// Use OverallMeanNormalization as normalization method.
CFType<NMFPolicy, OverallMeanNormalization> cf(data);

// Generate 10 recommendations for all users.
cf.GetRecommendations(10, recommendations);
```

Definition at line 39 of file overall_mean_normalization.hpp.

39.193.2 Constructor & Destructor Documentation

39.193.2.1 OverallMeanNormalization()

```
OverallMeanNormalization ( ) [inline]
```

Definition at line 43 of file overall_mean_normalization.hpp.

39.193.3 Member Function Documentation

39.193.3.1 Denormalize() [1/2]

```
double Denormalize (
    const size_t ,
    const size_t ,
    const double rating ) const [inline]
```

Denormalize computed rating by adding mean.

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.
<i>rating</i>	Computed rating before denormalization.

Definition at line 100 of file overall_mean_normalization.hpp.

39.193.3.2 Denormalize() [2/2]

```
void Denormalize (
    const arma::Mat< size_t > & ,
    arma::vec & predictions ) const [inline]
```

Denormalize computed rating by adding mean.

Parameters

<i>combinations</i>	User/Item combinations.
<i>predictions</i>	Predicted ratings for each user/item combination.

Definition at line 113 of file overall_mean_normalization.hpp.

39.193.3.3 Mean()

```
double Mean ( ) const [inline]
```

Return mean.

Definition at line 122 of file overall_mean_normalization.hpp.

39.193.3.4 Normalize() [1/2]

```
void Normalize (
    arma::mat & data ) [inline]
```

Normalize the data by subtracting the mean of all existing ratings.

Parameters

<i>data</i>	Input dataset in the form of coordinate list.
-------------	---

Definition at line 50 of file overall_mean_normalization.hpp.

39.193.3.5 Normalize() [2/2]

```
void Normalize (
    arma::sp_mat & cleanedData ) [inline]
```

Normalize the data by subtracting the mean of all existing ratings.

Parameters

<i>cleanedData</i>	Input data as a sparse matrix.
--------------------	--------------------------------

Definition at line 68 of file overall_mean_normalization.hpp.

39.193.3.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialization.

Definition at line 131 of file overall_mean_normalization.hpp.

39.194 PearsonSearch Class Reference

Nearest neighbor search with pearson distance (or furthest neighbor search with pearson correlation).

Public Member Functions

- **PearsonSearch** (const arma::mat &referenceSet)
Constructor with reference set.
- void **Search** (const arma::mat &query, const size_t k, arma::Mat< size_t > &neighbors, arma::mat &similarities)
Given a set of query points, find the nearest k neighbors, and return similarities.

39.194.1 Detailed Description

Nearest neighbor search with pearson distance (or furthest neighbor search with pearson correlation).

Note that, with normalized vectors, neighbor search with pearson distance is equivalent to neighbor search with Euclidean distance. Therefore, instead of performing neighbor search directly with pearson distance, we first normalize all vectors, and then use **neighbor::KNN** (p. 432) (i.e. NeighborSearch with Euclidean distance, KDTree). Pearson correlation are calculated from Euclidean distance.

An example of how to use **PearsonSearch** (p. 1075) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CFTYPE<> cf(data);

// Generate 10 recommendations for all users.
cf.template GetRecommendations<PearsonSearch>(10, recommendations);
```

Definition at line 45 of file pearson_search.hpp.

39.194.2 Constructor & Destructor Documentation

39.194.2.1 PearsonSearch()

```
PearsonSearch (
    const arma::mat & referenceSet ) [inline]
```

Constructor with reference set.

In order to use **neighbor::KNN** (p. 432)(i.e. NeighborSearch with Euclidean distance, KDTree), we need to normalize all vectors in referenceSet. For each vector x , we first subtract $\text{mean}(x)$ from each element in x . Then, we normalize the vector to unit length.

Parameters

<i>Set</i>	of reference points.
------------	----------------------

Definition at line 57 of file pearson_search.hpp.

References NeighborSearch< SortPolicy, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTree↵ TraversalType >::Train().

39.194.3 Member Function Documentation

39.194.3.1 Search()

```
void Search (
    const arma::mat & query,
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & similarities ) [inline]
```

Given a set of query points, find the nearest k neighbors, and return similarities.

Similarities are non-negative and no larger than one.

Parameters

<i>query</i>	A set of query points.
<i>k</i>	Number of neighbors to search.
<i>neighbors</i>	Nearest neighbors.
<i>similarites</i>	Similarities between query point and its neighbors.

Definition at line 78 of file pearson_search.hpp.

References NeighborSearch< SortPolicy, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTreeTraversalType >::Search().

39.196 RandomizedSVDPolicy Class Reference

Implementation of the Randomized SVD policy to act as a wrapper when accessing Randomized SVD from within **CFTYPE** (p. 1045).

Public Member Functions

- **RandomizedSVDPolicy** (const size_t iteratedPower=0, const size_t maxIterations=2)
Use randomized SVD method to perform collaborative filtering.
- template<typename MatType >
void **Apply** (const MatType &, const arma::sp_mat &cleanedData, const size_t rank, const size_t maxIterations, const double, const bool)
Apply Collaborative Filtering to the provided data set using the randomized SVD.
- template<typename NeighborSearchPolicy >
void **GetNeighborhood** (const arma::Col< size_t > &users, const size_t numUsersForSimilarity, arma::Mat< size_t > &neighborhood, arma::mat &similarities) const
Get the neighborhood and corresponding similarities for a set of users.
- double **GetRating** (const size_t user, const size_t item) const
Return predicted rating given user ID and item ID.
- void **GetRatingOfUser** (const size_t user, arma::vec &rating) const
Get predicted ratings for a user.
- const arma::mat & **H** () const
Get the User Matrix.
- size_t **IteratedPower** () const
Get the size of the normalized power iterations.
- size_t & **IteratedPower** ()
Modify the size of the normalized power iterations.
- size_t **MaxIterations** () const
Get the number of iterations.
- size_t & **MaxIterations** ()
Modify the number of iterations.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialization.
- const arma::mat & **W** () const
Get the Item Matrix.

39.196.1 Detailed Description

Implementation of the Randomized SVD policy to act as a wrapper when accessing Randomized SVD from within **CFTYPE** (p. 1045).

An example of how to use **RandomizedSVDPolicy** (p. 1078) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CFTYPE<RandomizedSVDPolicy> cf(data);

// Generate 10 recommendations for all users.
cf.GetRecommendations(10, recommendations);
```

Definition at line 41 of file randomized_svd_method.hpp.

39.196.2 Constructor & Destructor Documentation

39.196.2.1 RandomizedSVDPolicy()

```
RandomizedSVDPolicy (
    const size_t iteratedPower = 0,
    const size_t maxIterations = 2 ) [inline]
```

Use randomized SVD method to perform collaborative filtering.

Parameters

<i>iteratedPower</i>	Size of the normalized power iterations (Default: rank + 2).
<i>maxIterations</i>	Number of iterations for the power method (Default: 2).

Definition at line 52 of file randomized_svd_method.hpp.

39.196.3 Member Function Documentation

39.196.3.1 Apply()

```
void Apply (
    const MatType & ,
    const arma::sp_mat & cleanedData,
    const size_t rank,
    const size_t maxIterations,
    const double ,
    const bool ) [inline]
```

Apply Collaborative Filtering to the provided data set using the randomized SVD.

Parameters

<i>data</i>	Data matrix: dense matrix (coordinate lists) or sparse matrix(cleaned).
<i>cleanedData</i>	item user table in form of sparse matrix.
<i>rank</i>	Rank parameter for matrix factorization.
<i>maxIterations</i>	Maximum number of iterations.
<i>minResidue</i>	Residue required to terminate.
<i>mit</i>	Whether to terminate only when maxIterations is reached.

Definition at line 73 of file randomized_svd_method.hpp.

References RandomizedSVD::Apply().

39.196.3.2 GetNeighborhood()

```
void GetNeighborhood (
    const arma::Col< size_t > & users,
    const size_t numUsersForSimilarity,
    arma::Mat< size_t > & neighborhood,
    arma::mat & similarities ) const [inline]
```

Get the neighborhood and corresponding similarities for a set of users.

Template Parameters

<i>NeighborSearchPolicy</i>	The policy to perform neighbor search.
-----------------------------	--

Parameters

<i>users</i>	Users whose neighborhood is to be computed.
<i>numUsersForSimilarity</i>	The number of neighbors returned for each user.
<i>neighborhood</i>	Neighbors represented by user IDs.
<i>similarities</i>	Similarity between each user and each of its neighbors.

Definition at line 129 of file randomized_svd_method.hpp.

39.196.3.3 GetRating()

```
double GetRating (
    const size_t user,
    const size_t item ) const [inline]
```

Return predicted rating given user ID and item ID.

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.

Definition at line 99 of file randomized_svd_method.hpp.

39.196.3.4 GetRatingOfUser()

```
void GetRatingOfUser (
    const size_t user,
    arma::vec & rating ) const [inline]
```

Get predicted ratings for a user.

Parameters

<i>user</i>	User ID.
<i>rating</i>	Resulting rating vector.

Definition at line 111 of file randomized_svd_method.hpp.

39.196.3.5 H()

```
const arma::mat& H ( ) const [inline]
```

Get the User Matrix.

Definition at line 158 of file randomized_svd_method.hpp.

39.196.3.6 IteratedPower() [1/2]

```
size_t IteratedPower ( ) const [inline]
```

Get the size of the normalized power iterations.

Definition at line 161 of file randomized_svd_method.hpp.

39.196.3.7 IteratedPower() [2/2]

```
size_t& IteratedPower ( ) [inline]
```

Modify the size of the normalized power iterations.

Definition at line 163 of file randomized_svd_method.hpp.

39.196.3.8 MaxIterations() [1/2]

```
size_t MaxIterations ( ) const [inline]
```

Get the number of iterations.

Definition at line 166 of file randomized_svd_method.hpp.

39.196.3.9 MaxIterations() [2/2]

```
size_t& MaxIterations ( ) [inline]
```

Modify the number of iterations.

Definition at line 168 of file randomized_svd_method.hpp.

39.196.3.10 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialization.

Definition at line 174 of file randomized_svd_method.hpp.

39.196.3.11 W()

```
const arma::mat& W ( ) const [inline]
```

Get the Item Matrix.

Definition at line 156 of file randomized_svd_method.hpp.

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/ **cf_model.hpp**

39.198 RegressionInterpolation Class Reference

Implementation of regression-based interpolation method.

Public Member Functions

- **RegressionInterpolation** ()
Empty Constructor.
- **RegressionInterpolation** (const arma::sp_mat &cleanedData)
Use cleanedData to perform necessary preprocessing.
- template<typename VectorType , typename DecompositionPolicy >
void **GetWeights** (VectorType &&weights, const DecompositionPolicy &decomposition, const size_t queryUser, const arma::Col< size_t > &neighbors, const arma::vec &, const arma::sp_mat &cleanedData)
The regression-based interpolation problem can be solved by a linear system of equations.

39.198.1 Detailed Description

Implementation of regression-based interpolation method.

Predicting a user's rating r_{iu} by it's neighbors' ratings can be regarded as solving linear regression of r_{iu} on r_{iv} , where v are u 's neighbors.

An example of how to use **RegressionInterpolation** (p. 1085) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CFType<> cf(data);

// Generate 10 recommendations for all users.
cf.template GetRecommendations<
    EuclideanSearch,
    RegressionInterpolation>(10, recommendations);
```

For more information, see the following paper.

```
@inproceedings{bell2007improved,
  title={Improved neighborhood-based collaborative filtering},
  author={Bell, Robert M and Koren, Yehuda},
  booktitle={KDD cup and workshop at the 13th ACM SIGKDD international
    conference on knowledge discovery and data mining},
  pages={7--14},
  year={2007},
  organization={Citeseer}
}
```

Definition at line 56 of file regression_interpolation.hpp.

39.198.2 Constructor & Destructor Documentation

39.198.2.1 RegressionInterpolation() [1/2]

```
RegressionInterpolation ( ) [inline]
```

Empty Constructor.

Definition at line 62 of file regression_interpolation.hpp.

39.198.2.2 RegressionInterpolation() [2/2]

```
RegressionInterpolation (
    const arma::sp_mat & cleanedData ) [inline]
```

Use cleanedData to perform necessary preprocessing.

Parameters

<i>cleanedData</i>	Sparse rating matrix.
--------------------	-----------------------

Definition at line 69 of file regression_interpolation.hpp.

39.198.3 Member Function Documentation

39.198.3.1 GetWeights()

```
void GetWeights (
    VectorType && weights,
    const DecompositionPolicy & decomposition,
    const size_t queryUser,
    const arma::Col< size_t > & neighbors,
    const arma::vec & ,
    const arma::sp_mat & cleanedData ) [inline]
```

The regression-based interpolation problem can be solved by a linear system of equations.

This method first calculates the coefficients and constant terms for the equations and then solve the equations. The solution of the linear system of equations is the resulting interpolation weights (the first parameter). After getting the weights, CF algorithm multiplies each neighbor's rating by its corresponding weight and sums them to get predicted rating.

Parameters

<i>weights</i>	Resulting interpolation weights. The size of weights should be set to the number of neighbors before calling GetWeights() (p. 1087).
<i>decomposition</i>	Decomposition object.
<i>queryUser</i>	Queried user.
<i>neighbors</i>	Neighbors of queried user.
<i>similarities</i>	Similarities between query user and neighbors.
<i>cleanedData</i>	Sparse rating matrix.

Definition at line 95 of file regression_interpolation.hpp.

39.199.2.1 RegSVDPolicy()

```
RegSVDPolicy (
    const size_t maxIterations = 10 ) [inline]
```

Use regularized SVD method to perform collaborative filtering.

Parameters

<i>maxIterations</i>	Number of iterations for the power method (Default: 2).
----------------------	---

Definition at line 50 of file `regularized_svd_method.hpp`.

39.199.3 Member Function Documentation

39.199.3.1 Apply()

```
void Apply (
    const arma::mat & data,
    const arma::sp_mat & ,
    const size_t rank,
    const size_t maxIterations,
    const double ,
    const bool ) [inline]
```

Apply Collaborative Filtering to the provided data set using the regularized SVD.

Parameters

<i>data</i>	Data matrix: dense matrix (coordinate lists) or sparse matrix(cleaned).
<i>cleanedData</i>	item user table in form of sparse matrix.
<i>rank</i>	Rank parameter for matrix factorization.
<i>maxIterations</i>	Maximum number of iterations.
<i>minResidue</i>	Residue required to terminate.
<i>mit</i>	Whether to terminate only when <i>maxIterations</i> is reached.

Definition at line 68 of file `regularized_svd_method.hpp`.

    const arma::Col< size_t > & users,
    const size_t numUsersForSimilarity,
    arma::Mat< size_t > & neighborhood,
    arma::mat & similarities ) const [inline]
```

Get the neighborhood and corresponding similarities for a set of users.

Template Parameters

<i>NeighborSearchPolicy</i>	The policy to perform neighbor search.
-----------------------------	--

Parameters

<i>users</i>	Users whose neighborhood is to be computed.
<i>numUsersForSimilarity</i>	The number of neighbors returned for each user.
<i>neighborhood</i>	Neighbors represented by user IDs.
<i>similarities</i>	Similarity between each user and each of its neighbors.

Definition at line 116 of file regularized_svd_method.hpp.

39.199.3.3 GetRating()

```
double GetRating (
    const size_t user,
    const size_t item ) const [inline]
```

Return predicted rating given user ID and item ID.

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.

Definition at line 86 of file regularized_svd_method.hpp.

39.199.3.4 GetRatingOfUser()

```
void GetRatingOfUser (
    const size_t user,
    arma::vec & rating ) const [inline]
```

Get predicted ratings for a user.

Parameters

<i>user</i>	User ID.
<i>rating</i>	Resulting rating vector.

Definition at line 98 of file regularized_svd_method.hpp.

39.199.3.5 H()

```
const arma::mat& H ( ) const [inline]
```

Get the User Matrix.

Definition at line 145 of file regularized_svd_method.hpp.

39.199.3.6 MaxIterations() [1/2]

```
size_t MaxIterations ( ) const [inline]
```

Get the number of iterations.

Definition at line 148 of file regularized_svd_method.hpp.

39.200 SimilarityInterpolation Class Reference

With **SimilarityInterpolation** (p. 1092), interpolation weights are based on similarities between query user and its neighbors.

Public Member Functions

- **SimilarityInterpolation** ()
- **SimilarityInterpolation** (const arma::sp_mat &)

This constructor is needed for interface consistency.
- `template<typename VectorType , typename DecompositionPolicy >`
void GetWeights (VectorType &&weights, const DecompositionPolicy &, const size_t, const arma::Col< size_t > &neighbors, const arma::vec &similarities, const arma::sp_mat &)

Interpolation weights are computed as normalized similarities.

39.200.1 Detailed Description

With **SimilarityInterpolation** (p. 1092), interpolation weights are based on similarities between query user and its neighbors.

All interpolation weights sum up to one.

An example of how to use **SimilarityInterpolation** (p. 1092) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CType<> cf(data);

// Generate 10 recommendations for all users.
cf.template GetRecommendations<
    EuclideanSearch,
    SimilarityInterpolation>(10, recommendations);
```

Definition at line 41 of file similarity_interpolation.hpp.

39.200.2 Constructor & Destructor Documentation

39.200.2.1 SimilarityInterpolation() [1/2]

```
SimilarityInterpolation ( ) [inline]
```

Definition at line 45 of file similarity_interpolation.hpp.

39.200.2.2 SimilarityInterpolation() [2/2]

```
SimilarityInterpolation (
    const arma::sp_mat & ) [inline]
```

This constructor is needed for interface consistency.

Definition at line 50 of file similarity_interpolation.hpp.

39.200.3 Member Function Documentation

39.200.3.1 GetWeights()

```
void GetWeights (
    VectorType && weights,
    const DecompositionPolicy & ,
    const size_t ,
    const arma::Col< size_t > & neighbors,
    const arma::vec & similarities,
    const arma::sp_mat & ) [inline]
```

Interpolation weights are computed as normalized similarities.

After getting the weights, CF algorithm multiplies each neighbor's rating by its corresponding weight and sums them to get predicted rating.

Parameters

<i>weights</i>	Resulting interpolation weights. The size of weights should be set to the number of neighbors before calling GetWeights() (p. 1093).
<i>decomposition</i>	Decomposition object.
<i>queryUser</i>	Queried user.
<i>neighbors</i>	Neighbors of queried user.
<i>similarities</i>	Similarities between query user and neighbors.
<i>cleanedData</i>	Sparse rating matrix.

Definition at line 67 of file similarity_interpolation.hpp.

39.201 SVDCompletePolicy Class Reference

Implementation of the SVD complete incremental policy to act as a wrapper when accessing SVD complete decomposition from within **CFTYPE** (p. 1045).

Public Member Functions

- template<typename MatType >
void **Apply** (const MatType &, const arma::sp_mat &cleanedData, const size_t rank, const size_t maxIterations, const double minResidue, const bool mit)
Apply Collaborative Filtering to the provided data set using the SVD complete incremental policy.

- `template<typename NeighborSearchPolicy >`
`void GetNeighborhood (const arma::Col< size_t > &users, const size_t numUsersForSimilarity, arma::Mat< size_t > &neighborhood, arma::mat &similarities) const`
Get the neighborhood and corresponding similarities for a set of users.
- `double GetRating (const size_t user, const size_t item) const`
Return predicted rating given user ID and item ID.
- `void GetRatingOfUser (const size_t user, arma::vec &rating) const`
Get predicted ratings for a user.
- `const arma::mat & H () const`
Get the User Matrix.
- `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialization.
- `const arma::mat & W () const`
Get the Item Matrix.

39.201.1 Detailed Description

Implementation of the SVD complete incremental policy to act as a wrapper when accessing SVD complete decomposition from within **CFTYPE** (p. 1045).

An example of how to use **SVDCompletePolicy** (p. 1094) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CFTYPE<SVDCompletePolicy> cf(data);

// Generate 10 recommendations for all users.
cf.GetRecommendations(10, recommendations);
```

Definition at line 44 of file `svd_complete_method.hpp`.

39.201.2 Member Function Documentation

39.201.2.1 Apply()

```
void Apply (
    const MatType & ,
    const arma::sp_mat & cleanedData,
    const size_t rank,
    const size_t maxIterations,
    const double minResidue,
    const bool mit ) [inline]
```

Apply Collaborative Filtering to the provided data set using the SVD complete incremental policy.

Parameters

<i>data</i>	Data matrix: dense matrix (coordinate lists) or sparse matrix(cleaned).
<i>cleanedData</i>	item user table in form of sparse matrix.
<i>rank</i>	Rank parameter for matrix factorization.
<i>maxIterations</i>	Maximum number of iterations.
<i>minResidue</i>	Residue required to terminate.
<i>mit</i>	Whether to terminate only when maxIterations is reached.

Definition at line 60 of file `svd_complete_method.hpp`.

References `AMF< TerminationPolicyType, InitializationRuleType, UpdateRuleType >::Apply()`.

39.201.2.2 GetNeighborhood()

```
void GetNeighborhood (
    const arma::Col< size_t > & users,
    const size_t numUsersForSimilarity,
    arma::Mat< size_t > & neighborhood,
    arma::mat & similarities ) const [inline]
```

Get the neighborhood and corresponding similarities for a set of users.

Template Parameters

<i>NeighborSearchPolicy</i>	The policy to perform neighbor search.
-----------------------------	--

Parameters

<i>users</i>	Users whose neighborhood is to be computed.
<i>numUsersForSimilarity</i>	The number of neighbors returned for each user.
<i>neighborhood</i>	Neighbors represented by user IDs.
<i>similarities</i>	Similarity between each user and each of its neighbors.

Definition at line 126 of file `svd_complete_method.hpp`.

39.201.2.3 GetRating()

```
double GetRating (
    const size_t user,
    const size_t item ) const [inline]
```

Return predicted rating given user ID and item ID.

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.

Definition at line 96 of file `svd_complete_method.hpp`.

39.201.2.4 GetRatingOfUser()

```
void GetRatingOfUser (
    const size_t user,
    arma::vec & rating ) const [inline]
```

Get predicted ratings for a user.

Parameters

<i>user</i>	User ID.
<i>rating</i>	Resulting rating vector.

Definition at line 108 of file `svd_complete_method.hpp`.

39.201.2.5 H()

```
const arma::mat& H ( ) const [inline]
```

Get the User Matrix.

Definition at line 155 of file `svd_complete_method.hpp`.

39.201.2.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialization.

Definition at line 161 of file `svd_complete_method.hpp`.

39.201.2.7 W()

```
const arma::mat& W ( ) const [inline]
```

Get the Item Matrix.

Definition at line 153 of file svd_complete_method.hpp.

The documentation for this class was generated from the following file:

- [/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/decomposition_policies/method.hpp](#) **svd_complete_↔**

39.202 SVDIncompletePolicy Class Reference

Implementation of the SVD incomplete incremental to act as a wrapper when accessing SVD incomplete incremental from within **CType** (p. 1045).

Public Member Functions

- `template<typename MatType >`
`void Apply (const MatType &, const arma::sp_mat &cleanedData, const size_t rank, const size_t maxIterations, const double minResidue, const bool mit)`
Apply Collaborative Filtering to the provided data set using the SVD incomplete incremental method.
- `template<typename NeighborSearchPolicy >`
`void GetNeighborhood (const arma::Col< size_t > &users, const size_t numUsersForSimilarity, arma::Mat< size_t > &neighborhood, arma::mat &similarities) const`
Get the neighborhood and corresponding similarities for a set of users.
- `double GetRating (const size_t user, const size_t item) const`
Return predicted rating given user ID and item ID.
- `void GetRatingOfUser (const size_t user, arma::vec &rating) const`
Get predicted ratings for a user.
- `const arma::mat & H () const`
Get the User Matrix.
- `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialization.
- `const arma::mat & W () const`
Get the Item Matrix.

39.202.1 Detailed Description

Implementation of the SVD incomplete incremental to act as a wrapper when accessing SVD incomplete incremental from within **CType** (p. 1045).

An example of how to use **SVDIncompletePolicy** (p. 1098) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CType<SVDIncompletePolicy> cf(data);

// Generate 10 recommendations for all users.
cf.GetRecommendations(10, recommendations);
```

Definition at line 44 of file `svd_incomplete_method.hpp`.

39.202.2 Member Function Documentation

39.202.2.1 Apply()

```
void Apply (
    const MatType & ,
    const arma::sp_mat & cleanedData,
    const size_t rank,
    const size_t maxIterations,
    const double minResidue,
    const bool mit ) [inline]
```

Apply Collaborative Filtering to the provided data set using the SVD incomplete incremental method.

Parameters

<i>data</i>	Data matrix: dense matrix (coordinate lists) or sparse matrix(cleaned).
<i>cleanedData</i>	item user table in form of sparse matrix.
<i>rank</i>	Rank parameter for matrix factorization.
<i>maxIterations</i>	Maximum number of iterations.
<i>minResidue</i>	Residue required to terminate.
<i>mit</i>	Whether to terminate only when maxIterations is reached.

Definition at line 60 of file `svd_incomplete_method.hpp`.

References `AMF< TerminationPolicyType, InitializationRuleType, UpdateRuleType >::Apply()`.

39.202.2.2 GetNeighborhood()

```
void GetNeighborhood (
    const arma::Col< size_t > & users,
    const size_t numUsersForSimilarity,
    arma::Mat< size_t > & neighborhood,
    arma::mat & similarities ) const [inline]
```

Get the neighborhood and corresponding similarities for a set of users.

Template Parameters

<i>NeighborSearchPolicy</i>	The policy to perform neighbor search.
-----------------------------	--

Parameters

<i>users</i>	Users whose neighborhood is to be computed.
<i>numUsersForSimilarity</i>	The number of neighbors returned for each user.
<i>neighborhood</i>	Neighbors represented by user IDs.
<i>similarities</i>	Similarity between each user and each of its neighbors.

Definition at line 125 of file `svd_incomplete_method.hpp`.

39.202.2.3 GetRating()

```
double GetRating (
    const size_t user,
    const size_t item ) const [inline]
```

Return predicted rating given user ID and item ID.

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.

Definition at line 95 of file `svd_incomplete_method.hpp`.

39.202.2.4 GetRatingOfUser()

```
void GetRatingOfUser (
    const size_t user,
    arma::vec & rating ) const [inline]
```

Get predicted ratings for a user.

Parameters

<i>user</i>	User ID.
<i>rating</i>	Resulting rating vector.

Definition at line 107 of file `svd_incomplete_method.hpp`.

39.202.2.5 `H()`

```
const arma::mat& H ( ) const [inline]
```

Get the User Matrix.

Definition at line 154 of file `svd_incomplete_method.hpp`.

39.202.2.6 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialization.

Definition at line 160 of file `svd_incomplete_method.hpp`.

39.202.2.7 `W()`

```
const arma::mat& W ( ) const [inline]
```

Get the Item Matrix.

Definition at line 152 of file `svd_incomplete_method.hpp`.

39.203 SVDPlusPlusPolicy Class Reference

Implementation of the SVDPlusPlus policy to act as a wrapper when accessing SVDPlusPlus from within **CType** (p. 1045).

Public Member Functions

- **SVDPlusPlusPolicy** (const size_t maxIterations=10, const double alpha=0.001, const double lambda=0.1)
Use SVDPlusPlus method to perform collaborative filtering.
- double **Alpha** () const
Get learning rate.
- double & **Alpha** ()
Modify learning rate.
- void **Apply** (const arma::mat &data, const arma::sp_mat &, const size_t rank, const size_t maxIterations, const double, const bool)
Apply Collaborative Filtering to the provided data set using the svdplusplus.
- template<typename NeighborSearchPolicy >
void **GetNeighborhood** (const arma::Col< size_t > &users, const size_t numUsersForSimilarity, arma::Mat< size_t > &neighborhood, arma::mat &similarities) const
Get the neighborhood and corresponding similarities for a set of users.
- double **GetRating** (const size_t user, const size_t item) const
Return predicted rating given user ID and item ID.
- void **GetRatingOfUser** (const size_t user, arma::vec &rating) const
Get predicted ratings for a user.
- const arma::mat & **H** () const
Get the User Matrix.
- const arma::sp_mat & **ImplicitData** () const
Get Implicit Feedback Data.
- double **Lambda** () const
Get regularization parameter.
- double & **Lambda** ()
Modify regularization parameter.
- size_t **MaxIterations** () const
Get the number of iterations.
- size_t & **MaxIterations** ()
Modify the number of iterations.
- const arma::vec & **P** () const
Get the Item Bias Vector.
- const arma::vec & **Q** () const
Get the User Bias Vector.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialization.
- const arma::mat & **W** () const
Get the Item Matrix.
- const arma::mat & **Y** () const
Get the Item Implicit Matrix.

39.203.1 Detailed Description

Implementation of the SVDPlusPlus policy to act as a wrapper when accessing SVDPlusPlus from within **CType** (p. 1045).

An example of how to use **SVDPlusPlusPolicy** (p. 1102) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

CType<SVDPlusPlusPolicy> cf(data);

// Generate 10 recommendations for all users.
cf.GetRecommendations(10, recommendations);
```

Definition at line 41 of file svdplusplus_method.hpp.

39.203.2 Constructor & Destructor Documentation

39.203.2.1 SVDPlusPlusPolicy()

```
SVDPlusPlusPolicy (
    const size_t maxIterations = 10,
    const double alpha = 0.001,
    const double lambda = 0.1 ) [inline]
```

Use SVDPlusPlus method to perform collaborative filtering.

Parameters

<i>maxIterations</i>	Number of iterations.
<i>alpha</i>	Learning rate for optimization.
<i>Regularization</i>	parameter for optimization.

Definition at line 51 of file svdplusplus_method.hpp.

39.203.3 Member Function Documentation

39.203.3.1 Alpha() [1/2]

```
double Alpha ( ) const [inline]
```

Get learning rate.

Definition at line 193 of file svdplusplus_method.hpp.

39.203.3.2 Alpha() [2/2]

```
double& Alpha ( ) [inline]
```

Modify learning rate.

Definition at line 195 of file svdplusplus_method.hpp.

39.203.3.3 Apply()

```
void Apply (
    const arma::mat & data,
    const arma::sp_mat & ,
    const size_t rank,
    const size_t maxIterations,
    const double ,
    const bool ) [inline]
```

Apply Collaborative Filtering to the provided data set using the svdplusplus.

Parameters

<i>data</i>	Data matrix: dense matrix (coordinate lists) or sparse matrix(cleaned).
<i>cleanedData</i>	item user table in form of sparse matrix.
<i>rank</i>	Rank parameter for matrix factorization.
<i>maxIterations</i>	Maximum number of iterations.
<i>minResidue</i>	Residue required to terminate.
<i>mit</i>	Whether to terminate only when maxIterations is reached.

Definition at line 73 of file svdplusplus_method.hpp.

References SVDPlusPlus< OptimizerType >::Apply(), and SVDPlusPlus< OptimizerType >::CleanData().

39.203.3.4 GetNeighborhood()

```
void GetNeighborhood (
    const arma::Col< size_t > & users,
    const size_t numUsersForSimilarity,
    arma::Mat< size_t > & neighborhood,
    arma::mat & similarities ) const [inline]
```

Get the neighborhood and corresponding similarities for a set of users.

Template Parameters

<i>NeighborSearchPolicy</i>	The policy to perform neighbor search.
-----------------------------	--

Parameters

<i>users</i>	Users whose neighborhood is to be computed.
<i>numUsersForSimilarity</i>	The number of neighbors returned for each user.
<i>neighborhood</i>	Neighbors represented by user IDs.
<i>similarities</i>	Similarity between each user and each of its neighbors.

Definition at line 157 of file svdplusplus_method.hpp.

39.203.3.5 GetRating()

```
double GetRating (
    const size_t user,
    const size_t item ) const [inline]
```

Return predicted rating given user ID and item ID.

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.

Definition at line 96 of file svdplusplus_method.hpp.

39.203.3.6 GetRatingOfUser()

```
void GetRatingOfUser (
    const size_t user,
    arma::vec & rating ) const [inline]
```

Get predicted ratings for a user.

Parameters

<i>user</i>	User ID.
<i>rating</i>	Resulting rating vector.

Definition at line 124 of file svdplusplus_method.hpp.

39.203.3.7 H()

```
const arma::mat& H ( ) const [inline]
```

Get the User Matrix.

Definition at line 177 of file svdplusplus_method.hpp.

39.203.3.8 ImplicitData()

```
const arma::sp_mat& ImplicitData ( ) const [inline]
```

Get Implicit Feedback Data.

Definition at line 185 of file svdplusplus_method.hpp.

39.203.3.9 Lambda() [1/2]

```
double Lambda ( ) const [inline]
```

Get regularization parameter.

Definition at line 198 of file svdplusplus_method.hpp.

39.203.3.10 Lambda() [2/2]

```
double& Lambda ( ) [inline]
```

Modify regularization parameter.

Definition at line 200 of file svdplusplus_method.hpp.

39.203.3.11 MaxIterations() [1/2]

```
size_t MaxIterations ( ) const [inline]
```

Get the number of iterations.

Definition at line 188 of file svdplusplus_method.hpp.

39.203.3.12 MaxIterations() [2/2]

```
size_t& MaxIterations ( ) [inline]
```

Modify the number of iterations.

Definition at line 190 of file svdplusplus_method.hpp.

39.203.3.13 P()

```
const arma::vec& P ( ) const [inline]
```

Get the Item Bias Vector.

Definition at line 181 of file svdplusplus_method.hpp.

39.203.3.14 Q()

```
const arma::vec& Q ( ) const [inline]
```

Get the User Bias Vector.

Definition at line 179 of file svdplusplus_method.hpp.

39.203.3.15 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialization.

Definition at line 206 of file svdplusplus_method.hpp.

39.203.3.16 `W()`

```
const arma::mat& W ( ) const [inline]
```

Get the Item Matrix.

Definition at line 175 of file `svdplusplus_method.hpp`.

39.203.3.17 `Y()`

```
const arma::mat& Y ( ) const [inline]
```

Get the Item Implicit Matrix.

Definition at line 183 of file `svdplusplus_method.hpp`.

39.204 SVDWrapper< Factorizer > Class Template Reference

This class acts as the wrapper for all SVD factorizers which are incompatible with CF module.

Public Member Functions

- **SVDWrapper** (const Factorizer &factorizer=Factorizer())
- double **Apply** (const arma::mat &V, arma::mat &W, arma::mat &sigma, arma::mat &H) const
Factorizer function which takes SVD of the given matrix and returns the frobenius norm of error.
- double **Apply** (const arma::mat &V, size_t r, arma::mat &W, arma::mat &H) const
Factorizer function which computes SVD and returns matrices as required by CF module.

39.204.1 Detailed Description

```
template<class Factorizer = DummyClass>
class mlpack::cf::SVDWrapper< Factorizer >
```

This class acts as the wrapper for all SVD factorizers which are incompatible with CF module.

Normally SVD factorizers implement Apply method which takes matrix V and factorizes it into P, sigma and Q where $V = P * \text{sigma} * \text{trans}(Q)$. But CF module requires factorization to be $V = W * H$. This class multiplies P and sigma and takes the first 'r' eigenvectors out where 'r' is the rank of factorization. Q matrix is transposed and trimmed to support the rank of factorization. The Factorizer class should implement Apply which takes matrices P, sigma, Q and V as their parameter respectively.

Definition at line 40 of file `svd_wrapper.hpp`.

39.204.2 Constructor & Destructor Documentation

39.204.2.1 SVDWrapper()

```
SVDWrapper (
    const Factorizer & factorizer = Factorizer() ) [inline]
```

Definition at line 44 of file svd_wrapper.hpp.

39.204.3 Member Function Documentation

39.204.3.1 Apply() [1/2]

```
double Apply (
    const arma::mat & V,
    arma::mat & W,
    arma::mat & sigma,
    arma::mat & H ) const
```

Factorizer function which takes SVD of the given matrix and returns the frobenius norm of error.

Parameters

<i>V</i>	input matrix
<i>W</i>	first unitary matrix
<i>sigma</i>	eigenvalue matrix
<i>H</i>	second unitary matrix

Note

$$V = W * \text{sigma} * \text{arma::trans}(H)$$

39.204.3.2 Apply() [2/2]

```
double Apply (
    const arma::mat & V,
    size_t r,
```

```
arma::mat & W,  
arma::mat & H ) const
```

Factorizer function which computes SVD and returns matrices as required by CF module.

Parameters

V	input matrix
W	first unitary matrix
H	second unitary matrix

Note

$$V = W * H$$

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/ **svd_wrapper.hpp**

39.205 UserMeanNormalization Class Reference

This normalization class performs user mean normalization on raw ratings.

Public Member Functions

- **UserMeanNormalization** ()
- double **Denormalize** (const size_t user, const size_t, const double rating) const
Denormalize computed rating by adding user mean.
- void **Denormalize** (const arma::Mat< size_t > &combinations, arma::vec &predictions) const
Denormalize computed rating by adding user mean.
- const arma::vec & **Mean** () const
Return user mean.
- void **Normalize** (arma::mat &data)
Normalize the data by subtracting user mean from each of existing ratings.
- void **Normalize** (arma::sp_mat &cleanedData)
Normalize the data by subtracting user mean from each of existing rating.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialization.

39.205.1 Detailed Description

This normalization class performs user mean normalization on raw ratings.

An example of how to use **UserMeanNormalization** (p. 1111) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

// Use UserMeanNormalization as normalization method.
CFType<NMFPolicy, UserMeanNormalization> cf(data);

// Generate 10 recommendations for all users.
cf.GetRecommendations(10, recommendations);
```

Definition at line 39 of file user_mean_normalization.hpp.

39.205.2 Constructor & Destructor Documentation

39.205.2.1 UserMeanNormalization()

UserMeanNormalization () [inline]

Definition at line 43 of file user_mean_normalization.hpp.

39.205.3 Member Function Documentation

39.205.3.1 Denormalize() [1/2]

```
double Denormalize (
    const size_t user,
    const size_t ,
    const double rating ) const [inline]
```

Denormalize computed rating by adding user mean.

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.
<i>rating</i>	Computed rating before denormalization.

Definition at line 127 of file user_mean_normalization.hpp.

39.205.3.2 Denormalize() [2/2]

```
void Denormalize (
    const arma::Mat< size_t > & combinations,
    arma::vec & predictions ) const [inline]
```

Denormalize computed rating by adding user mean.

Parameters

<i>combinations</i>	User/Item combinations.
<i>predictions</i>	Predicted ratings for each user/item combination.

Definition at line 140 of file `user_mean_normalization.hpp`.

39.205.3.3 Mean()

```
const arma::vec& Mean ( ) const [inline]
```

Return user mean.

Definition at line 153 of file `user_mean_normalization.hpp`.

39.205.3.4 Normalize() [1/2]

```
void Normalize (
    arma::mat & data ) [inline]
```

Normalize the data by subtracting user mean from each of existing ratings.

Parameters

<i>data</i>	Input dataset in the form of coordinate list.
-------------	---

Definition at line 50 of file `user_mean_normalization.hpp`.

39.205.3.5 Normalize() [2/2]

```
void Normalize (
    arma::sp_mat & cleanedData ) [inline]
```

Normalize the data by subtracting user mean from each of existing rating.

Parameters

<i>cleanedData</i>	Input data as a sparse matrix.
--------------------	--------------------------------

Definition at line 90 of file `user_mean_normalization.hpp`.

39.205.3.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialization.

Definition at line 159 of file `user_mean_normalization.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/normalization/ user_mean_normalization.hpp`

39.206 ZScoreNormalization Class Reference

This normalization class performs z-score normalization on raw ratings.

Public Member Functions

- **ZScoreNormalization** ()
- double **Denormalize** (const size_t, const size_t, const double rating) const
Denormalize computed rating by adding mean and multiplying stddev.
- void **Denormalize** (const arma::Mat< size_t > &, arma::vec &predictions) const
Denormalize computed rating by adding mean and multiplying stddev.
- double **Mean** () const
Return mean.
- void **Normalize** (arma::mat &data)
Normalize the data to zero mean and one standard deviation.
- void **Normalize** (arma::sp_mat &cleanedData)
Normalize the data to zero mean and one standard deviation.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialization.
- double **Stddev** () const
Return stddev.

39.206.1 Detailed Description

This normalization class performs z-score normalization on raw ratings.

An example of how to use **ZScoreNormalization** (p. 1114) in CF is shown below:

```
extern arma::mat data; // data is a (user, item, rating) table.
// Users for whom recommendations are generated.
extern arma::Col<size_t> users;
arma::Mat<size_t> recommendations; // Resulting recommendations.

// Use ZScoreNormalization as normalization method.
CFType<NMFPolicy, ZScoreNormalization> cf(data);

// Generate 10 recommendations for all users.
cf.GetRecommendations(10, recommendations);
```

Definition at line 38 of file `z_score_normalization.hpp`.

39.206.2 Constructor & Destructor Documentation

39.206.2.1 ZScoreNormalization()

```
ZScoreNormalization ( ) [inline]
```

Definition at line 42 of file `z_score_normalization.hpp`.

39.206.3 Member Function Documentation

39.206.3.1 Denormalize() [1/2]

```
double Denormalize (
    const size_t ,
    const size_t ,
    const double rating ) const [inline]
```

Denormalize computed rating by adding mean and multiplying stddev.

Parameters

<i>user</i>	User ID.
<i>item</i>	Item ID.
<i>rating</i>	Computed rating before denormalization.

Definition at line 110 of file `z_score_normalization.hpp`.

39.206.3.2 Denormalize() [2/2]

```
void Denormalize (
    const arma::Mat< size_t > & ,
    arma::vec & predictions ) const [inline]
```

Denormalize computed rating by adding mean and multiplying stddev.

Parameters

<i>combinations</i>	User/Item combinations.
<i>predictions</i>	Predicted ratings for each user/item combination.

Definition at line 123 of file `z_score_normalization.hpp`.

39.206.3.3 `Mean()`

```
double Mean ( ) const [inline]
```

Return mean.

Definition at line 132 of file `z_score_normalization.hpp`.

39.206.3.4 `Normalize()` [1/2]

```
void Normalize (
    arma::mat & data ) [inline]
```

Normalize the data to zero mean and one standard deviation.

Parameters

<i>data</i>	Input dataset in the form of coordinate list.
-------------	---

Definition at line 49 of file `z_score_normalization.hpp`.

References `Log::Fatal`.

39.206.3.5 `Normalize()` [2/2]

```
void Normalize (
    arma::sp_mat & cleanedData ) [inline]
```

Normalize the data to zero mean and one standard deviation.

Parameters

<i>cleanedData</i>	Input data as a sparse matrix.
--------------------	--------------------------------

Definition at line 76 of file `z_score_normalization.hpp`.

References `Log::Fatal`.

39.206.3.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialization.

Definition at line 149 of file `z_score_normalization.hpp`.

39.206.3.7 Stddev()

```
double Stddev ( ) const [inline]
```

Return stddev.

Definition at line 140 of file `z_score_normalization.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/normalization/ z_score_normalization.hpp`

39.207 CLI Class Reference

Parses the command line for parameters and holds user-specified parameters.

Public Types

- `typedef std::map< std::string, std::map< std::string, void(*) (const util::ParamData &, const void *, void *)> > >`
FunctionMapType
Map for functions and types.

Static Public Member Functions

- static void **Add** (**util::ParamData** &&d)
Adds a parameter to the hierarchy; use the `PARAM_` macros instead of this (i.e.*
- static std::map< char, std::string > & **Aliases** ()
*Return a modifiable list of aliases that **CLI** (p. 1117) knows about.*
- static void **ClearSettings** ()
Clear all of the settings, removing all parameters and function mappings.
- template<typename T >
static T & **GetParam** (const std::string &identifier)
Get the value of type T found while parsing.
- template<typename T >
static std::string **GetPrintableParam** (const std::string &identifier)
Cast the given parameter of the given type to a short, printable std::string, for use in status messages.
- template<typename T >
static T & **GetRawParam** (const std::string &identifier)
*Get the raw value of the parameter before any processing that **GetParam()** (p. 1122) might normally do.*
- static **CLI** & **GetSingleton** ()
Retrieve the singleton.
- static bool **HasParam** (const std::string &identifier)
See if the specified flag was found while parsing.
- static std::map< std::string, **util::ParamData** > & **Parameters** ()
*Return a modifiable list of parameters that **CLI** (p. 1117) knows about.*
- static std::string **ProgramName** ()
*Get the program name as set by the **PROGRAM_INFO()** (p. 2733) macro.*
- static void **RegisterProgramDoc** (**util::ProgramDoc** * doc)
Registers a ProgramDoc object, which contains documentation about the program.
- static void **RestoreSettings** (const std::string &name, const bool fatal=true)
Restore all of the parameters and function mappings of the given name, if they exist.
- static void **SetPassed** (const std::string &name)
Mark a particular parameter as passed.
- static void **StoreSettings** (const std::string &name)
Take all parameters and function mappings and store them, under the given name.

Public Attributes

- bool **didParse**
*True, if **CLI** (p. 1117) was used to parse command line options.*
- **util::ProgramDoc** * **doc**
Pointer to the ProgramDoc object.
- **FunctionMapType** **functionMap**
- std::string **programName**
Holds the name of the program for `--version`.
- **Timers** **timer**
Holds the timer objects.

39.207.1 Detailed Description

Parses the command line for parameters and holds user-specified parameters.

The **CLI** (p. 1117) class is a subsystem by which parameters for machine learning methods can be specified and accessed. In conjunction with the macros `PARAM_DOUBLE`, `PARAM_INT`, `PARAM_STRING`, `PARAM_FLAG`, and others, this class aims to make user configurability of mlpack methods very easy. There are only three methods in **CLI** (p. 1117) that a user should need: **CLI::ParseCommandLine()** (p. 302), **CLI::GetParam()** (p. 1122), and **CLI::HasParam()** (p. 1123) (in addition to the `PARAM_*`() macros).

39.207.2 Adding parameters to a program

```
$ ./executable --bar=5
```

Note

The `=` is optional; a space can also be used.

A parameter is specified by using one of the following macros (this is not a complete list; see `core/io/cli.hpp`):

- **PARAM_FLAG**(ID, DESC, ALIAS) (p. 2710)
- **PARAM_DOUBLE**(ID, DESC, ALIAS, DEF)
- **PARAM_INT**(ID, DESC, ALIAS, DEF)
- **PARAM_STRING**(ID, DESC, ALIAS, DEF)

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Short description of the parameter (one/two sentences).
<i>ALIAS</i>	An alias for the parameter.
<i>DEF</i>	Default value of the parameter.

The flag (boolean) type automatically defaults to false; it is specified merely as a flag on the command line (no `'=true'` is required).

Here is an example of a few parameters being defined; this is for the KNN executable (`methods/neighbor_search/knn_main.cpp`):

```
PARAM_STRING_REQ("reference_file", "File containing the reference dataset.",
    "r");
PARAM_STRING_REQ("distances_file", "File to output distances into.", "d");
PARAM_STRING_REQ("neighbors_file", "File to output neighbors into.", "n");
PARAM_INT_REQ("k", "Number of furthest neighbors to find.", "k");
PARAM_STRING("query_file", "File containing query points (optional).", "q",
    "");
PARAM_INT("leaf_size", "Leaf size for tree building.", "l", 20);
```

```
PARAM_FLAG("naive", "If true, O(n^2) naive mode is used for computation.",
           "N");
PARAM_FLAG("single_mode", "If true, single-tree search is used (as opposed "
           "to dual-tree search.", "s");
```

More documentation is available on the `PARAM_*`() macros in the documentation for `core/io/cli.hpp`.

39.207.3 Documenting the program itself

In addition to allowing documentation for each individual parameter and module, the **PROGRAM_INFO()** (p. 2733) macro provides support for documenting the program itself. There should only be one instance of the **PROGRAM_INFO()** (p. 2733) macro. Below is an example:

```
PROGRAM_INFO("Maximum Variance Unfolding", "This program performs maximum "
           "variance unfolding on the given dataset, writing a lower-dimensional "
           "unfolded dataset to the given output file.");
```

This description should be verbose, and explain to a non-expert user what the program does and how to use it. If relevant, paper citations should be included.

