.hpp.

39.192.2 Constructor & Destructor Documentation

39.192.2.1 NoNormalization()

```
NoNormalization ( ) [inline]
```

Definition at line 29 of file no_normalization.hpp.

39.192.3 Member Function Documentation

39.192.3.1 Denormalize() [1/2]

```
double Denormalize (
    const size_t ,
    const size_t ,
    const double rating ) const [inline]
```

Do nothing.

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.
<i>rating</i>	Computed rating before denormalization.

Definition at line 46 of file no_normalization.hpp.

39.192.3.2 Denormalize() [2/2]

```
void Denormalize (
    const arma::Mat< size_t > & ,
    const arma::vec & ) const [inline]
```

Do nothing.

Parameters

<i>combinations</i>	User/Item combinations.
<i>predictions</i>	Predicted ratings for each user/item combination.

Definition at line 59 of file no_normalization.hpp.

39.192.3.3 Normalize()

```
void Normalize (
    const MatType & ) const [inline]
```

Do nothing.

Parameters

<i>data</i>	Input dataset.
-------------	----------------

Definition at line 37 of file no_normalization.hpp.

39.192.3.4 serialize()

```
void serialize (
```

```
Archive & ,
const unsigned int ) [inline]
```

Serialization.

Definition at line 67 of file no_normalization.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/normalization/ **no_normalization.hpp**

39.193 OverallMeanNormalization Class Reference

This normalization class performs overall mean normalization on raw ratings.

Public Member Functions

- **OverallMeanNormalization** ()
- double **Denormalize** (const size_t, const size_t, const double rating) const
Denormalize computed rating by adding mean.
- void **Denormalize** (const arma::Mat< size_t > &, arma::vec &predictions) const
Denormalize computed rating by adding mean.
- double **Mean** () const
Return mean.
- void **Normalize** (arma::mat &data)
Normalize the data by subtracting the mean of all existing ratings.
- void **Normalize** (arma::sp_mat &cleanedData)
Normalize the data by subtracting the mean of all existing ratings.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialization.

39.193.1 Detailed Description

This normalization class performs overall mean normalization on raw ratings.

An example of how to use **OverallMeanNormalization** (p. 1072) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.