39.207.4 Parsing the command line with CLI

To have **CLI** (p. 1117) parse the command line at the beginning of code execution, only a call to **ParseCommandLine()** (p. 302) is necessary:

```
int main(int argc, char** argv)
{
    CLI::ParseCommandLine(argc, argv);

    ...
}
```

CLI (p. 1117) provides `–help` and `–info` options which give nicely formatted documentation of each option; the documentation is generated from the `DESC` arguments in the `PARAM_*`() macros.

39.207.5 Getting parameters with CLI

When the parameters have been defined, the next important thing is how to access them. For this, the **HasParam()** (p. 1123) and **GetParam()** (p. 1122) methods are used. For instance, to see if the user passed the flag (boolean) "naive":

```
if (CLI::HasParam("naive"))
{
    Log::Info << "Naive has been passed!" << std::endl;
}
```

To get the value of a parameter, such as a string, use **GetParam**:

```
const std::string filename = CLI::GetParam<std::string>("filename");
```

Note

Options should only be defined in files which define `main()` (that is, main executables). If options are defined elsewhere, they may be spuriously included into other executables and confuse users. Similarly, if your executable has options which you did not define, it is probably because the option is defined somewhere else and included in your executable.

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 166 of file `cli.hpp`.

39.207.6 Member Typedef Documentation

39.207.6.1 FunctionMapType

```
typedef std::map<std::string, std::map<std::string, void (*)(const util::ParamData&, const void*, void*)> > FunctionMapType
```

Map for functions and types.

Use as `functionMap["typename"]["functionName"]`.

Definition at line 289 of file `cli.hpp`.

39.207.7 Member Function Documentation

39.207.7.1 Add()

```
static void Add (  
    util::ParamData && d ) [static]
```

Adds a parameter to the hierarchy; use the `PARAM_*`() macros instead of this (i.e.

`PARAM_INT()`).

Parameters

<i>d</i>	Utility structure holding parameter data.
----------	---

Referenced by `CLIOption< N >::CLIOption()`, `MDOption< T >::MDOption()`, `PyOption< T >::PyOption()`, and `TestOption< N >::TestOption()`.

39.207.7.2 Aliases()

```
static std::map<char, std::string>& Aliases ( ) [static]
```

Return a modifiable list of aliases that **CLI** (p. 1117) knows about.

39.207.7.3 ClearSettings()

```
static void ClearSettings ( ) [static]
```

Clear all of the settings, removing all parameters and function mappings.

Referenced by `MDOption< T >::MDOption()`, `PyOption< T >::PyOption()`, and `TestOption< N >::TestOption()`.

39.207.7.4 GetParam()

```
static T& GetParam (
    const std::string & identifier ) [static]
```

Get the value of type `T` found while parsing.

You can set the value using this reference safely.

Parameters

<i>identifier</i>	The name of the parameter in question.
-------------------	--

39.207.7.5 GetPrintableParam()

```
static std::string GetPrintableParam (
```

```
const std::string & identifier ) [static]
```

Cast the given parameter of the given type to a short, printable `std::string`, for use in status messages.

Ideally the message returned here should be only a handful of characters, and certainly no longer than one line.

Parameters

<i>identifier</i>	The name of the parameter in question.
-------------------	--

39.207.7.6 GetRawParam()

```
static T& GetRawParam (
    const std::string & identifier ) [static]
```

Get the raw value of the parameter before any processing that **GetParam()** (p. 1122) might normally do.

So, e.g., for command-line programs, this does not perform any data loading or manipulation like **GetParam()** (p. 1122) does. So if you want to access a matrix or model (or similar) parameter before it is loaded, this is the method to use.

Parameters

<i>identifier</i>	The name of the parameter in question.
-------------------	--

39.207.7.7 GetSingleton()

```
static CLI& GetSingleton ( ) [static]
```

Retrieve the singleton.

As an end user, if you are just using the **CLI** (p. 1117) object, you should not need to use this function—the other static functions should be sufficient.

In this case, the singleton is used to store data for the static methods, as there is no point in defining static methods only to have users call private instance methods.

Returns

The singleton instance for use in the static methods.

Referenced by `CLIOption< N >::CLIOption()`, `mlpack::bindings::cli::EndProgram()`, `MDOption< T >::MDOption()`, `mlpack::bindings::cli::ParseCommandLine()`, `PyOption< T >::PyOption()`, `mlpack::util::ResetTimers()`, and `TestOption< N >::TestOption()`.

39.207.7.8 HasParam()

```
static bool HasParam (
    const std::string & identifier ) [static]
```

See if the specified flag was found while parsing.

Parameters

<i>identifier</i>	The name of the parameter in question.
-------------------	--

Referenced by `mlpack::bindings::cli::EndProgram()`, and `mlpack::bindings::cli::ParseCommandLine()`.

39.207.7.9 Parameters()

```
static std::map<std::string, util::ParamData>& Parameters ( ) [static]
```

Return a modifiable list of parameters that **CLI** (p. 1117) knows about.

Referenced by `CLIOption< N >::CLIOption()`, `mlpack::bindings::cli::EndProgram()`, `mlpack::bindings::cli::ParseCommandLine()`, and `mlpack::bindings::python::PrintOutputProcessing()`.

39.207.7.10 ProgramName()

```
static std::string ProgramName ( ) [static]
```

Get the program name as set by the **PROGRAM_INFO()** (p. 2733) macro.

Referenced by `mlpack::bindings::cli::ParseCommandLine()`.

39.207.7.11 RegisterProgramDoc()

```
static void RegisterProgramDoc (
    util::ProgramDoc * doc ) [static]
```

Registers a `ProgramDoc` object, which contains documentation about the program.

If this method has been called before (that is, if two `ProgramDocs` are instantiated in the program), a fatal error will occur.

Parameters

<i>doc</i>	Pointer to the ProgramDoc object.
------------	-----------------------------------

39.207.7.12 RestoreSettings()

```
static void RestoreSettings (
    const std::string & name,
    const bool fatal = true ) [static]
```

Restore all of the parameters and function mappings of the given name, if they exist.

A `std::invalid_argument` exception will be thrown if `fatal` is true and no settings with the given name have been stored (with **StoreSettings()** (p. 1125)).

Parameters

<i>name</i>	Name of settings to restore.
<i>fatal</i>	Whether to throw an exception on an unknown name.

Referenced by `MDOption< T >::MDOption()`, `PyOption< T >::PyOption()`, and `TestOption< N >::TestOption()`.

39.207.7.13 SetPassed()

```
static void SetPassed (
    const std::string & name ) [static]
```

Mark a particular parameter as passed.

Parameters

<i>name</i>	Name of the parameter.
-------------	------------------------

Referenced by `mlpack::util::SetInputParam()`, and `TestOption< N >::TestOption()`.

39.207.7.14 StoreSettings()

```
static void StoreSettings (
    const std::string & name ) [static]
```

Take all parameters and function mappings and store them, under the given name.

This can later be restored with **RestoreSettings()** (p. 1125). If settings have already been saved under the given name, they will be overwritten. This also clears the current parameters and function map.

Parameters

<i>name</i>	Name of settings to save.
-------------	---------------------------

Referenced by MDOption< T >::MDOption(), PyOption< T >::PyOption(), and TestOption< N >::TestOption().

39.207.8 Member Data Documentation

39.207.8.1 didParse

```
bool didParse
```

True, if **CLI** (p. 1117) was used to parse command line options.

Definition at line 299 of file cli.hpp.

Referenced by mlpack::bindings::cli::ParseCommandLine().

39.207.8.2 doc

```
util::ProgramDoc* doc
```

Pointer to the ProgramDoc object.

Definition at line 312 of file cli.hpp.

39.207.8.3 functionMap

```
FunctionMapType functionMap
```

Definition at line 290 of file cli.hpp.

Referenced by CLIOption< N >::CLIOption(), mlpack::bindings::cli::EndProgram(), MDOption< T >::MDOption(), mlpack::bindings::cli::ParseCommandLine(), PyOption< T >::PyOption(), and TestOption< N >::TestOption().

39.207.8.4 `programName`

```
std::string programName
```

Holds the name of the program for `--version`.

This is the true program name (`argv[0]`) not what is given in `ProgramDoc`.

Definition at line 303 of file `cli.hpp`.

39.207.8.5 `timer`

```
Timers timer
```

Holds the timer objects.

Definition at line 306 of file `cli.hpp`.

Referenced by `mlpack::bindings::cli::EndProgram()`, and `mlpack::util::ResetTimers()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/util/ cli.hpp`

39.208 Accuracy Class Reference

The **Accuracy** (p. 1127) is a metric of performance for classification algorithms that is equal to a proportion of correctly labeled test items among all ones for given test items.

Static Public Member Functions

- `template<typename MLEAlgorithm , typename DataType >`
`static double Evaluate (MLEAlgorithm &model, const DataType &data, const arma::Row< size_t > &labels)`
Run classification and calculate accuracy.

Static Public Attributes

- `static const bool NeedsMinimization = false`
Information for hyper-parameter tuning code.

39.208.1 Detailed Description

The **Accuracy** (p. 1127) is a metric of performance for classification algorithms that is equal to a proportion of correctly labeled test items among all ones for given test items.

Definition at line 25 of file accuracy.hpp.

39.208.2 Member Function Documentation

39.208.2.1 Evaluate()

```
static double Evaluate (
    MLAlgorithm & model,
    const DataType & data,
    const arma::Row< size_t > & labels ) [static]
```

Run classification and calculate accuracy.

Parameters

<i>model</i>	A classification model.
<i>data</i>	Column-major data containing test items.
<i>labels</i>	Ground truth (correct) labels for the test items.

39.208.3 Member Data Documentation

39.208.3.1 NeedsMinimization

```
const bool NeedsMinimization = false [static]
```

Information for hyper-parameter tuning code.

It indicates that we want to maximize the metric.

Definition at line 44 of file accuracy.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/metrics/ **accuracy.hpp**

39.209 CVBase< MLAlgorithm, MatType, PredictionsType, WeightsType > Class Template Reference

An auxiliary class for cross-validation.

Public Types

- using **MIE** = **MetalInfoExtractor**< MLAlgorithm, MatType, PredictionsType, WeightsType >
A short alias for **MetalInfoExtractor** (p. 1140).

Public Member Functions

- **CVBase** ()
Assert that *MLAlgorithm* doesn't take any additional basic parameters like *numClasses*.
- **CVBase** (const size_t numClasses)
Assert that *MLAlgorithm* takes the *numClasses* parameter and store it.
- **CVBase** (const **data::DatasetInfo** &datasetInfo, const size_t numClasses)
Assert that *MLAlgorithm* takes the *numClasses* parameter and a **data::DatasetInfo** (p. 376) parameter and store them.
- template<typename... MLAlgorithmArgs>
MLAlgorithm Train (const MatType &xs, const PredictionsType &ys, const MLAlgorithmArgs &... args)
Train *MLAlgorithm* with given data points, predictions, and hyperparameters depending on what **CVBase** (p. 1129) constructor has been called.
- template<typename... MLAlgorithmArgs>
MLAlgorithm Train (const MatType &xs, const PredictionsType &ys, const WeightsType &weights, const MLAlgorithmArgs &... args)
Train *MLAlgorithm* with given data points, predictions, weights, and hyperparameters depending on what **CVBase** (p. 1129) constructor has been called.

Static Public Member Functions

- static void **AssertDataConsistency** (const MatType &xs, const PredictionsType &ys)
Assert there is the equal number of data points and predictions.
- static void **AssertWeightsConsistency** (const MatType &xs, const WeightsType &weights)
Assert weighted learning is supported and there is the equal number of data points and weights.

39.209.1 Detailed Description

```
template<typename MLAlgorithm, typename MatType, typename PredictionsType, typename WeightsType>
class mlpack::cv::CVBase< MLAlgorithm, MatType, PredictionsType, WeightsType >
```

An auxiliary class for cross-validation.

It serves to handle basic non-data constructor parameters of a machine learning algorithm (like *datasetInfo* or *numClasses*) and to assert that the machine learning algorithm and data satisfy certain conditions.

This class is not meant to be used directly by users. To cross-validate rather use end-user classes like **SimpleCV** (p. 1151) or **KFoldCV** (p. 1134).

Template Parameters

<i>MLAlgorithm</i>	A machine learning algorithm.
<i>MatType</i>	The type of data.
<i>PredictionsType</i>	The type of predictions (labels/responses).
<i>WeightsType</i>	The type of weights. It supposed to be void* when weights are not supported.

Definition at line 39 of file cv_base.hpp.

39.209.2 Member Typedef Documentation

39.209.2.1 MIE

```
using MIE = MetaInfoExtractor<MLAlgorithm, MatType, PredictionsType, WeightsType>
```

A short alias for **MetaInfoExtractor** (p. 1140).

Definition at line 44 of file cv_base.hpp.

39.209.3 Constructor & Destructor Documentation

39.209.3.1 CVBase() [1/3]

```
CVBase ( )
```

Assert that MLAlgorithm doesn't take any additional basic parameters like numClasses.

39.209.3.2 CVBase() [2/3]

```
CVBase (
    const size_t numClasses )
```

Assert that MLAlgorithm takes the numClasses parameter and store it.

Parameters

<i>numClasses</i>	Number of classes in the dataset.
-------------------	-----------------------------------

39.209.3.3 CVBase() [3/3]

```
CVBase (
    const data::DatasetInfo & datasetInfo,
    const size_t numClasses )
```

Assert that MLAlgorithm takes the numClasses parameter and a **data::DatasetInfo** (p. 376) parameter and store them.

Parameters

<i>datasetInfo</i>	Type information for each dimension of the dataset.
<i>numClasses</i>	Number of classes in the dataset.

39.209.4 Member Function Documentation

39.209.4.1 AssertDataConsistency()

```
static void AssertDataConsistency (
    const MatType & xs,
    const PredictionsType & ys ) [static]
```

Assert there is the equal number of data points and predictions.

39.209.4.2 AssertWeightsConsistency()

```
static void AssertWeightsConsistency (
    const MatType & xs,
    const WeightsType & weights ) [static]
```

Assert weighted learning is supported and there is the equal number of data points and weights.

39.209.4.3 Train() [1/2]

```
MLAlgorithm Train (
    const MatType & xs,
    const PredictionsType & ys,
    const MLAlgorithmArgs &... args )
```

Train MLAlgorithm with given data points, predictions, and hyperparameters depending on what **CVBase** (p.1129) constructor has been called.

39.209.4.4 Train() [2/2]

```
MLAlgorithm Train (
    const MatType & xs,
    const PredictionsType & ys,
    const WeightsType & weights,
    const MLAlgorithmArgs &... args )
```

Train MLAlgorithm with given data points, predictions, weights, and hyperparameters depending on what **CVBase** (p. 1129) constructor has been called.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/ **cv_base.hpp**

39.210 F1 < AS, PositiveClass > Class Template Reference

F1 (p. 1132) is a metric of performance for classification algorithms that for binary classification is equal to $2 * \textit{precision} * \textit{recall} / (\textit{precision} + \textit{recall})$.

Static Public Member Functions

- template<typename MLAlgorithm, typename DataType>
static double **Evaluate** (MLAlgorithm &model, const DataType &data, const arma::Row< size_t > &labels)
*Run classification and calculate **F1** (p. 1132).*

Static Public Attributes

- static const bool **NeedsMinimization** = false
Information for hyper-parameter tuning code.

39.210.1 Detailed Description

```
template<AverageStrategy AS, size_t PositiveClass = 1>
class mlpack::cv::F1< AS, PositiveClass >
```

F1 (p. 1132) is a metric of performance for classification algorithms that for binary classification is equal to $2 * precision * recall / (precision + recall)$.

For multiclass classification the **F1** (p. 1132) metric can be used with the following strategies for averaging.

1. Micro. The result is calculated by the above formula, but microaveraged precision and microaveraged recall are used.
2. Macro. **F1** (p. 1132) is calculated for each class (with values used for calculation of macroaveraged precision and macroaveraged recall), and then the **F1** (p. 1132) values are averaged.

In the case of multiclass classification it is assumed that there are instances of every label from 0 to max(labels) among input data points.

The returned value for **F1** (p. 1132) will be zero if both precision and recall turn out to be zeros.

Template Parameters

<i>AS</i>	An average strategy.
<i>PositiveClass</i>	In the case of binary classification (AS = Binary) positives are assumed to have labels equal to this value.

Definition at line 45 of file f1.hpp.

39.210.2 Member Function Documentation

39.210.2.1 Evaluate()

```
static double Evaluate (
    MLAlgorithm & model,
    const DataType & data,
    const arma::Row< size_t > & labels ) [static]
```

Run classification and calculate **F1** (p. 1132).

Parameters

<i>model</i>	A classification model.
<i>data</i>	Column-major data containing test items.
<i>labels</i>	Ground truth (correct) labels for the test items.

39.210.3 Member Data Documentation

39.210.3.1 NeedsMinimization

```
const bool NeedsMinimization = false [static]
```

Information for hyper-parameter tuning code.

It indicates that we want to maximize the metric.

Definition at line 64 of file f1.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/metrics/ **f1.hpp**

39.211 KFoldCV< MLAlgorithm, Metric, MatType, PredictionsType, WeightsType > Class Template Reference

The class **KFoldCV** (p. 1134) implements k-fold cross-validation for regression and classification algorithms.

Public Member Functions

- **KFoldCV** (const size_t k, const MatType &xs, const PredictionsType &ys, const bool shuffle=true)
This constructor can be used for regression algorithms and for binary classification algorithms.
- **KFoldCV** (const size_t k, const MatType &xs, const PredictionsType &ys, const size_t numClasses, const bool shuffle=true)
This constructor can be used for multiclass classification algorithms.
- **KFoldCV** (const size_t k, const MatType &xs, const **data::DatasetInfo** &datasetInfo, const PredictionsType &ys, const size_t numClasses, const bool shuffle=true)
*This constructor can be used for multiclass classification algorithms that can take a **data::DatasetInfo** (p. 376) parameter.*
- **KFoldCV** (const size_t k, const MatType &xs, const PredictionsType &ys, const WeightsType &weights, const bool shuffle=true)
This constructor can be used for regression and binary classification algorithms that support weighted learning.
- **KFoldCV** (const size_t k, const MatType &xs, const PredictionsType &ys, const size_t numClasses, const WeightsType &weights, const bool shuffle=true)
This constructor can be used for multiclass classification algorithms that support weighted learning.
- **KFoldCV** (const size_t k, const MatType &xs, const **data::DatasetInfo** &datasetInfo, const PredictionsType &ys, const size_t numClasses, const WeightsType &weights, const bool shuffle=true)
*This constructor can be used for multiclass classification algorithms that can take a **data::DatasetInfo** (p. 376) parameter and support weighted learning.*
- template<typename... MLAlgorithmArgs>
double **Evaluate** (const MLAlgorithmArgs &...args)

Run k-fold cross-validation.

- **MLAlgorithm & Model ()**

Access and modify a model from the last run of k-fold cross-validation.

- `template<bool Enabled = !Base::MIE::SupportsWeights, typename = typename std::enable_if<Enabled>::type>`

`void Shuffle ()`

Shuffle the data.

- `template<bool Enabled = Base::MIE::SupportsWeights, typename = typename std::enable_if<Enabled>::type, typename = void>`

`void Shuffle ()`

Shuffle the data.

39.211.1 Detailed Description

```
template<typename MLAlgorithm, typename Metric, typename MatType = arma::mat, typename PredictionsType = typename MetaInfoExtractor<MLAlgorithm, MatType>::PredictionsType, typename WeightsType = typename MetaInfoExtractor<MLAlgorithm, MatType, PredictionsType>::WeightsType>
class mlpack::cv::KFoldCV< MLAlgorithm, Metric, MatType, PredictionsType, WeightsType >
```

The class **KFoldCV** (p. 1134) implements k-fold cross-validation for regression and classification algorithms.

To construct a **KFoldCV** (p. 1134) object you need to pass the `k` parameter and arguments that specify data. For example, you can run 10-fold cross-validation for SoftmaxRegression in the following way.

```
// 100-point 5-dimensional random dataset.
arma::mat data = arma::randu<arma::mat>(5, 100);
// Random labels in the [0, 4] interval.
arma::Row<size_t> labels =
    arma::randi<arma::Row<size_t>>(100, arma::distr_param(0, 4));
size_t numClasses = 5;

KFoldCV<SoftmaxRegression<>, Accuracy> cv(10, data, labels, numClasses);

double lambda = 0.1;
double softmaxAccuracy = cv.Evaluate(lambda);
```

Before calling **Evaluate()** (p. 1139), it is possible to shuffle the data by calling the **Shuffle()** (p. 1139) function. Shuffling is performed at construction time if the parameter `shuffle` is set to `true` in the constructor.

Template Parameters

<i>MLAlgorithm</i>	A machine learning algorithm.
<i>Metric</i>	A metric to assess the quality of a trained model.
<i>MatType</i>	The type of data.
<i>PredictionsType</i>	The type of predictions (should be passed when the predictions type is a template parameter in Train methods of MLAlgorithm).
<i>WeightsType</i>	The type of weights (should be passed when weighted learning is supported, and the weights type is a template parameter in Train methods of MLAlgorithm).

Definition at line 65 of file `k_fold_cv.hpp`.

39.211.2 Constructor & Destructor Documentation

39.211.2.1 KFoldCV() [1/6]

```
KFoldCV (
    const size_t k,
    const MatType & xs,
    const PredictionsType & ys,
    const bool shuffle = true )
```

This constructor can be used for regression algorithms and for binary classification algorithms.

Parameters

<i>k</i>	Number of folds (should be at least 2).
<i>xs</i>	Data points to cross-validate on.
<i>ys</i>	Predictions (labels for classification algorithms and responses for regression algorithms) for each data point.
<i>shuffle</i>	Whether or not to shuffle the data during construction.

39.211.2.2 KFoldCV() [2/6]

```
KFoldCV (
    const size_t k,
    const MatType & xs,
    const PredictionsType & ys,
    const size_t numClasses,
    const bool shuffle = true )
```

This constructor can be used for multiclass classification algorithms.

Parameters

<i>k</i>	Number of folds (should be at least 2).
<i>xs</i>	Data points to cross-validate on.
<i>ys</i>	Labels for each data point.
<i>numClasses</i>	Number of classes in the dataset.
<i>shuffle</i>	Whether or not to shuffle the data during construction.

39.211.2.3 KFoldCV() [3/6]

```

KFoldCV (
    const size_t k,
    const MatType & xs,
    const data::DatasetInfo & datasetInfo,
    const PredictionsType & ys,
    const size_t numClasses,
    const bool shuffle = true )

```

This constructor can be used for multiclass classification algorithms that can take a **data::DatasetInfo** (p. 376) parameter.

Parameters

<i>k</i>	Number of folds (should be at least 2).
<i>xs</i>	Data points to cross-validate on.
<i>datasetInfo</i>	Type information for each dimension of the dataset.
<i>ys</i>	Labels for each data point.
<i>numClasses</i>	Number of classes in the dataset.
<i>shuffle</i>	Whether or not to shuffle the data during construction.

39.211.2.4 KFoldCV() [4/6]

```

KFoldCV (
    const size_t k,
    const MatType & xs,
    const PredictionsType & ys,
    const WeightsType & weights,
    const bool shuffle = true )

```

This constructor can be used for regression and binary classification algorithms that support weighted learning.

Parameters

<i>k</i>	Number of folds (should be at least 2).
<i>xs</i>	Data points to cross-validate on.
<i>ys</i>	Predictions (labels for classification algorithms and responses for regression algorithms) for each data point.
<i>weights</i>	Observation weights (for boosting).
<i>shuffle</i>	Whether or not to shuffle the data during construction.

39.211.2.5 KFoldCV() [5/6]

```

KFoldCV (
    const size_t k,
    const MatType & xs,
    const PredictionsType & ys,
    const size_t numClasses,
    const WeightsType & weights,
    const bool shuffle = true )

```

This constructor can be used for multiclass classification algorithms that support weighted learning.

Parameters

<i>k</i>	Number of folds (should be at least 2).
<i>xs</i>	Data points to cross-validate on.
<i>ys</i>	Labels for each data point.
<i>numClasses</i>	Number of classes in the dataset.
<i>weights</i>	Observation weights (for boosting).
<i>shuffle</i>	Whether or not to shuffle the data during construction.

39.211.2.6 KFoldCV() [6/6]

```

KFoldCV (
    const size_t k,
    const MatType & xs,
    const data::DatasetInfo & datasetInfo,
    const PredictionsType & ys,
    const size_t numClasses,
    const WeightsType & weights,
    const bool shuffle = true )

```

This constructor can be used for multiclass classification algorithms that can take a **data::DatasetInfo** (p. 376) parameter and support weighted learning.

Parameters

<i>k</i>	Number of folds (should be at least 2).
<i>xs</i>	Data points to cross-validate on.
<i>datasetInfo</i>	Type information for each dimension of the dataset.
<i>ys</i>	Labels for each data point.
<i>numClasses</i>	Number of classes in the dataset.
<i>weights</i>	Observation weights (for boosting).
<i>shuffle</i>	Whether or not to shuffle the data during construction.

39.211.3 Member Function Documentation

39.211.3.1 Evaluate()

```
double Evaluate (
    const MLAlgorithmArgs &... args )
```

Run k-fold cross-validation.

Parameters

<i>args</i>	Arguments for MLAlgorithm (in addition to the passed ones in the constructor).
-------------	--

39.211.3.2 Model()

```
MLAlgorithm& Model ( )
```

Access and modify a model from the last run of k-fold cross-validation.

39.211.3.3 Shuffle() [1/2]

```
void Shuffle ( )
```

Shuffle the data.

This overload is called if weights are not supported by the model type.

39.211.3.4 Shuffle() [2/2]

```
void Shuffle ( )
```

Shuffle the data.

This overload is called if weights are supported by the model type.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/ **k_fold_cv.hpp**

39.212 MetalInfoExtractor< MLAlgorithm, MT, PT, WT > Class Template Reference

MetalInfoExtractor (p. 1140) is a tool for extracting meta information about a given machine learning algorithm.

Public Types

- using **PredictionsType** = typename Select< **TF1**, **TF2**, **TF3**, **TF4**, **TF5** >::Type::PredictionsType
The type of predictions used in MLAlgorithm.
- using **WeightsType** = typename Select< **WTF1**, **WTF2**, **WTF3**, **WTF4**, **WTF5** >::Type::WeightsType
The type of weights used in MLAlgorithm.

Static Public Attributes

- static const bool **IsSupported** = lstd::is_same< **PredictionsType**, void*>::value
An indication whether PredictionsType has been identified (i.e.
- static const bool **SupportsWeights** = lstd::is_same< **WeightsType**, void*>::value
An indication whether MLAlgorithm supports weighted learning.
- static const bool **TakesDatasetInfo** = Selects< **TF5**>::value
*An indication whether MLAlgorithm takes a **data::DatasetInfo** (p. 376) parameter.*
- static const bool **TakesNumClasses** = Selects< **TF4**, **TF5**>::value
An indication whether MLAlgorithm takes the numClasses (size_t) parameter.

39.212.1 Detailed Description

```
template<typename MLAlgorithm, typename MT = arma::mat, typename PT = arma::Row<size_t>, typename WT = arma::rowvec>
class mlpack::cv::MetalInfoExtractor< MLAlgorithm, MT, PT, WT >
```

MetalInfoExtractor (p. 1140) is a tool for extracting meta information about a given machine learning algorithm.

It can be used to automatically extract the type of predictions and weights (if weighted learning is supported), whether the machine learning algorithm takes a DatasetInfo parameter or a numClasses parameter.

The following assumptions are made about the machine learning algorithm.

1. All needed information can be extracted from signatures of Train methods.
2. The machine learning algorithm contains either only non-templated Train methods or only templated ones.
3. Train methods that can be used for extraction of needed information should be distinguishable by a number of arguments (for more information read discussion in <https://github.com/mlpack/mlpack/issues/929>).
4. If weighted learning is supported, passing weights is an option rather than a requirement.

Template Parameters

<i>MLAlgorithm</i>	A machine learning algorithm to investigate.
<i>MT</i>	The type of data.
<i>PT</i>	The type of predictions (should be passed when the predictions type is a template parameter in Train methods of MLAlgorithm).
<i>WT</i>	The type of weights (should be passed when weighted learning is supported, and the weights type is a template parameter in Train methods of MLAlgorithm).

Definition at line 272 of file meta_info_extractor.hpp.

39.212.2 Member Typedef Documentation

39.212.2.1 PredictionsType

```
using PredictionsType = typename Select< TF1, TF2, TF3, TF4, TF5>::Type::PredictionsType
```

The type of predictions used in MLAlgorithm.

It is equal to void* if the extraction fails.

Definition at line 319 of file meta_info_extractor.hpp.

39.212.2.2 WeightsType

```
using WeightsType = typename Select< WTF1, WTF2, WTF3, WTF4, WTF5>::Type::WeightsType
```

The type of weights used in MLAlgorithm.

It is equal to void* if the extraction fails.

Definition at line 326 of file meta_info_extractor.hpp.

39.212.3 Member Data Documentation

39.212.3.1 IsSupported

```
const bool IsSupported = !std::is_same< PredictionsType, void*>::value [static]
```

An indication whether PredictionsType has been identified (i.e.

MLAlgorithm is supported by **MetaInfoExtractor** (p. 1140)).

Definition at line 332 of file meta_info_extractor.hpp.

39.212.3.2 SupportsWeights

```
const bool SupportsWeights = !std::is_same< WeightsType, void*>::value [static]
```

An indication whether MLAlgorithm supports weighted learning.

Definition at line 337 of file meta_info_extractor.hpp.

39.212.3.3 TakesDatasetInfo

```
const bool TakesDatasetInfo = Selects< TF5>::value [static]
```

An indication whether MLAlgorithm takes a **data::DatasetInfo** (p. 376) parameter.

Definition at line 342 of file meta_info_extractor.hpp.

39.212.3.4 TakesNumClasses

```
const bool TakesNumClasses = Selects< TF4, TF5>::value [static]
```

An indication whether MLAlgorithm takes the numClasses (size_t) parameter.

Definition at line 347 of file meta_info_extractor.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/ **meta_info_extractor.hpp**

39.213 MSE Class Reference

The MeanSquaredError is a metric of performance for regression algorithms that is equal to the mean squared error between predicted values and ground truth (correct) values for given test items.

Static Public Member Functions

- `template<typename MLAlgorithm , typename DataType , typename ResponsesType >`
`static double Evaluate (MLAlgorithm &model, const DataType &data, const ResponsesType &responses)`
Run prediction and calculate the mean squared error.

Static Public Attributes

- `static const bool NeedsMinimization = true`
Information for hyper-parameter tuning code.

39.213.1 Detailed Description

The MeanSquaredError is a metric of performance for regression algorithms that is equal to the mean squared error between predicted values and ground truth (correct) values for given test items.

Definition at line 25 of file mse.hpp.

39.213.2 Member Function Documentation

39.213.2.1 Evaluate()

```
static double Evaluate (
    MLAlgorithm & model,
    const DataType & data,
    const ResponsesType & responses ) [static]
```

Run prediction and calculate the mean squared error.

Parameters

<i>model</i>	A regression model.
<i>data</i>	Column-major data containing test items.
<i>responses</i>	Ground truth (correct) target values for the test items, should be either a row vector or a column-major matrix.

39.213.3 Member Data Documentation

39.213.3.1 NeedsMinimization

```
const bool NeedsMinimization = true [static]
```

Information for hyper-parameter tuning code.

It indicates that we want to minimize the measurement.

39.215 Precision< AS, PositiveClass > Class Template Reference

Precision (p. 1145) is a metric of performance for classification algorithms that for binary classification is equal to $tp/(tp + fp)$, where tp and fp are the numbers of true positives and false positives respectively.

Static Public Member Functions

- template<typename MLAlgorithm, typename DataType >
static double **Evaluate** (MLAlgorithm &model, const DataType &data, const arma::Row< size_t > &labels)
Run classification and calculate precision.

Static Public Attributes

- static const bool **NeedsMinimization** = false
Information for hyper-parameter tuning code.

39.215.1 Detailed Description

```
template<AverageStrategy AS, size_t PositiveClass = 1>  
class mlpack::cv::Precision< AS, PositiveClass >
```

Precision (p. 1145) is a metric of performance for classification algorithms that for binary classification is equal to $tp/(tp + fp)$, where tp and fp are the numbers of true positives and false positives respectively.

For multiclass classification the precision metric can be used with the following strategies for averaging.

1. Micro. If there are $N + 1$ classes in total, the result is equal to

$$(tp_0 + tp_1 + \dots + tp_N)/(tp_0 + tp_1 + \dots + tp_N + fp_0 + fp_1 + \dots + fp_N),$$

where tp_i and fp_i are the numbers of true positives and false positives respectively for the class (label) i .

2. Macro. If there are $N + 1$ classes in total, the result is equal to the mean of the values

$$tp_0/(tp_0 + fp_0), tp_1/(tp_1 + fp_1), \dots, tp_N/(tp_N + fp_N),$$

where tp_i and fp_i are the numbers of true positives and false positives respectively for the class (label) i .

Template Parameters

<i>AS</i>	An average strategy.
<i>PositiveClass</i>	In the case of binary classification (AS = Binary) positives are assumed to have labels equal to this value.

Definition at line 48 of file precision.hpp.

39.215.2 Member Function Documentation

39.215.2.1 Evaluate()

```
static double Evaluate (
    MlAlgorithm & model,
    const DataType & data,
    const arma::Row< size_t > & labels ) [static]
```

Run classification and calculate precision.

Parameters

<i>model</i>	A classification model.
<i>data</i>	Column-major data containing test items.
<i>labels</i>	Ground truth (correct) labels for the test items.

39.215.3 Member Data Documentation

39.215.3.1 NeedsMinimization

```
const bool NeedsMinimization = false [static]
```

Information for hyper-parameter tuning code.

It indicates that we want to maximize the metric.

Definition at line 67 of file precision.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/metrics/ **precision.hpp**

39.216 Recall< AS, PositiveClass > Class Template Reference

Recall (p. 1147) is a metric of performance for classification algorithms that for binary classification is equal to $tp/(tp + fn)$, where tp and fn are the numbers of true positives and false negatives respectively.

Static Public Member Functions

- `template<typename MlAlgorithm , typename DataType >`
`static double Evaluate (MlAlgorithm &model, const DataType &data, const arma::Row< size_t > &labels)`
Run classification and calculate recall.

Static Public Attributes

- `static const bool NeedsMinimization = false`
Information for hyper-parameter tuning code.

39.216.1 Detailed Description

```
template<AverageStrategy AS, size_t PositiveClass = 1>
class mlpack::cv::Recall< AS, PositiveClass >
```

Recall (p. 1147) is a metric of performance for classification algorithms that for binary classification is equal to $tp/(tp + fn)$, where tp and fn are the numbers of true positives and false negatives respectively.

For multiclass classification the recall metric can be used with the following strategies for averaging.

1. Micro. If there are $N + 1$ classes in total, the result is equal to

$$(tp_0 + tp_1 + \dots + tp_N)/(tp_0 + tp_1 + \dots + tp_N + fn_0 + fn_1 + \dots + fn_N),$$

where tp_i and fn_i are the numbers of true positives and false negatives respectively for the class (label) i .

2. Macro. If there are $N + 1$ classes in total, the result is equal to the mean of the values

$$tp_0/(tp_0 + fn_0), tp_1/(tp_1 + fn_1), \dots, tp_N/(tp_N + fn_N),$$

where tp_i and fn_i are the numbers of true positives and false negatives respectively for the class (label) i .

Template Parameters

AS	An average strategy.
PositiveClass	In the case of binary classification (AS = Binary) positives are assumed to have labels equal to this value.

Definition at line 48 of file recall.hpp.

39.216.2 Member Function Documentation

39.216.2.1 Evaluate()

```
static double Evaluate (
    MLAlgorithm & model,
    const DataType & data,
    const arma::Row< size_t > & labels ) [static]
```

Run classification and calculate recall.

Parameters

<i>model</i>	A classification model.
<i>data</i>	Column-major data containing test items.
<i>labels</i>	Ground truth (correct) labels for the test items.

39.216.3 Member Data Documentation

39.216.3.1 NeedsMinimization

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/metrics/ **recall.hpp**

39.217 SelectMethodForm< MLAlgorithm, HMFs > Struct Template Reference

A type function that selects a right method form.

39.217.1 Detailed Description

```
template<typename MLAlgorithm, template< class, template< class... > class, size_t > class... HMFs>
struct mlpack::cv::SelectMethodForm< MLAlgorithm, HMFs >
```

A type function that selects a right method form.

As parameters it takes a machine learning algorithm, a set of HasMethodForm structs, and a set of method forms. Method forms are passed to the internal struct From. The result type can be accessed through the Type member of the From struct.

The implementation basically loops through all combinations of the HasMethodForm structs and the method forms. It stops when a right combination succeeds, or when there are no more combinations.

Definition at line 198 of file meta_info_extractor.hpp.

39.222 SimpleCV< MLAlgorithm, Metric, MatType, PredictionsType, WeightsType > Class Template Reference

SimpleCV (p. 1151) splits data into two sets - training and validation sets - and then runs training on the training set and evaluates performance on the validation set.

Public Member Functions

- `template<typename MatInType , typename PredictionsInType >`
SimpleCV (const double validationSize, MatInType &&xs, PredictionsInType &&ys)
This constructor can be used for regression algorithms and for binary classification algorithms.
- `template<typename MatInType , typename PredictionsInType >`
SimpleCV (const double validationSize, MatInType &&xs, PredictionsInType &&ys, const size_t numClasses)
This constructor can be used for multiclass classification algorithms.
- `template<typename MatInType , typename PredictionsInType >`
SimpleCV (const double validationSize, MatInType &&xs, const **data::DatasetInfo** &datasetInfo, PredictionsInType &&ys, const size_t numClasses)
*This constructor can be used for multiclass classification algorithms that can take a **data::DatasetInfo** (p. 376) parameter.*
- `template<typename MatInType , typename PredictionsInType , typename WeightsInType >`
SimpleCV (const double validationSize, MatInType &&xs, PredictionsInType &&ys, WeightsInType &&weights)
This constructor can be used for regression and binary classification algorithms that support weighted learning.
- `template<typename MatInType , typename PredictionsInType , typename WeightsInType >`
SimpleCV (const double validationSize, MatInType &&xs, PredictionsInType &&ys, const size_t numClasses, WeightsInType &&weights)
This constructor can be used for multiclass classification algorithms that support weighted learning.
- `template<typename MatInType , typename PredictionsInType , typename WeightsInType >`
SimpleCV (const double validationSize, MatInType &&xs, const **data::DatasetInfo** &datasetInfo, PredictionsInType &&ys, const size_t numClasses, WeightsInType &&weights)
*This constructor can be used for multiclass classification algorithms that can take a **data::DatasetInfo** (p. 376) parameter and support weighted learning.*
- `template<typename... MLAlgorithmArgs>`
double **Evaluate** (const MLAlgorithmArgs &... args)
Train on the training set and assess performance on the validation set by using the class Metric.
- `MLAlgorithm & Model ()`
Access and modify the last trained model.

39.222.1 Detailed Description

```
template<typename MLAlgorithm, typename Metric, typename MatType = arma::mat, typename PredictionsType = typename MetaInfoExtractor<MLAlgorithm, MatType>::PredictionsType, typename WeightsType = typename MetaInfoExtractor<MLAlgorithm, MatType, PredictionsType>::WeightsType>
class mlpack::cv::SimpleCV< MLAlgorithm, Metric, MatType, PredictionsType, WeightsType >
```

SimpleCV (p. 1151) splits data into two sets - training and validation sets - and then runs training on the training set and evaluates performance on the validation set.

To construct a **SimpleCV** (p. 1151) object you need to pass the validationSize parameter and arguments that specify data. For example, SoftmaxRegression can be validated in the following way.

```
// 100-point 5-dimensional random dataset.
arma::mat data = arma::randu<arma::mat>(5, 100);
// Random labels in the [0, 4] interval.
arma::Row<size_t> labels =
    arma::randi<arma::Row<size_t>>(100, arma::distr_param(0, 4));
size_t numClasses = 5;

double validationSize = 0.2;
SimpleCV<SoftmaxRegression<>, Accuracy> cv(validationSize, data, labels,
    numClasses);

double lambda = 0.1;
double softmaxAccuracy = cv.Evaluate(lambda);
```

In the example above, 80% of the passed dataset will be used for training, and remaining 20% will be used for calculating the accuracy metric.

Template Parameters

<i>MLAlgorithm</i>	A machine learning algorithm.
<i>Metric</i>	A metric to assess the quality of a trained model.
<i>MatType</i>	The type of data.
<i>PredictionsType</i>	The type of predictions (should be passed when the predictions type is a template parameter in Train methods of the given MLAlgorithm; arma::Row<size_t> will be used otherwise).
<i>WeightsType</i>	The type of weights (should be passed when weighted learning is supported, and the weights type is a template parameter in Train methods of the given MLAlgorithm; arma::vec will be used otherwise).

Definition at line 68 of file simple_cv.hpp.

39.222.2 Constructor & Destructor Documentation

39.222.2.1 SimpleCV() [1/6]

```
SimpleCV (
    const double validationSize,
    MatInType && xs,
    PredictionsInType && ys )
```

This constructor can be used for regression algorithms and for binary classification algorithms.

Parameters

<i>validationSize</i>	A proportion (between 0 and 1) of data used as a validation set.
<i>xs</i>	Data points to cross-validate on.
<i>ys</i>	Predictions (labels for classification algorithms and responses for regression algorithms) for each data point.

Template Parameters

<i>MatInType</i>	A type that can be converted to MatType.
<i>PredictionsInType</i>	A type that can be converted to PredictionsType.

39.222.2.2 SimpleCV() [2/6]

```
SimpleCV (
    const double validationSize,
    MatInType && xs,
    PredictionsInType && ys,
    const size_t numClasses )
```

This constructor can be used for multiclass classification algorithms.

Parameters

<i>validationSize</i>	A proportion (between 0 and 1) of data used as a validation set.
<i>xs</i>	Data points to cross-validate on.
<i>ys</i>	Labels for each data point.
<i>numClasses</i>	Number of classes in the dataset.

Template Parameters

<i>MatInType</i>	A type that can be converted to MatType.
<i>PredictionsInType</i>	A type that can be converted to PredictionsType.

39.222.2.3 SimpleCV() [3/6]

```
SimpleCV (
    const double validationSize,
    MatInType && xs,
    const data::DatasetInfo & datasetInfo,
    PredictionsInType && ys,
    const size_t numClasses )
```

This constructor can be used for multiclass classification algorithms that can take a **data::DatasetInfo** (p. 376) parameter.

Parameters

<i>validationSize</i>	A proportion (between 0 and 1) of data used as a validation set.
<i>xs</i>	Data points to cross-validate on.
<i>datasetInfo</i>	Type information for each dimension of the dataset.
<i>ys</i>	Labels for each data point.
<i>numClasses</i>	Number of classes in the dataset.

Template Parameters

<i>MatInType</i>	A type that can be converted to MatType.
------------------	--

Template Parameters

<i>PredictionsInType</i>	A type that can be converted to PredictionsType.
--------------------------	--

39.222.2.4 SimpleCV() [4/6]

```
SimpleCV (
    const double validationSize,
    MatInType && xs,
    PredictionsInType && ys,
    WeightsInType && weights )
```

This constructor can be used for regression and binary classification algorithms that support weighted learning.

Parameters

<i>validationSize</i>	A proportion (between 0 and 1) of data used as a validation set.
<i>xs</i>	Data points to cross-validate on.
<i>ys</i>	Predictions (labels for classification algorithms and responses for regression algorithms) for each data point.
<i>weights</i>	Observation weights (for boosting).

Template Parameters

<i>MatInType</i>	A type that can be converted to MatType.
<i>PredictionsInType</i>	A type that can be converted to PredictionsType.
<i>WeightsInType</i>	A type that can be converted to WeightsType.

39.222.2.5 SimpleCV() [5/6]

```
SimpleCV (
    const double validationSize,
    MatInType && xs,
    PredictionsInType && ys,
    const size_t numClasses,
    WeightsInType && weights )
```

This constructor can be used for multiclass classification algorithms that support weighted learning.

Parameters

<i>validationSize</i>	A proportion (between 0 and 1) of data used as a validation set.
-----------------------	--

Parameters

<i>xs</i>	Data points to cross-validate on.
<i>ys</i>	Labels for each data point.
<i>numClasses</i>	Number of classes in the dataset.
<i>weights</i>	Observation weights (for boosting).

Template Parameters

<i>MatInType</i>	A type that can be converted to MatType.
<i>PredictionsInType</i>	A type that can be converted to PredictionsType.
<i>WeightsInType</i>	A type that can be converted to WeightsType.

39.222.2.6 SimpleCV() [6/6]

```
SimpleCV (
    const double validationSize,
    MatInType && xs,
    const data::DatasetInfo & datasetInfo,
    PredictionsInType && ys,
    const size_t numClasses,
    WeightsInType && weights )
```

This constructor can be used for multiclass classification algorithms that can take a **data::DatasetInfo** (p. 376) parameter and support weighted learning.

Parameters

<i>validationSize</i>	A proportion (between 0 and 1) of data used as a validation set.
<i>xs</i>	Data points to cross-validate on.
<i>datasetInfo</i>	Type information for each dimension of the dataset.
<i>ys</i>	Labels for each data point.
<i>numClasses</i>	Number of classes in the dataset.
<i>weights</i>	Observation weights (for boosting).

Template Parameters

<i>MatInType</i>	A type that can be converted to MatType.
<i>PredictionsInType</i>	A type that can be converted to PredictionsType.
<i>WeightsInType</i>	A type that can be converted to WeightsType.

39.222.3 Member Function Documentation

39.222.3.1 Evaluate()

```
double Evaluate (
    const MLAlgorithmArgs &... args )
```

Train on the training set and assess performance on the validation set by using the class Metric.

Parameters

<i>args</i>	Arguments for the given MLAlgorithm taken by its constructor (in addition to the passed ones in the SimpleCV (p. 1151) constructor).
-------------	---

39.222.3.2 Model()

```
MLAlgorithm& Model ( )
```

Access and modify the last trained model.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/ **simple_cv.hpp**

39.223 TrainForm< MatType, PredictionsType, WeightsType, DatasetInfo, NumClasses > Struct Template Reference

A wrapper struct for holding a Train form.

39.223.1 Detailed Description

```
template<typename MatType, typename PredictionsType, typename WeightsType, bool DatasetInfo, bool NumClasses>
struct mlpack::cv::TrainForm< MatType, PredictionsType, WeightsType, DatasetInfo, NumClasses >
```

A wrapper struct for holding a Train form.

Template Parameters

<i>MatType</i>	The type of data.
<i>PredictionsType</i>	The type of predictions.
<i>WeightsType</i>	The type of weights.
<i>DatasetInfo</i>	An indicator whether a data::DatasetInfo (p. 376) parameter should be present.
<i>NumClasses</i>	An indicator whether the numClasses parameter should be present.

39.236 CustomImputation< T > Class Template Reference

A simple custom imputation class.

Public Member Functions

- **CustomImputation** (T customValue)
- void **Impute** (arma::Mat< T > &input, const T &mappedValue, const size_t dimension, const bool column↔Major=true)

Impute function searches through the input looking for mappedValue and replaces it with the user-defined custom value of the given dimension.

39.236.1 Detailed Description

```
template<typename T>
class mlpack::data::CustomImputation< T >
```

A simple custom imputation class.

Template Parameters

<i>T</i>	Type of armadillo matrix
----------	--------------------------

Definition at line 24 of file custom_imputation.hpp.

39.236.2 Constructor & Destructor Documentation

39.236.2.1 CustomImputation()

```
CustomImputation (
    T customValue ) [inline]
```

Definition at line 27 of file custom_imputation.hpp.

39.236.3 Member Function Documentation

39.236.3.1 Impute()

```
void Impute (
    arma::Mat< T > & input,
    const T & mappedValue,
    const size_t dimension,
    const bool columnMajor = true ) [inline]
```

Impute function searches through the input looking for mappedValue and replaces it with the user-defined custom value of the given dimension.

The result is overwritten to the input, not creating any copy. Custom value must be set when initializing the **CustomImputation** (p. 1170) object.

Parameters

<i>input</i>	Matrix that contains mappedValue.
<i>mappedValue</i>	Value that the user wants to get rid of.
<i>dimension</i>	Index of the dimension of the mappedValue.
<i>columnMajor</i>	State of whether the input matrix is columnMajor or not.

Definition at line 44 of file custom_imputation.hpp.

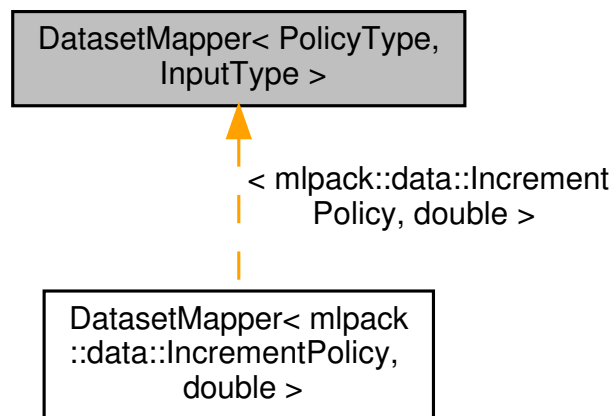

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/imputation_methods/ **custom_imputation.hpp**

39.237 DatasetMapper< PolicyType, InputType > Class Template Reference

Auxiliary information for a dataset, including mappings to/from strings (or other types) and the datatype of each dimension.

Inheritance diagram for DatasetMapper< PolicyType, InputType >:

Public Member Functions

- **DatasetMapper** (const size_t dimensionality=0)
Create the **DatasetMapper** (p. 1172) object with the given dimensionality.
- **DatasetMapper** (PolicyType &policy, const size_t dimensionality=0)
Create the **DatasetMapper** (p. 1172) object with the given policy and dimensionality.
- size_t **Dimensionality** () const
Get the dimensionality of the **DatasetMapper** (p. 1172) object (that is, how many dimensions it has information for).
- template<typename T >
void **MapFirstPass** (const InputType &input, const size_t dimension)
Preprocessing: during a first pass of the data, pass the input on to the MapPolicy if they are needed.
- template<typename T >
T **MapString** (const InputType &input, const size_t dimension)
Given the input and the dimension to which it belongs, return its numeric mapping.
- size_t **NumMappings** (const size_t dimension) const
Get the number of mappings for a particular dimension.
- template<typename T >
size_t **NumUnmappings** (const T value, const size_t dimension) const
Get the number of possible unmappings for a string in a given dimension.
- const PolicyType & **Policy** () const

- Return the policy of the mapper.*
- PolicyType & **Policy** ()
 - Modify the policy of the mapper (be careful!).*
- void **Policy** (PolicyType &&policy)
 - Modify (Replace) the policy of the mapper with a new policy.*
- template<typename Archive >
 - void **serialize** (Archive &ar, const unsigned int)
 - Serialize the dataset information.*
- void **SetDimensionality** (const size_t dimensionality)
 - Set the dimensionality of an existing **DatasetMapper** (p. 1172) object.*
- **Datatype Type** (const size_t dimension) const
 - Return the type of a given dimension (numeric or categorical).*
- **Datatype & Type** (const size_t dimension)
 - Modify the type of a given dimension (be careful!).*
- template<typename T >
 - const InputType & **UnmapString** (const T value, const size_t dimension, const size_t unmappingIndex=0) const
 - Return the input that corresponds to a given value in a given dimension.*
- PolicyType::MappedType **UnmapValue** (const InputType &input, const size_t dimension)
 - Return the value that corresponds to a given input in a given dimension.*

39.237.1 Detailed Description

```
template<typename PolicyType, typename InputType = std::string>
class mlpack::data::DatasetMapper< PolicyType, InputType >
```

Auxiliary information for a dataset, including mappings to/from strings (or other types) and the datatype of each dimension.

DatasetMapper (p. 1172) objects are optionally produced by **data::Load()** (p. 379), and store the type of each dimension (**Datatype::numeric** or **Datatype::categorical**) as well as mappings from strings to unsigned integers and vice versa.

DatasetMapper (p. 1172) objects can also map from arbitrary types; the type to map from can be specified with the **InputType** template parameter. By default, the **InputType** parameter is **std::string**.

Template Parameters

<i>PolicyType</i>	Mapping policy used to specify MapString() (p. 1175).
<i>InputType</i>	Type of input to be mapped.

Definition at line 41 of file `dataset_mapper.hpp`.

39.237.2 Constructor & Destructor Documentation

39.237.2.1 DatasetMapper() [1/2]

```
DatasetMapper (
    const size_t dimensionality = 0 ) [explicit]
```

Create the **DatasetMapper** (p. 1172) object with the given dimensionality.

Note that the dimensionality cannot be changed later; you will have to create a new **DatasetMapper** (p. 1172) object.

39.237.2.2 DatasetMapper() [2/2]

```
DatasetMapper (
    PolicyType & policy,
    const size_t dimensionality = 0 ) [explicit]
```

Create the **DatasetMapper** (p. 1172) object with the given policy and dimensionality.

Note that the dimensionality cannot be changed later; you will have to create a new **DatasetMapper** (p. 1172) object. Policy can be modified by the modifier.

39.237.3 Member Function Documentation**39.237.3.1 Dimensionality()**

```
size_t Dimensionality ( ) const
```

Get the dimensionality of the **DatasetMapper** (p. 1172) object (that is, how many dimensions it has information for).

If this object was created by a call to **mlpack::data::Load()** (p. 379), then the dimensionality will be the same as the number of rows (dimensions) in the dataset.

39.237.3.2 MapFirstPass()

```
void MapFirstPass (
    const InputType & input,
    const size_t dimension )
```

Preprocessing: during a first pass of the data, pass the input on to the MapPolicy if they are needed.

Parameters

<i>input</i>	Input to map.
<i>dimension</i>	Dimension to map for.

39.237.3.3 MapString()

```
T MapString (
    const InputType & input,
    const size_t dimension )
```

Given the input and the dimension to which it belongs, return its numeric mapping.

If no mapping yet exists, the input is added to the list of mappings for the given dimension. The dimension parameter refers to the index of the dimension of the string (i.e. the row in the dataset).

Template Parameters

<i>T</i>	Numeric type to map to (int/double/float/etc.).
----------	---

Parameters

<i>input</i>	Input to find/create mapping for.
<i>dimension</i>	Index of the dimension of the string.

Referenced by MockCategoricalData(), and mlpack::util::SetParamWithInfo().

39.237.3.4 NumMappings()

```
size_t NumMappings (
    const size_t dimension ) const
```

Get the number of mappings for a particular dimension.

If the dimension is numeric, then this will return 0.

39.237.3.5 NumUnmappings()

```
size_t NumUnmappings (
    const T value,
    const size_t dimension ) const
```

Get the number of possible unmappings for a string in a given dimension.

39.237.3.6 Policy() [1/3]

```
const PolicyType& Policy ( ) const
```

Return the policy of the mapper.

Referenced by DatasetMapper< mpack::data::IncrementPolicy, double >::serialize().

39.237.3.7 Policy() [2/3]

```
PolicyType& Policy ( )
```

Modify the policy of the mapper (be careful!).

39.237.3.8 Policy() [3/3]

```
void Policy (
    PolicyType && policy )
```

Modify (Replace) the policy of the mapper with a new policy.

39.237.3.9 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the dataset information.

Definition at line 154 of file dataset_mapper.hpp.

39.237.3.10 SetDimensionality()

```
void SetDimensionality (
    const size_t dimensionality )
```

Set the dimensionality of an existing **DatasetMapper** (p. 1172) object.

This resets all mappings (but not the PolicyType).

Parameters

<i>dimensionality</i>	New dimensionality.
-----------------------	---------------------

Referenced by LoadCSV::GetTransposeMatrixSize().

39.237.3.11 Type() [1/2]

```
Datatype Type (
    const size_t dimension ) const
```

Return the type of a given dimension (numeric or categorical).

Referenced by MockCategoricalData(), and mlpack::util::SetParamWithInfo().

39.237.3.12 Type() [2/2]

```
Datatype& Type (
    const size_t dimension )
```

Modify the type of a given dimension (be careful!).

39.237.3.13 UnmapString()

```
const InputType& UnmapString (
    const T value,
    const size_t dimension,
    const size_t unmappingIndex = 0 ) const
```

Return the input that corresponds to a given value in a given dimension.

If the value is not a valid mapping in the given dimension, a `std::invalid_argument` is thrown. Note that this does not remove the mapping.

If the mapping is non-unique (i.e. many strings can map to the same value), then you can pass a different value for `unmappingIndex` to get a different string that maps to the given value. `unmappingIndex` should be in the range from 0 to `(NumUnmappings(value, dimension) - 1)`.

If the mapping is unique (which it is for `DatasetInfo`), then the `unmappingIndex` parameter can be left as the default.

Parameters

<i>value</i>	Mapped value for input.
<i>dimension</i>	Dimension to unmap string from.
<i>unmappingIndex</i>	Index of non-unique unmapping (optional).

39.237.3.14 UnmapValue()

```
PolicyType::MappedType UnmapValue (
    const InputType & input,
    const size_t dimension )
```

Return the value that corresponds to a given input in a given dimension.

If the value is not a valid mapping in the given dimension, a `std::invalid_argument` is thrown. Note that this does not remove the mapping.

Parameters

<i>input</i>	Mapped input for value.
<i>dimension</i>	Dimension to unmap input from.

The documentation for this class was generated from the following file:

39.241 `Imputer< T, MapperType, StrategyType >` Class Template Reference

Given a dataset of a particular datatype, replace user-specified missing value with a variable dependent on the StrategyType and MapperType.

Public Member Functions

- **Imputer** (MapperType mapper, bool columnMajor=true)
- **Imputer** (MapperType mapper, StrategyType strategy, bool columnMajor=true)
- void **Impute** (arma::Mat< T > &input, const std::string &missingValue, const size_t dimension)
Given an input dataset, replace missing values of a dimension with given imputation strategy.
- const MapperType & **Mapper** () const
Get the mapper.
- MapperType & **Mapper** ()
Modify the given mapper.
- const StrategyType & **Strategy** () const
Get the strategy.
- StrategyType & **Strategy** ()
Modify the given strategy.

39.241.1 Detailed Description

```
template<typename T, typename MapperType, typename StrategyType>
class mlpack::data::Imputer< T, MapperType, StrategyType >
```

Given a dataset of a particular datatype, replace user-specified missing value with a variable dependent on the StrategyType and MapperType.

Template Parameters

<i>T</i>	Type of armadillo matrix used for imputation strategy.
<i>MapperType</i>	DatasetMapper (p. 1172) that is used to hold dataset information.
<i>StrategyType</i>	Imputation strategy used.

Definition at line 33 of file imputer.hpp.

39.241.2 Constructor & Destructor Documentation

39.241.2.1 Imputer() [1/2]

```

Imputer (
    MapperType mapper,
    bool columnMajor = true ) [inline]

```

Definition at line 36 of file imputer.hpp.

39.241.2.2 Imputer() [2/2]

```

Imputer (
    MapperType mapper,
    StrategyType strategy,
    bool columnMajor = true ) [inline]

```

Definition at line 43 of file imputer.hpp.

39.242 IncrementPolicy Class Reference

IncrementPolicy (p. 1184) is used as a helper class for **DatasetMapper** (p. 1172).

Public Types

- using **MappedType** = size_t

Public Member Functions

- **IncrementPolicy** (const bool forceAllMappings=false)
- template<typename T , typename InputType >
void **MapFirstPass** (const InputType &input, const size_t dim, std::vector< **Datatype** > &types)
Determine if the dimension is numeric or categorical.
- template<typename MapType , typename T , typename InputType >
T **MapString** (const InputType &input, const size_t dimension, MapType &maps, std::vector< **Datatype** > &types)
*Given the input and the dimension to which the it belongs, and the maps and types given by the **DatasetMapper** (p. 1172) class, returns its numeric mapping.*

Static Public Attributes

- static const bool **NeedsFirstPass** = true
We do need a first pass over the data to set the dimension types right.

39.242.1 Detailed Description

IncrementPolicy (p. 1184) is used as a helper class for **DatasetMapper** (p. 1172).

It tells how the strings should be mapped. Purpose of this policy is to map all dimension if one of the variables in a dimension turns out to be a categorical variable. **IncrementPolicy** (p. 1184) maps strings to incrementing unsigned integers (size_t). The first input to be mapped will be mapped to 0, the next to 1 and so on.

If the 'forceAllMappings' parameter is set to true, this will always map. Otherwise, inputs will only be mapped if they cannot be cast to the output type via a stringstream extraction.

Definition at line 33 of file increment_policy.hpp.

39.242.2 Member Typedef Documentation

39.242.2.1 MappedType

```
using MappedType = size_t
```

Definition at line 40 of file increment_policy.hpp.

39.242.3 Constructor & Destructor Documentation

39.242.3.1 IncrementPolicy()

```
IncrementPolicy (
    const bool forceAllMappings = false ) [inline]
```

Definition at line 36 of file `increment_policy.hpp`.

39.242.4 Member Function Documentation

39.242.4.1 MapFirstPass()

```
void MapFirstPass (
    const InputType & input,
    const size_t dim,
    std::vector< Datatype > & types ) [inline]
```

Determine if the dimension is numeric or categorical.

Definition at line 49 of file `increment_policy.hpp`.

References `mlpack::data::categorical`.

39.242.4.2 MapString()

```
T MapString (
    const InputType & input,
    const size_t dimension,
    MapType & maps,
    std::vector< Datatype > & types ) [inline]
```

Given the input and the dimension to which the it belongs, and the maps and types given by the **DatasetMapper** (p. 1172) class, returns its numeric mapping.

If no mapping yet exists, the input is added to the list of mappings for the given dimension. This function is used as a helper function for **DatasetMapper** (p. 1172) class.

Template Parameters

<i>MapType</i>	Type of <code>unordered_map</code> that contains mapped value pairs
----------------	---

Parameters

<i>input</i>	Input to find/create mapping for.
<i>dimension</i>	Index of the dimension of the input.
<i>maps</i>	Unordered map given by the DatasetMapper (p. 1172).
<i>types</i>	Vector containing the type information about each dimensions.

Definition at line 90 of file increment_policy.hpp.

References `mlpack::data::categorical`, and `mlpack::data::numeric`.

39.242.5 Member Data Documentation

39.242.5.1 NeedsFirstPass

```
const bool NeedsFirstPass = true [static]
```

We do need a first pass over the data to set the dimension types right.

Definition at line 43 of file increment_policy.hpp.

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/map_policies/ increment_policy.hpp`

39.243 ListwiseDeletion< T > Class Template Reference

A complete-case analysis to remove the values containing mappedValue.

Public Member Functions

- void **Impute** (`arma::Mat< T > &input`, `const T &mappedValue`, `const size_t dimension`, `const bool column↔Major=true`)

Impute function searches through the input looking for mappedValue and remove the whole row or column.

39.243.1 Detailed Description

```
template<typename T>
class mlpack::data::ListwiseDeletion< T >
```

A complete-case analysis to remove the values containing mappedValue.

Removes all data for a case that has one or more missing values.

Template Parameters

<i>T</i>	Type of armadillo matrix
----------	--------------------------

Definition at line 25 of file listwise_deletion.hpp.

39.243.2 Member Function Documentation

39.243.2.1 Impute()

```
void Impute (
    arma::Mat< T > & input,
    const T & mappedValue,
    const size_t dimension,
    const bool columnMajor = true ) [inline]
```

Impute function searches through the input looking for mappedValue and remove the whole row or column.

The result is overwritten to the input.

Parameters

<i>input</i>	Matrix that contains mappedValue.
<i>mappedValue</i>	Value that the user wants to get rid of.
<i>dimension</i>	Index of the dimension of the mappedValue.
<i>columnMajor</i>	State of whether the input matrix is columnMajor or not.

Definition at line 37 of file listwise_deletion.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/imputation_methods/ **listwise_deletion.hpp**

39.244 LoadCSV Class Reference

Load the csv file. This class use boost::spirit to implement the parser, please refer to following link <http://theboostcpplibraries.com/boost.spirit> for quick review.

Public Member Functions

- **LoadCSV** (const std::string &file)
Construct the **LoadCSV** (p. 1188) object on the given file.
- template<typename T , typename MapPolicy >
void **GetMatrixSize** (size_t &rows, size_t &cols, **DatasetMapper**< MapPolicy > &info)
Peek at the file to determine the number of rows and columns in the matrix, assuming a non-transposed matrix.
- template<typename T , typename MapPolicy >
void **GetTransposeMatrixSize** (size_t &rows, size_t &cols, **DatasetMapper**< MapPolicy > &info)
Peek at the file to determine the number of rows and columns in the matrix, assuming a transposed matrix.
- template<typename T , typename PolicyType >
void **Load** (arma::Mat< T > &inout, **DatasetMapper**< PolicyType > &infoSet, const bool transpose=true)
Load the file into the given matrix with the given **DatasetMapper** (p. 1172) object.

39.244.1 Detailed Description

Load the csv file. This class uses boost::spirit to implement the parser, please refer to following link <http://theboostcpplibraries.com/boost.spirit> for quick review.

Definition at line 36 of file load_csv.hpp.

39.244.2 Constructor & Destructor Documentation

39.244.2.1 LoadCSV()

```
LoadCSV (
    const std::string & file )
```

Construct the **LoadCSV** (p. 1188) object on the given file.

This will construct the rules necessary for loading and attempt to open the file.

39.244.3 Member Function Documentation

39.244.3.1 GetMatrixSize()

```
void GetMatrixSize (
    size_t & rows,
    size_t & cols,
    DatasetMapper< MapPolicy > & info ) [inline]
```

Peek at the file to determine the number of rows and columns in the matrix, assuming a non-transposed matrix.

This will also take a first pass over the data for **DatasetMapper** (p. 1172), if MapPolicy::NeedsFirstPass is true. The info object will be re-initialized with the correct dimensionality.

Parameters

<i>rows</i>	Variable to be filled with the number of rows.
<i>cols</i>	Variable to be filled with the number of columns.
<i>info</i>	DatasetMapper (p. 1172) object to use for first pass.

Definition at line 78 of file load_csv.hpp.

39.244.3.2 GetTransposeMatrixSize()

```
void GetTransposeMatrixSize (
    size_t & rows,
    size_t & cols,
    DatasetMapper< MapPolicy > & info ) [inline]
```

Peek at the file to determine the number of rows and columns in the matrix, assuming a transposed matrix.

This will also take a first pass over the data for **DatasetMapper** (p. 1172), if MapPolicy::NeedsFirstPass is true. The info object will be re-initialized with the correct dimensionality.

Parameters

<i>rows</i>	Variable to be filled with the number of rows.
<i>cols</i>	Variable to be filled with the number of columns.
<i>info</i>	DatasetMapper (p. 1172) object to use for first pass.

Definition at line 151 of file load_csv.hpp.

References DatasetMapper< PolicyType, InputType >::SetDimensionality().

39.244.3.3 Load()

```
void Load (
    arma::Mat< T > & inout,
    DatasetMapper< PolicyType > & infoSet,
    const bool transpose = true ) [inline]
```

Load the file into the given matrix with the given **DatasetMapper** (p. 1172) object.

Throws exceptions on errors.

Parameters

<i>inout</i>	Matrix to load into.
<i>infoSet</i>	DatasetMapper (p. 1172) to use while loading.
<i>transpose</i>	If true, the matrix should be transposed on loading (default).

Definition at line 55 of file load_csv.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/ **load_csv.hpp**

39.245 MeanImputation< T > Class Template Reference

A simple mean imputation class.

Public Member Functions

- void **Impute** (arma::Mat< T > &input, const T &mappedValue, const size_t dimension, const bool column↔Major=true)

Impute function searches through the input looking for mappedValue and replaces it with the mean of the given dimension.

39.245.1 Detailed Description

```
template<typename T>
class mlpack::data::MeanImputation< T >
```

A simple mean imputation class.

Template Parameters

<i>T</i>	Type of armadillo matrix
----------	--------------------------

Definition at line 24 of file mean_imputation.hpp.

39.245.2 Member Function Documentation

39.245.2.1 Impute()

```
void Impute (
    arma::Mat< T > & input,
    const T & mappedValue,
    const size_t dimension,
    const bool columnMajor = true ) [inline]
```

Impute function searches through the input looking for mappedValue and replaces it with the mean of the given dimension.

The result is overwritten to the input matrix.

Parameters

<i>input</i>	Matrix that contains mappedValue.
<i>mappedValue</i>	Value that the user wants to get rid of.
<i>dimension</i>	Index of the dimension of the mappedValue.
<i>columnMajor</i>	State of whether the input matrix is columnMajor or not.

Definition at line 37 of file mean_imputation.hpp.

References Log::Fatal.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/imputation_methods/ **mean_imputation.hpp**

39.246 MedianImputation< T > Class Template Reference

This is a class implementation of simple median imputation.

Public Member Functions

- void **Impute** (arma::Mat< T > &input, const T &mappedValue, const size_t dimension, const bool columnMajor=true)
Impute function searches through the input looking for mappedValue and replaces it with the median of the given dimension.

39.246.1 Detailed Description

```
template<typename T>
class mlpack::data::MedianImputation< T >
```

This is a class implementation of simple median imputation.

replace missing value with middle or average of middle values

Template Parameters

<i>T</i>	Type of armadillo matrix
----------	--------------------------

Definition at line 25 of file median_imputation.hpp.

39.246.2 Member Function Documentation

39.246.2.1 Impute()

```
void Impute (
    arma::Mat< T > & input,
    const T & mappedValue,
    const size_t dimension,
    const bool columnMajor = true ) [inline]
```

Impute function searches through the input looking for mappedValue and replaces it with the median of the given dimension.

The result is overwritten to the input matrix.

Parameters

<i>input</i>	Matrix that contains mappedValue.
<i>mappedValue</i>	Value that the user wants to get rid of.
<i>dimension</i>	Index of the dimension of the mappedValue.
<i>columnMajor</i>	State of whether the input matrix is columnMajor or not.

Definition at line 38 of file median_imputation.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/imputation_methods/ **median_imputation.hpp**

39.247 MissingPolicy Class Reference

MissingPolicy (p. 1193) is used as a helper class for **DatasetMapper** (p. 1172).

Public Types

- using **MappedType** = double

Public Member Functions

- **MissingPolicy** ()
- **MissingPolicy** (`std::set< std::string > missingSet`)
*Create the **MissingPolicy** (p. 1193) object with the given **missingSet**.*
- `template<typename T >`
`void MapFirstPass (const std::string &, const size_t)`
*There is nothing for us to do here, but this is required by the **MapPolicy** type.*
- `template<typename MapType , typename T >`
`T MapString (const std::string &string, const size_t dimension, MapType &maps, std::vector< Datatype > &)`
*Given the string and the dimension to which it belongs by the user, and the maps and types given by the **DatasetMapper** (p. 1172) class, returns its numeric mapping.*

Static Public Attributes

- static const bool **NeedsFirstPass** = false
This doesn't need a first pass over the data to set up.

39.247.1 Detailed Description

MissingPolicy (p. 1193) is used as a helper class for **DatasetMapper** (p. 1172).

It tells how the strings should be mapped. Purpose of this policy is to map all user-defined missing variables into maps so that users can decide what to do with the corrupted data. User-defined missing variables are given by the **missingSet**. Note that **MissingPolicy** (p. 1193) does not change type of features.

Definition at line 30 of file `missing_policy.hpp`.

39.247.2 Member Typedef Documentation

39.247.2.1 MappedType

```
using MappedType = double
```

Definition at line 34 of file `missing_policy.hpp`.

39.247.3 Constructor & Destructor Documentation

39.247.3.1 MissingPolicy() [1/2]

```
MissingPolicy ( ) [inline]
```

Definition at line 36 of file missing_policy.hpp.

39.247.3.2 MissingPolicy() [2/2]

```
MissingPolicy (  
    std::set< std::string > missingSet ) [inline], [explicit]
```

Create the **MissingPolicy** (p. 1193) object with the given missingSet.

Note that the missingSet cannot be changed later; you will have to create a new **MissingPolicy** (p. 1193) object.

Parameters

<i>missingSet</i>	Set of strings that should be mapped.
-------------------	---------------------------------------

Definition at line 48 of file missing_policy.hpp.

39.247.4 Member Function Documentation

39.247.4.1 MapFirstPass()

```
void MapFirstPass (  
    const std::string & ,  
    const size_t ) [inline]
```

There is nothing for us to do here, but this is required by the MapPolicy type.

Definition at line 62 of file missing_policy.hpp.

39.247.4.2 MapString()

```
T MapString (
    const std::string & string,
    const size_t dimension,
    MapType & maps,
    std::vector< Datatype > & ) [inline]
```

Given the string and the dimension to which it belongs by the user, and the maps and types given by the **DatasetMapper** (p. 1172) class, returns its numeric mapping.

If no mapping yet exists and the string is included in the missingSet, the string is added to the list of mappings for the given dimension. This function is used as a helper function for **DatasetMapper** (p. 1172) class.

Template Parameters

<i>MapType</i>	Type of unordered_map that contains mapped value pairs
----------------	--

Parameters

<i>string</i>	String to find/create mapping for.
<i>dimension</i>	Index of the dimension of the string.
<i>maps</i>	Unordered map given by the DatasetMapper (p. 1172).
<i>types</i>	Vector containing the type information about each dimensions.

Definition at line 82 of file missing_policy.hpp.

39.247.5 Member Data Documentation

39.247.5.1 NeedsFirstPass

```
const bool NeedsFirstPass = false [static]
```

This doesn't need a first pass over the data to set up.

Definition at line 55 of file missing_policy.hpp.

39.248 DBSCAN< RangeSearchType, PointSelectionPolicy > Class Template Reference

DBSCAN (p. 1197) (Density-Based Spatial Clustering of Applications with Noise) is a clustering technique described in the following paper:

Public Member Functions

- **DBSCAN** (const double epsilon, const size_t minPoints, const bool batchMode=true, RangeSearchType range↔ Search=RangeSearchType(), PointSelectionPolicy pointSelector=PointSelectionPolicy())
*Construct the **DBSCAN** (p. 1197) object with the given parameters.*
- template<typename MatType >
size_t **Cluster** (const MatType &data, arma::mat ¢roids)
*Performs **DBSCAN** (p. 1197) clustering on the data, returning number of clusters and also the centroid of each cluster.*
- template<typename MatType >
size_t **Cluster** (const MatType &data, arma::Row< size_t > &assignments)
*Performs **DBSCAN** (p. 1197) clustering on the data, returning number of clusters and also the list of cluster assignments.*
- template<typename MatType >
size_t **Cluster** (const MatType &data, arma::Row< size_t > &assignments, arma::mat ¢roids)
*Performs **DBSCAN** (p. 1197) clustering on the data, returning number of clusters, the centroid of each cluster and also the list of cluster assignments.*

39.248.1 Detailed Description

```
template<typename RangeSearchType = range::RangeSearch<>, typename PointSelectionPolicy = OrderedPointSelection>
class mlpack::dbscan::DBSCAN< RangeSearchType, PointSelectionPolicy >
```

DBSCAN (p. 1197) (Density-Based Spatial Clustering of Applications with Noise) is a clustering technique described in the following paper:

```
@inproceedings{ester1996density,
  title={A density-based algorithm for discovering clusters in large spatial
    databases with noise.},
  author={Ester, M. and Kriegel, H.-P. and Sander, J. and Xu, X.},
  booktitle={Proceedings of the Second International Conference on Knowledge
    Discovery and Data Mining (KDD '96)},
  pages={226--231},
  year={1996}
}
```

The **DBSCAN** (p. 1197) algorithm iteratively clusters points using range searches with a specified radius parameter. This implementation allows configuration of the range search technique used and the point selection strategy by means of template parameters.

Template Parameters

<i>RangeSearchType</i>	Class to use for range searching.
<i>PointSelectionPolicy</i>	Strategy for selecting next point to cluster with.

Definition at line 53 of file dbscan.hpp.

39.248.2 Constructor & Destructor Documentation

39.248.2.1 DBSCAN()

```
DBSCAN (
    const double epsilon,
    const size_t minPoints,
    const bool batchMode = true,
    RangeSearchType rangeSearch = RangeSearchType(),
    PointSelectionPolicy pointSelector = PointSelectionPolicy() )
```

Construct the **DBSCAN** (p. 1197) object with the given parameters.

The batchMode parameter should be set to false in the case where RAM issues will be encountered (i.e. if the dataset is very large or if epsilon is large). When batchMode is false, each point will be searched iteratively, which could be slower but will use less memory.

Parameters

<i>epsilon</i>	Size of range query.
<i>minPoints</i>	Minimum number of points for each cluster.
<i>batchMode</i>	If true, all points are searched in batch.
<i>rangeSearch</i>	Optional instantiated RangeSearch object.
<i>pointSelector</i>	OptionL instantiated PointSelectionPolicy object.

39.248.3 Member Function Documentation

39.248.3.1 Cluster() [1/3]

```
size_t Cluster (
    const MatType & data,
    arma::mat & centroids )
```

Performs **DBSCAN** (p. 1197) clustering on the data, returning number of clusters and also the centroid of each cluster.

Template Parameters

<i>MatType</i>	Type of matrix (arma::mat or arma::sp_mat).
----------------	---

Parameters

<i>data</i>	Dataset to cluster.
<i>centroids</i>	Matrix in which centroids are stored.

39.248.3.2 Cluster() [2/3]

```
size_t Cluster (
    const MatType & data,
    arma::Row< size_t > & assignments )
```

Performs **DBSCAN** (p. 1197) clustering on the data, returning number of clusters and also the list of cluster assignments.

If assignments[i] == SIZE_MAX, then the point is considered "noise".

Template Parameters

<i>MatType</i>	Type of matrix (arma::mat or arma::sp_mat).
----------------	---

Parameters

<i>data</i>	Dataset to cluster.
<i>assignments</i>	Vector to store cluster assignments.

39.248.3.3 Cluster() [3/3]

```
size_t Cluster (
    const MatType & data,
    arma::Row< size_t > & assignments,
    arma::mat & centroids )
```

Performs **DBSCAN** (p. 1197) clustering on the data, returning number of clusters, the centroid of each cluster and also the list of cluster assignments.

If assignments[i] == SIZE_MAX, then the point is considered "noise".

Template Parameters

<i>MatType</i>	Type of matrix (arma::mat or arma::sp_mat).
----------------	---

Parameters

<i>data</i>	Dataset to cluster.
<i>assignments</i>	Vector to store cluster assignments.
<i>centroids</i>	Matrix in which centroids are stored.

The documentation for this class was generated from the following file:

39.249 OrderedPointSelection Class Reference

This class can be used to sequentially select the next point to use for **DBSCAN** (p. 1197).

Static Public Member Functions

- template<typename MatType >
static size_t **Select** (const size_t point, const MatType &)
Select the next point to use, sequentially.

39.249.1 Detailed Description

This class can be used to sequentially select the next point to use for **DBSCAN** (p. 1197).

Definition at line 23 of file `ordered_point_selection.hpp`.

39.249.2 Member Function Documentation

39.249.2.1 Select()

```
static size_t Select (
    const size_t point,
    const MatType & ) [inline], [static]
```

Select the next point to use, sequentially.

Parameters

<i>unvisited</i>	Bitset indicating which points are unvisited.
<i>data</i>	Unused data.

Definition at line 33 of file `ordered_point_selection.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/dbscan/ ordered_point_selection.hpp`

39.250 RandomPointSelection Class Reference

This class can be used to randomly select the next point to use for **DBSCAN** (p. 1197).

Public Member Functions

- `template<typename MatType >`
`size_t Select (const size_t, const MatType &data)`
Select the next point to use, randomly.

39.250.1 Detailed Description

This class can be used to randomly select the next point to use for **DBSCAN** (p. 1197).

Definition at line 23 of file `random_point_selection.hpp`.

39.250.2 Member Function Documentation

39.250.2.1 Select()

```
size_t Select (
    const size_t ,
    const MatType & data ) [inline]
```

Select the next point to use, randomly.

Parameters

<i>point</i>	Unused data.
<i>data</i>	Dataset to cluster.

Definition at line 33 of file random_point_selection.hpp.

References `mlpack::math::RandInt()`.

The documentation for this class was generated from the following file:

39.251 DecisionStump< MatType > Class Template Reference

This class implements a decision stump.

Public Member Functions

- **DecisionStump** (const MatType &data, const arma::Row< size_t > &labels, const size_t numClasses, const size_t bucketSize=10)
Constructor.
- **DecisionStump** (const **DecisionStump**<> &other, const MatType &data, const arma::Row< size_t > &labels, const size_t numClasses, const arma::rowvec &weights)
Alternate constructor which copies the parameters bucketSize and classes from an already initiated decision stump, other.
- **DecisionStump** ()
Create a decision stump without training.
- const arma::Col< size_t > **BinLabels** () const
Access the labels for each split bin.
- arma::Col< size_t > & **BinLabels** ()
Modify the labels for each split bin (be careful!).
- void **Classify** (const MatType &test, arma::Row< size_t > &predictedLabels)

Classification function.

- `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialize the decision stump.
- `const arma::vec & Split () const`
Access the splitting values.
- `arma::vec & Split ()`
Modify the splitting values (be careful!).
- `size_t SplitDimension () const`
Access the splitting dimension.
- `size_t & SplitDimension ()`
Modify the splitting dimension (be careful!).
- `double Train (const MatType &data, const arma::Row< size_t > &labels, const size_t numClasses, const size_t bucketSize)`
Train the decision stump on the given data.
- `double Train (const MatType &data, const arma::Row< size_t > &labels, const arma::rowvec &weights, const size_t numClasses, const size_t bucketSize)`
Train the decision stump on the given data, with the given weights.

39.251.1 Detailed Description

```
template<typename MatType = arma::mat>
class mlpack::decision_stump::DecisionStump< MatType >
```

This class implements a decision stump.

It constructs a single level decision tree, i.e., a decision stump. It uses entropy to decide splitting ranges.

The stump is parameterized by a splitting dimension (the dimension on which points are split), a vector of bin split values, and a vector of labels for each bin. Bin *i* is specified by the range `[split[i], split[i + 1])`. The last bin has range up to `(split[i + 1]` does not exist in that case). Points that are below the first bin will take the label of the first bin.

Template Parameters

<i>MatType</i>	Type of matrix that is being used (sparse or dense).
----------------	--

Definition at line 34 of file `decision_stump.hpp`.

39.251.2 Constructor & Destructor Documentation

39.251.2.1 DecisionStump() [1/3]

```
DecisionStump (
    const MatType & data,
```

```
const arma::Row< size_t > & labels,
const size_t numClasses,
const size_t bucketSize = 10 )
```

Constructor.

Train on the provided data. Generate a decision stump from data.

Parameters

<i>data</i>	Input, training data.
<i>labels</i>	Labels of training data.
<i>numClasses</i>	Number of distinct classes in labels.
<i>bucketSize</i>	Minimum size of bucket when splitting.

39.251.2.2 DecisionStump() [2/3]

```
DecisionStump (
    const DecisionStump<> & other,
    const MatType & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const arma::rowvec & weights )
```

Alternate constructor which copies the parameters bucketSize and classes from an already initiated decision stump, other.

It appropriately sets the weight vector.

Parameters

<i>other</i>	The other initiated Decision Stump object from which we copy the values.
<i>data</i>	The data on which to train this object on.
<i>labels</i>	The labels of data.
<i>weights</i>	Weight vector to use while training. For boosting purposes.

39.251.2.3 DecisionStump() [3/3]

```
DecisionStump ( )
```

Create a decision stump without training.

This stump will not be useful and will always return a class of 0 for anything that is to be classified, so it would be a prudent idea to call **Train()** (p. 1206) after using this constructor.

39.251.3 Member Function Documentation

39.251.3.1 BinLabels() [1/2]

```
const arma::Col<size_t> BinLabels ( ) const [inline]
```

Access the labels for each split bin.

Definition at line 130 of file decision_stump.hpp.

39.251.3.2 BinLabels() [2/2]

```
arma::Col<size_t>& BinLabels ( ) [inline]
```

Modify the labels for each split bin (be careful!).

Definition at line 132 of file decision_stump.hpp.

References DecisionStump< MatType >::serialize(), and DecisionStump< MatType >::Train().

39.251.3.3 Classify()

```
void Classify (
    const MatType & test,
    arma::Row< size_t > & predictedLabels )
```

Classification function.

After training, classify test, and put the predicted classes in predictedLabels.

Parameters

<i>test</i>	Testing data or data to classify.
<i>predictedLabels</i>	Vector to store the predicted classes after classifying test data.

39.251.3.4 serialize()

```
void serialize (
```

```
Archive & ar,
const unsigned int )
```

Serialize the decision stump.

Referenced by `DecisionStump< MatType >::BinLabels()`.

39.251.3.5 Split() [1/2]

```
const arma::vec& Split ( ) const [inline]
```

Access the splitting values.

Definition at line 125 of file `decision_stump.hpp`.

39.251.3.6 Split() [2/2]

```
arma::vec& Split ( ) [inline]
```

Modify the splitting values (be careful!).

Definition at line 127 of file `decision_stump.hpp`.

39.251.3.7 SplitDimension() [1/2]

```
size_t SplitDimension ( ) const [inline]
```

Access the splitting dimension.

Definition at line 120 of file `decision_stump.hpp`.

39.251.3.8 SplitDimension() [2/2]

```
size_t& SplitDimension ( ) [inline]
```

Modify the splitting dimension (be careful!).

Definition at line 122 of file `decision_stump.hpp`.

39.251.3.9 Train() [1/2]

```
double Train (
    const MatType & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const size_t bucketSize )
```

Train the decision stump on the given data.

This completely overwrites any previous training data, so after training the stump may be completely different.

Parameters

<i>data</i>	Dataset to train on.
<i>labels</i>	Labels for each point in the dataset.
<i>numClasses</i>	Number of classes in the dataset.
<i>bucketSize</i>	Minimum size of bucket when splitting.

Returns

The final entropy after splitting.

Referenced by DecisionStump< MatType >::BinLabels().

39.251.3.10 Train() [2/2]

```
double Train (
    const MatType & data,
    const arma::Row< size_t > & labels,
    const arma::rowvec & weights,
    const size_t numClasses,
    const size_t bucketSize )
```

Train the decision stump on the given data, with the given weights.

This completely overwrites any previous training data, so after training the stump may be completely different.

Parameters

<i>data</i>	Dataset to train on.
<i>labels</i>	Labels for each point in the dataset.
<i>weights</i>	Weights for each point in the dataset.
<i>numClasses</i>	Number of classes in the dataset.
<i>bucketSize</i>	Minimum size of bucket when splitting.

Returns

The final entropy after splitting.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_stump/ **decision_stump.hpp**

39.252 DTree< MatType, TagType > Class Template Reference

A density estimation tree is similar to both a decision tree and a space partitioning tree (like a kd-tree).

Public Types

- `typedef MatType::elem_type ElemType`
The actual, underlying type we're working with.
- `typedef arma::Col< ElemType > StatType`
The statistic type we are holding.
- `typedef MatType::vec_type VecType`
The type of vector we are using.

Public Member Functions

- **DTree** ()
Create an empty density estimation tree.
- **DTree** (const **DTree** &obj)
Create a tree that is the copy of the given tree.
- **DTree** (**DTree** &&obj)
Create a tree by taking ownership of another tree (move constructor).
- **DTree** (const **StatType** &maxVals, const **StatType** &minVals, const size_t totalPoints)
Create a density estimation tree with the given bounds and the given number of total points.
- **DTree** (MatType &data)
Create a density estimation tree on the given data.
- **DTree** (const **StatType** &maxVals, const **StatType** &minVals, const size_t start, const size_t end, const double logNegError)
Create a child node of a density estimation tree given the bounding box specified by maxVals and minVals, using the size given in start and end and the specified error.
- **DTree** (const **StatType** &maxVals, const **StatType** &minVals, const size_t totalPoints, const size_t start, const size_t end)
Create a child node of a density estimation tree given the bounding box specified by maxVals and minVals, using the size given in start and end, and calculating the error with the total number of points given.
- **~DTree** ()
Clean up memory allocated by the tree.
- double **AlphaUpper** () const
Return the upper part of the alpha sum.
- TagType **BucketTag** () const
Return the current bucket's ID, if leaf, or -1 otherwise.
- **DTree** & **Child** (const size_t child) const
Return the specified child (0 will be left, 1 will be right).
- **DTree** *& **ChildPtr** (const size_t child)
- double **ComputeValue** (const **VecType** &query) const
Compute the logarithm of the density estimate of a given query point.
- void **ComputeVariableImportance** (arma::vec &importances) const
Compute the variable importance of each dimension in the learned tree.
- size_t **End** () const
Return the first index of a point not contained in this node.
- TagType **FindBucket** (const **VecType** &query) const
Return the tag of the leaf containing the query.

- double **Grow** (MatType &data, arma::Col< size_t > &oldFromNew, const bool useVolReg=false, const size_t maxLeafSize=10, const size_t minLeafSize=5)
Greedily expand the tree.
- **DTree * Left** () const
Return the left child.
- double **LogNegativeError** (const size_t totalPoints) const
Compute the log-negative-error for this point, given the total number of points in the dataset.
- double **LogNegError** () const
Return the log negative error of this node.
- double **LogVolume** () const
Return the inverse of the volume of this node.
- const **StatType & MaxVals** () const
Return the maximum values.
- const **StatType & MinVals** () const
Return the minimum values.
- size_t **NumChildren** () const
Return the number of children in this node.
- **DTree & operator=** (const **DTree** &obj)
Copy the given tree.
- **DTree & operator=** (**DTree** &&obj)
Take ownership of the given tree (move operator).
- double **PruneAndUpdate** (const double oldAlpha, const size_t points, const bool useVolReg=false)
Perform alpha pruning on a tree.
- double **Ratio** () const
Return the ratio of points in this node to the points in the whole dataset.
- **DTree * Right** () const
Return the right child.
- bool **Root** () const
Return whether or not this is the root of the tree.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the density estimation tree.
- size_t **SplitDim** () const
Return the split dimension of this node.
- **ElemType SplitValue** () const
Return the split value of this node.
- size_t **Start** () const
Return the starting index of points contained in this node.
- size_t **SubtreeLeaves** () const
Return the number of leaves which are descendants of this node.
- double **SubtreeLeavesLogNegError** () const
Return the log negative error of all descendants of this node.
- TagType **TagTree** (const TagType &tag=0, bool everyNode=false)
*Index the buckets for possible usage later; this results in every leaf in the tree having a specific tag (accessible with **BucketTag()** (p. 1214)).*
- bool **WithinRange** (const **VecType** &query) const
Return whether a query point is within the range of this node.

39.252.1 Detailed Description

```
template<typename MatType = arma::mat, typename TagType = int>
class mlpack::det::DTree< MatType, TagType >
```

A density estimation tree is similar to both a decision tree and a space partitioning tree (like a kd-tree).

Each leaf represents a constant-density hyper-rectangle. The tree is constructed in such a way as to minimize the integrated square error between the probability distribution of the tree and the observed probability distribution of the data. Because the tree is similar to a decision tree, the density estimation tree can provide very fast density estimates for a given point.

For more information, see the following paper:

39.252.2 Member Typedef Documentation

39.252.2.1 ElemType

```
typedef MatType::elem_type ElemType
```

The actual, underlying type we're working with.

Definition at line 50 of file dtree.hpp.

39.252.2.2 StatType

```
typedef arma::Col< ElemType> StatType
```

The statistic type we are holding.

Definition at line 54 of file dtree.hpp.

39.252.2.3 VecType

```
typedef MatType::vec_type VecType
```

The type of vector we are using.

Definition at line 52 of file dtree.hpp.

39.252.3 Constructor & Destructor Documentation

39.252.3.1 DTree() [1/7]

```
DTree ( )
```

Create an empty density estimation tree.

39.252.3.2 DTree() [2/7]

```
DTree (
    const DTree< MatType, TagType > & obj )
```

Create a tree that is the copy of the given tree.

Parameters

<i>obj</i>	Tree to copy.
------------	---------------

39.252.3.3 DTree() [3/7]

```
DTree (
    DTree< MatType, TagType > && obj )
```

Create a tree by taking ownership of another tree (move constructor).

Parameters

<i>obj</i>	Tree to take ownership of.
------------	----------------------------

39.252.3.4 DTree() [4/7]

```

DTree (
    const StatType & maxVals,
    const StatType & minVals,
    const size_t totalPoints )

```

Create a density estimation tree with the given bounds and the given number of total points.

Children will not be created.

Parameters

<i>maxVals</i>	Maximum values of the bounding box.
<i>minVals</i>	Minimum values of the bounding box.
<i>totalPoints</i>	Total number of points in the dataset.

39.252.3.5 DTree() [5/7]

```

DTree (
    MatType & data )

```

Create a density estimation tree on the given data.

Children will be created following the procedure outlined in the paper. The data will be modified; it will be reordered similar to the way BinarySpaceTree modifies datasets.

Parameters

<i>data</i>	Dataset to build tree on.
-------------	---------------------------

39.252.3.6 DTree() [6/7]

```

DTree (
    const StatType & maxVals,
    const StatType & minVals,
    const size_t start,
    const size_t end,
    const double logNegError )

```

Create a child node of a density estimation tree given the bounding box specified by `maxVals` and `minVals`, using the size given in `start` and `end` and the specified error.

Children of this node will not be created recursively.

Parameters

<i>maxVals</i>	Upper bound of bounding box.
<i>minVals</i>	Lower bound of bounding box.
<i>start</i>	Start of points represented by this node in the data matrix.
<i>end</i>	End of points represented by this node in the data matrix.
<i>error</i>	log-negative error of this node.

39.252.3.7 DTree() [7/7]

```
DTree (
    const StatType & maxVals,
    const StatType & minVals,
    const size_t totalPoints,
    const size_t start,
    const size_t end )
```

Create a child node of a density estimation tree given the bounding box specified by `maxVals` and `minVals`, using the size given in `start` and `end`, and calculating the error with the total number of points given.

Children of this node will not be created recursively.

Parameters

<i>maxVals</i>	Upper bound of bounding box.
<i>minVals</i>	Lower bound of bounding box.
<i>start</i>	Start of points represented by this node in the data matrix.
<i>end</i>	End of points represented by this node in the data matrix.

39.252.3.8 ~DTree()

```
~ DTree ( )
```

Clean up memory allocated by the tree.

39.252.4 Member Function Documentation

39.252.4.1 AlphaUpper()

```
double AlphaUpper ( ) const [inline]
```

Return the upper part of the alpha sum.

Definition at line 306 of file dtree.hpp.

39.252.4.2 BucketTag()

```
TagType BucketTag ( ) const [inline]
```

Return the current bucket's ID, if leaf, or -1 otherwise.

Definition at line 308 of file dtree.hpp.

39.252.4.3 Child()

```
DTree& Child (
    const size_t child ) const [inline]
```

Return the specified child (0 will be left, 1 will be right).

If the index is greater than 1, this will return the right child.

Parameters

<i>child</i>	Index of child to return.
--------------	---------------------------

Definition at line 318 of file dtree.hpp.

39.252.4.4 ChildPtr()

```
DTree*& ChildPtr (
    const size_t child ) [inline]
```

Definition at line 320 of file dtree.hpp.

39.252.4.5 ComputeValue()

```
double ComputeValue (
    const VecType & query ) const
```

Compute the logarithm of the density estimate of a given query point.

Parameters

<i>query</i>	Point to estimate density of.
--------------	-------------------------------

39.252.4.6 ComputeVariableImportance()

```
void ComputeVariableImportance (
    arma::vec & importances ) const
```

Compute the variable importance of each dimension in the learned tree.

Parameters

<i>importances</i>	Vector to store the calculated importances in.
--------------------	--

39.252.4.7 End()

```
size_t End ( ) const [inline]
```

Return the first index of a point not contained in this node.

Definition at line 283 of file dtree.hpp.

39.252.4.8 FindBucket()

```
TagType FindBucket (
    const VecType & query ) const
```

Return the tag of the leaf containing the query.

This is useful for generating class memberships.

Parameters

<i>query</i>	Query to search for.
--------------	----------------------

39.252.4.9 Grow()

```
double Grow (
    MatType & data,
    arma::Col< size_t > & oldFromNew,
    const bool useVolReg = false,
    const size_t maxLeafSize = 10,
    const size_t minLeafSize = 5 )
```

Greedily expand the tree.

The points in the dataset will be reordered during tree growth.

Parameters

<i>data</i>	Dataset to build tree on.
<i>oldFromNew</i>	Mappings from old points to new points.
<i>useVolReg</i>	If true, volume regularization is used.
<i>maxLeafSize</i>	Maximum size of a leaf.
<i>minLeafSize</i>	Minimum size of a leaf.

39.252.4.10 Left()

```
DTree* Left ( ) const [inline]
```

Return the left child.

Definition at line 300 of file dtree.hpp.

39.252.4.11 LogNegativeError()

```
double LogNegativeError (
    const size_t totalPoints ) const
```

Compute the log-negative-error for this point, given the total number of points in the dataset.

Parameters

<i>totalPoints</i>	Total number of points in the dataset.
--------------------	--

39.252.4.12 LogNegError()

```
double LogNegError ( ) const [inline]
```

Return the log negative error of this node.

Definition at line 289 of file dtree.hpp.

39.252.4.13 LogVolume()

```
double LogVolume ( ) const [inline]
```

Return the inverse of the volume of this node.

Definition at line 298 of file dtree.hpp.

39.252.4.14 MaxVals()

```
const StatType& MaxVals ( ) const [inline]
```

Return the maximum values.

Definition at line 323 of file dtree.hpp.

39.252.4.15 MinVals()

```
const StatType& MinVals ( ) const [inline]
```

Return the minimum values.

Definition at line 326 of file dtree.hpp.

References DTree< MatType, TagType >::serialize().

39.252.4.16 NumChildren()

```
size_t NumChildren ( ) const [inline]
```

Return the number of children in this node.

Definition at line 310 of file dtree.hpp.

39.252.4.17 operator=() [1/2]

```
DTree& operator= (
    const DTree< MatType, TagType > & obj )
```

Copy the given tree.

Parameters

<i>obj</i>	Tree to copy.
------------	---------------

39.252.4.18 operator=() [2/2]

```
DTree& operator= (
    DTree< MatType, TagType > && obj )
```

Take ownership of the given tree (move operator).

Parameters

<i>obj</i>	Tree to take ownership of.
------------	----------------------------

39.252.4.19 PruneAndUpdate()

```
double PruneAndUpdate (
    const double oldAlpha,
    const size_t points,
    const bool useVolReg = false )
```

Perform alpha pruning on a tree.

Returns the new value of alpha.

Parameters

<i>oldAlpha</i>	Old value of alpha.
<i>points</i>	Total number of points in dataset.
<i>useVolReg</i>	If true, volume regularization is used.

Returns

New value of alpha.

39.252.4.20 Ratio()

```
double Ratio ( ) const [inline]
```

Return the ratio of points in this node to the points in the whole dataset.

Definition at line 296 of file dtree.hpp.

39.252.4.21 Right()

```
DTree* Right ( ) const [inline]
```

Return the right child.

Definition at line 302 of file dtree.hpp.

39.252.4.22 Root()

```
bool Root ( ) const [inline]
```

Return whether or not this is the root of the tree.

Definition at line 304 of file dtree.hpp.

39.252.4.23 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the density estimation tree.

Referenced by DTree< MatType, TagType >::MinVals().

39.252.4.24 SplitDim()

```
size_t SplitDim ( ) const [inline]
```

Return the split dimension of this node.

Definition at line 285 of file dtree.hpp.

39.252.4.25 SplitValue()

```
ElementType SplitValue ( ) const [inline]
```

Return the split value of this node.

Definition at line 287 of file dtree.hpp.

39.252.4.26 Start()

```
size_t Start ( ) const [inline]
```

Return the starting index of points contained in this node.

Definition at line 281 of file dtree.hpp.

39.252.4.27 SubtreeLeaves()

```
size_t SubtreeLeaves ( ) const [inline]
```

Return the number of leaves which are descendants of this node.

Definition at line 293 of file dtree.hpp.

39.252.4.28 SubtreeLeavesLogNegError()

```
double SubtreeLeavesLogNegError ( ) const [inline]
```

Return the log negative error of all descendants of this node.

Definition at line 291 of file `dtree.hpp`.

39.252.4.29 TagTree()

```
TagType TagTree (
    const TagType & tag = 0,
    bool everyNode = false )
```

Index the buckets for possible usage later; this results in every leaf in the tree having a specific tag (accessible with **BucketTag()** (p. 1214)).

This function calls itself recursively. The tag is incremented with `operator++()`, so any `TagType` overriding it will do.

Parameters

<i>tag</i>	Tag for the next leaf; leave at 0 for the initial call.
<i>everyNode</i>	Whether to increment on every node, not just leaves.

39.252.4.30 WithinRange()

```
bool WithinRange (
    const VecType & query ) const
```

Return whether a query point is within the range of this node.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/det/ dtree.hpp`

39.253 PathCacher Class Reference

This class is responsible for caching the path to each node of the tree.

Public Types

- enum **PathFormat** {
 FormatLR,
 FormatLR_ID,
 FormatID_LR }

Possible formats to use for output.

Public Member Functions

- template<typename MatType >
 PathCacher (**PathFormat** fmt, **DTree**< MatType, int > *tree)
 *Construct a **PathCacher** (p. 1221) object on the given tree with the given format.*
- template<typename MatType >
 void **Enter** (const **DTree**< MatType, int > *node, const **DTree**< MatType, int > *parent)
 Enter a given node.
- template<typename MatType >
 void **Leave** (const **DTree**< MatType, int > *node, const **DTree**< MatType, int > *parent)
 Leave the given node.
- size_t **NumNodes** () const
 Get the number of nodes in the path cache.
- int **ParentOf** (int tag) const
 Get the parent tag of a given tag.
- const std::string & **PathFor** (int tag) const
 Return the constructed path for a given tag.

Protected Types

- typedef std::vector< std::pair< int, std::string > > **PathCacheType**
- typedef std::list< std::pair< bool, int > > **PathType**

Protected Member Functions

- std::string **BuildString** ()

Protected Attributes

- **PathFormat** format
- **PathType** path
- **PathCacheType** pathCache

39.253.1 Detailed Description

This class is responsible for caching the path to each node of the tree.

Its instance is provided to **EnumerateTree()** (p. 463) utility ONCE and it caches the paths to all the leafs and then easily (and quickly) retrieves these paths for each test entry.

Definition at line 79 of file dt_utils.hpp.

39.253.2 Member Typedef Documentation

39.253.2.1 PathCacheType

```
typedef std::vector<std::pair<int, std::string> > PathCacheType [protected]
```

Definition at line 135 of file dt_utils.hpp.

39.253.2.2 PathType

```
typedef std::list<std::pair<bool, int> > PathType [protected]
```

Definition at line 134 of file dt_utils.hpp.

39.253.3 Member Enumeration Documentation

39.253.3.1 PathFormat

```
enum PathFormat
```

Possible formats to use for output.

Enumerator

FormatLR	Print only whether we went left or right.
FormatLR_ID	Print the direction, then the tag of the node.
FormatID_LR	Print the tag of the node, then the direction.

Definition at line 85 of file dt_utils.hpp.

39.253.4 Constructor & Destructor Documentation

39.253.4.1 PathCacher()

```
PathCacher (  
    PathFormat fmt,  
    DTree< MatType, int > * tree )
```

Construct a **PathCacher** (p. 1221) object on the given tree with the given format.

Parameters

<i>fmt</i>	Format to use for output.
<i>tree</i>	Tree to cache paths in.

39.253.5 Member Function Documentation

39.253.5.1 BuildString()

```
std::string BuildString ( ) [inline], [protected]
```

39.253.5.2 Enter()

```
void Enter (  
    const DTree< MatType, int > * node,  
    const DTree< MatType, int > * parent )
```

Enter a given node.

39.253.5.3 Leave()

```
void Leave (  
    const DTree< MatType, int > * node,  
    const DTree< MatType, int > * parent )
```

Leave the given node.

39.253.5.4 NumNodes()

```
size_t NumNodes ( ) const [inline]
```

Get the number of nodes in the path cache.

Definition at line 131 of file dt_utils.hpp.

References PathCacher::pathCache.

39.253.5.5 ParentOf()

```
int ParentOf (
    int tag ) const [inline]
```

Get the parent tag of a given tag.

39.253.5.6 PathFor()

```
const std::string& PathFor (
    int tag ) const [inline]
```

Return the constructed path for a given tag.

39.253.6 Member Data Documentation

39.253.6.1 format

```
PathFormat format [protected]
```

Definition at line 138 of file dt_utils.hpp.

39.253.6.2 path

```
PathType path [protected]
```

Definition at line 137 of file dt_utils.hpp.

39.253.6.3 pathCache

PathCacheType pathCache [protected]

Definition at line 139 of file dt_utils.hpp.

Referenced by PathCacher::NumNodes().

The documentation for this class was generated from the following file:

39.254 DiagonalGaussianDistribution Class Reference

A single multivariate Gaussian distribution with diagonal covariance.

Public Member Functions

- **DiagonalGaussianDistribution** ()
Default constructor, which creates a Gaussian with zero dimension.
- **DiagonalGaussianDistribution** (const size_t dimension)
Create a Gaussian Distribution with zero mean and diagonal covariance with the given dimensionality.
- **DiagonalGaussianDistribution** (const arma::vec &mean, const arma::vec &covariance)
Create a Gaussian distribution with the given mean and diagonal covariance.
- const arma::vec & **Covariance** () const
Return the covariance matrix.
- void **Covariance** (const arma::vec &covariance)
Set the covariance matrix.
- void **Covariance** (arma::vec &&covariance)
Set the covariance matrix using move assignment.
- size_t **Dimensionality** () const
Return the dimensionality of this distribution.
- double **LogProbability** (const arma::vec &observation) const
Return the log probability of the given observation.
- void **LogProbability** (const arma::mat &observations, arma::vec &logProbabilities) const
Calculate the multivariate Gaussian log probability density function for each data point (column) in the given matrix.
- const arma::vec & **Mean** () const
Return the mean.
- arma::vec & **Mean** ()
Return a modifiable copy of the mean.
- double **Probability** (const arma::vec &observation) const
Return the probability of the given observation.
- void **Probability** (const arma::mat &x, arma::vec &probabilities) const
Calculate the multivariate Gaussian probability density function for each data point (column) in the given matrix.
- arma::vec **Random** () const

Return a randomly generated observation according to the probability distribution defined by this object.

- `template<typename Archive >`

`void serialize (Archive &ar, const unsigned int)`

Serialize the distribution.

- `void Train (const arma::mat &observations)`

Estimate the Gaussian distribution directly from the given observations.

- `void Train (const arma::mat &observations, const arma::vec &probabilities)`

Estimate the Gaussian distribution from the given observations, taking into account the probability of each observation actually being from this distribution.

39.254.1 Detailed Description

A single multivariate Gaussian distribution with diagonal covariance.

Definition at line 21 of file `diagonal_gaussian_distribution.hpp`.

39.254.2 Constructor & Destructor Documentation

39.254.2.1 DiagonalGaussianDistribution() [1/3]

```
DiagonalGaussianDistribution ( ) [inline]
```

Default constructor, which creates a Gaussian with zero dimension.

Definition at line 38 of file `diagonal_gaussian_distribution.hpp`.

Referenced by `DiagonalGaussianDistribution::DiagonalGaussianDistribution()`.

39.254.2.2 DiagonalGaussianDistribution() [2/3]

```
DiagonalGaussianDistribution (
    const size_t dimension ) [inline]
```

Create a Gaussian Distribution with zero mean and diagonal covariance with the given dimensionality.

Parameters

<i>dimension</i>	Number of dimensions.
------------------	-----------------------

Definition at line 46 of file `diagonal_gaussian_distribution.hpp`.

References `DiagonalGaussianDistribution::DiagonalGaussianDistribution()`.

39.254.2.3 `DiagonalGaussianDistribution()` [3/3]

```
DiagonalGaussianDistribution (
    const arma::vec & mean,
    const arma::vec & covariance )
```

Create a Gaussian distribution with the given mean and diagonal covariance.

Parameters

<i>mean</i>	Mean of distribution.
<i>covariance</i>	Covariance of distribution.

39.254.3 Member Function Documentation

39.254.3.1 `Covariance()` [1/3]

```
const arma::vec& Covariance ( ) const [inline]
```

Return the covariance matrix.

Definition at line 133 of file `diagonal_gaussian_distribution.hpp`.

39.254.3.2 `Covariance()` [2/3]

```
void Covariance (
    const arma::vec & covariance )
```

Set the covariance matrix.

39.254.3.3 `Covariance()` [3/3]

```
void Covariance (
    arma::vec && covariance )
```

Set the covariance matrix using move assignment.

39.254.3.4 Dimensionality()

```
size_t Dimensionality ( ) const [inline]
```

Return the dimensionality of this distribution.

Definition at line 64 of file diagonal_gaussian_distribution.hpp.

39.254.3.5 LogProbability() [1/2]

```
double LogProbability (
    const arma::vec & observation ) const
```

Return the log probability of the given observation.

Referenced by DiagonalGaussianDistribution::Probability().

39.254.3.6 LogProbability() [2/2]

```
void LogProbability (
    const arma::mat & observations,
    arma::vec & logProbabilities ) const
```

Calculate the multivariate Gaussian log probability density function for each data point (column) in the given matrix.

Parameters

<i>observations</i>	Matrix of observations.
<i>probabilities</i>	Output log probabilities for each input observation.

39.254.3.7 Mean() [1/2]

```
const arma::vec& Mean ( ) const [inline]
```

Return the mean.

Definition at line 127 of file diagonal_gaussian_distribution.hpp.

39.254.3.8 Mean() [2/2]

```
arma::vec& Mean ( ) [inline]
```

Return a modifiable copy of the mean.

Definition at line 130 of file `diagonal_gaussian_distribution.hpp`.

39.254.3.9 Probability() [1/2]

```
double Probability (
    const arma::vec & observation ) const [inline]
```

Return the probability of the given observation.

Definition at line 67 of file `diagonal_gaussian_distribution.hpp`.

References `DiagonalGaussianDistribution::LogProbability()`.

39.254.3.10 Probability() [2/2]

```
void Probability (
    const arma::mat & x,
    arma::vec & probabilities ) const [inline]
```

Calculate the multivariate Gaussian probability density function for each data point (column) in the given matrix.

Parameters

<i>x</i>	Matrix of observations.
<i>probabilities</i>	Output probabilities for each input observation.

Definition at line 82 of file `diagonal_gaussian_distribution.hpp`.

References `DiagonalGaussianDistribution::LogProbability()`, `DiagonalGaussianDistribution::Random()`, and `DiagonalGaussianDistribution::Train()`.

39.254.3.11 Random()

```
arma::vec Random ( ) const
```

Return a randomly generated observation according to the probability distribution defined by this object.

Returns

Random observation from this Diagonal Gaussian distribution.

Referenced by `DiagonalGaussianDistribution::Probability()`.

39.254.3.12 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the distribution.

Definition at line 143 of file `diagonal_gaussian_distribution.hpp`.

39.254.3.13 `Train()` [1/2]

```
void Train (
    const arma::mat & observations )
```

Estimate the Gaussian distribution directly from the given observations.

Parameters

<i>observations</i>	Matrix of observations.
---------------------	-------------------------

Referenced by `DiagonalGaussianDistribution::Probability()`.

39.254.3.14 `Train()` [2/2]

```
void Train (
    const arma::mat & observations,
    const arma::vec & probabilities )
```

Estimate the Gaussian distribution from the given observations, taking into account the probability of each observation actually being from this distribution.

Parameters

<i>observations</i>	Matrix of observations.
<i>probabilities</i>	List of probability of the each observation being from this distribution.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/dists/ **diagonal_gaussian_distribution.hpp**

39.255 DiscreteDistribution Class Reference

A discrete distribution where the only observations are discrete observations.

Public Member Functions

- **DiscreteDistribution** ()
Default constructor, which creates a distribution that has no observations.
- **DiscreteDistribution** (const size_t numObservations)
Define the discrete distribution as having numObservations possible observations.
- **DiscreteDistribution** (const arma::Col< size_t > &numObservations)
Define the multidimensional discrete distribution as having numObservations possible observations.
- **DiscreteDistribution** (const std::vector< arma::vec > &probabilities)
Define the multidimensional discrete distribution as having the given probabilities for each observation.
- size_t **Dimensionality** () const
Get the dimensionality of the distribution.
- double **LogProbability** (const arma::vec &observation) const
Return the log probability of the given observation.
- void **LogProbability** (const arma::mat &x, arma::vec &logProbabilities) const
*Returns the **Log** (p. 1538) probability of the given matrix.*
- arma::vec & **Probabilities** (const size_t dim=0)
Return the vector of probabilities for the given dimension.
- const arma::vec & **Probabilities** (const size_t dim=0) const
Modify the vector of probabilities for the given dimension.
- double **Probability** (const arma::vec &observation) const
Return the probability of the given observation.
- void **Probability** (const arma::mat &x, arma::vec &probabilities) const
Calculates the Discrete probability density function for each data point (column) in the given matrix.
- arma::vec **Random** () const
Return a randomly generated observation (one-dimensional vector; one observation) according to the probability distribution defined by this object.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the distribution.
- void **Train** (const arma::mat &observations)
Estimate the probability distribution directly from the given observations.
- void **Train** (const arma::mat &observations, const arma::vec &probabilities)
Estimate the probability distribution from the given observations, taking into account the probability of each observation actually being from this distribution.

39.255.1 Detailed Description

A discrete distribution where the only observations are discrete observations.

This is useful (for example) with discrete Hidden Markov Models, where observations are non-negative integers representing specific emissions.

No bounds checking is performed for observations, so if an invalid observation is passed (i.e. `observation > numObservations`), a crash will probably occur.

This distribution only supports one-dimensional observations, so when passing an `arma::vec` as an observation, it should only have one dimension (`vec.n_rows == 1`). Any additional dimensions will simply be ignored.

Note

This class, like every other class in `mlpack`, uses `arma::vec` to represent observations. While a discrete distribution only has positive integers (`size_t`) as observations, these can be converted to doubles (which is what `arma::vec` holds). This distribution internally converts those doubles back into `size_t` before comparisons.

Definition at line 46 of file `discrete_distribution.hpp`.

39.255.2 Constructor & Destructor Documentation

39.255.2.1 DiscreteDistribution() [1/4]

```
DiscreteDistribution ( ) [inline]
```

Default constructor, which creates a distribution that has no observations.

Definition at line 53 of file `discrete_distribution.hpp`.

39.255.2.2 DiscreteDistribution() [2/4]

```
DiscreteDistribution (
    const size_t numObservations ) [inline]
```

Define the discrete distribution as having `numObservations` possible observations.

The probability in each state will be set to $(1 / \text{numObservations})$.

Parameters

<i>numObservations</i>	Number of possible observations this distribution can have.
------------------------	---

Definition at line 64 of file discrete_distribution.hpp.

39.255.2.3 DiscreteDistribution() [3/4]

```
DiscreteDistribution (
    const arma::Col< size_t > & numObservations ) [inline]
```

Define the multidimensional discrete distribution as having numObservations possible observations.

The probability in each state will be set to (1 / numObservations of each dimension).

Parameters

<i>numObservations</i>	Number of possible observations this distribution can have.
------------------------	---

Definition at line 77 of file discrete_distribution.hpp.

39.255.2.4 DiscreteDistribution() [4/4]

```
DiscreteDistribution (
    const std::vector< arma::vec > & probabilities ) [inline]
```

Define the multidimensional discrete distribution as having the given probabilities for each observation.

Parameters

<i>probabilities</i>	Probabilities of each possible observation.
----------------------	---

Definition at line 99 of file discrete_distribution.hpp.

39.255.3 Member Function Documentation

39.255.3.1 Dimensionality()

```
size_t Dimensionality ( ) const [inline]
```

Get the dimensionality of the distribution.

Definition at line 118 of file `discrete_distribution.hpp`.

39.255.3.2 LogProbability() [1/2]

```
double LogProbability (
    const arma::vec & observation ) const [inline]
```

Return the log probability of the given observation.

If the observation is greater than the number of possible observations, then a crash will probably occur – bounds checking is not performed.

Parameters

<i>observation</i>	Observation to return the log probability of.
--------------------	---

Returns

Log (p. 1538) probability of the given observation.

Definition at line 167 of file `discrete_distribution.hpp`.

References `DiscreteDistribution::Probability()`.

39.255.3.3 LogProbability() [2/2]

```
void LogProbability (
    const arma::mat & x,
    arma::vec & logProbabilities ) const [inline]
```

Returns the **Log** (p. 1538) probability of the given matrix.

These values are stored in `logProbabilities`.

Parameters

<i>x</i>	List of observations.
<i>logProbabilities</i>	Output log-probabilities for each input observation.

Definition at line 195 of file `discrete_distribution.hpp`.

References `DiscreteDistribution::Probability()`, `DiscreteDistribution::Random()`, and `DiscreteDistribution::Train()`.

39.255.3.4 Probabilities() [1/2]

```
arma::vec& Probabilities (
    const size_t dim = 0 ) [inline]
```

Return the vector of probabilities for the given dimension.

Definition at line 233 of file `discrete_distribution.hpp`.

39.255.3.5 Probabilities() [2/2]

```
const arma::vec& Probabilities (
    const size_t dim = 0 ) const [inline]
```

Modify the vector of probabilities for the given dimension.

Definition at line 235 of file `discrete_distribution.hpp`.

39.255.3.6 Probability() [1/2]

```
double Probability (
    const arma::vec & observation ) const [inline]
```

Return the probability of the given observation.

If the observation is greater than the number of possible observations, then a crash will probably occur – bounds checking is not performed.

Parameters

<i>observation</i>	Observation to return the probability of.
--------------------	---

Returns

Probability of the given observation.

Definition at line 128 of file `discrete_distribution.hpp`.

References Log::Fatal.

Referenced by DiscreteDistribution::LogProbability(), and DiscreteDistribution::Probability().

39.255.3.7 Probability() [2/2]

```
void Probability (
    const arma::mat & x,
    arma::vec & probabilities ) const [inline]
```

Calculates the Discrete probability density function for each data point (column) in the given matrix.

Parameters

<i>x</i>	List of observations.
<i>probabilities</i>	Output probabilities for each input observation.

Definition at line 180 of file discrete_distribution.hpp.

References DiscreteDistribution::Probability().

39.255.3.8 Random()

```
arma::vec Random ( ) const
```

Return a randomly generated observation (one-dimensional vector; one observation) according to the probability distribution defined by this object.

Returns

Random observation.

Referenced by DiscreteDistribution::LogProbability(), MockCategoricalData(), and AggregatedPolicy< PolicyType >::←Sample().

39.255.3.9 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the distribution.

Definition at line 242 of file discrete_distribution.hpp.

39.255.3.10 Train() [1/2]

```
void Train (
    const arma::mat & observations )
```

Estimate the probability distribution directly from the given observations.

If any of the observations is greater than numObservations, a crash is likely to occur.

Parameters

<i>observations</i>	List of observations.
---------------------	-----------------------

Referenced by DiscreteDistribution::LogProbability().

39.255.3.11 Train() [2/2]

```
void Train (
    const arma::mat & observations,
    const arma::vec & probabilities )
```

Estimate the probability distribution from the given observations, taking into account the probability of each observation actually being from this distribution.

Parameters

<i>observations</i>	List of observations.
<i>probabilities</i>	List of probabilities that each observation is actually from this distribution.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/dists/ **discrete_distribution.hpp**

39.256 GammaDistribution Class Reference

This class represents the Gamma distribution.

Public Member Functions

- **GammaDistribution** (const size_t dimensionality=0)
Construct the Gamma distribution with the given number of dimensions (default 0); each parameter will be initialized to 0.

- **GammaDistribution** (const arma::mat &data, const double tol=1e-8)
Construct the Gamma distribution, training on the given parameters.
- **GammaDistribution** (const arma::vec &alpha, const arma::vec &beta)
Construct the Gamma distribution given two vectors alpha and beta.
- **~GammaDistribution** ()
Destructor.
- double **Alpha** (const size_t dim) const
Get the alpha parameter of the given dimension.
- double & **Alpha** (const size_t dim)
Modify the alpha parameter of the given dimension.
- double **Beta** (const size_t dim) const
Get the beta parameter of the given dimension.
- double & **Beta** (const size_t dim)
Modify the beta parameter of the given dimension.
- size_t **Dimensionality** () const
Get the dimensionality of the distribution.
- void **LogProbability** (const arma::mat &observations, arma::vec &logProbabilities) const
This function returns the logarithm of the probability of a group of observations.
- double **LogProbability** (double x, const size_t dim) const
This function returns the logarithm of the probability of a single observation.
- void **Probability** (const arma::mat &observations, arma::vec &probabilities) const
This function returns the probability of a group of observations.
- double **Probability** (double x, const size_t dim) const
This is a shortcut to the Probability(arma::mat&, arma::vec&) function for when we want to evaluate only the probability of one dimension of the gamma.
- arma::vec **Random** () const
This function returns an observation of this distribution.
- void **Train** (const arma::mat &rdata, const double tol=1e-8)
This function trains (fits distribution parameters) to new data or the dataset the object owns.
- void **Train** (const arma::mat &observations, const arma::vec &probabilities, const double tol=1e-8)
Fits an alpha and beta parameter according to observation probabilities.
- void **Train** (const arma::vec &logMeanxVec, const arma::vec &meanLogxVec, const arma::vec &meanxVec, const double tol=1e-8)
This function trains (fits distribution parameters) to a dataset with pre-computed statistics logMeanx, meanLogx, meanx for each dimension.

39.256.1 Detailed Description

This class represents the Gamma distribution.

It supports training a Gamma distribution on a given dataset and accessing the fitted alpha and beta parameters.

This class supports multidimensional Gamma distributions; however, it is assumed that each dimension is independent; therefore, a multidimensional Gamma distribution here may be seen as a set of independent single-dimensional Gamma distributions—and the parameters are estimated under this assumption.

The estimation algorithm used can be found in the following paper:

```
@techreport{minka2002estimating,
  title={Estimating a {G}amma distribution},
  author={Minka, Thomas P.},
  institution={Microsoft Research},
  address={Cambridge, U.K.},
  year={2002}
}
```

Definition at line 52 of file gamma_distribution.hpp.

39.256.2 Constructor & Destructor Documentation

39.256.2.1 GammaDistribution() [1/3]

```
GammaDistribution (
    const size_t dimensionality = 0 )
```

Construct the Gamma distribution with the given number of dimensions (default 0); each parameter will be initialized to 0.

Parameters

<i>dimensionality</i>	Number of dimensions.
-----------------------	-----------------------

39.256.2.2 GammaDistribution() [2/3]

```
GammaDistribution (
    const arma::mat & data,
    const double tol = 1e-8 )
```

Construct the Gamma distribution, training on the given parameters.

Parameters

<i>data</i>	Data to train the distribution on.
<i>tol</i>	Convergence tolerance. This is <i>not</i> an absolute measure: It will stop the approximation once the <i>change</i> in the value is smaller than tol.

39.256.2.3 GammaDistribution() [3/3]

```
GammaDistribution (
```

```
const arma::vec & alpha,
const arma::vec & beta )
```

Construct the Gamma distribution given two vectors alpha and beta.

Parameters

<i>alpha</i>	The vector of alphas, one per dimension.
<i>beta</i>	The vector of betas, one per dimension.

39.256.2.4 ~GammaDistribution()

```
~ GammaDistribution ( ) [inline]
```

Destructor.

Definition at line 84 of file gamma_distribution.hpp.

References GammaDistribution::LogProbability(), GammaDistribution::Probability(), GammaDistribution::Random(), and GammaDistribution::Train().

39.256.3 Member Function Documentation

39.256.3.1 Alpha() [1/2]

```
double Alpha (
    const size_t dim ) const [inline]
```

Get the alpha parameter of the given dimension.

Definition at line 197 of file gamma_distribution.hpp.

39.256.3.2 Alpha() [2/2]

```
double& Alpha (
    const size_t dim ) [inline]
```

Modify the alpha parameter of the given dimension.

Definition at line 199 of file gamma_distribution.hpp.

39.256.3.3 Beta() [1/2]

```
double Beta (
    const size_t dim ) const [inline]
```

Get the beta parameter of the given dimension.

Definition at line 202 of file gamma_distribution.hpp.

39.256.3.4 Beta() [2/2]

```
double& Beta (
    const size_t dim ) [inline]
```

Modify the beta parameter of the given dimension.

Definition at line 204 of file gamma_distribution.hpp.

39.256.3.5 Dimensionality()

```
size_t Dimensionality ( ) const [inline]
```

Get the dimensionality of the distribution.

Definition at line 207 of file gamma_distribution.hpp.

39.256.3.6 LogProbability() [1/2]

```
void LogProbability (
    const arma::mat & observations,
    arma::vec & logProbabilities ) const
```

This function returns the logarithm of the probability of a group of observations.

The logarithm of the probability of a value x is

$$\log\left(\frac{x^{(\alpha-1)}}{\Gamma(\alpha)\beta^\alpha}e^{-\frac{x}{\beta}}\right)$$

for one dimension. This implementation assumes each dimension is independent, so the product rule is used.

Parameters

<i>observations</i>	Matrix of observations, one per column.
<i>logProbabilities</i>	Column vector of log probabilities, one per observation.

Referenced by GammaDistribution::~GammaDistribution().

39.256.3.7 LogProbability() [2/2]

```
double LogProbability (
    double x,
    const size_t dim ) const
```

This function returns the logarithm of the probability of a single observation.

Parameters

<i>x</i>	The 1-dimensional observation.
<i>dim</i>	The dimension for which to calculate the probability.

39.256.3.8 Probability() [1/2]

```
void Probability (
    const arma::mat & observations,
    arma::vec & probabilities ) const
```

This function returns the probability of a group of observations.

The probability of the value x is

$$\frac{x^{(\alpha-1)}}{\Gamma(\alpha)\beta^\alpha} e^{-\frac{x}{\beta}}$$

for one dimension. This implementation assumes each dimension is independent, so the product rule is used.

Parameters

<i>observations</i>	Matrix of observations, one per column.
<i>probabilities</i>	Column vector of probabilities, one per observation.

Referenced by GammaDistribution::~~GammaDistribution().

39.256.3.9 Probability() [2/2]

```
double Probability (
    double x,
    const size_t dim ) const
```

This is a shortcut to the Probability(arma::mat&, arma::vec&) function for when we want to evaluate only the probability of one dimension of the gamma.

Parameters

<i>x</i>	The 1-dimensional observation.
<i>dim</i>	The dimension for which to calculate the probability.

39.256.3.10 Random()

```
arma::vec Random ( ) const
```

This function returns an observation of this distribution.

Referenced by GammaDistribution::~~GammaDistribution().

39.256.3.11 Train() [1/3]

```
void Train (
    const arma::mat & rdata,
    const double tol = 1e-8 )
```

This function trains (fits distribution parameters) to new data or the dataset the object owns.

Parameters

<i>rdata</i>	Reference data to fit parameters to.
<i>tol</i>	Convergence tolerance. This is <i>not</i> an absolute measure: It will stop the approximation once the <i>change</i> in the value is smaller than tol.

Referenced by GammaDistribution::~~GammaDistribution().

39.256.3.12 Train() [2/3]

```
void Train (
    const arma::mat & observations,
    const arma::vec & probabilities,
    const double tol = 1e-8 )
```

Fits an alpha and beta parameter according to observation probabilities.

This method is not yet implemented.

Parameters

<i>observations</i>	The reference data, one observation per column.
<i>probabilities</i>	The probability of each observation. One value per column of the observations matrix.
<i>tol</i>	Convergence tolerance. This is <i>not</i> an absolute measure: It will stop the approximation once the <i>change</i> in the value is smaller than tol.

39.256.3.13 Train() [3/3]

```
void Train (
    const arma::vec & logMeanxVec,
    const arma::vec & meanLogxVec,
    const arma::vec & meanxVec,
    const double tol = 1e-8 )
```

This function trains (fits distribution parameters) to a dataset with pre-computed statistics logMeanx, meanLogx, meanx for each dimension.

Parameters

<i>logMeanxVec</i>	Is each dimension's logarithm of the mean (log(mean(x))).
<i>meanLogxVec</i>	Is each dimension's mean of logarithms (mean(log(x))).
<i>meanxVec</i>	Is each dimension's mean (mean(x)).
<i>tol</i>	Convergence tolerance. This is <i>not</i> an absolute measure: It will stop the approximation once the <i>change</i> in the value is smaller than tol.

The documentation for this class was generated from the following file:

39.257 GaussianDistribution Class Reference

A single multivariate Gaussian distribution.

Public Member Functions

- **GaussianDistribution** ()
Default constructor, which creates a Gaussian with zero dimension.
- **GaussianDistribution** (const size_t dimension)
Create a Gaussian distribution with zero mean and identity covariance with the given dimensionality.
- **GaussianDistribution** (const arma::vec &mean, const arma::mat &covariance)
Create a Gaussian distribution with the given mean and covariance.
- const arma::mat & **Covariance** () const
Return the covariance matrix.
- void **Covariance** (const arma::mat &covariance)
Set the covariance.
- void **Covariance** (arma::mat &&covariance)
- size_t **Dimensionality** () const
Return the dimensionality of this distribution.
- double **LogProbability** (const arma::vec &observation) const
Return the log probability of the given observation.
- void **LogProbability** (const arma::mat &x, arma::vec &logProbabilities) const
*Returns the **Log** (p. 1538) probability of the given matrix.*
- const arma::vec & **Mean** () const
Return the mean.
- arma::vec & **Mean** ()
Return a modifiable copy of the mean.
- double **Probability** (const arma::vec &observation) const
Return the probability of the given observation.
- void **Probability** (const arma::mat &x, arma::vec &probabilities) const
Calculates the multivariate Gaussian probability density function for each data point (column) in the given matrix.
- arma::vec **Random** () const
Return a randomly generated observation according to the probability distribution defined by this object.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the distribution.
- void **Train** (const arma::mat &observations)
Estimate the Gaussian distribution directly from the given observations.
- void **Train** (const arma::mat &observations, const arma::vec &probabilities)
Estimate the Gaussian distribution from the given observations, taking into account the probability of each observation actually being from this distribution.

39.257.1 Detailed Description

A single multivariate Gaussian distribution.

Definition at line 24 of file gaussian_distribution.hpp.

39.257.2 Constructor & Destructor Documentation

39.257.2.1 GaussianDistribution() [1/3]

```
GaussianDistribution ( ) [inline]
```

Default constructor, which creates a Gaussian with zero dimension.

Definition at line 45 of file gaussian_distribution.hpp.

Referenced by GaussianDistribution::GaussianDistribution().

39.257.2.2 GaussianDistribution() [2/3]

```
GaussianDistribution (  
    const size_t dimension ) [inline]
```

Create a Gaussian distribution with zero mean and identity covariance with the given dimensionality.

Definition at line 51 of file gaussian_distribution.hpp.

References GaussianDistribution::GaussianDistribution().

39.257.2.3 GaussianDistribution() [3/3]

```
GaussianDistribution (  
    const arma::vec & mean,  
    const arma::mat & covariance )
```

Create a Gaussian distribution with the given mean and covariance.

covariance is expected to be positive definite.

39.257.3 Member Function Documentation

39.257.3.1 Covariance() [1/3]

```
const arma::mat& Covariance ( ) const [inline]
```

Return the covariance matrix.

Definition at line 162 of file `gaussian_distribution.hpp`.

Referenced by `RegressionDistribution::RegressionDistribution()`.

39.257.3.2 Covariance() [2/3]

```
void Covariance (
    const arma::mat & covariance )
```

Set the covariance.

39.257.3.3 Covariance() [3/3]

```
void Covariance (
    arma::mat && covariance )
```

39.257.3.4 Dimensionality()

```
size_t Dimensionality ( ) const [inline]
```

Return the dimensionality of this distribution.

Definition at line 69 of file `gaussian_distribution.hpp`.

39.257.3.5 LogProbability() [1/2]

```
double LogProbability (
    const arma::vec & observation ) const
```

Return the log probability of the given observation.

Referenced by `GaussianDistribution::Probability()`.

39.257.3.6 LogProbability() [2/2]

```
void LogProbability (
    const arma::mat & x,
    arma::vec & logProbabilities ) const [inline]
```

Returns the **Log** (p. 1538) probability of the given matrix.

These values are stored in `logProbabilities`.

Parameters

<i>x</i>	List of observations.
<i>logProbabilities</i>	Output log probabilities for each input observation.

Definition at line 108 of file gaussian_distribution.hpp.

References GaussianDistribution::Random(), and GaussianDistribution::Train().

39.257.3.7 Mean() [1/2]

```
const arma::vec& Mean ( ) const [inline]
```

Return the mean.

Definition at line 152 of file gaussian_distribution.hpp.

39.257.3.8 Mean() [2/2]

```
arma::vec& Mean ( ) [inline]
```

Return a modifiable copy of the mean.

Definition at line 157 of file gaussian_distribution.hpp.

39.257.3.9 Probability() [1/2]

```
double Probability (
    const arma::vec & observation ) const [inline]
```

Return the probability of the given observation.

Definition at line 74 of file gaussian_distribution.hpp.

References GaussianDistribution::LogProbability().

Referenced by GaussianDistribution::Probability().

39.257.3.10 Probability() [2/2]

```
void Probability (
    const arma::mat & x,
    arma::vec & probabilities ) const [inline]
```

Calculates the multivariate Gaussian probability density function for each data point (column) in the given matrix.

Parameters

<i>x</i>	List of observations.
<i>probabilities</i>	Output probabilities for each input observation.

Definition at line 91 of file gaussian_distribution.hpp.

References GaussianDistribution::Probability().

39.257.3.11 Random()

```
arma::vec Random ( ) const
```

Return a randomly generated observation according to the probability distribution defined by this object.

Returns

Random observation from this Gaussian distribution.

Referenced by LogisticRegressionTestData(), and GaussianDistribution::LogProbability().

39.257.3.12 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the distribution.

Definition at line 175 of file gaussian_distribution.hpp.

39.257.3.13 Train() [1/2]

```
void Train (
    const arma::mat & observations )
```

Estimate the Gaussian distribution directly from the given observations.

Parameters

<i>observations</i>	List of observations.
---------------------	-----------------------

Referenced by GaussianDistribution::LogProbability().

39.257.3.14 Train() [2/2]

```
void Train (
    const arma::mat & observations,
    const arma::vec & probabilities )
```

Estimate the Gaussian distribution from the given observations, taking into account the probability of each observation actually being from this distribution.

The documentation for this class was generated from the following file:

39.258 LaplaceDistribution Class Reference

The multivariate Laplace distribution centered at 0 has pdf.

Public Member Functions

- **LaplaceDistribution** ()
Default constructor, which creates a Laplace distribution with zero dimension and zero scale parameter.
- **LaplaceDistribution** (const size_t dimensionality, const double scale)
Construct the Laplace distribution with the given scale and dimensionality.
- **LaplaceDistribution** (const arma::vec &mean, const double scale)
Construct the Laplace distribution with the given mean and scale parameter.
- size_t **Dimensionality** () const
Return the dimensionality of this distribution.
- void **Estimate** (const arma::mat &observations)
Estimate the Laplace distribution directly from the given observations.
- void **Estimate** (const arma::mat &observations, const arma::vec &probabilities)
Estimate the Laplace distribution from the given observations, taking into account the probability of each observation actually being from this distribution.
- double **LogProbability** (const arma::vec &observation) const
Return the log probability of the given observation.
- void **LogProbability** (const arma::mat &x, arma::vec &logProbabilities) const
Evaluate log probability density function of given observation.

- `const arma::vec & Mean () const`
Return the mean.
- `arma::vec & Mean ()`
Modify the mean.
- `double Probability (const arma::vec &observation) const`
Return the probability of the given observation.
- `void Probability (const arma::mat &x, arma::vec &probabilities) const`
Evaluate probability density function of given observation.
- `arma::vec Random () const`
Return a randomly generated observation according to the probability distribution defined by this object.
- `double Scale () const`
Return the scale parameter.
- `double & Scale ()`
Modify the scale parameter.
- `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialize the distribution.

39.258.1 Detailed Description

The multivariate Laplace distribution centered at 0 has pdf.

$$f(x|\theta) = \frac{1}{2\theta} \exp\left(-\frac{\|x - \mu\|}{\theta}\right)$$

given scale parameter θ and mean μ . This implementation assumes a diagonal covariance, but a rewrite to support arbitrary covariances is possible.

See the following paper for more information on the non-diagonal-covariance Laplace distribution and estimation techniques:

```
@article{eltoft2006multivariate,
  title={On the Multivariate Laplace Distribution},
  author={Eltoft, Torbjørn and Kim, Taesu and Lee, Te-Won},
  journal={IEEE Signal Processing Letters},
  volume={13},
  number={5},
  pages={300--304},
  year={2006}
}
```

Note that because of the diagonal covariance restriction, much of the algebra in the paper above becomes simplified, and the PDF takes roughly the same form as the univariate case.

Definition at line 50 of file `laplace_distribution.hpp`.

39.258.2 Constructor & Destructor Documentation

39.258.2.1 LaplaceDistribution() [1/3]

```
LaplaceDistribution ( ) [inline]
```

Default constructor, which creates a Laplace distribution with zero dimension and zero scale parameter.

Definition at line 57 of file laplace_distribution.hpp.

39.258.2.2 LaplaceDistribution() [2/3]

```
LaplaceDistribution (
    const size_t dimensionality,
    const double scale ) [inline]
```

Construct the Laplace distribution with the given scale and dimensionality.

The mean is initialized to zero.

Parameters

<i>dimensionality</i>	Dimensionality of distribution.
<i>scale</i>	Scale of distribution.

Definition at line 66 of file laplace_distribution.hpp.

39.258.2.3 LaplaceDistribution() [3/3]

```
LaplaceDistribution (
    const arma::vec & mean,
    const double scale ) [inline]
```

Construct the Laplace distribution with the given mean and scale parameter.

Parameters

<i>mean</i>	Mean of distribution.
<i>scale</i>	Scale of distribution.

Definition at line 76 of file laplace_distribution.hpp.

39.258.3 Member Function Documentation

39.258.3.1 Dimensionality()

```
size_t Dimensionality ( ) const [inline]
```

Return the dimensionality of this distribution.

Definition at line 80 of file `laplace_distribution.hpp`.

39.258.3.2 Estimate() [1/2]

```
void Estimate (
    const arma::mat & observations )
```

Estimate the Laplace distribution directly from the given observations.

Parameters

<i>observations</i>	List of observations.
---------------------	-----------------------

Referenced by `LaplaceDistribution::Random()`.

39.258.3.3 Estimate() [2/2]

```
void Estimate (
    const arma::mat & observations,
    const arma::vec & probabilities )
```

Estimate the Laplace distribution from the given observations, taking into account the probability of each observation actually being from this distribution.

39.258.3.4 LogProbability() [1/2]

```
double LogProbability (
    const arma::vec & observation ) const
```

Return the log probability of the given observation.

Parameters

<i>observation</i>	Point to evaluate logarithm of probability.
--------------------	---

Referenced by LaplaceDistribution::LogProbability(), and LaplaceDistribution::Probability().

39.258.3.5 LogProbability() [2/2]

```
void LogProbability (
    const arma::mat & x,
    arma::vec & logProbabilities ) const [inline]
```

Evaluate log probability density function of given observation.

Parameters

<i>x</i>	List of observations.
<i>logProbabilities</i>	Output probabilities for each input observation.

Definition at line 113 of file laplace_distribution.hpp.

References LaplaceDistribution::LogProbability().

39.258.3.6 Mean() [1/2]

```
const arma::vec& Mean ( ) const [inline]
```

Return the mean.

Definition at line 163 of file laplace_distribution.hpp.

39.258.3.7 Mean() [2/2]

```
arma::vec& Mean ( ) [inline]
```

Modify the mean.

Definition at line 165 of file laplace_distribution.hpp.

39.258.3.8 Probability() [1/2]

```
double Probability (
    const arma::vec & observation ) const [inline]
```

Return the probability of the given observation.

Parameters

<i>observation</i>	Point to evaluate probability at.
--------------------	-----------------------------------

Definition at line 87 of file laplace_distribution.hpp.

References LaplaceDistribution::LogProbability().

39.258.3.9 Probability() [2/2]

```
void Probability (
    const arma::mat & x,
    arma::vec & probabilities ) const
```

Evaluate probability density function of given observation.

Parameters

<i>x</i>	List of observations.
<i>probabilities</i>	Output probabilities for each input observation.

39.258.3.10 Random()

```
arma::vec Random ( ) const [inline]
```

Return a randomly generated observation according to the probability distribution defined by this object.

This is inlined for speed.

Returns

Random observation from this Laplace distribution.

Definition at line 128 of file laplace_distribution.hpp.

References LaplaceDistribution::Estimate().

39.258.3.11 Scale() [1/2]

```
double Scale ( ) const [inline]
```

Return the scale parameter.

Definition at line 168 of file `laplace_distribution.hpp`.

39.258.3.12 Scale() [2/2]

```
double& Scale ( ) [inline]
```

Modify the scale parameter.

Definition at line 170 of file `laplace_distribution.hpp`.

39.258.3.13 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the distribution.

Definition at line 176 of file `laplace_distribution.hpp`.

The documentation for this class was generated from the following file:

39.259 RegressionDistribution Class Reference

A class that represents a univariate conditionally Gaussian distribution.

Public Member Functions

- **RegressionDistribution** ()
Default constructor, which creates a Gaussian with zero dimension.
- **mlpack_deprecated RegressionDistribution** (const arma::mat &predictors, const arma::vec &responses)
Create a Conditional Gaussian distribution with conditional mean function obtained by running RegressionFunction on predictors, responses.
- **RegressionDistribution** (const arma::mat &predictors, const arma::rowvec &responses)
Create a Conditional Gaussian distribution with conditional mean function obtained by running RegressionFunction on predictors, responses.
- size_t **Dimensionality** () const
Return the dimensionality.
- const **GaussianDistribution & Err** () const
Return error distribution.
- **GaussianDistribution & Err** ()
Modify error distribution.
- double **LogProbability** (const arma::vec &observation) const
Evaluate log probability density function of given observation.
- const arma::vec & **Parameters** () const
Return the parameters (the b vector).
- **mlpack_deprecated void Predict** (const arma::mat &points, arma::vec &predictions) const
Calculate y_i for each data point in points.
- void **Predict** (const arma::mat &points, arma::rowvec &predictions) const
Calculate y_i for each data point in points.
- double **Probability** (const arma::vec &observation) const
Evaluate probability density function of given observation.
- const **regression::LinearRegression & Rf** () const
Return regression function.
- **regression::LinearRegression & Rf** ()
Modify regression function.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the distribution.
- void **Train** (const arma::mat &observations)
Estimate the Gaussian distribution directly from the given observations.
- **mlpack_deprecated void Train** (const arma::mat &observations, const arma::vec &weights)
Estimate parameters using provided observation weights.
- void **Train** (const arma::mat &observations, const arma::rowvec &weights)
Estimate parameters using provided observation weights.

39.259.1 Detailed Description

A class that represents a univariate conditionally Gaussian distribution.

Can be used as an emission distribution with the hmm class to implement HMM regression (HMMR) as described in <https://www.ima.umn.edu/preprints/January1994/1195.pdf> The hmm observations should have the dependent variable in the first row, with the independent variables in the other rows.

Definition at line 31 of file regression_distribution.hpp.

39.259.2 Constructor & Destructor Documentation

39.259.2.1 RegressionDistribution() [1/3]

```
RegressionDistribution ( ) [inline]
```

Default constructor, which creates a Gaussian with zero dimension.

Definition at line 43 of file `regression_distribution.hpp`.

39.259.2.2 RegressionDistribution() [2/3]

```
mlpack_deprecated RegressionDistribution (  
    const arma::mat & predictors,  
    const arma::vec & responses ) [inline]
```

Create a Conditional Gaussian distribution with conditional mean function obtained by running `RegressionFunction` on `predictors`, `responses`.

Parameters

<i>predictors</i>	Matrix of predictors (X).
<i>responses</i>	Vector of responses (y).

Definition at line 52 of file `regression_distribution.hpp`.

39.259.2.3 RegressionDistribution() [3/3]

```
RegressionDistribution (  
    const arma::mat & predictors,  
    const arma::rowvec & responses ) [inline]
```

Create a Conditional Gaussian distribution with conditional mean function obtained by running `RegressionFunction` on `predictors`, `responses`.

Parameters

<i>predictors</i>	Matrix of predictors (X).
<i>responses</i>	Vector of responses (y).

Definition at line 64 of file `regression_distribution.hpp`.

References `LinearRegression::ComputeError()`, `GaussianDistribution::Covariance()`, and `LinearRegression::Train()`.

39.259.3 Member Function Documentation

39.259.3.1 Dimensionality()

```
size_t Dimensionality ( ) const [inline]
```

Return the dimensionality.

Definition at line 156 of file `regression_distribution.hpp`.

References `LinearRegression::Parameters()`.

39.259.3.2 Err() [1/2]

```
const GaussianDistribution& Err ( ) const [inline]
```

Return error distribution.

Definition at line 90 of file `regression_distribution.hpp`.

39.259.3.3 Err() [2/2]

```
GaussianDistribution& Err ( ) [inline]
```

Modify error distribution.

Definition at line 92 of file `regression_distribution.hpp`.

References `mlpack_deprecated`, `RegressionDistribution::Probability()`, and `RegressionDistribution::Train()`.

39.259.3.4 LogProbability()

```
double LogProbability (
    const arma::vec & observation ) const [inline]
```

Evaluate log probability density function of given observation.

Parameters

<i>observation</i>	Point to evaluate log probability at.
--------------------	---------------------------------------

Definition at line 130 of file regression_distribution.hpp.

References `mlpack_deprecated`, `RegressionDistribution::Predict()`, and `RegressionDistribution::Probability()`.

39.259.3.5 Parameters()

```
const arma::vec& Parameters ( ) const [inline]
```

Return the parameters (the *b* vector).

Definition at line 153 of file regression_distribution.hpp.

References `LinearRegression::Parameters()`.

39.259.3.6 Predict() [1/2]

```
mlpack_deprecated void Predict (
    const arma::mat & points,
    arma::vec & predictions ) const
```

Calculate y_i for each data point in *points*.

Parameters

<i>points</i>	The data points to calculate with.
<i>predictions</i>	Y, will contain calculated values on completion.

Referenced by `RegressionDistribution::LogProbability()`.

39.259.3.7 Predict() [2/2]

```
void Predict (
    const arma::mat & points,
    arma::rowvec & predictions ) const
```

Calculate y_i for each data point in *points*.

Parameters

<i>points</i>	The data points to calculate with.
<i>predictions</i>	Y, will contain calculated values on completion.

39.259.3.8 Probability()

```
double Probability (
    const arma::vec & observation ) const
```

Evaluate probability density function of given observation.

Parameters

<i>observation</i>	Point to evaluate probability at.
--------------------	-----------------------------------

Referenced by RegressionDistribution::Err(), and RegressionDistribution::LogProbability().

39.259.3.9 Rf() [1/2]

```
const regression::LinearRegression& Rf ( ) const [inline]
```

Return regression function.

Definition at line 85 of file regression_distribution.hpp.

39.259.3.10 Rf() [2/2]

```
regression::LinearRegression& Rf ( ) [inline]
```

Modify regression function.

Definition at line 87 of file regression_distribution.hpp.

39.259.3.11 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the distribution.

Definition at line 78 of file `regression_distribution.hpp`.

39.259.3.12 `Train()` [1/3]

```
void Train (
    const arma::mat & observations )
```

Estimate the Gaussian distribution directly from the given observations.

Parameters

<i>observations</i>	List of observations.
---------------------	-----------------------

Referenced by `RegressionDistribution::Err()`.

39.259.3.13 `Train()` [2/3]

```
mlpack_deprecated void Train (
    const arma::mat & observations,
    const arma::vec & weights )
```

Estimate parameters using provided observation weights.

Parameters

<i>observations</i>	List of observations.
<i>weights</i>	Probability that given observation is from distribution.

39.259.3.14 `Train()` [3/3]

```
void Train (
    const arma::mat & observations,
    const arma::rowvec & weights )
```

Estimate parameters using provided observation weights.

Parameters

<i>observations</i>	List of observations.
<i>weights</i>	Probability that given observation is from distribution.

39.260 DTBRules< MetricType, TreeType > Class Template Reference

Public Types

- typedef **tree::TraversallInfo**< TreeType > **TraversallInfoType**

Public Member Functions

- **DTBRules** (const arma::mat &dataSet, **UnionFind** &connections, arma::vec &neighborsDistances, arma::Col< size_t > &neighborsInComponent, arma::Col< size_t > &neighborsOutComponent, MetricType &metric)
- double **BaseCase** (const size_t queryIndex, const size_t referenceIndex)
- size_t **BaseCases** () const
Get the number of base cases performed.
- size_t & **BaseCases** ()
Modify the number of base cases performed.
- double **Rescore** (const size_t queryIndex, TreeType &referenceNode, const double oldScore)
Re-evaluate the score for recursion order.
- double **Rescore** (TreeType &queryNode, TreeType &referenceNode, const double oldScore) const
Re-evaluate the score for recursion order.
- double **Score** (const size_t queryIndex, TreeType &referenceNode)
Get the score for recursion order.
- double **Score** (TreeType &queryNode, TreeType &referenceNode)
Get the score for recursion order.
- size_t **Scores** () const
Get the number of node combinations that have been scored.
- size_t & **Scores** ()
Modify the number of node combinations that have been scored.
- const **TraversallInfoType** & **TraversallInfo** () const
- **TraversallInfoType** & **TraversallInfo** ()

39.260.1 Detailed Description

```
template<typename MetricType, typename TreeType>
class mlpack::emst::DTBRules< MetricType, TreeType >
```

Definition at line 23 of file dtb_rules.hpp.

39.260.2 Member Typedef Documentation

39.260.2.1 TraversalInfoType

```
typedef tree::TraversalInfo<TreeType> TraversalInfoType
```

Definition at line 85 of file dtb_rules.hpp.

39.260.3 Constructor & Destructor Documentation

39.260.3.1 DTBRules()

```
DTBRules (
    const arma::mat & dataSet,
    UnionFind & connections,
    arma::vec & neighborsDistances,
    arma::Col< size_t > & neighborsInComponent,
    arma::Col< size_t > & neighborsOutComponent,
    MetricType & metric )
```

39.260.4 Member Function Documentation

39.260.4.1 BaseCase()

```
double BaseCase (
    const size_t queryIndex,
    const size_t referenceIndex )
```

39.260.4.2 BaseCases() [1/2]

```
size_t BaseCases ( ) const [inline]
```

Get the number of base cases performed.

Definition at line 91 of file dtb_rules.hpp.

39.260.4.3 BaseCases() [2/2]

```
size_t& BaseCases ( ) [inline]
```

Modify the number of base cases performed.

Definition at line 93 of file dtb_rules.hpp.

39.260.4.4 Rescore() [1/2]

```
double Rescore (
    const size_t queryIndex,
    TreeType & referenceNode,
    const double oldScore )
```

Re-evaluate the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned). This is used when the score has already been calculated, but another recursion may have modified the bounds for pruning. So the old score is checked against the new pruning bound.

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceNode</i>	Candidate node to be recursed into.
<i>oldScore</i>	Old score produced by Score() (p. 1267) (or Rescore() (p. 1266)).

39.260.4.5 Rescore() [2/2]

```
double Rescore (
    TreeType & queryNode,
```

```
TreeType & referenceNode,
const double oldScore ) const
```

Re-evaluate the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned). This is used when the score has already been calculated, but another recursion may have modified the bounds for pruning. So the old score is checked against the new pruning bound.

Parameters

<i>queryNode</i>	Candidate query node to recurse into.
<i>referenceNode</i>	Candidate reference node to recurse into.
<i>oldScore</i>	Old score produced by Socre() (or Rescore() (p. 1266)).

39.260.4.6 Score() [1/2]

```
double Score (
    const size_t queryIndex,
    TreeType & referenceNode )
```

Get the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned).

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceNode</i>	Candidate node to be recursed into.

39.260.4.7 Score() [2/2]

```
double Score (
    TreeType & queryNode,
    TreeType & referenceNode )
```

Get the score for recursion order.

A low score indicates priority for recursionm while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned).

Parameters

<i>queryNode</i>	Candidate query node to recurse into.
<i>referenceNode</i>	Candidate reference node to recurse into.

39.260.4.8 Scores() [1/2]

```
size_t Scores ( ) const [inline]
```

Get the number of node combinations that have been scored.

Definition at line 96 of file dtb_rules.hpp.

39.260.4.9 Scores() [2/2]

```
size_t& Scores ( ) [inline]
```

Modify the number of node combinations that have been scored.

Definition at line 98 of file dtb_rules.hpp.

39.260.4.10 TraversalInfo() [1/2]

```
const TraversalInfoType& TraversalInfo ( ) const [inline]
```

Definition at line 87 of file dtb_rules.hpp.

39.260.4.11 TraversalInfo() [2/2]

```
TraversalInfoType& TraversalInfo ( ) [inline]
```

Definition at line 88 of file dtb_rules.hpp.

39.261 DTBStat Class Reference

A statistic for use with mlpack trees, which stores the upper bound on distance to nearest neighbors and the component which this node belongs to.

Public Member Functions

- **DTBStat** ()
A generic initializer.
- template<typename TreeType >
DTBStat (const TreeType &node)
This is called when a node is finished initializing.
- double **Bound** () const
Get the total bound for pruning.
- double & **Bound** ()
Modify the total bound for pruning.
- int **ComponentMembership** () const
Get the component membership of this node.
- int & **ComponentMembership** ()
Modify the component membership of this node.
- double **MaxNeighborDistance** () const
Get the maximum neighbor distance.
- double & **MaxNeighborDistance** ()
Modify the maximum neighbor distance.
- double **MinNeighborDistance** () const
Get the minimum neighbor distance.
- double & **MinNeighborDistance** ()
Modify the minimum neighbor distance.

39.261.1 Detailed Description

A statistic for use with mlpack trees, which stores the upper bound on distance to nearest neighbors and the component which this node belongs to.

Definition at line 24 of file dtb_stat.hpp.

39.261.2 Constructor & Destructor Documentation

39.261.2.1 DTBStat() [1/2]

```
DTBStat ( ) [inline]
```

A generic initializer.

Sets the maximum neighbor distance to its default, and the component membership to -1 (no component).

Definition at line 49 of file dtb_stat.hpp.

39.261.2.2 DTBStat() [2/2]

```
DTBStat (
    const TreeType & node ) [inline]
```

This is called when a node is finished initializing.

We set the maximum neighbor distance to its default, and if possible, we set the component membership of the node (if it has only one point and no children).

Parameters

<i>node</i>	Node that has been finished.
-------------	------------------------------

Definition at line 63 of file dtb_stat.hpp.

39.261.3 Member Function Documentation**39.261.3.1 Bound()** [1/2]

```
double Bound ( ) const [inline]
```

Get the total bound for pruning.

Definition at line 82 of file dtb_stat.hpp.

39.261.3.2 Bound() [2/2]

```
double& Bound ( ) [inline]
```

Modify the total bound for pruning.

Definition at line 84 of file dtb_stat.hpp.

39.261.3.3 ComponentMembership() [1/2]

```
int ComponentMembership ( ) const [inline]
```

Get the component membership of this node.

Definition at line 87 of file dtb_stat.hpp.

39.261.3.4 ComponentMembership() [2/2]

```
int& ComponentMembership ( ) [inline]
```

Modify the component membership of this node.

Definition at line 89 of file dtb_stat.hpp.

39.261.3.5 MaxNeighborDistance() [1/2]

```
double MaxNeighborDistance ( ) const [inline]
```

Get the maximum neighbor distance.

Definition at line 72 of file dtb_stat.hpp.

39.261.3.6 MaxNeighborDistance() [2/2]

```
double& MaxNeighborDistance ( ) [inline]
```

Modify the maximum neighbor distance.

Definition at line 74 of file dtb_stat.hpp.

39.261.3.7 MinNeighborDistance() [1/2]

```
double MinNeighborDistance ( ) const [inline]
```

Get the minimum neighbor distance.

Definition at line 77 of file dtb_stat.hpp.

39.261.3.8 MinNeighborDistance() [2/2]

```
double& MinNeighborDistance ( ) [inline]
```

Modify the minimum neighbor distance.

Definition at line 79 of file dtb_stat.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/emst/ **dtb_stat.hpp**

39.262 DualTreeBoruvka< MetricType, MatType, TreeType > Class Template Reference

Performs the MST calculation using the Dual-Tree Boruvka algorithm, using any type of tree.

Public Types

- typedef TreeType< MetricType, **DTBStat**, MatType > **Tree**
Convenience typedef.

Public Member Functions

- **DualTreeBoruvka** (const MatType &dataset, const bool naive=false, const MetricType metric=MetricType())
Create the tree from the given dataset.
- **DualTreeBoruvka** (**Tree** *tree, const MetricType metric=MetricType())
*Create the **DualTreeBoruvka** (p. 1272) object with an already initialized tree.*
- **~DualTreeBoruvka** ()
Delete the tree, if it was created inside the object.
- void **ComputeMST** (arma::mat &results)
Iteratively find the nearest neighbor of each component until the MST is complete.

39.262.1 Detailed Description

```
template<typename MetricType = metric::EuclideanDistance, typename MatType = arma::mat, template< typename TreeMetricType,
typename TreeStatType, typename TreeMatType > class TreeType = tree::KDTree>
class mlpack::emst::DualTreeBoruvka< MetricType, MatType, TreeType >
```

Performs the MST calculation using the Dual-Tree Boruvka algorithm, using any type of tree.

For more information on the algorithm, see the following citation:

```
@inproceedings{
  author = {March, W.B., Ram, P., and Gray, A.G.},
  title = {{Fast Euclidean Minimum Spanning Tree: Algorithm, Analysis,
    Applications.}},
  booktitle = {Proceedings of the 16th ACM SIGKDD International Conference
    on Knowledge Discovery and Data Mining}
  series = {KDD 2010},
  year = {2010}
}
```

General usage of this class might be like this:

```
extern arma::mat data; // We want to find the MST of this dataset.
DualTreeBoruvka<> dtb(data); // Create the tree with default options.

// Find the MST.
arma::mat mstResults;
dtb.ComputeMST(mstResults);
```

More advanced usage of the class can use different types of trees, pass in an already-built tree, or compute the MST using the $O(n^2)$ naive algorithm.

Template Parameters

<i>MetricType</i>	The metric to use.
<i>MatType</i>	The type of data matrix to use.
<i>TreeType</i>	Type of tree to use. This should follow the TreeType policy API.

Definition at line 83 of file dtb.hpp.

39.262.2 Member Typedef Documentation

39.262.2.1 Tree

```
typedef TreeType<MetricType, DTBStat, MatType> Tree
```

Convenience typedef.

Definition at line 87 of file dtb.hpp.

39.262.3 Constructor & Destructor Documentation

39.262.3.1 DualTreeBoruvka() [1/2]

```
DualTreeBoruvka (
    const MatType & dataset,
    const bool naive = false,
    const MetricType metric = MetricType() )
```

Create the tree from the given dataset.

This copies the dataset to an internal copy, because tree-building modifies the dataset.

Parameters

<i>data</i>	Dataset to build a tree for.
<i>naive</i>	Whether the computation should be done in $O(n^2)$ naive mode.
<i>metric</i>	An optional instantiated metric to use.

39.262.3.2 DualTreeBoruvka() [2/2]

```
DualTreeBoruvka (
    Tree * tree,
    const MetricType metric = MetricType() )
```

Create the **DualTreeBoruvka** (p. 1272) object with an already initialized tree.

This will not copy the dataset, and can save a little processing power. Naive mode is not available as an option for this constructor; instead, to run naive computation, construct a tree with all the points in one leaf (i.e. leafSize = number of points).

Note

Because tree-building (at least with BinarySpaceTree) modifies the ordering of a matrix, be sure you pass the modified matrix to this object! In addition, mapping the points of the matrix back to their original indices is not done when this constructor is used.

Parameters

<i>tree</i>	Pre-built tree.
<i>metric</i>	An optional instantiated metric to use.

39.262.3.3 `~DualTreeBoruvka()`

`~ DualTreeBoruvka ()`

Delete the tree, if it was created inside the object.

39.262.4 Member Function Documentation

39.262.4.1 `ComputeMST()`

```
void ComputeMST (
    arma::mat & results )
```

Iteratively find the nearest neighbor of each component until the MST is complete.

The results will be a 3xN matrix (with N equal to the number of edges in the minimum spanning tree). The first row will contain the lesser index of the edge; the second row will contain the greater index of the edge; and the third row will contain the distance between the two edges.

Parameters

<i>results</i>	Matrix which results will be stored in.
----------------	---

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/emst/ dtb.hpp`

39.263 EdgePair Class Reference

An edge pair is simply two indices and a distance.

Public Member Functions

- **EdgePair** (const size_t lesser, const size_t greater, const double dist)
*Initialize an **EdgePair** (p. 1275) with two indices and a distance.*
- double **Distance** () const
Get the distance.

- double & **Distance** ()
Modify the distance.
- size_t **Greater** () const
Get the greater index.
- size_t & **Greater** ()
Modify the greater index.
- size_t **Lesser** () const
Get the lesser index.
- size_t & **Lesser** ()
Modify the lesser index.

39.263.1 Detailed Description

An edge pair is simply two indices and a distance.

It is used as the basic element of an edge list when computing a minimum spanning tree.

Definition at line 28 of file edge_pair.hpp.

39.263.2 Constructor & Destructor Documentation

39.263.2.1 EdgePair()

```
EdgePair (
    const size_t lesser,
    const size_t greater,
    const double dist ) [inline]
```

Initialize an **EdgePair** (p. 1275) with two indices and a distance.

The indices are called lesser and greater, implying that they be sorted before calling Init. However, this is not necessary for functionality; it is just a way to keep the edge list organized in other code.

Definition at line 45 of file edge_pair.hpp.

References Log::Assert().

39.263.3 Member Function Documentation

39.263.3.1 Distance() [1/2]

```
double Distance ( ) const [inline]
```

Get the distance.

Definition at line 63 of file edge_pair.hpp.

39.263.3.2 Distance() [2/2]

```
double& Distance ( ) [inline]
```

Modify the distance.

Definition at line 65 of file edge_pair.hpp.

39.263.3.3 Greater() [1/2]

```
size_t Greater ( ) const [inline]
```

Get the greater index.

Definition at line 58 of file edge_pair.hpp.

39.263.3.4 Greater() [2/2]

```
size_t& Greater ( ) [inline]
```

Modify the greater index.

Definition at line 60 of file edge_pair.hpp.

39.263.3.5 Lesser() [1/2]

```
size_t Lesser ( ) const [inline]
```

Get the lesser index.

Definition at line 53 of file edge_pair.hpp.

39.263.3.6 Lesser() [2/2]

```
size_t& Lesser ( ) [inline]
```

Modify the lesser index.

Definition at line 55 of file edge_pair.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/emst/ **edge_pair.hpp**

39.264 UnionFind Class Reference

A Union-Find data structure.

Public Member Functions

- **UnionFind** (const size_t size)
Construct the object with the given size.
- **~UnionFind** ()
Destroy the object (nothing to do).
- size_t **Find** (const size_t x)
Returns the component containing an element.
- void **Union** (const size_t x, const size_t y)
Union the components containing x and y.

39.264.1 Detailed Description

A Union-Find data structure.

See Cormen, Rivest, & Stein for details. The structure tracks the components of a graph. Each point in the graph is initially in its own component. Calling Union(x, y) unites the components indexed by x and y. Find(x) returns the index of the component containing point x.

Definition at line 30 of file union_find.hpp.

39.264.2 Constructor & Destructor Documentation

39.264.2.1 UnionFind()

```
UnionFind (
    const size_t size ) [inline]
```

Construct the object with the given size.

Definition at line 38 of file union_find.hpp.

39.264.2.2 ~UnionFind()

```
~ UnionFind ( ) [inline]
```

Destroy the object (nothing to do).

Definition at line 48 of file union_find.hpp.

39.264.3 Member Function Documentation

39.264.3.1 Find()

```
size_t Find (
    const size_t x ) [inline]
```

Returns the component containing an element.

Parameters

x	the component to be found
---	---------------------------

Returns

The index of the component containing x

Definition at line 56 of file union_find.hpp.

Referenced by UnionFind::Union().

39.264.3.2 Union()

```
void Union (
    const size_t x,
    const size_t y ) [inline]
```

Union the components containing x and y.

Parameters

x	one component
y	the other component

Definition at line 76 of file union_find.hpp.

References UnionFind::Find().

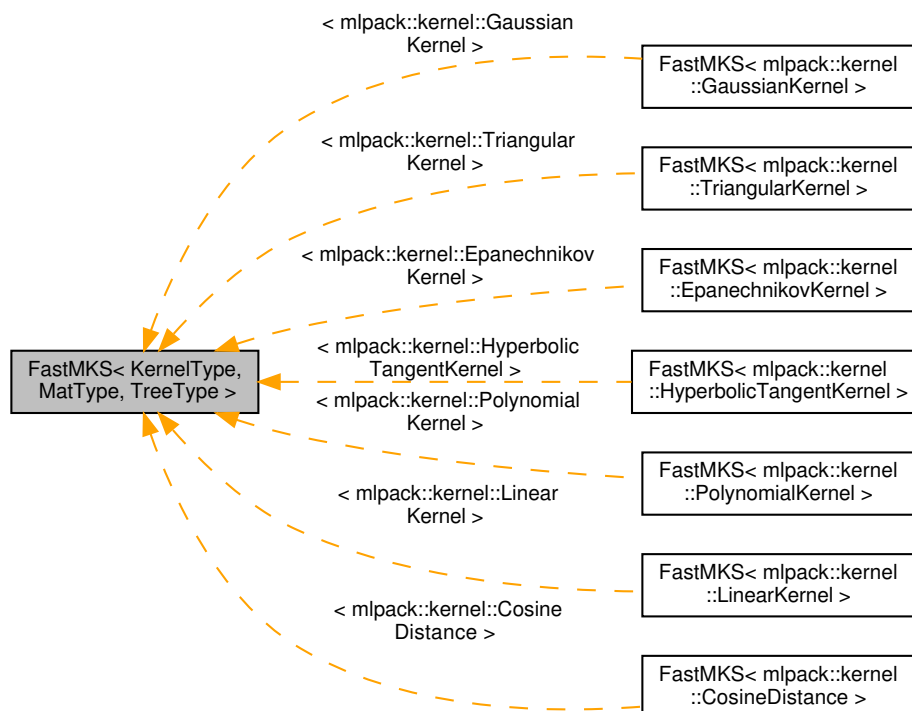

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/emst/ **union_find.hpp**

39.265 FastMKS< KernelType, MatType, TreeType > Class Template Reference

An implementation of fast exact max-kernel search.

Inheritance diagram for FastMKS< KernelType, MatType, TreeType >:

Public Types

- typedef TreeType< **metric::IPMetric**< KernelType >, **FastMKSStat**, MatType > **Tree**

Convenience typedef.

Public Member Functions

- **FastMKS** (const bool singleMode=false, const bool naive=false)
*Create the **FastMKS** (p. 1280) object with an empty reference set and default kernel.*
- **FastMKS** (const MatType &referenceSet, const bool singleMode=false, const bool naive=false)
*Create the **FastMKS** (p. 1280) object with the given reference set (this is the set that is searched).*
- **FastMKS** (const MatType &referenceSet, KernelType &kernel, const bool singleMode=false, const bool naive=false)
*Create the **FastMKS** (p. 1280) object using the reference set (this is the set that is searched) with an initialized kernel.*
- **FastMKS** (MatType &&referenceSet, const bool singleMode=false, const bool naive=false)
*Create the **FastMKS** (p. 1280) object with the given reference set (this is the set that is searched), taking ownership of the reference set.*
- **FastMKS** (MatType &&referenceSet, KernelType &kernel, const bool singleMode=false, const bool naive=false)
*Create the **FastMKS** (p. 1280) object using the reference set (this is the set that is searched) with an initialized kernel, taking ownership of the reference set.*
- **FastMKS** (**Tree** *referenceTree, const bool singleMode=false)
*Create the **FastMKS** (p. 1280) object with an already-initialized tree built on the reference points.*
- **FastMKS** (const **FastMKS** &other)
Copy the parameters of the given model.
- **FastMKS** (**FastMKS** &&other)
Take ownership of the given model.
- **~FastMKS** ()
*Destructor for the **FastMKS** (p. 1280) object.*
- const **metric::IPMetric**< KernelType > & **Metric** () const
Get the inner-product metric induced by the given kernel.
- **metric::IPMetric**< KernelType > & **Metric** ()
Modify the inner-product metric induced by the given kernel.
- bool **Naive** () const
Get whether or not brute-force (naive) search is used.
- bool & **Naive** ()
Modify whether or not brute-force (naive) search is used.
- **FastMKS** & **operator=** (const **FastMKS** &other)
Assign this model to be a copy of the given model.
- void **Search** (const MatType &querySet, const size_t k, arma::Mat< size_t > &indices, arma::mat &kernels)
Search for the points in the reference set with maximum kernel evaluation to each point in the given query set.
- void **Search** (**Tree** *querySet, const size_t k, arma::Mat< size_t > &indices, arma::mat &kernels)
Search for the points in the reference set with maximum kernel evaluation to each point in the query set corresponding to the given pre-built query tree.
- void **Search** (const size_t k, arma::Mat< size_t > &indices, arma::mat &products)
Search for the maximum inner products of the query set (or if no query set was passed, the reference set is used).
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)

- *Serialize the model.*
- `bool SingleMode () const`
Get whether or not single-tree search is used.
- `bool & SingleMode ()`
Modify whether or not single-tree search is used.
- `void Train (const MatType &referenceSet)`
*"Train" the **FastMKS** (p. 1280) model on the given reference set (this will just build a tree, if the current search mode is not naive mode).*
- `void Train (const MatType &referenceSet, KernelType &kernel)`
*"Train" the **FastMKS** (p. 1280) model on the given reference set and use the given kernel.*
- `void Train (MatType &&referenceSet)`
*"Train" the **FastMKS** (p. 1280) model on the given reference set (this will just build a tree, if the current search mode is not naive mode).*
- `void Train (MatType &&referenceSet, KernelType &kernel)`
*"Train" the **FastMKS** (p. 1280) model on the given reference set and use the given kernel.*
- `void Train (Tree *referenceTree)`
*Train the **FastMKS** (p. 1280) model on the given reference tree.*

39.265.1 Detailed Description

```
template<typename KernelType, typename MatType = arma::mat, template< typename TreeMetricType, typename TreeStatType, type-
name TreeMatType > class TreeType = tree::StandardCoverTree>
class mlpack::fastmks::FastMKS< KernelType, MatType, TreeType >
```

An implementation of fast exact max-kernel search.

Given a query dataset and a reference dataset (or optionally just a reference dataset which is also used as the query dataset), fast exact max-kernel search finds, for each point in the query dataset, the k points in the reference set with maximum kernel value $K(p_q, p_r)$, where k is a specified parameter and $K()$ is a Mercer kernel.

For more information, see the following paper.

```
@inproceedings{curtin2013fast,
  title={Fast Exact Max-Kernel Search},
  author={Curtin, Ryan R. and Ram, Parikshit and Gray, Alexander G.},
  booktitle={Proceedings of the 2013 SIAM International Conference on Data
    Mining (SDM 13)},
  year={2013}
}
```

This class allows specification of the type of kernel and also of the type of tree. **FastMKS** (p. 1280) can be run on kernels that work on arbitrary objects – however, this only works with cover trees and other trees that are built only on points in the dataset (and not centroids of regions or anything like that).

Template Parameters

<i>KernelType</i>	Type of kernel to run FastMKS (p. 1280) with.
<i>MatType</i>	Type of data matrix (usually <code>arma::mat</code>).
<i>TreeType</i>	Type of tree to run FastMKS (p. 1280) with; it must satisfy the <code>TreeType</code> policy API.

Definition at line 63 of file fastmks.hpp.

39.265.2 Member Typedef Documentation

39.265.2.1 Tree

```
typedef TreeType< metric::IPMetric<KernelType>, FastMKStat, MatType> Tree
```

Convenience typedef.

Definition at line 67 of file fastmks.hpp.

39.265.3 Constructor & Destructor Documentation

39.265.3.1 FastMKS() [1/8]

```
FastMKS (
    const bool singleMode = false,
    const bool naive = false )
```

Create the **FastMKS** (p. 1280) object with an empty reference set and default kernel.

Make sure to call **Train()** (p. 1289) before **Search()** (p. 1287) is called!

Parameters

<i>singleMode</i>	Whether or not to run single-tree search.
<i>naive</i>	Whether or not to run brute-force (naive) search.

39.265.3.2 FastMKS() [2/8]

```
FastMKS (
    const MatType & referenceSet,
    const bool singleMode = false,
    const bool naive = false )
```

Create the **FastMKS** (p. 1280) object with the given reference set (this is the set that is searched).

Optionally, specify whether or not single-tree search or naive (brute-force) search should be used.

Parameters

<i>referenceSet</i>	Set of reference data.
<i>singleMode</i>	Whether or not to run single-tree search.
<i>naive</i>	Whether or not to run brute-force (naive) search.

39.265.3.3 **FastMKS()** [3/8]

```
FastMKS (
    const MatType & referenceSet,
    KernelType & kernel,
    const bool singleMode = false,
    const bool naive = false )
```

Create the **FastMKS** (p. 1280) object using the reference set (this is the set that is searched) with an initialized kernel.

This is useful for when the kernel stores state. Optionally, specify whether or not single-tree search or naive (brute-force) search should be used.

Parameters

<i>referenceSet</i>	Reference set of data for FastMKS (p. 1280).
<i>kernel</i>	Initialized kernel.
<i>single</i>	Whether or not to run single-tree search.
<i>naive</i>	Whether or not to run brute-force (naive) search.

39.265.3.4 **FastMKS()** [4/8]

```
FastMKS (
    MatType && referenceSet,
    const bool singleMode = false,
    const bool naive = false )
```

Create the **FastMKS** (p. 1280) object with the given reference set (this is the set that is searched), taking ownership of the reference set.

Optionally, specify whether or not single-tree search or naive (brute-force) search should be used.

Parameters

<i>referenceSet</i>	Set of reference data.
<i>singleMode</i>	Whether or not to run single-tree search.
<i>naive</i>	Whether or not to run brute-force (naive) search.

39.265.3.5 FastMKS() [5/8]

```

FastMKS (
    MatType && referenceSet,
    KernelType & kernel,
    const bool singleMode = false,
    const bool naive = false )

```

Create the **FastMKS** (p. 1280) object using the reference set (this is the set that is searched) with an initialized kernel, taking ownership of the reference set.

This is useful for when the kernel stores state. Optionally, specify whether or not single-tree search or naive (brute-force) search should be used.

Parameters

<i>referenceSet</i>	Reference set of data for FastMKS (p. 1280).
<i>kernel</i>	Initialized kernel.
<i>single</i>	Whether or not to run single-tree search.
<i>naive</i>	Whether or not to run brute-force (naive) search.

39.265.3.6 FastMKS() [6/8]

```

FastMKS (
    Tree * referenceTree,
    const bool singleMode = false )

```

Create the **FastMKS** (p. 1280) object with an already-initialized tree built on the reference points.

Be sure that the tree is built with the metric type IPMetric<KernelType>. Optionally, whether or not to run single-tree search can be specified. Brute-force search is not available with this constructor since a tree is given (use one of the other constructors).

Parameters

<i>referenceTree</i>	Tree built on reference data.
<i>single</i>	Whether or not to run single-tree search.
<i>naive</i>	Whether or not to run brute-force (naive) search.

39.265.3.7 FastMKS() [7/8]

```
FastMKS (
    const FastMKS< KernelType, MatType, TreeType > & other )
```

Copy the parameters of the given model.

39.265.3.8 FastMKS() [8/8]

```
FastMKS (
    FastMKS< KernelType, MatType, TreeType > && other )
```

Take ownership of the given model.

39.265.3.9 ~FastMKS()

```
~ FastMKS ( )
```

Destructor for the **FastMKS** (p. 1280) object.

39.265.4 Member Function Documentation**39.265.4.1 Metric()** [1/2]

```
const metric::IPMetric<KernelType>& Metric ( ) const [inline]
```

Get the inner-product metric induced by the given kernel.

Definition at line 287 of file fastmks.hpp.

39.265.4.2 Metric() [2/2]

```
metric::IPMetric<KernelType>& Metric ( ) [inline]
```

Modify the inner-product metric induced by the given kernel.

Definition at line 289 of file fastmks.hpp.

39.265.4.3 Naive() [1/2]

```
bool Naive ( ) const [inline]
```

Get whether or not brute-force (naive) search is used.

Definition at line 297 of file fastmks.hpp.

39.265.4.4 Naive() [2/2]

```
bool& Naive ( ) [inline]
```

Modify whether or not brute-force (naive) search is used.

Definition at line 299 of file fastmks.hpp.

39.265.4.5 operator=()

```
FastMKS& operator= (
    const FastMKS< KernelType, MatType, TreeType > & other )
```

Assign this model to be a copy of the given model.

39.265.4.6 Search() [1/3]

```
void Search (
    const MatType & querySet,
    const size_t k,
    arma::Mat< size_t > & indices,
    arma::mat & kernels )
```

Search for the points in the reference set with maximum kernel evaluation to each point in the given query set.

The resulting kernel evaluations are stored in the kernels matrix, and the corresponding point indices are stored in the indices matrix. The results for each point in the query set are stored in the corresponding column of the kernels and products matrices; for instance, the index of the point with maximum kernel evaluation to point 4 in the query set will be stored in row 0 and column 4 of the indices matrix.

If querySet only contains a few points, the extra overhead of building a tree to perform dual-tree search may not be warranted, and it may be faster to use single-tree search, either by setting singleMode to false in the constructor or with **SingleMode()** (p. 1289).

Parameters

<i>querySet</i>	Set of query points (can be a single point).
<i>k</i>	The number of maximum kernels to find.
<i>indices</i>	Matrix to store resulting indices of max-kernel search in.
<i>kernels</i>	Matrix to store resulting max-kernel values in.

39.265.4.7 Search() [2/3]

```
void Search (
    Tree * querySet,
    const size_t k,
    arma::Mat< size_t > & indices,
    arma::mat & kernels )
```

Search for the points in the reference set with maximum kernel evaluation to each point in the query set corresponding to the given pre-built query tree.

The resulting kernel evaluations are stored in the kernels matrix, and the corresponding point indices are stored in the indices matrix. The results for each point in the query set are stored in the corresponding column of the kernels and products matrices; for instance, the index of the point with maximum kernel evaluation to point 4 in the query set will be stored in row 0 and column 4 of the indices matrix.

This will throw an exception if called while the **FastMKS** (p. 1280) object has 'single' set to true.

Be aware that if your tree modifies the original input matrix, the results here are with respect to the modified input matrix (that is, queryTree->Dataset()).

Parameters

<i>queryTree</i>	Tree built on query points.
<i>k</i>	The number of maximum kernels to find.
<i>indices</i>	Matrix to store resulting indices of max-kernel search in.
<i>kernels</i>	Matrix to store resulting max-kernel values in.

39.265.4.8 Search() [3/3]

```
void Search (
    const size_t k,
    arma::Mat< size_t > & indices,
    arma::mat & products )
```

Search for the maximum inner products of the query set (or if no query set was passed, the reference set is used).

The resulting maximum inner products are stored in the products matrix and the corresponding point indices are stores in the indices matrix. The results for each point in the query set are stored in the corresponding column of the indices and products matrices; for instance, the index of the point with maximum inner product to point 4 in the query set will be stored in row 0 and column 4 of the indices matrix.

Parameters

<i>k</i>	The number of maximum kernels to find.
<i>indices</i>	Matrix to store resulting indices of max-kernel search in.
<i>products</i>	Matrix to store resulting max-kernel values in.

39.265.4.9 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the model.

Referenced by FastMKS< mlpack::kernel::CosineDistance >::Naive().

39.265.4.10 SingleMode() [1/2]

```
bool SingleMode ( ) const [inline]
```

Get whether or not single-tree search is used.

Definition at line 292 of file fastmks.hpp.

39.265.4.11 SingleMode() [2/2]

```
bool& SingleMode ( ) [inline]
```

Modify whether or not single-tree search is used.

Definition at line 294 of file fastmks.hpp.

39.265.4.12 Train() [1/5]

```
void Train (
    const MatType & referenceSet )
```

"Train" the **FastMKS** (p. 1280) model on the given reference set (this will just build a tree, if the current search mode is not naive mode).

Parameters

<i>referenceSet</i>	Set of reference points.
---------------------	--------------------------

39.265.4.13 **Train()** [2/5]

```
void Train (
    const MatType & referenceSet,
    KernelType & kernel )
```

"Train" the **FastMKS** (p. 1280) model on the given reference set and use the given kernel.

This will just build a tree and replace the metric, if the current search mode is not naive mode.

Parameters

<i>referenceSet</i>	Set of reference points.
<i>kernel</i>	Kernel to use for search.

39.265.4.14 **Train()** [3/5]

```
void Train (
    MatType && referenceSet )
```

"Train" the **FastMKS** (p. 1280) model on the given reference set (this will just build a tree, if the current search mode is not naive mode).

This takes ownership of the reference set.

Parameters

<i>referenceSet</i>	Set of reference points.
---------------------	--------------------------

39.265.4.15 **Train()** [4/5]

```
void Train (
    MatType && referenceSet,
    KernelType & kernel )
```

"Train" the **FastMKS** (p. 1280) model on the given reference set and use the given kernel.

This will just build a tree and replace the metric, if the current search mode is not naive mode. This takes ownership of the reference set.

Parameters

<i>referenceSet</i>	Set of reference points.
<i>kernel</i>	Kernel to use for search.

39.265.4.16 Train() [5/5]

```
void Train (
    Tree * referenceTree )
```

Train the **FastMKS** (p. 1280) model on the given reference tree.

This takes ownership of the tree, so you do not need to delete it! This will throw an exception if the model is searching in naive mode (i.e. if **Naive()** (p. 1287) == true).

Parameters

<i>tree</i>	Tree to use as reference data.
-------------	--------------------------------

The documentation for this class was generated from the following file:

Clean memory.

39.266.4 Member Function Documentation

39.266.4.1 BuildModel()

```
void BuildModel (
    arma::mat && referenceData,
    TKernelType & kernel,
    const bool singleMode,
    const bool naive,
    const double base )
```

Build the model on the given reference set.

Make sure `kernelType` is equal to the correct entry in `KernelTypes` for the given `KernelType` class!

39.266.4.2 KernelType() [1/2]

```
int KernelType ( ) const [inline]
```

Get the kernel type.

Definition at line 90 of file `fastmks_model.hpp`.

39.266.4.3 KernelType() [2/2]

```
int& KernelType ( ) [inline]
```

Modify the kernel type.

Definition at line 92 of file `fastmks_model.hpp`.

References `FastMKModel::Search()`, and `FastMKModel::serialize()`.

39.266.4.4 Naive() [1/2]

```
bool Naive ( ) const
```

Get whether or not naive search is used.

39.266.4.5 Naive() [2/2]

```
bool& Naive ( )
```

Set whether or not naive search is used.

39.266.4.6 operator=()

```
FastMKModel& operator= (
    const FastMKModel & other )
```

Copy assignment operator.

39.266.4.7 Search() [1/2]

```
void Search (
    const arma::mat & querySet,
    const size_t k,
    arma::Mat< size_t > & indices,
    arma::mat & kernels,
    const double base )
```

Search with a different query set.

Parameters

<i>querySet</i>	Set to search with.
<i>k</i>	Number of max-kernel candidates to search for.
<i>indices</i>	A matrix in which to store the indices of max-kernel candidates.
<i>kernels</i>	A matrix in which to store the max-kernel candidate kernel values.
<i>base</i>	Base to use for cover tree building (if in dual-tree search mode).

Referenced by `FastMKModel::KernelType()`.

39.266.4.8 Search() [2/2]

```
void Search (
    const size_t k,
    arma::Mat< size_t > & indices,
    arma::mat & kernels )
```

Search with the reference set as the query set.

Parameters

<i>k</i>	Number of max-kernel candidates to search for.
<i>indices</i>	A matrix in which to store the indices of max-kernel candidates.
<i>kernels</i>	A matrix in which to store the max-kernel candidate kernel values.

39.266.4.9 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the model.

Referenced by FastMKModel::KernelType().

39.266.4.10 SingleMode() [1/2]

```
bool SingleMode ( ) const
```

Get whether or not single-tree search is used.

39.266.4.11 SingleMode() [2/2]

```
bool& SingleMode ( )
```

Set whether or not single-tree search is used.

39.267 FastMKSRules< KernelType, TreeType > Class Template Reference

The **FastMKSRules** (p. 1298) class is a template helper class used by **FastMKS** (p. 1280) class when performing exact max-kernel search.

Public Types

- typedef **tree::TraversallInfo**< TreeType > **TraversallInfoType**

Public Member Functions

- **FastMKSRules** (const typename TreeType::Mat &referenceSet, const typename TreeType::Mat &querySet, const size_t k, KernelType &kernel)
*Construct the **FastMKSRules** (p. 1298) object.*
- double **BaseCase** (const size_t queryIndex, const size_t referenceIndex)
Compute the base case (kernel value) between two points.
- size_t **BaseCases** () const
*Get the number of times **BaseCase()** (p. 1300) was called.*
- size_t & **BaseCases** ()
*Modify the number of times **BaseCase()** (p. 1300) was called.*
- void **GetResults** (arma::Mat< size_t > &indices, arma::mat &products)
Store the list of candidates for each query point in the given matrices.
- double **Rescore** (const size_t queryIndex, TreeType &referenceNode, const double oldScore) const
Re-evaluate the score for recursion order.
- double **Rescore** (TreeType &queryNode, TreeType &referenceNode, const double oldScore) const
Re-evaluate the score for recursion order.
- double **Score** (const size_t queryIndex, TreeType &referenceNode)
Get the score for recursion order.
- double **Score** (TreeType &queryNode, TreeType &referenceNode)
Get the score for recursion order.
- size_t **Scores** () const
*Get the number of times **Score()** (p. 1301) was called.*
- size_t & **Scores** ()
*Modify the number of times **Score()** (p. 1301) was called.*
- const **TraversallInfoType** & **TraversallInfo** () const
- **TraversallInfoType** & **TraversallInfo** ()

39.267.1 Detailed Description

```
template<typename KernelType, typename TreeType>
class mlpack::fastmks::FastMKSRules< KernelType, TreeType >
```

The **FastMKSRules** (p. 1298) class is a template helper class used by **FastMKS** (p. 1280) class when performing exact max-kernel search.

For each point in the query dataset, it keeps track of the k best candidates in the reference dataset.

Template Parameters

<i>KernelType</i>	Type of kernel to run FastMKS (p. 1280) with.
<i>TreeType</i>	Type of tree to run FastMKS (p. 1280) with; it must satisfy the <i>TreeType</i> policy API.

Definition at line 34 of file `fastmks_rules.hpp`.

39.267.2 Member Typedef Documentation

39.267.2.1 TraversalInfoType

```
typedef tree::TraversalInfo<TreeType> TraversalInfoType
```

Definition at line 122 of file `fastmks_rules.hpp`.

39.267.3 Constructor & Destructor Documentation

39.267.3.1 FastMKSRules()

```
FastMKSRules (
    const typename TreeType::Mat & referenceSet,
    const typename TreeType::Mat & querySet,
    const size_t k,
    KernelType & kernel )
```

Construct the **FastMKSRules** (p. 1298) object.

This is usually done from within the **FastMKS** (p. 1280) class at search time.

Parameters

<i>referenceSet</i>	Set of reference data.
<i>querySet</i>	Set of query data.
<i>k</i>	Number of candidates to search for.
<i>kernel</i>	Kernel to run FastMKS (p. 1280) with.

39.267.4 Member Function Documentation

39.267.4.1 BaseCase()

```
double BaseCase (
    const size_t queryIndex,
    const size_t referenceIndex )
```

Compute the base case (kernel value) between two points.

39.267.4.2 BaseCases() [1/2]

```
size_t BaseCases ( ) const [inline]
```

Get the number of times **BaseCase()** (p. 1300) was called.

Definition at line 113 of file fastmks_rules.hpp.

39.267.4.3 BaseCases() [2/2]

```
size_t& BaseCases ( ) [inline]
```

Modify the number of times **BaseCase()** (p. 1300) was called.

Definition at line 115 of file fastmks_rules.hpp.

39.267.4.4 GetResults()

```
void GetResults (
    arma::Mat< size_t > & indices,
    arma::mat & products )
```

Store the list of candidates for each query point in the given matrices.

Parameters

<i>indices</i>	Matrix storing lists of candidate for each query point.
<i>products</i>	Matrix storing kernel value for each candidate.

39.267.4.5 Rescore() [1/2]

```
double Rescore (
    const size_t queryIndex,
    TreeType & referenceNode,
    const double oldScore ) const
```

Re-evaluate the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that a node should not be recursed into at all (it should be pruned). This is used when the score has already been calculated, but another recursion may have modified the bounds for pruning. So the old score is checked against the new pruning bound.

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceNode</i>	Candidate node to be recursed into.
<i>oldScore</i>	Old score produced by Score() (p. 1301) (or Rescore() (p. 1301)).

39.267.4.6 Rescore() [2/2]

```
double Rescore (
    TreeType & queryNode,
    TreeType & referenceNode,
    const double oldScore ) const
```

Re-evaluate the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that a node should not be recursed into at all (it should be pruned). This is used when the score has already been calculated, but another recursion may have modified the bounds for pruning. So the old score is checked against the new pruning bound.

Parameters

<i>queryNode</i>	Candidate query node to be recursed into.
<i>referenceNode</i>	Candidate reference node to be recursed into.
<i>oldScore</i>	Old score produced by Score() (p. 1301) (or Rescore() (p. 1301)).

39.267.4.7 Score() [1/2]

```
double Score (
```

```
const size_t queryIndex,
TreeType & referenceNode )
```

Get the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned).

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceNode</i>	Candidate to be recursed into.

39.267.4.8 Score() [2/2]

```
double Score (
    TreeType & queryNode,
    TreeType & referenceNode )
```

Get the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned).

Parameters

<i>queryNode</i>	Candidate query node to be recursed into.
<i>referenceNode</i>	Candidate reference node to be recursed into.

39.267.4.9 Scores() [1/2]

```
size_t Scores ( ) const [inline]
```

Get the number of times **Score()** (p. 1301) was called.

39.268 FastMKSSStat Class Reference

The statistic used in trees with **FastMKS** (p. 1280).

Public Member Functions

- **FastMKSSStat** ()
Default initialization.
- template<typename TreeType >
FastMKSSStat (const TreeType &node)
Initialize this statistic for the given tree node.
- double **Bound** () const
Get the bound.
- double & **Bound** ()
Modify the bound.
- double **LastKernel** () const
Get the last kernel evaluation.
- double & **LastKernel** ()
Modify the last kernel evaluation.
- void * **LastKernelNode** () const
Get the address of the node corresponding to the last distance evaluation.
- void *& **LastKernelNode** ()
Modify the address of the node corresponding to the last distance evaluation.
- double **SelfKernel** () const
Get the self-kernel.
- double & **SelfKernel** ()
Modify the self-kernel.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the statistic.

39.268.1 Detailed Description

The statistic used in trees with **FastMKS** (p. 1280).

This stores both the bound and the self-kernels for each node in the tree.

Definition at line 25 of file `fastmks_stat.hpp`.

39.268.2 Constructor & Destructor Documentation

39.268.2.1 `FastMKStat()` [1/2]

```
FastMKStat ( ) [inline]
```

Default initialization.

Definition at line 31 of file `fastmks_stat.hpp`.

39.268.2.2 `FastMKStat()` [2/2]

```
FastMKStat (  
    const TreeType & node ) [inline]
```

Initialize this statistic for the given tree node.

The TreeType's metric better be IPMetric with some kernel type (that is, `Metric().Kernel()` must exist).

Parameters

<i>node</i>	Node that this statistic is built for.
-------------	--

39.270 DiagonalGMM Class Reference

A Diagonal Gaussian Mixture Model.

Public Member Functions

- **DiagonalGMM** ()
Create an empty Diagonal Gaussian Mixture Model, with zero gaussians.
- **DiagonalGMM** (const size_t gaussians, const size_t dimensionality)
*Create a **GMM** (p. 1323) with the given number of Gaussians, each of which have the specified dimensionality.*
- **DiagonalGMM** (const std::vector< **distribution::DiagonalGaussianDistribution** > &dists, const arma::vec &weights)
*Create a **DiagonalGMM** (p. 1308) with the given dists and weights.*
- **DiagonalGMM** (const **DiagonalGMM** &other)
Copy constructor for DiagonalGMMs.
- void **Classify** (const arma::mat &observations, arma::Row< size_t > &labels) const
*Classify the given observations as being from an individual component in this **DiagonalGMM** (p. 1308).*
- const **distribution::DiagonalGaussianDistribution** & **Component** (size_t i) const
Return a const reference to a component distribution.
- **distribution::DiagonalGaussianDistribution** & **Component** (size_t i)
Return a reference to a component distribution.
- size_t **Dimensionality** () const
Return the dimensionality of the model.
- size_t **Gaussians** () const
Return the number of Gaussians in the model.
- double **LogProbability** (const arma::vec &observation) const
Return the log probability that the given observation came from this distribution.
- double **LogProbability** (const arma::vec &observation, const size_t component) const
Return the log probability that the given observation came from the given Gaussian component in this distribution.
- **DiagonalGMM** & **operator=** (const **DiagonalGMM** &other)
Copy operator for DiagonalGMMs.

- double **Probability** (const arma::vec &observation) const
Return the probability that the given observation came from this distribution.
- double **Probability** (const arma::vec &observation, const size_t component) const
Return the probability that the given observation came from the given Gaussian component in this distribution.
- arma::vec **Random** () const
Return a randomly generated observation according to the probability distribution defined by this object.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
*Serialize the **DiagonalGMM** (p. 1308).*
- template<typename FittingType = EMFit<kmeans::KMeans<>, DiagonalConstraint, distribution::DiagonalGaussianDistribution>>
double **Train** (const arma::mat &observations, const size_t trials=1, const bool useExistingModel=false, FittingType←
Type fitter=FittingType())
Estimate the probability distribution directly from the given observations, using the given algorithm in the FittingType class to fit the data.
- template<typename FittingType = EMFit<kmeans::KMeans<>, DiagonalConstraint, distribution::DiagonalGaussianDistribution>>
double **Train** (const arma::mat &observations, const arma::vec &probabilities, const size_t trials=1, const bool useExistingModel=false, FittingType fitter=FittingType())
Estimate the probability distribution directly from the given observations, taking into account the probability of each observation actually being from this distribution, and using the given algorithm in the FittingType class to fit the data.
- const arma::vec & **Weights** () const
Return a const reference to the a priori weights of each Gaussian.
- arma::vec & **Weights** ()
Return a reference to the a priori weights of each Gaussian.

39.270.1 Detailed Description

A Diagonal Gaussian Mixture Model.

This class uses maximum likelihood loss functions to estimate the parameters of the **DiagonalGMM** (p. 1308) on a given dataset via the given fitting mechanism, defined by the FittingType template parameter. The **DiagonalGMM** (p. 1308) can be trained using normal data, or data with probabilities of being from this **GMM** (p. 1323) (see **DiagonalGMM::Train()** (p. 1315) for more information). The **DiagonalGMM** (p. 1308) is the same as **GMM** (p. 1323) except for wrapping gmm_diag class.

The **Train()** (p. 1315) method uses a template type 'FittingType'. The FittingType template class must provide a way for the **DiagonalGMM** (p. 1308) to train on data. It must provide the following two functions:

```
void Estimate(
    const arma::mat& observations,
    std::vector<distribution::DiagonalGaussianDistribution>& dists,
    arma::vec& weights);

void Estimate(
    const arma::mat& observations,
    const arma::vec& probabilities,
    std::vector<distribution::DiagonalGaussianDistribution>& dists,
    arma::vec& weights);
```

Example use:

```
// Set up a mixture of 5 gaussians in a 4-dimensional space.
DiagonalGMM g(5, 4);

// Train the DiagonalGMM given the data observations, using the default
// EM fitting mechanism.

g.Train(data);

// Get the probability of 'observation' being observed from this
// DiagonalGMM.
double probability = g.Probability(observation);

// Get a random observation from the DiagonalGMM.
arma::vec observation = g.Random();
```

Definition at line 74 of file diagonal_gmm.hpp.

39.270.2 Constructor & Destructor Documentation

39.270.2.1 DiagonalGMM() [1/4]

```
DiagonalGMM ( ) [inline]
```

Create an empty Diagonal Gaussian Mixture Model, with zero gaussians.

Definition at line 92 of file diagonal_gmm.hpp.

References Log::Debug.

Referenced by DiagonalGMM::DiagonalGMM().

39.270.2.2 DiagonalGMM() [2/4]

```
DiagonalGMM (
    const size_t gaussians,
    const size_t dimensionality )
```

Create a **GMM** (p. 1323) with the given number of Gaussians, each of which have the specified dimensionality.

The means and covariances will be set to 0.

Parameters

<i>gaussians</i>	Number of Gaussians in this DiagonalGMM (p. 1308).
<i>dimensionality</i>	Dimensionality of each Gaussian.

39.270.2.3 DiagonalGMM() [3/4]

```
DiagonalGMM (
    const std::vector< distribution::DiagonalGaussianDistribution > & dists,
    const arma::vec & weights ) [inline]
```

Create a **DiagonalGMM** (p. 1308) with the given *dists* and *weights*.

Parameters

<i>dists</i>	Distributions of the model.
<i>weights</i>	Weights of the model.

Definition at line 118 of file `diagonal_gmm.hpp`.

References `DiagonalGMM::DiagonalGMM()`, and `DiagonalGMM::operator=()`.

39.270.2.4 DiagonalGMM() [4/4]

```
DiagonalGMM (
    const DiagonalGMM & other )
```

Copy constructor for **DiagonalGMMs**.

39.270.3 Member Function Documentation

39.270.3.1 Classify()

```
void Classify (
    const arma::mat & observations,
    arma::Row< size_t > & labels ) const
```

Classify the given observations as being from an individual component in this **DiagonalGMM** (p. 1308).

The resultant classifications are stored in the 'labels' object, and each label will be between 0 and (**Gaussians()** (p. 1312) - 1). Supposing that a point was classified with label 2, and that our **DiagonalGMM** (p. 1308) object was called 'dgmm', one could access the relevant Gaussian distribution as follows:

```
arma::vec mean = dgmm.Means()[2];
arma::mat covariance = dgmm.Covariances()[2];
double priorWeight = dgmm.Weights()[2];
```

Parameters

<i>observations</i>	Matrix of observations to classify.
<i>labels</i>	Object which will be filled with labels.

Referenced by DiagonalGMM::Weights().

39.270.3.2 Component() [1/2]

```
const distribution::DiagonalGaussianDistribution& Component (
    size_t i ) const [inline]
```

Return a const reference to a component distribution.

Parameters

<i>i</i>	Index of component.
----------	---------------------

Definition at line 141 of file diagonal_gmm.hpp.

39.270.3.3 Component() [2/2]

```
distribution::DiagonalGaussianDistribution& Component (
    size_t i ) [inline]
```

Return a reference to a component distribution.

Parameters

<i>i</i>	Index of component.
----------	---------------------

Definition at line 151 of file diagonal_gmm.hpp.

39.270.3.4 Dimensionality()

```
size_t Dimensionality ( ) const [inline]
```

Return the dimensionality of the model.

Definition at line 134 of file diagonal_gmm.hpp.

39.270.3.5 Gaussians()

```
size_t Gaussians ( ) const [inline]
```

Return the number of Gaussians in the model.

Definition at line 132 of file diagonal_gmm.hpp.

39.270.3.6 LogProbability() [1/2]

```
double LogProbability (
    const arma::vec & observation ) const
```

Return the log probability that the given observation came from this distribution.

Parameters

<i>observation</i>	Observation to evaluate the probability of.
--------------------	---

Referenced by DiagonalGMM::Weights().

39.270.3.7 LogProbability() [2/2]

```
double LogProbability (
    const arma::vec & observation,
    const size_t component ) const
```

Return the log probability that the given observation came from the given Gaussian component in this distribution.

Parameters

<i>observation</i>	Observation to evaluate the probability of.
<i>component</i>	Index of the component of the DiagonalGMM (p. 1308).

39.270.3.8 operator=()

```
DiagonalGMM& operator= (
    const DiagonalGMM & other )
```

Copy operator for DiagonalGMMs.

Referenced by DiagonalGMM::DiagonalGMM().

39.270.3.9 Probability() [1/2]

```
double Probability (
    const arma::vec & observation ) const
```

Return the probability that the given observation came from this distribution.

Parameters

<i>observation</i>	Observation to evaluate the probability of.
--------------------	---

Referenced by DiagonalGMM::Weights().

39.270.3.10 Probability() [2/2]

```
double Probability (
    const arma::vec & observation,
    const size_t component ) const
```

Return the probability that the given observation came from the given Gaussian component in this distribution.

Parameters

<i>observation</i>	Observation to evaluate the probability of.
<i>component</i>	Index of the component of the DiagonalGMM (p. 1308).

39.270.3.11 Random()

```
arma::vec Random ( ) const
```

Return a randomly generated observation according to the probability distribution defined by this object.

Returns

Random observation from this **DiagonalGMM** (p. 1308).

Referenced by DiagonalGMM::Weights().

39.270.3.12 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the **DiagonalGMM** (p. 1308).

Referenced by `DiagonalGMM::Weights()`.

39.270.3.13 `Train()` [1/2]

```
double Train (
    const arma::mat & observations,
    const size_t trials = 1,
    const bool useExistingModel = false,
    FittingType fitter = FittingType() )
```

Estimate the probability distribution directly from the given observations, using the given algorithm in the `FittingType` class to fit the data.

The fitting will be performed 'trials' times; from these trials, the model with the greatest log-likelihood will be selected. By default, only one trial is performed. The log-likelihood of the best fitting is returned.

Optionally, the existing model can be used as an initial model for the estimation by setting 'useExistingModel' to true. If the fitting procedure is deterministic after the initial position is given, then 'trials' should be set to 1.

Parameters

<i>observations</i>	Observations of the model.
<i>trials</i>	Number of trials to perform; the model in these trials with the greatest log-likelihood will be selected.
<i>useExistingModel</i>	If true, the existing model is used as an initial model for the estimation.
<i>fitter</i>	Fitting type that estimates observations.

Returns

The log-likelihood of the best fit.

Referenced by `DiagonalGMM::Weights()`.

39.270.3.14 `Train()` [2/2]

```
double Train (
    const arma::mat & observations,
```

```
const arma::vec & probabilities,
const size_t trials = 1,
const bool useExistingModel = false,
FittingType fitter = FittingType() )
```

Estimate the probability distribution directly from the given observations, taking into account the probability of each observation actually being from this distribution, and using the given algorithm in the FittingType class to fit the data.

The fitting will be performed 'trials' times; from these trials, the model with the greatest log-likelihood will be selected. By default, only one trial is performed. The log-likelihood of the best fitting is returned.

Optionally, the existing model can be used as an initial model for the estimation by setting 'useExistingModel' to true. If the fitting procedure is deterministic after the initial position is given, then 'trials' should be set to 1.

Parameters

<i>observations</i>	Observations of the model.
<i>probabilities</i>	Probability of each observation being from this distribution.
<i>trials</i>	Number of trials to perform; the model in these trials with the greatest log-likelihood will be selected.
<i>useExistingModel</i>	If true, the existing model is used as an initial model for the estimation.
<i>fitter</i>	Fitting type that estimates observations.

Returns

The log-likelihood of the best fit.

39.270.3.15 Weights() [1/2]

```
const arma::vec& Weights ( ) const [inline]
```

Return a const reference to the a priori weights of each Gaussian.

Definition at line 157 of file diagonal_gmm.hpp.

39.270.3.16 Weights() [2/2]

```
arma::vec& Weights ( ) [inline]
```

Return a reference to the a priori weights of each Gaussian.

Definition at line 159 of file diagonal_gmm.hpp.

References DiagonalGMM::Classify(), DiagonalGMM::LogProbability(), DiagonalGMM::Probability(), DiagonalGMM::↵ Random(), DiagonalGMM::serialize(), and DiagonalGMM::Train().

The documentation for this class was generated from the following file:

39.271 EigenvalueRatioConstraint Class Reference

Given a vector of eigenvalue ratios, ensure that the covariance matrix always has those eigenvalue ratios.

Public Member Functions

- **EigenvalueRatioConstraint** (const arma::vec &ratios)
*Create the **EigenvalueRatioConstraint** (p. 1317) object with the given vector of eigenvalue ratios.*
 - void **ApplyConstraint** (arma::mat &covariance) const
Apply the eigenvalue ratio constraint to the given covariance matrix.
 - void **ApplyConstraint** (arma::vec &diagCovariance) const
Apply the eigenvalue ratio constraint to the given diagonal covariance matrix (represented as a vector).
 - template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
- Serialize the constraint.*

39.271.1 Detailed Description

Given a vector of eigenvalue ratios, ensure that the covariance matrix always has those eigenvalue ratios.

When you create this object, make sure that the vector of ratios that you pass does not go out of scope, because this object holds a reference to that vector instead of copying it. (This doesn't apply if you are deserializing the object from a file.)

Definition at line 27 of file eigenvalue_ratio_constraint.hpp.

39.271.2 Constructor & Destructor Documentation

39.271.2.1 EigenvalueRatioConstraint()

```
EigenvalueRatioConstraint (  
    const arma::vec & ratios ) [inline]
```

Create the **EigenvalueRatioConstraint** (p. 1317) object with the given vector of eigenvalue ratios.

These ratios are with respect to the first eigenvalue, which is the largest eigenvalue, so the first element of the vector should be 1. In addition, all other elements should be less than or equal to 1.

Definition at line 36 of file eigenvalue_ratio_constraint.hpp.

References Log::Fatal, and Log::Warn.

39.271.3 Member Function Documentation

39.271.3.1 ApplyConstraint() [1/2]

```
void ApplyConstraint (
    arma::mat & covariance ) const [inline]
```

Apply the eigenvalue ratio constraint to the given covariance matrix.

Definition at line 62 of file eigenvalue_ratio_constraint.hpp.

39.271.3.2 ApplyConstraint() [2/2]

```
void ApplyConstraint (
    arma::vec & diagCovariance ) const [inline]
```

Apply the eigenvalue ratio constraint to the given diagonal covariance matrix (represented as a vector).

Definition at line 83 of file eigenvalue_ratio_constraint.hpp.

39.271.3.3 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the constraint.

Definition at line 102 of file eigenvalue_ratio_constraint.hpp.

The documentation for this class was generated from the following file:

- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int version)
Serialize the fitter.
- double **Tolerance** () const
Get the tolerance for the convergence of the EM algorithm.
- double & **Tolerance** ()
Modify the tolerance for the convergence of the EM algorithm.

39.272.1 Detailed Description

```
template<typename InitialClusteringType = kmeans::KMeans<>, typename CovarianceConstraintPolicy = PositiveDefiniteConstraint,
typename Distribution = distribution::GaussianDistribution>
class mlpack::gmm::EMFit< InitialClusteringType, CovarianceConstraintPolicy, Distribution >
```

This class contains methods which can fit a **GMM** (p. 1323) to observations using the EM algorithm.

It requires an initial clustering mechanism, which is by default the KMeans algorithm. The clustering mechanism must implement the following method:

- void Cluster(const arma::mat& observations, const size_t clusters, arma::Row<size_t>& assignments);

This method should create 'clusters' clusters, and return the assignment of each point to a cluster.

Definition at line 45 of file em_fit.hpp.

39.272.2 Constructor & Destructor Documentation

39.272.2.1 EMFit()

```
EMFit (
    const size_t maxIterations = 300,
    const double tolerance = 1e-10,
    InitialClusteringType clusterer = InitialClusteringType(),
    CovarianceConstraintPolicy constraint = CovarianceConstraintPolicy() )
```

Construct the **EMFit** (p. 1318) object, optionally passing an InitialClusteringType object (just in case it needs to store state).

Setting the maximum number of iterations to 0 means that the EM algorithm will iterate until convergence (with the given tolerance).

The parameter *forcePositive* controls whether or not the covariance matrices are checked for positive definiteness at each iteration. This could be a time-consuming task, so, if you know your data is well-behaved, you can set it to false and save some runtime.

Parameters

<i>maxIterations</i>	Maximum number of iterations for EM.
<i>tolerance</i>	Log-likelihood tolerance required for convergence.
<i>clusterer</i>	Object which will perform the initial clustering.
<i>constraint</i>	Constraint policy of covariance.

39.272.3 Member Function Documentation

39.272.3.1 Clusterer() [1/2]

```
const InitialClusteringType& Clusterer ( ) const [inline]
```

    const bool useInitialModel = false )
```

Fit the observations to a Gaussian mixture model (**GMM** (p. 1323)) using the EM algorithm.

The size of the vectors (indicating the number of components) must already be set. Optionally, if useInitialModel is set to true, then the model given in the means, covariances, and weights parameters is used as the initial model, instead of using the InitialClusteringType::Cluster() option.

Parameters

<i>observations</i>	List of observations to train on.
<i>means</i>	Vector to store trained means in.
<i>covariances</i>	Vector to store trained covariances in.
<i>weights</i>	Vector to store a priori weights in.
<i>useInitialModel</i>	If true, the given model is used for the initial clustering.

39.272.3.6 Estimate() [2/2]

```
void Estimate (
    const arma::mat & observations,
    const arma::vec & probabilities,
    std::vector< Distribution > & dists,
    arma::vec & weights,
    const bool useInitialModel = false )
```

Fit the observations to a Gaussian mixture model (**GMM** (p. 1323)) using the EM algorithm, taking into account the probabilities of each point being from this mixture.

The size of the vectors (indicating the number of components) must already be set. Optionally, if `useInitialModel` is set to true, then the model given in the means, covariances, and weights parameters is used as the initial model, instead of using the `InitialClusteringType::Cluster()` option.

Parameters

<i>observations</i>	List of observations to train on.
<i>probabilities</i>	Probability of each point being from this model.
<i>means</i>	Vector to store trained means in.
<i>covariances</i>	Vector to store trained covariances in.
<i>weights</i>	Vector to store a priori weights in.
<i>useInitialModel</i>	If true, the given model is used for the initial clustering.

39.272.3.7 MaxIterations() [1/2]

```
size_t MaxIterations ( ) const [inline]
```

Get the maximum number of iterations of the EM algorithm.

Definition at line 123 of file `em_fit.hpp`.

39.272.3.8 MaxIterations() [2/2]

```
size_t& MaxIterations ( ) [inline]
```

Modify the maximum number of iterations of the EM algorithm.

Definition at line 125 of file `em_fit.hpp`.

39.272.3.9 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int version )
```

Serialize the fitter.

Referenced by EMFit< InitialClusteringType, CovarianceConstraintPolicy, Distribution >::Tolerance().

39.272.3.10 Tolerance() [1/2]

```
double Tolerance ( ) const [inline]
```

Get the tolerance for the convergence of the EM algorithm.

Definition at line 128 of file em_fit.hpp.

39.272.3.11 Tolerance() [2/2]

```
double& Tolerance ( ) [inline]
```

Modify the tolerance for the convergence of the EM algorithm.

Definition at line 130 of file em_fit.hpp.

References EMFit< InitialClusteringType, CovarianceConstraintPolicy, Distribution >::serialize().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/gmm/ **em_fit.hpp**

39.273 GMM Class Reference

A Gaussian Mixture Model (**GMM** (p. 1323)).

Public Member Functions

- **GMM** ()
Create an empty Gaussian Mixture Model, with zero gaussians.
- **GMM** (const size_t gaussians, const size_t dimensionality)
*Create a **GMM** (p. 1323) with the given number of Gaussians, each of which have the specified dimensionality.*
- **GMM** (const std::vector< **distribution::GaussianDistribution** > &dists, const arma::vec &weights)
*Create a **GMM** (p. 1323) with the given dists and weights.*
- **GMM** (const **GMM** &other)
Copy constructor for GMMs.
- void **Classify** (const arma::mat &observations, arma::Row< size_t > &labels) const
*Classify the given observations as being from an individual component in this **GMM** (p. 1323).*
- const **distribution::GaussianDistribution** & **Component** (size_t i) const
Return a const reference to a component distribution.
- **distribution::GaussianDistribution** & **Component** (size_t i)
Return a reference to a component distribution.
- size_t **Dimensionality** () const
Return the dimensionality of the model.
- size_t **Gaussians** () const
Return the number of gaussians in the model.
- double **LogProbability** (const arma::vec &observation) const
Return the log probability that the given observation came from this distribution.
- double **LogProbability** (const arma::vec &observation, const size_t component) const
Return the log probability that the given observation came from the given Gaussian component in this distribution.
- **GMM** & **operator=** (const **GMM** &other)
Copy operator for GMMs.
- double **Probability** (const arma::vec &observation) const
Return the probability that the given observation came from this distribution.
- double **Probability** (const arma::vec &observation, const size_t component) const
Return the probability that the given observation came from the given Gaussian component in this distribution.
- arma::vec **Random** () const
Return a randomly generated observation according to the probability distribution defined by this object.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
*Serialize the **GMM** (p. 1323).*
- template<typename FittingType = EMFit<>>
double **Train** (const arma::mat &observations, const size_t trials=1, const bool useExistingModel=false, FittingType fitter=FittingType())
Estimate the probability distribution directly from the given observations, using the given algorithm in the FittingType class to fit the data.
- template<typename FittingType = EMFit<>>
double **Train** (const arma::mat &observations, const arma::vec &probabilities, const size_t trials=1, const bool useExistingModel=false, FittingType fitter=FittingType())
Estimate the probability distribution directly from the given observations, taking into account the probability of each observation actually being from this distribution, and using the given algorithm in the FittingType class to fit the data.
- const arma::vec & **Weights** () const
Return a const reference to the a priori weights of each Gaussian.
- arma::vec & **Weights** ()
Return a reference to the a priori weights of each Gaussian.

39.273.1 Detailed Description

A Gaussian Mixture Model (**GMM** (p. 1323)).

This class uses maximum likelihood loss functions to estimate the parameters of the **GMM** (p. 1323) on a given dataset via the given fitting mechanism, defined by the `FittingType` template parameter. The **GMM** (p. 1323) can be trained using normal data, or data with probabilities of being from this **GMM** (p. 1323) (see **GMM::Train()** (p. 1330) for more information).

The **Train()** (p. 1330) method uses a template type 'FittingType'. The `FittingType` template class must provide a way for the **GMM** (p. 1323) to train on data. It must provide the following two functions:

```
void Estimate(const arma::mat& observations,
              std::vector<distribution::GaussianDistribution>& dists,
              arma::vec& weights);

void Estimate(const arma::mat& observations,
              const arma::vec& probabilities,
              std::vector<distribution::GaussianDistribution>& dists,
              arma::vec& weights);
```

These functions should produce a trained **GMM** (p. 1323) from the given observations and probabilities. These may modify the size of the model (by increasing the size of the mean and covariance vectors as well as the weight vectors), but the method should expect that these vectors are already set to the size of the **GMM** (p. 1323) as specified in the constructor.

For a sample implementation, see the **EMFit** (p. 1318) class; this class uses the EM algorithm to train a **GMM** (p. 1323), and is the default fitting type for the **Train()** (p. 1330) method.

The **GMM** (p. 1323), once trained, can be used to generate random points from the distribution and estimate the probability of points being from the distribution. The parameters of the **GMM** (p. 1323) can be obtained through the accessors and mutators.

Example use:

```
// Set up a mixture of 5 gaussians in a 4-dimensional space.
GMM g(5, 4);

// Train the GMM given the data observations, using the default EM fitting
// mechanism.
g.Train(data);

// Get the probability of 'observation' being observed from this GMM.
double probability = g.Probability(observation);

// Get a random observation from the GMM.
arma::vec observation = g.Random();
```

Definition at line 78 of file `gmm.hpp`.

39.273.2 Constructor & Destructor Documentation

39.273.2.1 GMM() [1/4]

```
GMM ( ) [inline]
```

Create an empty Gaussian Mixture Model, with zero gaussians.

Definition at line 96 of file gmm.hpp.

References Log::Debug.

Referenced by GMM::GMM().

39.273.2.2 GMM() [2/4]

```
GMM (
    const size_t gaussians,
    const size_t dimensionality )
```

Create a **GMM** (p. 1323) with the given number of Gaussians, each of which have the specified dimensionality.

The means and covariances will be set to 0.

Parameters

<i>gaussians</i>	Number of Gaussians in this GMM (p. 1323).
<i>dimensionality</i>	Dimensionality of each Gaussian.

39.273.2.3 GMM() [3/4]

```
GMM (
    const std::vector< distribution::GaussianDistribution > & dists,
    const arma::vec & weights ) [inline]
```

Create a **GMM** (p. 1323) with the given dists and weights.

Parameters

<i>dists</i>	Distributions of the model.
<i>weights</i>	Weights of the model.

Definition at line 122 of file gmm.hpp.

References GMM::GMM(), and GMM::operator=().

39.273.2.4 GMM() [4/4]

```
GMM (
    const GMM & other )
```

Copy constructor for GMMs.

39.273.3 Member Function Documentation

39.273.3.1 Classify()

```
void Classify (
    const arma::mat & observations,
    arma::Row< size_t > & labels ) const
```

Classify the given observations as being from an individual component in this **GMM** (p. 1323).

The resultant classifications are stored in the 'labels' object, and each label will be between 0 and (**Gaussians()** (p. 1328) - 1). Supposing that a point was classified with label 2, and that our **GMM** (p. 1323) object was called 'gmm', one could access the relevant Gaussian distribution as follows:

```
arma::vec mean = gmm.Means()[2];
arma::mat covariance = gmm.Covariances()[2];
double priorWeight = gmm.Weights()[2];
```

Parameters

<i>observations</i>	List of observations to classify.
<i>labels</i>	Object which will be filled with labels.

Referenced by **GMM::Weights()**.

39.273.3.2 Component() [1/2]

```
const distribution::GaussianDistribution& Component (
    size_t i ) const [inline]
```

Return a const reference to a component distribution.

Parameters

<i>i</i>	Index of component.
----------	---------------------

Definition at line 145 of file gmm.hpp.

39.273.3.3 Component() [2/2]

```
distribution::GaussianDistribution& Component (
    size_t i ) [inline]
```

Return a reference to a component distribution.

Parameters

<i>i</i>	Index of component.
----------	---------------------

Definition at line 152 of file gmm.hpp.

39.273.3.4 Dimensionality()

```
size_t Dimensionality ( ) const [inline]
```

Return the dimensionality of the model.

Definition at line 138 of file gmm.hpp.

39.273.3.5 Gaussians()

```
size_t Gaussians ( ) const [inline]
```

Return the number of gaussians in the model.

Definition at line 136 of file gmm.hpp.

39.273.3.6 LogProbability() [1/2]

```
double LogProbability (
    const arma::vec & observation ) const
```

Return the log probability that the given observation came from this distribution.

Parameters

<i>observation</i>	Observation to evaluate the probability of.
--------------------	---

Referenced by GMM::Weights().

39.273.3.7 LogProbability() [2/2]

```
double LogProbability (
    const arma::vec & observation,
    const size_t component ) const
```

Return the log probability that the given observation came from the given Gaussian component in this distribution.

Parameters

<i>observation</i>	Observation to evaluate the probability of.
<i>component</i>	Index of the component of the GMM (p. 1323) to be considered.

39.273.3.8 operator=()

```
GMM& operator= (
    const GMM & other )
```

Copy operator for GMMs.

Referenced by GMM::GMM().

39.273.3.9 Probability() [1/2]

```
double Probability (
    const arma::vec & observation ) const
```

Return the probability that the given observation came from this distribution.

Parameters

<i>observation</i>	Observation to evaluate the probability of.
--------------------	---

Referenced by GMM::Weights().

39.273.3.10 Probability() [2/2]

```
double Probability (
    const arma::vec & observation,
    const size_t component ) const
```

Return the probability that the given observation came from the given Gaussian component in this distribution.

Parameters

<i>observation</i>	Observation to evaluate the probability of.
<i>component</i>	Index of the component of the GMM (p. 1323) to be considered.

39.273.3.11 Random()

```
arma::vec Random ( ) const
```

Return a randomly generated observation according to the probability distribution defined by this object.

Returns

Random observation from this **GMM** (p. 1323).

Referenced by GMM::Weights().

39.273.3.12 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the **GMM** (p. 1323).

Referenced by GMM::Weights().

39.273.3.13 Train() [1/2]

```
double Train (
    const arma::mat & observations,
    const size_t trials = 1,
    const bool useExistingModel = false,
    FittingType fitter = FittingType() )
```

Estimate the probability distribution directly from the given observations, using the given algorithm in the FittingType class to fit the data.

The fitting will be performed 'trials' times; from these trials, the model with the greatest log-likelihood will be selected. By default, only one trial is performed. The log-likelihood of the best fitting is returned.

Optionally, the existing model can be used as an initial model for the estimation by setting 'useExistingModel' to true. If the fitting procedure is deterministic after the initial position is given, then 'trials' should be set to 1.

Template Parameters

<i>FittingType</i>	The type of fitting method which should be used (EMFit<> is suggested).
--------------------	---

Parameters

<i>observations</i>	Observations of the model.
<i>trials</i>	Number of trials to perform; the model in these trials with the greatest log-likelihood will be selected.
<i>useExistingModel</i>	If true, the existing model is used as an initial model for the estimation.

Returns

The log-likelihood of the best fit.

Referenced by GMM::Weights().

39.273.3.14 Train() [2/2]

```
double Train (
    const arma::mat & observations,
    const arma::vec & probabilities,
    const size_t trials = 1,
    const bool useExistingModel = false,
    FittingType fitter = FittingType() )
```

Estimate the probability distribution directly from the given observations, taking into account the probability of each observation actually being from this distribution, and using the given algorithm in the FittingType class to fit the data.

The fitting will be performed 'trials' times; from these trials, the model with the greatest log-likelihood will be selected. By default, only one trial is performed. The log-likelihood of the best fitting is returned.

Optionally, the existing model can be used as an initial model for the estimation by setting 'useExistingModel' to true. If the fitting procedure is deterministic after the initial position is given, then 'trials' should be set to 1.

Parameters

<i>observations</i>	Observations of the model.
<i>probabilities</i>	Probability of each observation being from this distribution.
<i>trials</i>	Number of trials to perform; the model in these trials with the greatest log-likelihood will be selected.
<i>useExistingModel</i>	If true, the existing model is used as an initial model for the estimation.

Returns

The log-likelihood of the best fit.

39.273.3.15 **Weights()** [1/2]

```
const arma::vec& Weights ( ) const [inline]
```

Return a const reference to the a priori weights of each Gaussian.

Definition at line 155 of file gmm.hpp.

39.273.3.16 **Weights()** [2/2]

```
arma::vec& Weights ( ) [inline]
```

Return a reference to the a priori weights of each Gaussian.

Definition at line 157 of file gmm.hpp.

References GMM::Classify(), GMM::LogProbability(), GMM::Probability(), GMM::Random(), GMM::serialize(), and GMM::Train().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/gmm/ **gmm.hpp**

39.274 **NoConstraint Class Reference**

This class enforces no constraint on the covariance matrix.

Static Public Member Functions

- static void **ApplyConstraint** (const arma::mat &)
Do nothing, and do not modify the covariance matrix.
- template<typename Archive >
static void **serialize** (Archive &, const unsigned int)
Serialize the object (nothing to do).

39.274.1 Detailed Description

This class enforces no constraint on the covariance matrix.

It's faster this way, although depending on your situation you may end up with a non-invertible covariance matrix.

Definition at line 25 of file no_constraint.hpp.

39.274.2 Member Function Documentation

39.274.2.1 ApplyConstraint()

```
static void ApplyConstraint (  
    const arma::mat & ) [inline], [static]
```

Do nothing, and do not modify the covariance matrix.

Definition at line 29 of file no_constraint.hpp.

39.274.2.2 serialize()

```
static void serialize (  
    Archive & ,  
    const unsigned int ) [inline], [static]
```

Serialize the object (nothing to do).

Definition at line 33 of file no_constraint.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/gmm/ **no_constraint.hpp**

39.275 PositiveDefiniteConstraint Class Reference

Given a covariance matrix, force the matrix to be positive definite.

Static Public Member Functions

- static void **ApplyConstraint** (arma::mat &covariance)
Apply the positive definiteness constraint to the given covariance matrix, and ensure each value on the diagonal is at least 1e-50.
- static void **ApplyConstraint** (arma::vec &diagCovariance)
Apply the positive definiteness constraint to the given diagonal covariance matrix (which is represented as a vector), and ensure each value on the diagonal is at least 1e-50.
- template<typename Archive >
static void **serialize** (Archive &, const unsigned int)
Serialize the constraint (which stores nothing, so, nothing to do).

39.275.1 Detailed Description

Given a covariance matrix, force the matrix to be positive definite.

Also force a minimum value on the diagonal, so that even if the matrix is invertible, it doesn't cause problems with Cholesky decompositions. The forcing here is also done in order to bring the condition number of the matrix under 1e5 (10k), which should help with numerical stability.

Definition at line 27 of file positive_definite_constraint.hpp.

39.275.2 Member Function Documentation

39.275.2.1 ApplyConstraint() [1/2]

```
static void ApplyConstraint (
    arma::mat & covariance ) [inline], [static]
```

Apply the positive definiteness constraint to the given covariance matrix, and ensure each value on the diagonal is at least 1e-50.

Parameters

<i>covariance</i>	Covariance matrix.
-------------------	--------------------

Definition at line 36 of file positive_definite_constraint.hpp.

39.275.2.2 ApplyConstraint() [2/2]

```
static void ApplyConstraint (
    arma::vec & diagCovariance ) [inline], [static]
```

Apply the positive definiteness constraint to the given diagonal covariance matrix (which is represented as a vector), and ensure each value on the diagonal is at least 1e-50.

Definition at line 70 of file positive_definite_constraint.hpp.

39.275.2.3 serialize()

```
static void serialize (
    Archive & ,
    const unsigned int ) [inline], [static]
```

Serialize the constraint (which stores nothing, so, nothing to do).

Definition at line 95 of file positive_definite_constraint.hpp.

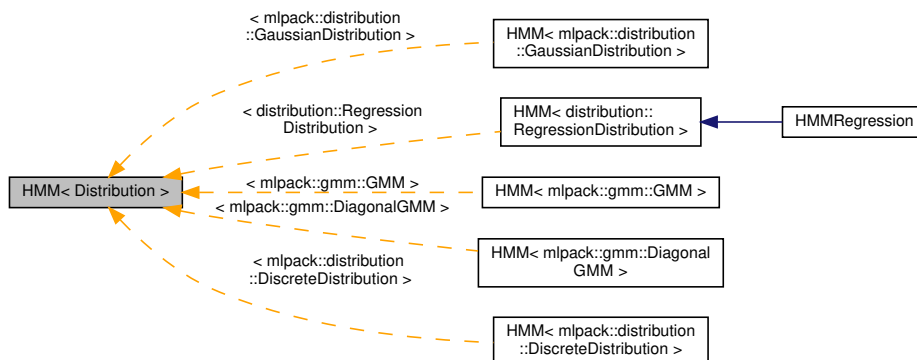

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/gmm/ **positive_definite_constraint.hpp**

39.276 HMM< Distribution > Class Template Reference

A class that represents a Hidden Markov Model with an arbitrary type of emission distribution.

Inheritance diagram for HMM< Distribution >:

Public Member Functions

- **HMM** (const size_t states=0, const Distribution emissions=Distribution(), const double tolerance=1e-5)
Create the Hidden Markov Model with the given number of hidden states and the given default distribution for emissions.
- **HMM** (const arma::vec &initial, const arma::mat & **transition**, const std::vector< Distribution > & **emission**, const double tolerance=1e-5)
Create the Hidden Markov Model with the given initial probability vector, the given transition matrix, and the given emission distributions.
- size_t **Dimensionality** () const
Get the dimensionality of observations.
- size_t & **Dimensionality** ()
Set the dimensionality of observations.
- const std::vector< Distribution > & **Emission** () const
Return the emission distributions.
- std::vector< Distribution > & **Emission** ()
Return a modifiable emission probability matrix reference.
- double **Estimate** (const arma::mat &dataSeq, arma::mat &stateProb, arma::mat &forwardProb, arma::mat &backwardProb, arma::vec &scales) const
Estimate the probabilities of each hidden state at each time step for each given data observation, using the Forward-↔ Backward algorithm.
- double **Estimate** (const arma::mat &dataSeq, arma::mat &stateProb) const
Estimate the probabilities of each hidden state at each time step of each given data observation, using the Forward-↔ Backward algorithm.
- void **Filter** (const arma::mat &dataSeq, arma::mat &filterSeq, size_t ahead=0) const
HMM (p. 1335) filtering.
- void **Generate** (const size_t length, arma::mat &dataSequence, arma::Row< size_t > &stateSequence, const size_t startState=0) const
Generate a random data sequence of the given length.
- const arma::vec & **Initial** () const
Return the vector of initial state probabilities.
- arma::vec & **Initial** ()
Modify the vector of initial state probabilities.
- double **LogEstimate** (const arma::mat &dataSeq, arma::mat &stateLogProb, arma::mat &forwardLogProb, arma::mat &backwardLogProb, arma::vec &logScales) const
Estimate the probabilities of each hidden state at each time step for each given data observation, using the Forward-↔ Backward algorithm.
- double **LogLikelihood** (const arma::mat &dataSeq) const
Compute the log-likelihood of the given data sequence.
- double **Predict** (const arma::mat &dataSeq, arma::Row< size_t > &stateSeq) const
Compute the most probable hidden state sequence for the given data sequence, using the Viterbi algorithm, returning the log-likelihood of the most likely state sequence.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int version)
Serialize the object.
- void **Smooth** (const arma::mat &dataSeq, arma::mat &smoothSeq) const
HMM (p. 1335) smoothing.
- double **Tolerance** () const
Get the tolerance of the Baum-Welch algorithm.
- double & **Tolerance** ()

Modify the tolerance of the Baum-Welch algorithm.

- double **Train** (const std::vector< arma::mat > &dataSeq)
Train the model using the Baum-Welch algorithm, with only the given unlabeled observations.
- void **Train** (const std::vector< arma::mat > &dataSeq, const std::vector< arma::Row< size_t > > &stateSeq)
Train the model using the given labeled observations; the transition and emission matrices are directly estimated.
- const arma::mat & **Transition** () const
Return the transition matrix.
- arma::mat & **Transition** ()
Return a modifiable transition matrix reference.

Protected Member Functions

- void **Backward** (const arma::mat &dataSeq, const arma::vec &logScales, arma::mat &backwardLogProb) const
The Backward algorithm (part of the Forward-Backward algorithm).
- void **Forward** (const arma::mat &dataSeq, arma::vec &logScales, arma::mat &forwardLogProb) const
The Forward algorithm (part of the Forward-Backward algorithm).

Protected Attributes

- std::vector< Distribution > **emission**
Set of emission probability distributions; one for each state.
- arma::mat **transition**
Transition probability matrix.

39.276.1 Detailed Description

```
template<typename Distribution = distribution::DiscreteDistribution>
class mpack::hmm::HMM< Distribution >
```

A class that represents a Hidden Markov Model with an arbitrary type of emission distribution.

This **HMM** (p. 1335) class supports training (supervised and unsupervised), prediction of state sequences via the Viterbi algorithm, estimation of state probabilities, generation of random sequences, and calculation of the log-likelihood of a given sequence.

The template parameter, *Distribution*, specifies the distribution which the emissions follow. The class should implement the following functions:

```
class Distribution
{
public:
    // The type of observation used by this distribution.
    typedef something DataType;

    // Return the probability of the given observation.
    double Probability(const DataType& observation) const;

    // Estimate the distribution based on the given observations.
    double Train(const std::vector<DataType>& observations);

    // Estimate the distribution based on the given observations, given also
    // the probability of each observation coming from this distribution.
    double Train(const std::vector<DataType>& observations,
                const std::vector<double>& probabilities);
};
```

See the `mlpack::distribution::DiscreteDistribution` (p. 1232) class for an example. One would use the `DiscreteDistribution` class when the observations are non-negative integers. Other distributions could be Gaussians, a mixture of Gaussians (GMM), or any other probability distribution implementing the four Distribution functions.

Usage of the **HMM** (p. 1335) class generally involves either training an **HMM** (p. 1335) or loading an already-known **HMM** (p. 1335) and taking probability measurements of sequences. Example code for supervised training of a Gaussian **HMM** (p. 1335) (that is, where the emission output distribution is a single Gaussian for each hidden state) is given below.

```
extern arma::mat observations; // Each column is an observation.
extern arma::Row<size_t> states; // Hidden states for each observation.
// Create an untrained HMM with 5 hidden states and default (N(0, 1))
// Gaussian distributions with the dimensionality of the dataset.
HMM<GaussianDistribution> hmm(5, GaussianDistribution(observations.n_rows));

// Train the HMM (the labels could be omitted to perform unsupervised
// training).
hmm.Train(observations, states);
```

Once initialized, the **HMM** (p. 1335) can evaluate the probability of a certain sequence (with **LogLikelihood()** (p. 1346)), predict the most likely sequence of hidden states (with **Predict()** (p. 1346)), generate a sequence (with **Generate()** (p. 1343)), or estimate the probabilities of each state for a sequence of observations (with **Train()** (p. 1348)).

Template Parameters

<i>Distribution</i>	Type of emission distribution for this HMM (p. 1335).
---------------------	--

Definition at line 85 of file `hmm.hpp`.

39.276.2 Constructor & Destructor Documentation

39.276.2.1 HMM() [1/2]

```
HMM (
    const size_t states = 0,
    const Distribution emissions = Distribution(),
    const double tolerance = 1e-5 )
```

Create the Hidden Markov Model with the given number of hidden states and the given default distribution for emissions.

The dimensionality of the observations is taken from the emissions variable, so it is important that the given default emission distribution is set with the correct dimensionality. Alternately, set the dimensionality with **Dimensionality()** (p. 1341). Optionally, the tolerance for convergence of the Baum-Welch algorithm can be set.

By default, the transition matrix and initial probability vector are set to contain equal probability for each state.

Parameters

<i>states</i>	Number of states.
<i>emissions</i>	Default distribution for emissions.
<i>tolerance</i>	Tolerance for convergence of training algorithm (Baum-Welch).

39.276.2.2 HMM() [2/2]

```

HMM (
    const arma::vec & initial,
    const arma::mat & transition,
    const std::vector< Distribution > & emission,
    const double tolerance = 1e-5 )

```

Create the Hidden Markov Model with the given initial probability vector, the given transition matrix, and the given emission distributions.

The dimensionality of the observations of the **HMM** (p. 1335) are taken from the given emission distributions. Alternately, the dimensionality can be set with **Dimensionality()** (p. 1341).

The initial state probability vector should have length equal to the number of states, and each entry represents the probability of being in the given state at time $T = 0$ (the beginning of a sequence).

The transition matrix should be such that $T(i, j)$ is the probability of transition to state i from state j . The columns of the matrix should sum to 1.

The emission matrix should be such that $E(i, j)$ is the probability of emission i while in state j . The columns of the matrix should sum to 1.

Optionally, the tolerance for convergence of the Baum-Welch algorithm can be set.

Parameters

<i>initial</i>	Initial state probabilities.
<i>transition</i>	Transition matrix.
<i>emission</i>	Emission distributions.
<i>tolerance</i>	Tolerance for convergence of training algorithm (Baum-Welch).

39.276.3 Member Function Documentation

39.276.3.1 Backward()

```

void Backward (
    const arma::mat & dataSeq,
    const arma::vec & logScales,
    arma::mat & backwardLogProb ) const [protected]

```

The Backward algorithm (part of the Forward-Backward algorithm).

Computes backward probabilities for each state for each observation in the given data sequence, using the scaling factors found (presumably) by **Forward()** (p. 1343). The returned matrix has rows equal to the number of hidden states and columns equal to the number of observations.

Parameters

<i>dataSeq</i>	Data sequence to compute probabilities for.
<i>scales</i>	Vector of scaling factors.
<i>backwardProb</i>	Matrix in which backward probabilities will be saved.

Referenced by HMM< mlpack::distribution::DiscreteDistribution >::Tolerance().

39.276.3.2 Dimensionality() [1/2]

```
size_t Dimensionality ( ) const [inline]
```

Get the dimensionality of observations.

Definition at line 341 of file hmm.hpp.

39.276.3.3 Dimensionality() [2/2]

```
size_t& Dimensionality ( ) [inline]
```

Set the dimensionality of observations.

Definition at line 343 of file hmm.hpp.

39.276.3.4 Emission() [1/2]

```
const std::vector<Distribution>& Emission ( ) const [inline]
```

Return the emission distributions.

Definition at line 336 of file hmm.hpp.

39.276.3.5 Emission() [2/2]

```
std::vector<Distribution>& Emission ( ) [inline]
```

Return a modifiable emission probability matrix reference.

Definition at line 338 of file hmm.hpp.

39.276.3.6 Estimate() [1/2]

```
double Estimate (
    const arma::mat & dataSeq,
    arma::mat & stateProb,
    arma::mat & forwardProb,
    arma::mat & backwardProb,
    arma::vec & scales ) const
```

Estimate the probabilities of each hidden state at each time step for each given data observation, using the Forward-↔ Backward algorithm.

Each matrix which is returned has columns equal to the number of data observations, and rows equal to the number of hidden states in the model. The log-likelihood of the most probable sequence is returned.

Parameters

<i>dataSeq</i>	Sequence of observations.
<i>stateProb</i>	Matrix in which the probabilities of each state at each time interval will be stored.
<i>forwardProb</i>	Matrix in which the forward probabilities of each state at each time interval will be stored.
<i>backwardProb</i>	Matrix in which the backward probabilities of each state at each time interval will be stored.
<i>scales</i>	Vector in which the scaling factors at each time interval will be stored.

Returns

Log-likelihood of most likely state sequence.

39.276.3.7 Estimate() [2/2]

```
double Estimate (
    const arma::mat & dataSeq,
    arma::mat & stateProb ) const
```

Estimate the probabilities of each hidden state at each time step of each given data observation, using the Forward-↔ Backward algorithm.

The returned matrix of state probabilities has columns equal to the number of data observations, and rows equal to the number of hidden states in the model. The log-likelihood of the most probable sequence is returned.

Parameters

<i>dataSeq</i>	Sequence of observations.
<i>stateProb</i>	Probabilities of each state at each time interval.

Returns

Log-likelihood of most likely state sequence.

39.276.3.8 Filter()

```
void Filter (
    const arma::mat & dataSeq,
    arma::mat & filterSeq,
    size_t ahead = 0 ) const
```

HMM (p. 1335) filtering.

Computes the k-step-ahead expected emission at each time conditioned only on prior observations. That is $E\{Y[t+k] \mid Y[0], \dots, Y[t]\}$. The returned matrix has columns equal to the number of observations. Note that the expectation may not be meaningful for discrete emissions.

Parameters

<i>dataSeq</i>	Sequence of observations.
<i>filterSeq</i>	Vector in which the expected emission sequence will be stored.
<i>ahead</i>	Number of steps ahead (k) for expectations.

39.276.3.9 Forward()

```
void Forward (
    const arma::mat & dataSeq,
    arma::vec & logScales,
    arma::mat & forwardLogProb ) const [protected]
```

The Forward algorithm (part of the Forward-Backward algorithm).

Computes forward probabilities for each state for each observation in the given data sequence. The returned matrix has rows equal to the number of hidden states and columns equal to the number of observations.

Parameters

<i>dataSeq</i>	Data sequence to compute probabilities for.
<i>scales</i>	Vector in which scaling factors will be saved.
<i>forwardProb</i>	Matrix in which forward probabilities will be saved.

Referenced by HMM< mlpack::distribution::DiscreteDistribution >::Tolerance().

39.276.3.10 Generate()

```
void Generate (
    const size_t length,
    arma::mat & dataSequence,
    arma::Row< size_t > & stateSequence,
    const size_t startState = 0 ) const
```

Generate a random data sequence of the given length.

The data sequence is stored in the `dataSequence` parameter, and the state sequence is stored in the `stateSequence` parameter. Each column of `dataSequence` represents a random observation.

Parameters

<i>length</i>	Length of random sequence to generate.
<i>dataSequence</i>	Vector to store data in.
<i>stateSequence</i>	Vector to store states in.
<i>startState</i>	Hidden state to start sequence in (default 0).

39.276.3.11 Initial() [1/2]

```
const arma::vec& Initial ( ) const [inline]
```

Return the vector of initial state probabilities.

Definition at line 326 of file `hmm.hpp`.

39.276.3.12 Initial() [2/2]

```
arma::vec& Initial ( ) [inline]
```

Modify the vector of initial state probabilities.

Definition at line 328 of file `hmm.hpp`.

39.276.3.13 LogEstimate()

```
double LogEstimate (
    const arma::mat & dataSeq,
    arma::mat & stateLogProb,
    arma::mat & forwardLogProb,
    arma::mat & backwardLogProb,
    arma::vec & logScales ) const
```

Estimate the probabilities of each hidden state at each time step for each given data observation, using the Forward-↔ Backward algorithm.

Each matrix which is returned has columns equal to the number of data observations, and rows equal to the number of hidden states in the model. The log-likelihood of the most probable sequence is returned.

Parameters

<i>dataSeq</i>	Sequence of observations.
<i>stateProb</i>	Matrix in which the log probabilities of each state at each time interval will be stored.
<i>forwardProb</i>	Matrix in which the forward log probabilities of each state at each time interval will be stored.
<i>backwardProb</i>	Matrix in which the backward log probabilities of each state at each time interval will be stored.
<i>scales</i>	Vector in which the log of scaling factors at each time interval will be stored.

Returns

Log-likelihood of most likely state sequence.

39.276.3.14 LogLikelihood()

```
double LogLikelihood (
    const arma::mat & dataSeq ) const
```

Compute the log-likelihood of the given data sequence.

Parameters

<i>dataSeq</i>	Data sequence to evaluate the likelihood of.
----------------	--

Returns

Log-likelihood of the given sequence.

39.276.3.15 Predict()

```
double Predict (
    const arma::mat & dataSeq,
    arma::Row< size_t > & stateSeq ) const
```

Compute the most probable hidden state sequence for the given data sequence, using the Viterbi algorithm, returning the log-likelihood of the most likely state sequence.

Parameters

<i>dataSeq</i>	Sequence of observations.
<i>stateSeq</i>	Vector in which the most probable state sequence will be stored.

Returns

Log-likelihood of most probable state sequence.

39.276.3.16 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int version )
```

Serialize the object.

Referenced by HMM< mlpack::distribution::DiscreteDistribution >::Tolerance().

39.276.3.17 Smooth()

```
void Smooth (
    const arma::mat & dataSeq,
    arma::mat & smoothSeq ) const
```

HMM (p. 1335) smoothing.

Computes expected emission at each time conditioned on all observations. That is $E\{Y[t] \mid Y[0], \dots, Y[T]\}$. The returned matrix has columns equal to the number of observations. Note that the expectation may not be meaningful for discrete emissions.

Parameters

<i>dataSeq</i>	Sequence of observations.
<i>smoothSeq</i>	Vector in which the expected emission sequence will be stored.

39.276.3.18 Tolerance() [1/2]

```
double Tolerance ( ) const [inline]
```

Get the tolerance of the Baum-Welch algorithm.

Definition at line 346 of file hmm.hpp.

39.276.3.19 Tolerance() [2/2]

```
double& Tolerance ( ) [inline]
```

Modify the tolerance of the Baum-Welch algorithm.

Definition at line 348 of file `hmm.hpp`.

39.276.3.20 Train() [1/2]

```
double Train (
    const std::vector< arma::mat > & dataSeq )
```

Train the model using the Baum-Welch algorithm, with only the given unlabeled observations.

Instead of giving a guess transition and emission matrix here, do that in the constructor. Each matrix in the vector of data sequences holds an individual data sequence; each point in each individual data sequence should be a column in the matrix. The number of rows in each matrix should be equal to the dimensionality of the **HMM** (p. 1335) (which is set in the constructor).

It is preferable to use the other overload of **Train()** (p. 1348), with labeled data. That will produce much better results. However, if labeled data is unavailable, this will work. In addition, it is possible to use **Train()** (p. 1348) with labeled data first, and then continue to train the model using this overload of **Train()** (p. 1348) with unlabeled data.

The tolerance of the Baum-Welch algorithm can be set either in the constructor or with the **Tolerance()** (p. 1347) method. When the change in log-likelihood of the model between iterations is less than the tolerance, the Baum-Welch algorithm terminates.

Note

Train() (p. 1348) can be called multiple times with different sequences; each time it is called, it uses the current parameters of the **HMM** (p. 1335) as a starting point for training.

Parameters

<i>dataSeq</i>	Vector of observation sequences.
----------------	----------------------------------

Returns

Log-likelihood of state sequence.

39.276.3.21 Train() [2/2]

```
void Train (
    const std::vector< arma::mat > & dataSeq,
    const std::vector< arma::Row< size_t > > & stateSeq )
```

Train the model using the given labeled observations; the transition and emission matrices are directly estimated.

Each matrix in the vector of data sequences corresponds to a vector in the vector of state sequences. Each point in each individual data sequence should be a column in the matrix, and its state should be the corresponding element in the state sequence vector. For instance, `dataSeq[0].col(3)` corresponds to the fourth observation in the first data sequence, and its state is `stateSeq[0][3]`. The number of rows in each matrix should be equal to the dimensionality of the **HMM** (p. 1335) (which is set in the constructor).

Note

Train() (p. 1348) can be called multiple times with different sequences; each time it is called, it uses the current parameters of the **HMM** (p. 1335) as a starting point for training.

Parameters

<i>dataSeq</i>	Vector of observation sequences.
<i>stateSeq</i>	Vector of state sequences, corresponding to each observation.

39.276.3.22 Transition() [1/2]

```
const arma::mat& Transition ( ) const [inline]
```

Return the transition matrix.

Definition at line 331 of file `hmm.hpp`.

39.276.3.23 Transition() [2/2]

```
arma::mat& Transition ( ) [inline]
```

Return a modifiable transition matrix reference.

Definition at line 333 of file `hmm.hpp`.

```

Definition at line 219 of file hmm_model.hpp.

References `BOOST_CLASS_VERSION()`.

39.277.3.2 DiscreteHMM()

```
HMM< distribution::DiscreteDistribution>* DiscreteHMM ( ) [inline]
```

Accessor methods for discreteHMM, gaussianHMM, gmmHMM, and diagGMMHMM.

Note that an instantiation of this class will only contain one type of **HMM** (p. 1335) (as indicated by the "type" instance variable) - the other two pointers will be NULL.

For instance, if the **HMMModel** (p. 1350) object holds a discrete **HMM** (p. 1335), then: type → DiscreteHMM gaussian↔ HMM → NULL gmmHMM → NULL diagGMMHMM → NULL discreteHMM → **HMM**<DiscreteDistribution> object and hence, calls to **GMMHMM()** (p. 1352), **DiagGMMHMM()** (p. 1352) and **GaussianHMM()** (p. 1352) will return NULL. Only the call to **DiscreteHMM()** (p. 1352) will return a non NULL pointer.

Hence, in practice, a user should be careful to first check the type of **HMM** (p. 1335) (by calling the **Type()** (p. 1353) accessor) and then perform subsequent actions, to avoid null pointer dereferences.

39.278 HMMRegression Class Reference

A class that represents a Hidden Markov Model Regression (HMMR).

Inheritance diagram for HMMRegression:

Public Member Functions

- **HMMRegression** (const size_t states, const **distribution::RegressionDistribution** emissions, const double tolerance=1e-5)
Create the Hidden Markov Model Regression with the given number of hidden states and the given default regression emission.
- **HMMRegression** (const arma::vec &initial, const arma::mat & **transition**, const std::vector< **distribution::RegressionDistribution** > & **emission**, const double tolerance=1e-5)
Create the Hidden Markov Model Regression with the given initial probability vector, the given transition matrix, and the given regression emission distributions.
- double **Estimate** (const arma::mat &predictors, const arma::vec &responses, arma::mat &stateProb, arma::mat &forwardProb, arma::mat &backwardProb, arma::vec &scales) const

Estimate the probabilities of each hidden state at each time step for each given data observation, using the Forward-Backward algorithm.

- double **Estimate** (const arma::mat &predictors, const arma::vec &responses, arma::mat &stateProb) const

Estimate the probabilities of each hidden state at each time step of each given data observation, using the Forward-Backward algorithm.

- void **Filter** (const arma::mat &predictors, const arma::vec &responses, arma::vec &filterSeq, size_t ahead=0) const

HMMR filtering.

- double **LogLikelihood** (const arma::mat &predictors, const arma::vec &responses) const

Compute the log-likelihood of the given predictors and responses.

- double **Predict** (const arma::mat &predictors, const arma::vec &responses, arma::Row< size_t > &stateSeq) const

Compute the most probable hidden state sequence for the given predictors and responses, using the Viterbi algorithm, returning the log-likelihood of the most likely state sequence.

- void **Smooth** (const arma::mat &predictors, const arma::vec &responses, arma::vec &smoothSeq) const

HMM (p. 1335) smoothing.

- void **Train** (const std::vector< arma::mat > &predictors, const std::vector< arma::vec > &responses)

Train the model using the Baum-Welch algorithm, with only the given predictors and responses.

- void **Train** (const std::vector< arma::mat > &predictors, const std::vector< arma::vec > &responses, const std::vector< arma::Row< size_t > > &stateSeq)

Train the model using the given labeled observations; the transition and regression emissions are directly estimated.

Additional Inherited Members

39.278.1 Detailed Description

A class that represents a Hidden Markov Model Regression (HMMR).

HMMR is an extension of Hidden Markov Models to regression analysis. The method is described in (Fridman, 1993) <https://www.ima.umn.edu/preprints/January1994/1195.pdf> An HMMR is a linear regression model whose coefficients are determined by a finite-state Markov chain. The error terms are conditionally independently normally distributed with zero mean and state-dependent variance. Let Q_t be a finite-state Markov chain, X_t a vector of predictors and Y_t a response. The HMMR is $Y_t = X_t \{Q_t\} + \{Q_t\}$

This HMMR class supports training (supervised and unsupervised), prediction of state sequences via the Viterbi algorithm, estimation of state probabilities, filtering and smoothing of responses, and calculation of the log-likelihood of a given sequence.

Usage of the HMMR class generally involves either training an HMMR or loading an already-known HMMR and using to filter a sequence. Example code for supervised training of an HMMR is given below.

```
// Each column is a vector of predictors for a single observation.
arma::mat predictors(5, 100, arma::fill::randn);
// Responses for each observation
arma::vec responses(100, arma::fill::randn);

// Create an untrained HMMR with 3 hidden states
RegressionDistribution rd(predictors, responses);
arma::mat transition("0.5 0.5;" "0.5 0.5;");
std::vector<RegressionDistribution> emissions(2,rd);
HMMRegression hmmr("0.9 0.1", transition, emissions);

// Train the HMM (supply a state sequence to perform supervised training)
std::vector<arma::mat> predictorsSeq(1, predictors);
std::vector< arma::vec> responsesSeq(1, responses);
hmmr.Train(predictorsSeq, responsesSeq);
hmm.Train(observations, states);
```

Once initialized, the HMMR can evaluate the probability of a certain sequence (with **LogLikelihood()** (p. 1359)), predict the most likely sequence of hidden states (with **Predict()** (p. 1359)), estimate the probabilities of each state for a sequence of observations (with **Estimate()** (p. 1357)), or perform filtering or smoothing of observations.

Definition at line 69 of file `hmm_regression.hpp`.

39.278.2 Constructor & Destructor Documentation

39.278.2.1 HMMRegression() [1/2]

```
HMMRegression (
    const size_t states,
    const distribution::RegressionDistribution emissions,
    const double tolerance = 1e-5 ) [inline]
```

Create the Hidden Markov Model Regression with the given number of hidden states and the given default regression emission.

The dimensionality of the observations is taken from the emissions variable, so it is important that the given default emission distribution is set with the correct dimensionality. Alternately, set the dimensionality with **Dimensionality()** (p. 1341). Optionally, the tolerance for convergence of the Baum-Welch algorithm can be set.

By default, the transition matrix and initial probability vector are set to contain equal probability for each state.

Parameters

<i>states</i>	Number of states.
<i>emissions</i>	Default distribution for emissions.
<i>tolerance</i>	Tolerance for convergence of training algorithm (Baum-Welch).

Definition at line 89 of file `hmm_regression.hpp`.

39.278.2.2 HMMRegression() [2/2]

```
HMMRegression (
    const arma::vec & initial,
    const arma::mat & transition,
    const std::vector< distribution::RegressionDistribution > & emission,
    const double tolerance = 1e-5 ) [inline]
```

Create the Hidden Markov Model Regression with the given initial probability vector, the given transition matrix, and the given regression emission distributions.

The dimensionality of the observations of the HMMR are taken from the given emission distributions. Alternately, the dimensionality can be set with **Dimensionality()** (p. 1341).

The initial state probability vector should have length equal to the number of states, and each entry represents the probability of being in the given state at time $T = 0$ (the beginning of a sequence).

The transition matrix should be such that $T(i, j)$ is the probability of transition to state i from state j . The columns of the matrix should sum to 1.

Optionally, the tolerance for convergence of the Baum-Welch algorithm can be set.

Parameters

<i>initial</i>	Initial state probabilities.
<i>transition</i>	Transition matrix.
<i>emission</i>	Emission distributions.
<i>tolerance</i>	Tolerance for convergence of training algorithm (Baum-Welch).

Definition at line 119 of file `hmm_regression.hpp`.

References `HMMRegression::Estimate()`, `HMMRegression::Filter()`, `HMMRegression::LogLikelihood()`, `HMMRegression::Predict()`, `HMMRegression::Smooth()`, and `HMMRegression::Train()`.

39.278.3 Member Function Documentation

39.278.3.1 Estimate() [1/2]

```
double Estimate (
    const arma::mat & predictors,
    const arma::vec & responses,
    arma::mat & stateProb,
    arma::mat & forwardProb,
    arma::mat & backwardProb,
    arma::vec & scales ) const
```

Estimate the probabilities of each hidden state at each time step for each given data observation, using the Forward-Backward algorithm.

Each matrix which is returned has columns equal to the number of data observations, and rows equal to the number of hidden states in the model. The log-likelihood of the most probable sequence is returned.

Parameters

<i>predictors</i>	Vector of predictor sequences.
<i>responses</i>	Vector of response sequences.
<i>stateProb</i>	Matrix in which the probabilities of each state at each time interval will be stored.
<i>forwardProb</i>	Matrix in which the forward probabilities of each state at each time interval will be stored.
<i>backwardProb</i>	Matrix in which the backward probabilities of each state at each time interval will be stored.
<i>scales</i>	Vector in which the scaling factors at each time interval will be stored.

Returns

Log-likelihood of most likely state sequence.

Referenced by HMMRegression::HMMRegression().

39.278.3.2 Estimate() [2/2]

```
double Estimate (
    const arma::mat & predictors,
    const arma::vec & responses,
    arma::mat & stateProb ) const
```

Estimate the probabilities of each hidden state at each time step of each given data observation, using the Forward-↔ Backward algorithm.

The returned matrix of state probabilities has columns equal to the number of data observations, and rows equal to the number of hidden states in the model. The log-likelihood of the most probable sequence is returned.

Parameters

<i>predictors</i>	Vector of predictor sequences.
<i>responses</i>	Vector of response sequences.
<i>stateProb</i>	Probabilities of each state at each time interval.

Returns

Log-likelihood of most likely state sequence.

39.278.3.3 Filter()

```
void Filter (
    const arma::mat & predictors,
    const arma::vec & responses,
    arma::vec & filterSeq,
    size_t ahead = 0 ) const
```

HMMR filtering.

Computes the k-step-ahead expected response at each time conditioned only on prior observations. That is $E\{Y[t+k] \mid Y[0], \dots, Y[t]\}$. The returned matrix has columns equal to the number of observations. Note that the expectation may not be meaningful for discrete emissions.

Parameters

<i>predictors</i>	Vector of predictor sequences.
<i>responses</i>	Vector of response sequences.
<i>initial</i>	Distribution of initial state.
<i>ahead</i>	Number of steps ahead (k) for expectations.
<i>filterSeq</i>	Vector in which the expected emission sequence will be stored.

Referenced by HMMRegression::HMMRegression().

39.278.3.4 LogLikelihood()

```
double LogLikelihood (
    const arma::mat & predictors,
    const arma::vec & responses ) const
```

Compute the log-likelihood of the given predictors and responses.

Parameters

<i>predictors</i>	Vector of predictor sequences.
<i>responses</i>	Vector of response sequences.

Returns

Log-likelihood of the given sequence.

Referenced by HMMRegression::HMMRegression().

39.278.3.5 Predict()

```
double Predict (
    const arma::mat & predictors,
    const arma::vec & responses,
    arma::Row< size_t > & stateSeq ) const
```

Compute the most probable hidden state sequence for the given predictors and responses, using the Viterbi algorithm, returning the log-likelihood of the most likely state sequence.

Parameters

<i>predictors</i>	Vector of predictor sequences.
<i>responses</i>	Vector of response sequences.
<i>stateSeq</i>	Vector in which the most probable state sequence will be stored.

Returns

Log-likelihood of most probable state sequence.

Referenced by `HMMRegression::HMMRegression()`.

39.278.3.6 Smooth()

```
void Smooth (
    const arma::mat & predictors,
    const arma::vec & responses,
    arma::vec & smoothSeq ) const
```

HMM (p. 1335) smoothing.

Computes expected emission at each time conditioned on all observations. That is $E\{Y[t] \mid Y[0], \dots, Y[T]\}$. The returned matrix has columns equal to the number of observations. Note that the expectation may not be meaningful for discrete emissions.

Parameters

<i>predictors</i>	Vector of predictor sequences.
<i>responses</i>	Vector of response sequences..
<i>initial</i>	Distribution of initial state.
<i>smoothSeq</i>	Vector in which the expected emission sequence will be stored.

Referenced by `HMMRegression::HMMRegression()`.

39.278.3.7 Train() [1/2]

```
void Train (
    const std::vector< arma::mat > & predictors,
    const std::vector< arma::vec > & responses )
```

Train the model using the Baum-Welch algorithm, with only the given predictors and responses.

Instead of giving a guess transition and emission here, do that in the constructor. Each matrix in the vector of predictors corresponds to an individual data sequence, and likewise for each vec in the vector of responses. The number of rows in each matrix of predictors plus one should be equal to the dimensionality of the **HMM** (p. 1335) (which is set in the constructor).

It is preferable to use the other overload of **Train()** (p. 1360), with labeled data. That will produce much better results. However, if labeled data is unavailable, this will work. In addition, it is possible to use **Train()** (p. 1360) with labeled data first, and then continue to train the model using this overload of **Train()** (p. 1360) with unlabeled data.

The tolerance of the Baum-Welch algorithm can be set either in the constructor or with the **Tolerance()** (p. 1347) method. When the change in log-likelihood of the model between iterations is less than the tolerance, the Baum-Welch algorithm terminates.

Note

Train() (p. 1360) can be called multiple times with different sequences; each time it is called, it uses the current parameters of the **HMM** (p. 1335) as a starting point for training.

Parameters

<i>predictors</i>	Vector of predictor sequences.
<i>responses</i>	Vector of response sequences.

Referenced by HMMRegression::HMMRegression().

39.278.3.8 Train() [2/2]

```
void Train (
    const std::vector< arma::mat > & predictors,
    const std::vector< arma::vec > & responses,
    const std::vector< arma::Row< size_t > > & stateSeq )
```

Train the model using the given labeled observations; the transition and regression emissions are directly estimated.

Each matrix in the vector of predictors corresponds to an individual data sequence, and likewise for each vec in the vector of responses. The number of rows in each matrix of predictors plus one should be equal to the dimensionality of the **HMM** (p. 1335) (which is set in the constructor).

Note

Train() (p. 1360) can be called multiple times with different sequences; each time it is called, it uses the current parameters of the HMMR as a starting point for training.

Parameters

<i>predictors</i>	Vector of predictor sequences.
<i>responses</i>	Vector of response sequences.
<i>stateSeq</i>	Vector of state sequences, corresponding to each observation.

39.279 CVFunction< CVType, MLAlgorithm, TotalArgs, BoundArgs > Class Template Reference

This wrapper serves for adapting the interface of the cross-validation classes to the one that can be utilized by the mlpack optimizers.

Public Member Functions

- **CVFunction** (CVType &cv, **data::DatasetMapper**< **data::IncrementPolicy**, double > &datasetInfo, const double relativeDelta, const double minDelta, const BoundArgs &... args)
*Initialize a **CVFunction** (p. 1361) object.*
- **MLAlgorithm** & **BestModel** ()
Access and modify the best model so far.
- double **Evaluate** (const arma::mat ¶meters)
Run cross-validation with the bound and passed parameters.
- void **Gradient** (const arma::mat ¶meters, arma::mat &gradient)
*Evaluate numerically the gradient of the **CVFunction** (p. 1361) with the given parameters.*

39.279.1 Detailed Description

```
template<typename CVType, typename MLAlgorithm, size_t TotalArgs, typename... BoundArgs>
class mlpack::hpt::CVFunction< CVType, MLAlgorithm, TotalArgs, BoundArgs >
```

This wrapper serves for adapting the interface of the cross-validation classes to the one that can be utilized by the mlpack optimizers.

This class is not supposed to be used directly by users. To tune hyper-parameters see **HyperParameterTuner** (p. 1375).

Template Parameters

<i>CVType</i>	A cross-validation strategy.
<i>MLAlgorithm</i>	The machine learning algorithm used in cross-validation.
<i>TotalArgs</i>	The total number of arguments that are supposed to be passed to the Evaluate method of a CVType object.
<i>BoundArgs</i>	Types of arguments (wrapped into the BoundArg struct) that should be passed into the Evaluate method of a CVType object but are not going to be passed into the Evaluate method of a CVFunction (p. 1361) object.

Definition at line 39 of file cv_function.hpp.

39.279.2 Constructor & Destructor Documentation

39.279.2.1 CVFunction()

```
CVFunction (
    CVType & cv,
    data::DatasetMapper< data::IncrementPolicy, double > & datasetInfo,
    const double relativeDelta,
```

```
const double minDelta,  
const BoundArgs &... args )
```

Initialize a **CVFunction** (p. 1361) object.

Parameters

<i>cv</i>	A cross-validation object.
<i>datasetInfo</i>	Information on each parameter (categorical/numeric). Contains mappings from optimizer-passed <code>size_t</code> indices to double values that should be used.
<i>relativeDelta</i>	Relative increase of arguments for calculation of partial derivatives (by the definition). The exact increase for some particular argument is equal to the absolute value of the argument multiplied by the relative increase (see also the documentation for the <code>minDelta</code> parameter).
<i>minDelta</i>	Minimum increase of arguments for calculation of partial derivatives (by the definition). This value is going to be used when it is greater than the increase calculated with the rules described in the documentation for the <code>relativeDelta</code> parameter.
<i>BoundArgs</i>	Arguments that should be passed into the Evaluate method of the CVType object but are not going to be passed into the Evaluate method of this object.

39.279.3 Member Function Documentation

39.279.3.1 BestModel()

```
MLAlgorithm& BestModel ( ) [inline]
```

Access and modify the best model so far.

Definition at line 87 of file `cv_function.hpp`.

References `CVFunction< CVType, MLAlgorithm, TotalArgs, BoundArgs >::Evaluate()`.

39.279.3.2 Evaluate()

```
double Evaluate (
    const arma::mat & parameters )
```

Run cross-validation with the bound and passed parameters.

Parameters

<i>parameters</i>	Arguments (rather than the bound arguments) that should be passed into the Evaluate method of the CVType object.
-------------------	--

Referenced by `CVFunction< CVType, MLAlgorithm, TotalArgs, BoundArgs >::BestModel()`.

39.279.3.3 Gradient()

```
void Gradient (
    const arma::mat & parameters,
    arma::mat & gradient )
```

Evaluate numerically the gradient of the **CVFunction** (p. 1361) with the given parameters.

Parameters

<i>parameters</i>	Arguments (rather than the bound arguments) that should be passed into the Evaluate method of the CVType object.
<i>gradient</i>	Vector to output the gradient into.

39.280 DeduceHyperParameterTypes< Args > Struct Template Reference

A type function for deducing types of hyper-parameters from types of arguments in the Optimize method in **Hyper↔ParameterTuner** (p. 1375).

Classes

- struct **ResultHolder**

39.280.1 Detailed Description

```
template<typename... Args>
struct mlpack::hpt::DeduceHyperParameterTypes< Args >
```

A type function for deducing types of hyper-parameters from types of arguments in the Optimize method in **Hyper↔ParameterTuner** (p. 1375).

We start by putting all types of the arguments into Args, and then process each of them one by one and put results into the internal struct **ResultHolder** (p. 1366). By the end Args become empty, while **ResultHolder** (p. 1366) holds the tuple type of hyper-parameters.

Here we declare and define **DeduceHyperParameterTypes** (p. 1365) for the end phase when Args are empty (all argument types have been processed).

Definition at line 34 of file deduce_hp_types.hpp.

39.290 FixedArg< T, I > Struct Template Reference

A struct for storing information about a fixed argument.

Public Attributes

- `const T & value`

The value of the fixed argument.

Static Public Attributes

- `static const size_t index = I`

The index of the fixed argument.

39.290.1 Detailed Description

```
template<typename T, size_t I>
struct mlpack::hpt::FixedArg< T, I >
```

A struct for storing information about a fixed argument.

Objects of this type are supposed to be passed into the **CVFunction** (p. 1361) constructor.

This struct is not meant to be used directly by users. Rather use the **mlpack::hpt::Fixed** (p. 398) function.

Template Parameters

<i>T</i>	The type of the fixed argument.
<i>I</i>	The index of the fixed argument.

Definition at line 52 of file fixed.hpp.

39.290.2 Member Data Documentation

39.290.2.1 index

```
const size_t index = I [static]
```

The index of the fixed argument.

Definition at line 55 of file fixed.hpp.

39.290.2.2 value

```
const T& value
```

The value of the fixed argument.

Definition at line 58 of file fixed.hpp.

39.291 HyperParameterTuner< MLAlgorithm, Metric, CV, OptimizerType, MatType, PredictionsType, WeightsType > Class Template Reference

The class **HyperParameterTuner** (p. 1375) for the given MLAlgorithm utilizes the provided Optimizer to find the values of hyper-parameters that optimize the value of the given Metric.

Public Member Functions

- template<typename... CVArgs>
HyperParameterTuner (const CVArgs &...args)
*Create a **HyperParameterTuner** (p. 1375) object by passing constructor arguments for the given cross-validation strategy (the CV class).*
- const MLAlgorithm & **BestModel** () const
Get the best model from the last run.
- MLAlgorithm & **BestModel** ()
Modify the best model from the last run.
- double **BestObjective** () const
Get the performance measurement of the best model from the last run.
- double **MinDelta** () const
Get minimum increase of arguments for calculation of partial derivatives (by the definition) in gradient-based optimization.
- double & **MinDelta** ()
Modify minimum increase of arguments for calculation of partial derivatives (by the definition) in gradient-based optimization.
- template<typename... Args>
TupleOfHyperParameters< Args... > **Optimize** (const Args &... args)
Find the best hyper-parameters by using the given Optimizer.
- OptimizerType & **Optimizer** ()
Access and modify the optimizer.
- double **RelativeDelta** () const
Get relative increase of arguments for calculation of partial derivatives (by the definition) in gradient-based optimization.
- double & **RelativeDelta** ()
Modify relative increase of arguments for calculation of partial derivatives (by the definition) in gradient-based optimization.

39.291.1 Detailed Description

```
template<typename MlAlgorithm, typename Metric, template< typename, typename, typename, typename > class CV,
typename OptimizerType = ens::GridSearch, typename MatType = arma::mat, typename PredictionsType = typename cv::MetalInfo<↵
Extractor<MlAlgorithm, MatType>::PredictionsType, typename WeightsType = typename cv::MetalInfoExtractor<MlAlgorithm, Mat<↵
Type, PredictionsType>::WeightsType>
class mlpack::hpt::HyperParameterTuner< MlAlgorithm, Metric, CV, OptimizerType, MatType, PredictionsType, WeightsType >
```

The class **HyperParameterTuner** (p. 1375) for the given **MlAlgorithm** utilizes the provided **Optimizer** to find the values of hyper-parameters that optimize the value of the given **Metric**.

The value of the **Metric** is calculated by performing cross-validation with the provided cross-validation strategy.

To construct a **HyperParameterTuner** (p. 1375) object you need to pass the same arguments as for construction of an object of the given **CV** class. For example, we can use the following code to try to find a good **lambda** value for **LinearRegression**.

```
// 100-point 5-dimensional random dataset.
arma::mat data = arma::randu<arma::mat>(5, 100);
// Noisy responses retrieved by a random linear transformation of data.
arma::rowvec responses = arma::randu<arma::rowvec>(5) * data +
    0.1 * arma::randn<arma::rowvec>(100);

// Using 80% of data for training and remaining 20% for assessing MSE.
double validationSize = 0.2;
HyperParameterTuner<LinearRegression, MSE, SimpleCV> hpt(validationSize,
    data, responses);

// Finding the best value for lambda from the values 0.0, 0.001, 0.01, 0.1,
// and 1.0.
arma::vec lambdas{0.0, 0.001, 0.01, 0.1, 1.0};
double bestLambda;
std::tie(bestLambda) = hpt.Optimize(lambdas);
```

When some hyper-parameters should not be optimized, you can specify values for them with the **Fixed** function as in the following example of finding good **lambda1** and **lambda2** values for **LARS**.

```
HyperParameterTuner<LARS, MSE, SimpleCV> hpt2(validationSize, data,
    responses);

bool transposeData = true;
bool useCholesky = false;
arma::vec lambda1Set{0.0, 0.001, 0.01, 0.1, 1.0};
arma::vec lambda2Set{0.0, 0.002, 0.02, 0.2, 2.0};

double bestLambda1, bestLambda2;
std::tie(bestLambda1, bestLambda2) = hpt2.Optimize(Fixed(transposeData),
    Fixed(useCholesky), lambda1Set, lambda2Set);
```

Template Parameters

<i>MlAlgorithm</i>	A machine learning algorithm.
<i>Metric</i>	A metric to assess the quality of a trained model.
<i>CV</i>	A cross-validation strategy used to assess a set of hyper-parameters.
<i>OptimizerType</i>	An optimization strategy (GridSearch and GradientDescent are supported).
<i>MatType</i>	The type of data.
<i>PredictionsType</i>	The type of predictions (should be passed when the predictions type is a template parameter in Train methods of the given MlAlgorithm ; arma::Row<size_t> will be used otherwise).
<i>WeightsType</i>	The type of weights (should be passed when weighted learning is supported, and the weights type is a template parameter in Train methods of the given MlAlgorithm ; arma::vec will be used otherwise).

Definition at line 96 of file hpt.hpp.

39.291.2 Constructor & Destructor Documentation

39.291.2.1 HyperParameterTuner()

```
HyperParameterTuner (  
    const CVArgs &... args )
```

Create a **HyperParameterTuner** (p. 1375) object by passing constructor arguments for the given cross-validation strategy (the CV class).

Parameters

<i>args</i>	Constructor arguments for the given cross-validation strategy (the CV class).
-------------	---

39.291.3 Member Function Documentation

39.291.3.1 BestModel() [1/2]

```
const MLAlgorithm& BestModel ( ) const [inline]
```

Get the best model from the last run.

Definition at line 184 of file hpt.hpp.

39.291.3.2 BestModel() [2/2]

```
MLAlgorithm& BestModel ( ) [inline]
```

Modify the best model from the last run.

Definition at line 187 of file hpt.hpp.

39.291.3.3 BestObjective()

```
double BestObjective ( ) const [inline]
```

Get the performance measurement of the best model from the last run.

Definition at line 181 of file hpt.hpp.

39.291.3.4 MinDelta() [1/2]

```
double MinDelta ( ) const [inline]
```

Get minimum increase of arguments for calculation of partial derivatives (by the definition) in gradient-based optimization.

This value is going to be used when it is greater than the increase calculated with the rules described in the documentation for **RelativeDelta()** (p. 1379).

The default value is 1e-10.

Definition at line 142 of file hpt.hpp.

39.291.3.5 MinDelta() [2/2]

```
double& MinDelta ( ) [inline]
```

Modify minimum increase of arguments for calculation of partial derivatives (by the definition) in gradient-based optimization.

This value is going to be used when it is greater than the increase calculated with the rules described in the documentation for **RelativeDelta()** (p. 1379).

The default value is 1e-10.

Definition at line 152 of file hpt.hpp.

References `HyperParameterTuner< MLAlgorithm, Metric, CV, OptimizerType, MatType, PredictionsType, WeightsType >::Optimize()`.

39.291.3.6 Optimize()

```
TupleOfHyperParameters<Args...> Optimize (
    const Args &... args )
```

Find the best hyper-parameters by using the given Optimizer.

For each hyper-parameter one of the following should be passed as an argument.

1. A set of values to choose from (when using GridSearch as an optimizer). The set of values should be an STL-compatible container (it should provide begin() and end() methods returning iterators).
2. A starting value (when using any other optimizer than GridSearch).
3. A value fixed by using the function **mlpack::hpt::Fixed** (p.398). In this case the hyper-parameter will not be optimized.

All arguments should be passed in the same order as if the corresponding hyper-parameters would be passed into the Evaluate method of the given CV class (in the order as they appear in the constructor(s) of the given MLAlgorithm). Also, arguments for all required hyper-parameters (ones that don't have default values in the corresponding MLAlgorithm constructor) should be provided.

The method returns a tuple of values for hyper-parameters that haven't been fixed.

Parameters

<i>args</i>	Arguments corresponding to hyper-parameters (see the method description for more information).
-------------	--

Referenced by HyperParameterTuner< MLAlgorithm, Metric, CV, OptimizerType, MatType, PredictionsType, WeightsType >::MinDelta().

39.291.3.7 Optimizer()

```
OptimizerType& Optimizer ( ) [inline]
```

Access and modify the optimizer.

Definition at line 110 of file hpt.hpp.

39.291.3.8 RelativeDelta() [1/2]

```
double RelativeDelta ( ) const [inline]
```

Get relative increase of arguments for calculation of partial derivatives (by the definition) in gradient-based optimization.

The exact increase for some particular argument is equal to the absolute value of the argument multiplied by the relative increase (see also the documentation for **MinDelta()** (p. 1378)).

The default value is 0.01.

Definition at line 121 of file hpt.hpp.

39.291.3.9 RelativeDelta() [2/2]

```
double& RelativeDelta ( ) [inline]
```

Modify relative increase of arguments for calculation of partial derivatives (by the definition) in gradient-based optimization.

The exact increase for some particular argument is equal to the absolute value of the argument multiplied by the relative increase (see also the documentation for **MinDelta()** (p. 1378)).

The default value is 0.01.

Definition at line 132 of file hpt.hpp.

39.293 PreFixedArg< T > Struct Template Reference

A struct for marking arguments as ones that should be fixed (it can be useful for the Optimize method of **Hyper**↔**ParameterTuner** (p. 1375)).

Public Types

- using **Type** = T

Public Attributes

- const T **value**

39.293.1 Detailed Description

```
template<typename T>
struct mlpack::hpt::PreFixedArg< T >
```

A struct for marking arguments as ones that should be fixed (it can be useful for the Optimize method of **Hyper**↔**ParameterTuner** (p. 1375)).

Arguments of this type are supposed to be converted into structs of the type **FixedArg** (p. 1373) by adding information about argument positions.

This struct is not meant to be used directly by users. Rather use the **mlpack::hpt::Fixed** (p. 398) function.

Definition at line 23 of file fixed.hpp.

39.297.3.1 DualMonoKDE()

```
DualMonoKDE (
    arma::vec & estimations )
```

DualMonoKDE (p. 1386) constructor.

39.297.4 Member Function Documentation

39.297.4.1 operator>()

```
void operator() (
    KDETypeT< KernelType, TreeType > * kde ) const
```

Default **DualMonoKDE** (p. 1386) on some KDEType.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kde/ **kde_model.hpp**

39.298 KDE< KernelType, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTreeTraversalType > Class Template Reference

The **KDE** (p. 1387) class is a template class for performing Kernel Density Estimations.

Public Types

- typedef TreeType< MetricType, **kde::KDEStat**, MatType > **Tree**
Convenience typedef.

Public Member Functions

- **KDE** (const double relError=0.05, const double absError=0, KernelType kernel=KernelType(), const **KDEMode** mode= **DUAL_TREE_MODE**, MetricType metric=MetricType())
*Initialize **KDE** (p. 1387) object using custom instantiated Metric and Kernel objects.*
- **KDE** (const **KDE** &other)
*Construct **KDE** (p. 1387) object as a copy of the given model.*
- **KDE** (**KDE** &&other)
*Construct **KDE** (p. 1387) object taking ownership of the given model.*
- ~**KDE** ()
*Destroy the **KDE** (p. 1387) object.*
- double **AbsoluteError** () const
Get absolute error tolerance.
- void **AbsoluteError** (const double newError)
Modify absolute error tolerance ($0 \leq \text{newError}$).
- void **Evaluate** (MatType querySet, arma::vec &estimations)
Estimate density of each point in the query set given the data of the reference set.
- void **Evaluate** (**Tree** *queryTree, const std::vector< size_t > &oldFromNewQueries, arma::vec &estimations)
Estimate density of each point in the query set given the data of an already created query tree.
- void **Evaluate** (arma::vec &estimations)
Estimate density of each point in the reference set given the data of the reference set.
- bool **IsTrained** () const
*Check whether **KDE** (p. 1387) model is trained or not.*
- const KernelType & **Kernel** () const
Get the kernel.
- KernelType & **Kernel** ()
Modify the kernel.
- const MetricType & **Metric** () const
Get the metric.
- MetricType & **Metric** ()
Modify the metric.
- **KDEMode** **Mode** () const
*Get the mode of **KDE** (p. 1387).*
- **KDEMode** & **Mode** ()
*Modify the mode of **KDE** (p. 1387).*
- **KDE** & **operator=** (**KDE** other)
*Copy a **KDE** (p. 1387) model.*
- bool **OwnsReferenceTree** () const
*Check whether reference tree is owned by the **KDE** (p. 1387) model.*
- **Tree** * **ReferenceTree** ()
Get the reference tree.
- double **RelativeError** () const

Get relative error tolerance.

- void **RelativeError** (const double newError)
Modify relative error tolerance (0 <= newError <= 1).
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the model.
- void **Train** (MatType referenceSet)
Trains the KDE (p. 1387) model.
- void **Train** (**Tree** *referenceTree, std::vector< size_t > *oldFromNewReferences)
Trains the KDE (p. 1387) model.

39.298.1 Detailed Description

```
template<typename KernelType = kernel::GaussianKernel, typename MetricType = mlpack::metric::EuclideanDistance, typename
MatType = arma::mat, template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType = tree<
::KDTree, template< typename RuleType > class DualTreeTraversalType = TreeType<MetricType, kde::KDEStat, MatType>::template
DualTreeTraverser, template< typename RuleType > class SingleTreeTraversalType = TreeType<MetricType, kde::KDEStat, Mat<
Type>::template SingleTreeTraverser>
class mlpack::kde::KDE< KernelType, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTreeTraversalType >
```

The **KDE** (p. 1387) class is a template class for performing Kernel Density Estimations.

In statistics, kernel density estimation is a way to estimate the probability density function of a variable in a non parametric way. This implementation performs this estimation using a tree-independent dual-tree algorithm. Details about this algorithm are available in **KDERules** (p. 1404).

Template Parameters

<i>KernelType</i>	Kernel function to use for KDE (p. 1387) calculations.
<i>MetricType</i>	Metric to use for KDE (p. 1387) calculations.
<i>MatType</i>	Type of data to use.
<i>TreeType</i>	Type of tree to use; must satisfy the TreeType policy API.
<i>DualTreeTraversalType</i>	Type of dual-tree traversal to use.
<i>SingleTreeTraversalType</i>	Type of single-tree traversal to use.

Definition at line 59 of file kde.hpp.

39.298.2 Member Typedef Documentation

39.298.2.1 Tree

```
typedef TreeType<MetricType, kde::KDEStat, MatType> Tree
```

Convenience typedef.

Definition at line 63 of file kde.hpp.

39.298.3 Constructor & Destructor Documentation

39.298.3.1 KDE() [1/3]

```
KDE (
    const double relError = 0.05,
    const double absError = 0,
    KernelType kernel = KernelType(),
    const KDEMode mode = DUAL_TREE_MODE,
    MetricType metric = MetricType() )
```

Initialize **KDE** (p. 1387) object using custom instantiated Metric and Kernel objects.

Parameters

<i>relError</i>	Relative error tolerance of the model.
<i>absError</i>	Absolute error tolerance of the model.
<i>kernel</i>	Instantiated kernel object.
<i>mode</i>	Mode for the algorithm.
<i>metric</i>	Instantiated metric object.

39.298.3.2 KDE() [2/3]

```
KDE (
    const KDE< KernelType, MetricType, MatType, TreeType, DualTreeTraversalType, Single↵
TreeTraversalType > & other )
```

Construct **KDE** (p. 1387) object as a copy of the given model.

This may be computationally intensive!

Parameters

<i>other</i>	KDE (p. 1387) object to copy.
--------------	--------------------------------------

39.298.3.3 KDE() [3/3]

```
KDE (
    KDE< KernelType, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTree↵
TraversalType > && other )
```

Construct **KDE** (p. 1387) object taking ownership of the given model.

Parameters

<i>other</i>	KDE (p. 1387) object to take ownership of.
--------------	---

39.298.3.4 ~KDE()

`~ KDE ()`

Destroy the **KDE** (p. 1387) object.

If this object created any trees, they will be deleted. If you created the trees then you have to delete them yourself.

39.298.4 Member Function Documentation

39.298.4.1 AbsoluteError() [1/2]

```
double AbsoluteError ( ) const [inline]
```

Get absolute error tolerance.

Definition at line 200 of file kde.hpp.

39.298.4.2 AbsoluteError() [2/2]

```
void AbsoluteError (
    const double newError )
```

Modify absolute error tolerance (0 <= newError).

39.298.4.3 Evaluate() [1/3]

```
void Evaluate (
    MatType querySet,
    arma::vec & estimations )
```

Estimate density of each point in the query set given the data of the reference set.

The result is stored in an estimations vector. Estimations might not be normalized.

- Dimension of each point in the query set must match the dimension of each point in the reference set.
- Use `std::move` if the query set is no longer needed.

Precondition

The model has to be previously trained.

Parameters

<i>querySet</i>	Set of query points to get the density of.
<i>estimations</i>	Object which will hold the density of each query point.

39.298.4.4 Evaluate() [2/3]

```
void Evaluate (
    Tree * queryTree,
    const std::vector< size_t > & oldFromNewQueries,
    arma::vec & estimations )
```

Estimate density of each point in the query set given the data of an already created query tree.

The result is stored in an estimations vector. Estimations might not be normalized.

- Dimension of each point in the queryTree dataset must match the dimension of each point in the reference set.
- Use std::move if the query tree is no longer needed.

Precondition

The model has to be previously trained and mode has to be dual-tree.

Parameters

<i>queryTree</i>	Tree of query points to get the density of.
<i>oldFromNewQueries</i>	Mappings of query points to the tree dataset.
<i>estimations</i>	Object which will hold the density of each query point.

39.298.4.5 Evaluate() [3/3]

```
void Evaluate (
    arma::vec & estimations )
```

Estimate density of each point in the reference set given the data of the reference set.

It does not compute the estimation of a point with itself. The result is stored in an estimations vector. Estimations might not be normalized.

Precondition

The model has to be previously trained.

Parameters

<i>estimations</i>	Object which will hold the density of each reference point.
--------------------	---

39.298.4.6 IsTrained()

```
bool IsTrained ( ) const [inline]
```

Check whether **KDE** (p. 1387) model is trained or not.

Definition at line 209 of file kde.hpp.

39.298.4.7 Kernel() [1/2]

```
const KernelType& Kernel ( ) const [inline]
```

Get the kernel.

Definition at line 179 of file kde.hpp.

39.298.4.8 Kernel() [2/2]

```
KernelType& Kernel ( ) [inline]
```

Modify the kernel.

Definition at line 182 of file kde.hpp.

39.298.4.9 Metric() [1/2]

```
const MetricType& Metric ( ) const [inline]
```

Get the metric.

Definition at line 185 of file kde.hpp.

39.298.4.10 Metric() [2/2]

```
MetricType& Metric ( ) [inline]
```

Modify the metric.

Definition at line 188 of file kde.hpp.

39.298.4.11 Mode() [1/2]

```
KDEMode Mode ( ) const [inline]
```

Get the mode of **KDE** (p. 1387).

Definition at line 212 of file kde.hpp.

39.298.4.12 Mode() [2/2]

```
KDEMode& Mode ( ) [inline]
```

Modify the mode of **KDE** (p. 1387).

Definition at line 215 of file kde.hpp.

References KDE< KernelType, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTreeTraversalType >↵
::serialize().

39.298.4.13 operator=()

```
KDE& operator= (
    KDE< KernelType, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTree↵
    TraversalType > other )
```

Copy a **KDE** (p. 1387) model.

Use std::move if the object to copy is no longer needed.

Parameters

<i>other</i>	KDE (p. 1387) model to copy.
--------------	-------------------------------------

39.298.4.14 OwnsReferenceTree()

```
bool OwnsReferenceTree ( ) const [inline]
```

Check whether reference tree is owned by the **KDE** (p. 1387) model.

Definition at line 206 of file kde.hpp.

39.298.4.15 ReferenceTree()

```
Tree* ReferenceTree ( ) [inline]
```

Get the reference tree.

Definition at line 191 of file kde.hpp.

39.298.4.16 RelativeError() [1/2]

```
double RelativeError ( ) const [inline]
```

Get relative error tolerance.

Definition at line 194 of file kde.hpp.

39.298.4.17 RelativeError() [2/2]

```
void RelativeError (
    const double newError )
```

Modify relative error tolerance ($0 \leq \text{newError} \leq 1$).

39.298.4.18 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the model.

Referenced by KDE< KernelType, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTreeTraversalType >::Mode().

39.298.4.19 Train() [1/2]

```
void Train (
    MatType referenceSet )
```

Trains the **KDE** (p. 1387) model.

It builds a tree using a reference set.

Use std::move if the reference set is no longer needed.

Parameters

<i>referenceSet</i>	Set of reference data.
---------------------	------------------------

39.298.4.20 Train() [2/2]

```
void Train (
    Tree * referenceTree,
    std::vector< size_t > * oldFromNewReferences )
```

Trains the **KDE** (p. 1387) model.

Sets the reference tree to an already created tree.

- If TreeTraits<TreeType>::RearrangesDataset is false then it is possible to use an empty oldFromNewReferences vector.

Parameters

<i>referenceTree</i>	Built reference tree.
<i>oldFromNewReferences</i>	Permutations of reference points obtained during tree generation.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kde/ **kde.hpp**

Initialize **KDEModel** (p. 1397).
- **KDEModel** (const **KDEModel** &other)
Copy constructor of the given model.
- **KDEModel** (**KDEModel** &&other)
Move constructor of the given model. Takes ownership of the model.
- **~KDEModel** ()
Destroy the **KDEModel** (p. 1397) object.
- double **AbsoluteError** () const
Get the absolute error tolerance.
- double & **AbsoluteError** ()
Modify the absolute error tolerance.
- double **Bandwidth** () const
Get the bandwidth of the kernel.
- double & **Bandwidth** ()
Modify the bandwidth of the kernel.
- void **BuildModel** (arma::mat &&referenceSet)
Build the **KDE** (p. 1387) model with the given parameters and then trains it with the given reference data.
- void **Evaluate** (arma::mat &&querySet, arma::vec &estimations)
Perform kernel density estimation on the given query set.
- void **Evaluate** (arma::vec &estimations)
Perform kernel density estimation on the reference set.

- **KernelTypes** **KernelType** () const
Get the kernel type of the model.
- **KernelTypes** & **KernelType** ()
Modify the kernel type of the model.
- **KDEMode** **Mode** () const
Get the mode of the model.
- **KDEMode** & **Mode** ()
Modify the mode of the model.
- **KDEModel** & **operator=** (**KDEModel** other)
Copy the given model.
- double **RelativeError** () const
Get the relative error tolerance.
- double & **RelativeError** ()
Modify the relative error tolerance.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
*Serialize the **KDE** (p. 1387) model.*
- **TreeTypes** **TreeType** () const
Get the tree type of the model.
- **TreeTypes** & **TreeType** ()
Modify the tree type of the model.

39.299.1 Detailed Description

Definition at line 193 of file kde_model.hpp.

39.299.2 Member Enumeration Documentation

39.299.2.1 KernelTypes

enum **KernelTypes**

Enumerator

GAUSSIAN_KERNEL	
EPANECHNIKOV_KERNEL	
LAPLACIAN_KERNEL	
SPHERICAL_KERNEL	
TRIANGULAR_KERNEL	

Definition at line 205 of file kde_model.hpp.

39.299.2.2 TreeTypes

```
enum TreeTypes
```

Enumerator

KD_TREE	
BALL_TREE	
COVER_TREE	
OCTREE	
R_TREE	

Definition at line 196 of file kde_model.hpp.

39.299.3 Constructor & Destructor Documentation

39.299.3.1 KDEModel() [1/3]

```
KDEModel (
    const double bandwidth = 1.0,
    const double relError = 0.05,
    const double absError = 0,
    const KernelTypes kernelType = KernelTypes::GAUSSIAN_KERNEL,
    const TreeTypes treeType = TreeTypes::KD_TREE )
```

Initialize **KDEModel** (p. 1397).

Parameters

<i>bandwidth</i>	Bandwidth to use for the kernel.
<i>relError</i>	Maximum relative error tolerance for each point in the model. For example, 0.05 means that each value must be within 5% of the true KDE (p. 1387) value.
<i>absError</i>	Maximum absolute error tolerance for each point in the model. For example, 0.1 means that for each point the value can have a maximum error of 0.1 units.
<i>kernelType</i>	Type of kernel to use.
<i>treeType</i>	Type of tree to use.

39.299.3.2 KDEMModel() [2/3]

```
KDEMModel (
    const KDEMModel & other )
```

Copy constructor of the given model.

39.299.3.3 KDEMModel() [3/3]

```
KDEMModel (
    KDEMModel && other )
```

Move constructor of the given model. Takes ownership of the model.

39.299.3.4 ~KDEMModel()

```
~ KDEMModel ( )
```

Destroy the **KDEMModel** (p. 1397) object.

39.299.4 Member Function Documentation**39.299.4.1 AbsoluteError()** [1/2]

```
double AbsoluteError ( ) const [inline]
```

Get the absolute error tolerance.

Definition at line 315 of file kde_model.hpp.

39.299.4.2 AbsoluteError() [2/2]

```
double& AbsoluteError ( ) [inline]
```

Modify the absolute error tolerance.

Definition at line 318 of file kde_model.hpp.

39.299.4.3 Bandwidth() [1/2]

```
double Bandwidth ( ) const [inline]
```

Get the bandwidth of the kernel.

Definition at line 303 of file kde_model.hpp.

39.299.4.4 Bandwidth() [2/2]

```
double& Bandwidth ( ) [inline]
```

Modify the bandwidth of the kernel.

Definition at line 306 of file kde_model.hpp.

39.299.4.5 BuildModel()

```
void BuildModel (
    arma::mat && referenceSet )
```

Build the **KDE** (p. 1387) model with the given parameters and then trains it with the given reference data.

Takes possession of the reference set to avoid a copy, so the reference set will not be usable after this.

Parameters

<i>referenceSet</i>	Set of reference points.
---------------------	--------------------------

39.299.4.6 Evaluate() [1/2]

```
void Evaluate (
    arma::mat && querySet,
    arma::vec & estimations )
```

Perform kernel density estimation on the given query set.

Takes possession of the query set to avoid a copy, so the query set will not be usable after this. If possible, it returns normalized estimations.

Precondition

The model has to be previously created with BuildModel.

Parameters

<i>querySet</i>	Set of query points.
<i>estimations</i>	Vector where the results will be stored in the same order as the query points.

39.299.4.7 Evaluate() [2/2]

```
void Evaluate (
    arma::vec & estimations )
```

Perform kernel density estimation on the reference set.

If possible, it returns normalized estimations.

Precondition

The model has to be previously created with BuildModel.

Parameters

<i>estimations</i>	Vector where the results will be stored in the same order as the query points.
--------------------	--

39.299.4.8 KernelType() [1/2]

```
KernelTypes KernelType ( ) const [inline]
```

Get the kernel type of the model.

Definition at line 327 of file kde_model.hpp.

39.299.4.9 KernelType() [2/2]

```
KernelTypes& KernelType ( ) [inline]
```

Modify the kernel type of the model.

Definition at line 330 of file kde_model.hpp.

References mlpack::bindings::tests::CleanMemory().

39.299.4.10 Mode() [1/2]

```
KDEMode Mode ( ) const
```

Get the mode of the model.

39.299.4.11 Mode() [2/2]

```
KDEMode& Mode ( )
```

Modify the mode of the model.

39.299.4.12 operator=()

```
KDEModel& operator= (
    KDEModel other )
```

Copy the given model.

Use std::move if the object to copy is no longer needed.

Parameters

<i>other</i>	KDEModel (p. 1397) to copy.
--------------	------------------------------------

39.299.4.13 RelativeError() [1/2]

```
double RelativeError ( ) const [inline]
```

Get the relative error tolerance.

Definition at line 309 of file kde_model.hpp.

39.299.4.14 RelativeError() [2/2]

```
double& RelativeError ( ) [inline]
```

Modify the relative error tolerance.

Definition at line 312 of file kde_model.hpp.

39.299.4.15 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the **KDE** (p. 1387) model.

39.299.4.16 `TreeType()` [1/2]

```
TreeTypes TreeType ( ) const [inline]
```

Get the tree type of the model.

Definition at line 321 of file `kde_model.hpp`.

39.299.4.17 `TreeType()` [2/2]

```
TreeTypes& TreeType ( ) [inline]
```

Modify the tree type of the model.

Definition at line 324 of file `kde_model.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kde/ kde_model.hpp`

39.300 `KDERules< MetricType, KernelType, TreeType >` Class Template Reference

A dual-tree traversal Rules class for kernel density estimation.

Public Types

- typedef `tree::TraversallInfo< TreeType >` **TraversallInfoType**

Public Member Functions

- **KDERules** (const arma::mat &referenceSet, const arma::mat &querySet, arma::vec &densities, const double relError, const double absError, MetricType &metric, KernelType &kernel, const bool sameSet)
*Construct **KDERules** (p. 1404).*
- double **BaseCase** (const size_t queryIndex, const size_t referenceIndex)
Base Case.
- size_t **BaseCases** () const
Get the number of base cases.
- double **Rescore** (const size_t queryIndex, TreeType &referenceNode, const double oldScore) const
SingleTree Score.
- double **Rescore** (TreeType &queryNode, TreeType &referenceNode, const double oldScore) const
DoubleTree Rescore.
- double **Score** (const size_t queryIndex, TreeType &referenceNode)
SingleTree Rescore.
- double **Score** (TreeType &queryNode, TreeType &referenceNode)
DoubleTree Score.
- size_t **Scores** () const
Get the number of scores.
- const **TraversalInfoType** & **TraversalInfo** () const
Get traversal information.
- **TraversalInfoType** & **TraversalInfo** ()
Modify traversal information.

39.300.1 Detailed Description

```
template<typename MetricType, typename KernelType, typename TreeType>
class mlpack::kde::KDERules< MetricType, KernelType, TreeType >
```

A dual-tree traversal Rules class for kernel density estimation.

This contains the **Score()** (p. 1407) and **BaseCase()** (p. 1406) implementations.

Definition at line 26 of file kde_rules.hpp.

39.300.2 Member Typedef Documentation

39.300.2.1 TraversalInfoType

```
typedef tree::TraversalInfo<TreeType> TraversalInfoType
```

Definition at line 70 of file kde_rules.hpp.

39.300.3 Constructor & Destructor Documentation

39.300.3.1 KDERules()

```
KDERules (
    const arma::mat & referenceSet,
    const arma::mat & querySet,
    arma::vec & densities,
    const double relError,
    const double absError,
    MetricType & metric,
    KernelType & kernel,
    const bool sameSet )
```

Construct **KDERules** (p. 1404).

Parameters

<i>referenceSet</i>	Reference set data.
<i>querySet</i>	Query set data.
<i>densities</i>	Vector where estimations will be written.
<i>relError</i>	Relative error tolerance.
<i>absError</i>	Absolute error tolerance.
<i>metric</i>	Instantiated metric.
<i>kernel</i>	Instantiated kernel.
<i>sameSet</i>	True if query and reference sets are the same (monochromatic evaluation).

39.300.4 Member Function Documentation

39.300.4.1 BaseCase()

```
double BaseCase (
    const size_t queryIndex,
    const size_t referenceIndex )
```

Base Case.

39.300.4.2 BaseCases()

```
size_t BaseCases ( ) const [inline]
```

Get the number of base cases.

Definition at line 79 of file kde_rules.hpp.

39.300.4.3 Rescore() [1/2]

```
double Rescore (
    const size_t queryIndex,
    TreeType & referenceNode,
    const double oldScore ) const
```

SingleTree Score.

39.300.4.4 Rescore() [2/2]

```
double Rescore (
    TreeType & queryNode,
    TreeType & referenceNode,
    const double oldScore ) const
```

DoubleTree Rescore.

39.300.4.5 Score() [1/2]

```
double Score (
    const size_t queryIndex,
    TreeType & referenceNode )
```

SingleTree Rescore.

39.300.4.6 Score() [2/2]

```
double Score (
    TreeType & queryNode,
    TreeType & referenceNode )
```

DoubleTree Score.

39.300.4.7 Scores()

```
size_t Scores ( ) const [inline]
```

Get the number of scores.

Definition at line 82 of file kde_rules.hpp.

39.300.4.8 TraversalInfo() [1/2]

```
const TraversalInfoType& TraversalInfo ( ) const [inline]
```

Get traversal information.

Definition at line 73 of file kde_rules.hpp.

39.300.4.9 TraversalInfo() [2/2]

```
TraversalInfoType& TraversalInfo ( ) [inline]
```

Modify traversal information.

Definition at line 76 of file kde_rules.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kde/ **kde_rules.hpp**

39.301 KDEStat Class Reference

Extra data for each node in the tree for the task of kernel density estimation.

Public Member Functions

- **KDEStat** ()
Initialize the statistic.
- template<typename TreeType >
KDEStat (TreeType &node)
Initialization for a fully initialized node.
- const arma::vec & **Centroid** () const
Get the centroid of the node.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the statistic to/from an archive.
- void **SetCentroid** (arma::vec newCentroid)
Modify the centroid of the node.
- bool **ValidCentroid** () const
Get whether the centroid is valid.

39.301.1 Detailed Description

Extra data for each node in the tree for the task of kernel density estimation.

Definition at line 24 of file kde_stat.hpp.

39.301.2 Constructor & Destructor Documentation

39.301.2.1 KDEStat() [1/2]

```
KDEStat ( ) [inline]
```

Initialize the statistic.

Definition at line 28 of file kde_stat.hpp.

39.301.2.2 KDEStat() [2/2]

```
KDEStat (
    TreeType & node ) [inline]
```

Initialization for a fully initialized node.

Definition at line 32 of file kde_stat.hpp.

39.301.3 Member Function Documentation

39.301.3.1 Centroid()

```
const arma::vec& Centroid ( ) const [inline]
```

Get the centroid of the node.

Definition at line 47 of file kde_stat.hpp.

39.301.3.2 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the statistic to/from an archive.

Definition at line 67 of file kde_stat.hpp.

39.301.3.3 SetCentroid()

```
void SetCentroid (
    arma::vec newCentroid ) [inline]
```

Modify the centroid of the node.

Definition at line 56 of file kde_stat.hpp.

39.301.3.4 ValidCentroid()

```
bool ValidCentroid ( ) const [inline]
```

Get whether the centroid is valid.

Definition at line 63 of file kde_stat.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kde/ **kde_stat.hpp**

39.302 KernelNormalizer Class Reference

KernelNormalizer (p. 1410) holds a set of methods to normalize estimations applying in each case the appropriate kernel normalizer function.

Static Public Member Functions

- `template<typename KernelType >`
 static void **ApplyNormalizer** (KernelType &, const size_t, arma::vec &, const typename std::enable_if< !HasNormalizer< KernelType, double(KernelType::*)(size_t)>::value >::type !=0)
Normalization not needed.
- `template<typename KernelType >`
 static void **ApplyNormalizer** (KernelType &kernel, const size_t dimension, arma::vec &estimations, const typename std::enable_if< HasNormalizer< KernelType, double(KernelType::*)(size_t)>::value >::type !=0)
Normalize kernels that have normalizer.

39.302.1 Detailed Description

KernelNormalizer (p. 1410) holds a set of methods to normalize estimations applying in each case the appropriate kernel normalizer function.

Definition at line 51 of file `kde_model.hpp`.

39.302.2 Member Function Documentation

39.302.2.1 ApplyNormalizer() [1/2]

```
static void ApplyNormalizer (
    KernelType & ,
    const size_t ,
    arma::vec & ,
    const typename std::enable_if< !HasNormalizer< KernelType, double(KernelType::*) (size_t)>::value >::type * = 0 ) [inline], [static]
```

Normalization not needed.

Definition at line 60 of file `kde_model.hpp`.

39.302.2.2 ApplyNormalizer() [2/2]

```
static void ApplyNormalizer (
    KernelType & kernel,
    const size_t dimension,
    arma::vec & estimations,
    const typename std::enable_if< HasNormalizer< KernelType, double(KernelType::*) (size_t)>::value >::type * = 0 ) [inline], [static]
```

Normalize kernels that have normalizer.

Definition at line 71 of file `kde_model.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kde/ kde_model.hpp`

39.303 ModeVisitor Class Reference

ModeVisitor (p. 1412) exposes the Mode() method of the KDEType.

Inheritance diagram for ModeVisitor:

Public Member Functions

- template<typename KDEType >
KDEMode & operator() (KDEType *kde) const
Return mode of KDEType instance.

39.303.1 Detailed Description

ModeVisitor (p. 1412) exposes the Mode() method of the KDEType.

Definition at line 177 of file kde_model.hpp.

39.303.2 Member Function Documentation

39.303.2.1 operator()()

```

KDEMode& operator() (
    KDEType * kde ) const
  
```

Return mode of KDEType instance.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kde/ **kde_model.hpp**

39.304 TrainVisitor Class Reference

TrainVisitor (p. 1413) trains a given KDEType using a reference set.

Inheritance diagram for TrainVisitor:

Public Member Functions

- **TrainVisitor** (arma::mat &&referenceSet)
***TrainVisitor** (p. 1413) constructor. Takes ownership of the given referenceSet.*
- template<typename KernelType , template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType>
void **operator()** (KDEType< KernelType, TreeType > *kde) const
*Default **TrainVisitor** (p. 1413) on some KDEType.*

39.304.1 Detailed Description

TrainVisitor (p. 1413) trains a given KDEType using a reference set.

Definition at line 154 of file kde_model.hpp.

39.304.2 Constructor & Destructor Documentation

39.304.2.1 TrainVisitor()

```

TrainVisitor (
    arma::mat && referenceSet )
  
```

TrainVisitor (p. 1413) constructor. Takes ownership of the given referenceSet.

39.304.3 Member Function Documentation

39.304.3.1 operator>()

```
void operator() (
    KDEType< KernelType, TreeType > * kde ) const
```

Default **TrainVisitor** (p. 1413) on some KDEType.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kde/ **kde_model.hpp**

39.305 CauchyKernel Class Reference

The Cauchy kernel.

Public Member Functions

- **CauchyKernel** (double bandwidth=1.0)
Construct the Cauchy kernel; by default, the bandwidth is 1.0.
- template<typename VecTypeA , typename VecTypeB >
double **Evaluate** (const VecTypeA &a, const VecTypeB &b)
Evaluation of the Cauchy kernel.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the kernel.

39.305.1 Detailed Description

The Cauchy kernel.

Given two vector x , y , and a bandwidth σ (set in the constructor),

$$K(x, y) = \frac{1}{1 + \left(\frac{\|x - y\|}{\sigma}\right)^2}.$$

For more details, see the following published paper:

```
@inproceedings{Basak2008,
  title={A least square kernel machine with box constraints},
  author={Basak, Jayanta},
  booktitle={Pattern Recognition, 2008. ICPR 2008. 19th International
    Conference on},
  pages={1--4},
  year={2008},
  organization={IEEE}
}
```

Definition at line 44 of file `cauchy_kernel.hpp`.

39.305.2 Constructor & Destructor Documentation

39.305.2.1 CauchyKernel()

```
CauchyKernel (
    double bandwidth = 1.0 ) [inline]
```

Construct the Cauchy kernel; by default, the bandwidth is 1.0.

Definition at line 50 of file `cauchy_kernel.hpp`.

39.305.3 Member Function Documentation

39.305.3.1 Evaluate()

```
double Evaluate (
    const VecTypeA & a,
    const VecTypeB & b ) [inline]
```

Evaluation of the Cauchy kernel.

This could be generalized to use any distance metric, not the Euclidean distance, but for now, the Euclidean distance is used.

Template Parameters

<i>VecTypeA</i>	Type of first vector (arma::vec, arma::sp_vec).
<i>VecTypeB</i>	Type of second vector (arma::vec, arma::sp_vec).

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Returns

$K(a, b)$.

Definition at line 65 of file `cauchy_kernel.hpp`.

References `LMetric< TPower, TTakeRoot >::Evaluate()`.

39.305.3.2 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the kernel.

Definition at line 75 of file `cauchy_kernel.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ cauchy_kernel.hpp`

39.306 CosineDistance Class Reference

The cosine distance (or cosine similarity).

Public Member Functions

- `template<typename Archive >`
`void serialize (Archive &, const unsigned int)`
Serialize the class (there's nothing to save).

Static Public Member Functions

- `template<typename VecTypeA , typename VecTypeB >`
`static double Evaluate (const VecTypeA &a, const VecTypeB &b)`
Computes the cosine distance between two points.

39.306.1 Detailed Description

The cosine distance (or cosine similarity).

It is defined by

$$d(a,b) = \frac{a^T b}{||a|| ||b||}$$

and this class assumes the standard L2 inner product.

Definition at line 31 of file `cosine_distance.hpp`.

39.306.2 Member Function Documentation

39.306.2.1 Evaluate()

```
static double Evaluate (
    const VecTypeA & a,
    const VecTypeB & b ) [static]
```

Computes the cosine distance between two points.

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Returns

$d(a, b)$.

39.306.2.2 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serialize the class (there's nothing to save).

Definition at line 46 of file cosine_distance.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **cosine_distance.hpp**

39.307 EpanechnikovKernel Class Reference

The Epanechnikov kernel, defined as.

Public Member Functions

- **EpanechnikovKernel** (const double bandwidth=1.0)
Instantiate the Epanechnikov kernel with the given bandwidth (default 1.0).
- template<typename VecTypeA , typename VecTypeB >
double **ConvolutionIntegral** (const VecTypeA &a, const VecTypeB &b)
Obtains the convolution integral [integral of $K(\|x-a\|) K(\|b-x\|) dx$] for the two vectors.
- template<typename VecTypeA , typename VecTypeB >
double **Evaluate** (const VecTypeA &a, const VecTypeB &b) const
Evaluate the Epanechnikov kernel on the given two inputs.
- double **Evaluate** (const double distance) const
Evaluate the Epanechnikov kernel given that the distance between the two input points is known.
- double **Gradient** (const double distance) const
Evaluate the Gradient of Epanechnikov kernel given that the distance between the two input points is known.
- double **GradientForSquaredDistance** (const double distanceSquared) const
Evaluate the Gradient of Epanechnikov kernel given that the squared distance between the two input points is known.
- double **Normalizer** (const size_t dimension)
Compute the normalizer of this Epanechnikov kernel for the given dimension.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int version)
Serialize the kernel.

39.307.1 Detailed Description

The Epanechnikov kernel, defined as.

$$K(x, y) = \max\{0, 1 - \|x - y\|_2^2 / b^2\}$$

where b is the bandwidth the of the kernel (defaults to 1.0).

Definition at line 30 of file epanechnikov_kernel.hpp.

39.307.2 Constructor & Destructor Documentation

39.307.2.1 EpanechnikovKernel()

```
EpanechnikovKernel (
    const double bandwidth = 1.0 ) [inline]
```

Instantiate the Epanechnikov kernel with the given bandwidth (default 1.0).

Parameters

<i>bandwidth</i>	Bandwidth of the kernel.
------------------	--------------------------

Definition at line 38 of file epanechnikov_kernel.hpp.

References `EpanechnikovKernel::ConvolutionIntegral()`, `EpanechnikovKernel::Evaluate()`, `EpanechnikovKernel::↵ Gradient()`, `EpanechnikovKernel::GradientForSquaredDistance()`, `EpanechnikovKernel::Normalizer()`, and `Epanechnikov↵ Kernel::serialize()`.

39.307.3 Member Function Documentation

39.307.3.1 ConvolutionIntegral()

```
double ConvolutionIntegral (
    const VecTypeA & a,
    const VecTypeB & b )
```

Obtains the convolution integral [integral of $K(\|x-a\|) K(\|b-x\|) dx$] for the two vectors.

Template Parameters

<i>VecType</i>	Type of vector (arma::vec, arma::spvec should be expected).
----------------	---

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Returns

the convolution integral value.

Referenced by EpanechnikovKernel::EpanechnikovKernel().

39.307.3.2 Evaluate() [1/2]

```
double Evaluate (
    const VecTypeA & a,
    const VecTypeB & b ) const
```

Evaluate the Epanechnikov kernel on the given two inputs.

Template Parameters

<i>VecTypeA</i>	Type of first vector.
<i>VecTypeB</i>	Type of second vector.

Parameters

<i>a</i>	One input vector.
<i>b</i>	The other input vector.

Referenced by EpanechnikovKernel::EpanechnikovKernel().

39.307.3.3 Evaluate() [2/2]

```
double Evaluate (
    const double distance ) const
```

Evaluate the Epanechnikov kernel given that the distance between the two input points is known.

39.307.3.4 Gradient()

```
double Gradient (
    const double distance ) const
```

Evaluate the Gradient of Epanechnikov kernel given that the distance between the two input points is known.

Referenced by EpanechnikovKernel::EpanechnikovKernel().

39.307.3.5 GradientForSquaredDistance()

```
double GradientForSquaredDistance (
    const double distanceSquared ) const
```

Evaluate the Gradient of Epanechnikov kernel given that the squared distance between the two input points is known.

Referenced by EpanechnikovKernel::EpanechnikovKernel().

39.307.3.6 Normalizer()

```
double Normalizer (
    const size_t dimension )
```

Compute the normalizer of this Epanechnikov kernel for the given dimension.

Parameters

<i>dimension</i>	Dimension to calculate the normalizer for.
------------------	--

Referenced by EpanechnikovKernel::EpanechnikovKernel().

39.307.3.7 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int version )
```

Serialize the kernel.

Referenced by EpanechnikovKernel::EpanechnikovKernel().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **epanechnikov_kernel.hpp**

39.308 ExampleKernel Class Reference

An example kernel function.

Public Member Functions

- **ExampleKernel** ()
The default constructor, which takes no parameters.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serializes the kernel.

Static Public Member Functions

- template<typename VecTypeA , typename VecTypeB >
static double **ConvolutionIntegral** (const VecTypeA &, const VecTypeB &)
Obtains the convolution integral $\int K(\|x-a\|)K(\|b-x\|)dx$ for the two vectors.
- template<typename VecTypeA , typename VecTypeB >
static double **Evaluate** (const VecTypeA &, const VecTypeB &)
Evaluates the kernel function for two given vectors.
- static double **Normalizer** ()
Obtains the normalizing volume for the kernel with dimension \$dimension\$.

39.308.1 Detailed Description

An example kernel function.

This is not a useful kernel, but it implements the two functions necessary to satisfy the Kernel policy (so that a class can be used whenever an mpack method calls for a `typename Kernel` template parameter).

All that is necessary is a constructor and an **Evaluate()** (p. 1423) function. More methods could be added; for instance, one useful idea is a constructor which takes parameters for a kernel (for instance, the width of the Gaussian for a Gaussian kernel). However, mpack methods cannot count on these various constructors existing, which is why most methods allow passing an already-instantiated kernel object (and by default the method will construct the kernel with the default constructor). So, for instance,

```
GaussianKernel k(5.0);
KernelPCA<GaussianKernel> kpca(dataset, k);
```

will set up kernel PCA using a Gaussian kernel with a width of 5.0, but

```
KernelPCA<GaussianKernel> kpca(dataset);
```

will create the kernel with the default constructor. It is important (but not strictly mandatory) that your default constructor still gives a working kernel.

Note

Not all kernels require state. For instance, the regular dot product needs no parameters. In that case, no local variables are necessary and **Evaluate()** (p. 1423) can (and should) be declared static. However, for greater generalization, mpack methods expect all kernels to require state and hence must store instantiated kernel functions; this is why a default constructor is necessary.

Definition at line 77 of file `example_kernel.hpp`.

39.308.2 Constructor & Destructor Documentation

39.308.2.1 ExampleKernel()

```
ExampleKernel ( ) [inline]
```

The default constructor, which takes no parameters.

Because our simple example kernel has no internal parameters that need to be stored, the constructor does not need to do anything. For a more complex example, see the **GaussianKernel** (p. 1424), which stores an internal parameter.

Definition at line 86 of file example_kernel.hpp.

39.308.3 Member Function Documentation

39.308.3.1 ConvolutionIntegral()

```
static double ConvolutionIntegral (
    const VecTypeA & ,
    const VecTypeB & ) [inline], [static]
```

Obtains the convolution integral $[\text{integral } K(\|x-a\|)K(\|b-x\|)dx]$ for the two vectors.

In this case, because our simple example kernel has no internal parameters, we can declare the function static. For a more complex example which cannot be declared static, see the **GaussianKernel** (p. 1424), which stores an internal parameter.

Template Parameters

<i>VecTypeA</i>	Type of first vector (arma::vec, arma::sp_vec should be expected).
<i>VecTypeB</i>	Type of second vector (arma::vec, arma::sp_vec).

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Returns

the convolution integral value.

Definition at line 127 of file example_kernel.hpp.

39.308.3.2 Evaluate()

```
static double Evaluate (
    const VecTypeA & ,
    const VecTypeB & ) [inline], [static]
```

Evaluates the kernel function for two given vectors.

In this case, because our simple example kernel has no internal parameters, we can declare the function static. For a more complex example which cannot be declared static, see the **GaussianKernel** (p. 1424), which stores an internal parameter.

Template Parameters

<i>VecTypeA</i>	Type of first vector (arma::vec, arma::sp_vec should be expected).
<i>VecTypeB</i>	Type of second vector (arma::vec, arma::sp_vec).

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Returns

$K(a, b)$.

Definition at line 102 of file example_kernel.hpp.

39.308.3.3 Normalizer()

```
static double Normalizer ( ) [inline], [static]
```

Obtains the normalizing volume for the kernel with dimension $\$dimension\$$.

In this case, because our simple example kernel has no internal parameters, we can declare the function static. For a more complex example which cannot be declared static, see the **GaussianKernel** (p. 1424), which stores an internal parameter.

Parameters

<i>dimension</i>	the dimension of the space.
------------------	-----------------------------

Returns

the normalization constant.

Definition at line 140 of file example_kernel.hpp.

39.308.3.4 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serializes the kernel.

In this case, the kernel has no members, so we do not need to do anything at all.

Definition at line 110 of file example_kernel.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **example_kernel.hpp**

39.309 GaussianKernel Class Reference

The standard Gaussian kernel.

Public Member Functions

- **GaussianKernel** ()
Default constructor; sets bandwidth to 1.0.
- **GaussianKernel** (const double bandwidth)
Construct the Gaussian kernel with a custom bandwidth.
- double **Bandwidth** () const
Get the bandwidth.
- void **Bandwidth** (const double bandwidth)
Modify the bandwidth.
- template<typename VecTypeA , typename VecTypeB >
double **ConvolutionIntegral** (const VecTypeA &a, const VecTypeB &b)
Obtain a convolution integral of the Gaussian kernel.
- template<typename VecTypeA , typename VecTypeB >
double **Evaluate** (const VecTypeA &a, const VecTypeB &b) const
Evaluation of the Gaussian kernel.
- double **Evaluate** (const double t) const
Evaluation of the Gaussian kernel given the distance between two points.

- double **Gamma** () const
Get the precalculated constant.
- double **Gradient** (const double t) const
Evaluation of the gradient of Gaussian kernel given the distance between two points.
- double **GradientForSquaredDistance** (const double t) const
Evaluation of the gradient of Gaussian kernel given the squared distance between two points.
- double **Normalizer** (const size_t dimension)
Obtain the normalization constant of the Gaussian kernel.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the kernel.

39.309.1 Detailed Description

The standard Gaussian kernel.

Given two vectors x , y , and a bandwidth μ (set in the constructor),

$$K(x, y) = \exp\left(-\frac{\|x - y\|^2}{2\mu^2}\right).$$

The implementation is all in the header file because it is so simple.

Definition at line 34 of file gaussian_kernel.hpp.

39.309.2 Constructor & Destructor Documentation

39.309.2.1 GaussianKernel() [1/2]

```
GaussianKernel ( ) [inline]
```

Default constructor; sets bandwidth to 1.0.

Definition at line 40 of file gaussian_kernel.hpp.

39.309.2.2 GaussianKernel() [2/2]

```
GaussianKernel (
    const double bandwidth ) [inline]
```

Construct the Gaussian kernel with a custom bandwidth.

Parameters

<i>bandwidth</i>	The bandwidth of the kernel (μ).
------------------	--

Definition at line 48 of file gaussian_kernel.hpp.

39.309.3 Member Function Documentation**39.309.3.1 Bandwidth()** [1/2]

```
double Bandwidth ( ) const [inline]
```

Get the bandwidth.

Definition at line 135 of file gaussian_kernel.hpp.

39.309.3.2 Bandwidth() [2/2]

```
void Bandwidth (
    const double bandwidth ) [inline]
```

Modify the bandwidth.

This takes an argument because we must update the precalculated constant (gamma).

Definition at line 139 of file gaussian_kernel.hpp.

39.309.3.3 ConvolutionIntegral()

```
double ConvolutionIntegral (
    const VecTypeA & a,
    const VecTypeB & b ) [inline]
```

Obtain a convolution integral of the Gaussian kernel.

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Returns

The convolution integral.

Definition at line 127 of file gaussian_kernel.hpp.

References GaussianKernel::Evaluate(), LMetric< TPower, TTakeRoot >::Evaluate(), and GaussianKernel::←Normalizer().

39.309.3.4 Evaluate() [1/2]

```
double Evaluate (
    const VecTypeA & a,
    const VecTypeB & b ) const [inline]
```

Evaluation of the Gaussian kernel.

This could be generalized to use any distance metric, not the Euclidean distance, but for now, the Euclidean distance is used.

Template Parameters

<i>VecType</i>	Type of vector (likely arma::vec or arma::spvec).
----------------	---

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Returns

K(a, b) using the bandwidth (μ) specified in the constructor.

Definition at line 65 of file gaussian_kernel.hpp.

References LMetric< TPower, TTakeRoot >::Evaluate().

Referenced by GaussianKernel::ConvolutionIntegral().

39.309.3.5 Evaluate() [2/2]

```
double Evaluate (
    const double t ) const [inline]
```

Evaluation of the Gaussian kernel given the distance between two points.

Parameters

t	The distance between the two points the kernel is evaluated on.
-----	---

Returns

K(t) using the bandwidth (μ) specified in the constructor.

Definition at line 78 of file gaussian_kernel.hpp.

39.309.3.6 Gamma()

```
double Gamma ( ) const [inline]
```

Get the precalculated constant.

Definition at line 146 of file gaussian_kernel.hpp.

39.309.3.7 Gradient()

```
double Gradient (
    const double t ) const [inline]
```

Evaluation of the gradient of Gaussian kernel given the distance between two points.

Parameters

t	The distance between the two points the kernel is evaluated on.
-----	---

Returns

K(t) using the bandwidth (μ) specified in the constructor.

Definition at line 92 of file gaussian_kernel.hpp.

39.309.3.8 GradientForSquaredDistance()

```
double GradientForSquaredDistance (
    const double t ) const [inline]
```

Evaluation of the gradient of Gaussian kernel given the squared distance between two points.

Parameters

<i>t</i>	The squared distance between the two points
----------	---

Returns

$K(t)$ using the bandwidth (μ) specified in the constructor.

Definition at line 104 of file gaussian_kernel.hpp.

39.309.3.9 Normalizer()

```
double Normalizer (
    const size_t dimension ) [inline]
```

Obtain the normalization constant of the Gaussian kernel.

Parameters

<i>dimension</i>	
------------------	--

Returns

the normalization constant

Definition at line 114 of file gaussian_kernel.hpp.

References `M_PI`.

Referenced by `GaussianKernel::ConvolutionIntegral()`.

39.309.3.10 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the kernel.

Definition at line 150 of file gaussian_kernel.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **gaussian_kernel.hpp**

39.310 HyperbolicTangentKernel Class Reference

Hyperbolic tangent kernel.

Public Member Functions

- **HyperbolicTangentKernel** ()
This constructor sets the default scale to 1.0 and offset to 0.0.
- **HyperbolicTangentKernel** (double scale, double offset)
Construct the hyperbolic tangent kernel with custom scale factor and offset.
- template<typename VecTypeA , typename VecTypeB >
double **Evaluate** (const VecTypeA &a, const VecTypeB &b)
Evaluate the hyperbolic tangent kernel.
- double **Offset** () const
Get offset for the kernel.
- double & **Offset** ()
Modify offset for the kernel.
- double **Scale** () const
Get scale factor.
- double & **Scale** ()
Modify scale factor.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the kernel.

39.310.1 Detailed Description

Hyperbolic tangent kernel.

For any two vectors x, y and a given scale s and offset t

$$K(x, y) = \tanh(s \langle x, y \rangle + t)$$

Definition at line 28 of file hyperbolic_tangent_kernel.hpp.

39.310.2 Constructor & Destructor Documentation

39.310.2.1 HyperbolicTangentKernel() [1/2]

```
HyperbolicTangentKernel ( ) [inline]
```

This constructor sets the default scale to 1.0 and offset to 0.0.

Definition at line 34 of file hyperbolic_tangent_kernel.hpp.

39.310.2.2 HyperbolicTangentKernel() [2/2]

```
HyperbolicTangentKernel (
    double scale,
    double offset ) [inline]
```

Construct the hyperbolic tangent kernel with custom scale factor and offset.

Parameters

<i>scale</i>	Scaling factor for $\langle x, y \rangle$.
<i>offset</i>	Kernel offset.

Definition at line 44 of file hyperbolic_tangent_kernel.hpp.

39.310.3 Member Function Documentation

39.310.3.1 Evaluate()

```
double Evaluate (
    const VecTypeA & a,
    const VecTypeB & b ) [inline]
```

Evaluate the hyperbolic tangent kernel.

This evaluation uses Armadillo's dot() function.

Template Parameters

<i>VecTypeA</i>	Type of first vector (should be arma::vec or arma::sp_vec).
<i>VecTypeB</i>	Type of second vector (arma::vec / arma::sp_vec).

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Returns

$K(a, b)$.

Definition at line 60 of file hyperbolic_tangent_kernel.hpp.

39.310.3.2 Offset() [1/2]

```
double Offset ( ) const [inline]
```

Get offset for the kernel.

Definition at line 71 of file hyperbolic_tangent_kernel.hpp.

39.310.3.3 Offset() [2/2]

```
double& Offset ( ) [inline]
```

Modify offset for the kernel.

Definition at line 73 of file hyperbolic_tangent_kernel.hpp.

39.310.3.4 Scale() [1/2]

```
double Scale ( ) const [inline]
```

Get scale factor.

Definition at line 66 of file hyperbolic_tangent_kernel.hpp.

39.310.3.5 Scale() [2/2]

```
double& Scale ( ) [inline]
```

Modify scale factor.

Definition at line 68 of file hyperbolic_tangent_kernel.hpp.

39.310.3.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the kernel.

Definition at line 77 of file hyperbolic_tangent_kernel.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **hyperbolic_tangent_kernel.hpp**

39.311 KernelTraits< KernelType > Class Template Reference

This is a template class that can provide information about various kernels.

Static Public Attributes

- static const bool **IsNormalized** = false
If true, then the kernel is normalized: $K(x, x) = K(y, y) = 1$ for all x .
- static const bool **UsesSquaredDistance** = false
If true, then the kernel include a squared distance, $\|x - y\|^2$.

39.311.1 Detailed Description

```
template<typename KernelType>
class mlpack::kernel::KernelTraits< KernelType >
```

This is a template class that can provide information about various kernels.

By default, this class will provide the weakest possible assumptions on kernels, and each kernel should override values as necessary. If a kernel doesn't need to override a value, then there's no need to write a **KernelTraits** (p. 1433) specialization for that class.

Definition at line 27 of file kernel_traits.hpp.

39.311.2 Member Data Documentation

39.311.2.1 IsNormalized

```
const bool IsNormalized = false [static]
```

If true, then the kernel is normalized: $K(x, x) = K(y, y) = 1$ for all x .

Definition at line 33 of file kernel_traits.hpp.

39.311.2.2 UsesSquaredDistance

```
const bool UsesSquaredDistance = false [static]
```

If true, then the kernel include a squared distance, $\|x - y\|^2$.

Definition at line 38 of file kernel_traits.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **kernel_traits.hpp**

39.312 KernelTraits< CauchyKernel > Class Template Reference

Kernel traits for the Cauchy kernel.

Static Public Attributes

- static const bool **IsNormalized** = true
The Cauchy kernel is normalized: $K(x, x) = 1$ for all x .

39.312.1 Detailed Description

```
template<>
class mlpack::kernel::KernelTraits< CauchyKernel >
```

Kernel traits for the Cauchy kernel.

Definition at line 87 of file cauchy_kernel.hpp.

39.312.2 Member Data Documentation

39.312.2.1 IsNormalized

```
const bool IsNormalized = true [static]
```

The Cauchy kernel is normalized: $K(x, x) = 1$ for all x .

Definition at line 91 of file `cauchy_kernel.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ cauchy_kernel.hpp`

39.313 KernelTraits< CosineDistance > Class Template Reference

Kernel traits for the cosine distance.

Static Public Attributes

- static const bool **IsNormalized** = true
The cosine kernel is normalized: $K(x, x) = 1$ for all x .
- static const bool **UsesSquaredDistance** = false
The cosine kernel doesn't include a squared distance.

39.313.1 Detailed Description

```
template<>  
class mlpack::kernel::KernelTraits< CosineDistance >
```

Kernel traits for the cosine distance.

Definition at line 51 of file `cosine_distance.hpp`.

39.313.2 Member Data Documentation

39.313.2.1 IsNormalized

```
const bool IsNormalized = true [static]
```

The cosine kernel is normalized: $K(x, x) = 1$ for all x .

Definition at line 55 of file cosine_distance.hpp.

39.313.2.2 UsesSquaredDistance

```
const bool UsesSquaredDistance = false [static]
```

The cosine kernel doesn't include a squared distance.

Definition at line 58 of file cosine_distance.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **cosine_distance.hpp**

39.314 KernelTraits< EpanechnikovKernel > Class Template Reference

Kernel traits for the Epanechnikov kernel.

Static Public Attributes

- static const bool **IsNormalized** = true
The Epanechnikov kernel is normalized: $K(x, x) = 1$ for all x .
- static const bool **UsesSquaredDistance** = true
The Epanechnikov kernel includes a squared distance.

39.314.1 Detailed Description

```
template<>
class mlpack::kernel::KernelTraits< EpanechnikovKernel >
```

Kernel traits for the Epanechnikov kernel.

Definition at line 107 of file epanechnikov_kernel.hpp.

39.314.2 Member Data Documentation

39.314.2.1 IsNormalized

```
const bool IsNormalized = true [static]
```

The Epanechnikov kernel is normalized: $K(x, x) = 1$ for all x .

Definition at line 111 of file epanechnikov_kernel.hpp.

39.314.2.2 UsesSquaredDistance

```
const bool UsesSquaredDistance = true [static]
```

The Epanechnikov kernel includes a squared distance.

Definition at line 113 of file epanechnikov_kernel.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ epanechnikov_kernel.hpp

39.315 KernelTraits< GaussianKernel > Class Template Reference

Kernel traits for the Gaussian kernel.

Static Public Attributes

- static const bool **IsNormalized** = true
The Gaussian kernel is normalized: $K(x, x) = 1$ for all x .
- static const bool **UsesSquaredDistance** = true
The Gaussian kernel includes a squared distance.

39.315.1 Detailed Description

```
template<>
class mlpack::kernel::KernelTraits< GaussianKernel >
```

Kernel traits for the Gaussian kernel.

Definition at line 167 of file gaussian_kernel.hpp.

39.315.2 Member Data Documentation

39.315.2.1 IsNormalized

```
const bool IsNormalized = true [static]
```

The Gaussian kernel is normalized: $K(x, x) = 1$ for all x .

Definition at line 171 of file gaussian_kernel.hpp.

39.315.2.2 UsesSquaredDistance

```
const bool UsesSquaredDistance = true [static]
```

The Gaussian kernel includes a squared distance.

Definition at line 173 of file gaussian_kernel.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **gaussian_kernel.hpp**

39.316 KernelTraits< LaplacianKernel > Class Template Reference

Kernel traits of the Laplacian kernel.

Static Public Attributes

- static const bool **IsNormalized** = true
The Laplacian kernel is normalized: $K(x, x) = 1$ for all x .
- static const bool **UsesSquaredDistance** = false
The Laplacian kernel doesn't include a squared distance.

39.316.1 Detailed Description

```
template<>
class mlpack::kernel::KernelTraits< LaplacianKernel >
```

Kernel traits of the Laplacian kernel.

Definition at line 113 of file laplacian_kernel.hpp.

39.316.2 Member Data Documentation

39.316.2.1 IsNormalized

```
const bool IsNormalized = true [static]
```

The Laplacian kernel is normalized: $K(x, x) = 1$ for all x .

Definition at line 117 of file laplacian_kernel.hpp.

39.316.2.2 UsesSquaredDistance

```
const bool UsesSquaredDistance = false [static]
```

The Laplacian kernel doesn't include a squared distance.

Definition at line 119 of file laplacian_kernel.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **laplacian_kernel.hpp**

39.317 KernelTraits< SphericalKernel > Class Template Reference

Kernel traits for the spherical kernel.

Static Public Attributes

- static const bool **IsNormalized** = true
The spherical kernel is normalized: $K(x, x) = 1$ for all x .
- static const bool **UsesSquaredDistance** = false
The spherical kernel doesn't include a squared distance.

39.317.1 Detailed Description

```
template<>  
class mlpack::kernel::KernelTraits< SphericalKernel >
```

Kernel traits for the spherical kernel.

Definition at line 123 of file spherical_kernel.hpp.

39.317.2 Member Data Documentation

39.317.2.1 IsNormalized

```
const bool IsNormalized = true [static]
```

The spherical kernel is normalized: $K(x, x) = 1$ for all x .

Definition at line 127 of file spherical_kernel.hpp.

39.317.2.2 UsesSquaredDistance

```
const bool UsesSquaredDistance = false [static]
```

The spherical kernel doesn't include a squared distance.

Definition at line 129 of file spherical_kernel.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **spherical_kernel.hpp**

39.318 KernelTraits< TriangularKernel > Class Template Reference

Kernel traits for the triangular kernel.

Static Public Attributes

- static const bool **IsNormalized** = true
The triangular kernel is normalized: $K(x, x) = 1$ for all x .
- static const bool **UsesSquaredDistance** = false
The triangular kernel doesn't include a squared distance.

39.318.1 Detailed Description

```
template<>
class mlpack::kernel::KernelTraits< TriangularKernel >
```

Kernel traits for the triangular kernel.

Definition at line 108 of file triangular_kernel.hpp.

39.318.2 Member Data Documentation

39.318.2.1 IsNormalized

```
const bool IsNormalized = true [static]
```

The triangular kernel is normalized: $K(x, x) = 1$ for all x .

Definition at line 112 of file triangular_kernel.hpp.

39.318.2.2 UsesSquaredDistance

```
const bool UsesSquaredDistance = false [static]
```

The triangular kernel doesn't include a squared distance.

Definition at line 114 of file triangular_kernel.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **triangular_kernel.hpp**

39.319 KMeansSelection< ClusteringType, maxIterations > Class Template Reference

Implementation of the kmeans sampling scheme.

Static Public Member Functions

- static const arma::mat * **Select** (const arma::mat &data, const size_t m)
Use the K-Means clustering method to select the specified number of points in the dataset.

39.319.1 Detailed Description

```
template<typename ClusteringType = kmeans::KMeans<>, size_t maxIterations = 5>
class mlpack::kernel::KMeansSelection< ClusteringType, maxIterations >
```

Implementation of the kmeans sampling scheme.

Template Parameters

<i>ClusteringType</i>	Type of clustering.
<i>maxIterations</i>	Maximum number of iterations allowed before giving up.

Definition at line 29 of file kmeans_selection.hpp.

39.319.2 Member Function Documentation

39.319.2.1 Select()

```
static const arma::mat* Select (
    const arma::mat & data,
    const size_t m ) [inline], [static]
```

Use the K-Means clustering method to select the specified number of points in the dataset.

You are responsible for deleting the returned matrix!

Parameters

<i>data</i>	Dataset to sample from.
<i>m</i>	Number of points to select.

Returns

Matrix pointer in which centroids are stored.

Definition at line 40 of file kmeans_selection.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/nystroem_method/ **kmeans_selection.hpp**

39.320 LaplacianKernel Class Reference

The standard Laplacian kernel.

Public Member Functions

- **LaplacianKernel** ()
Default constructor; sets bandwidth to 1.0.
- **LaplacianKernel** (double bandwidth)
Construct the Laplacian kernel with a custom bandwidth.
- double **Bandwidth** () const
Get the bandwidth.
- double & **Bandwidth** ()
Modify the bandwidth.
- template<typename VecTypeA , typename VecTypeB >
double **Evaluate** (const VecTypeA &a, const VecTypeB &b) const
Evaluation of the Laplacian kernel.
- double **Evaluate** (const double t) const
Evaluation of the Laplacian kernel given the distance between two points.
- double **Gradient** (const double t) const
Evaluation of the gradient of the Laplacian kernel given the distance between two points.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the kernel.

39.320.1 Detailed Description

The standard Laplacian kernel.

Given two vectors x , y , and a bandwidth μ (set in the constructor),

$$K(x, y) = \exp\left(-\frac{\|x - y\|}{\mu}\right).$$

The implementation is all in the header file because it is so simple.

Definition at line 30 of file laplacian_kernel.hpp.

39.320.2 Constructor & Destructor Documentation

39.320.2.1 LaplacianKernel() [1/2]

```
LaplacianKernel ( ) [inline]
```

Default constructor; sets bandwidth to 1.0.

Definition at line 36 of file laplacian_kernel.hpp.

39.320.2.2 LaplacianKernel() [2/2]

```
LaplacianKernel (  
    double bandwidth ) [inline]
```

Construct the Laplacian kernel with a custom bandwidth.

Parameters

<i>bandwidth</i>	The bandwidth of the kernel (μ).
------------------	--

Definition at line 44 of file laplacian_kernel.hpp.

39.320.3 Member Function Documentation

39.320.3.1 Bandwidth() [1/2]

```
double Bandwidth ( ) const [inline]
```

Get the bandwidth.

Definition at line 95 of file laplacian_kernel.hpp.

39.320.3.2 Bandwidth() [2/2]

```
double& Bandwidth ( ) [inline]
```

Modify the bandwidth.

Definition at line 97 of file laplacian_kernel.hpp.

39.320.3.3 Evaluate() [1/2]

```
double Evaluate (
    const VecTypeA & a,
    const VecTypeB & b ) const [inline]
```

Evaluation of the Laplacian kernel.

This could be generalized to use any distance metric, not the Euclidean distance, but for now, the Euclidean distance is used.

Template Parameters

<i>VecTypeA</i>	Type of first vector (likely arma::vec or arma::sp_vec).
<i>VecTypeB</i>	Type of second vector (arma::vec / arma::sp_vec).

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Returns

K(a, b) using the bandwidth (μ) specified in the constructor.

Definition at line 61 of file laplacian_kernel.hpp.

References LMetric< TPower, TTakeRoot >::Evaluate().

39.320.3.4 Evaluate() [2/2]

```
double Evaluate (  
    const double t ) const [inline]
```

Evaluation of the Laplacian kernel given the distance between two points.

Parameters

<i>t</i>	The distance between the two points the kernel should be evaluated on.
----------	--

Returns

K(t) using the bandwidth (μ) specified in the constructor.

Definition at line 75 of file laplacian_kernel.hpp.

39.320.3.5 Gradient()

```
double Gradient (  
    const double t ) const [inline]
```

Evaluation of the gradient of the Laplacian kernel given the distance between two points.

Parameters

<i>t</i>	The distance between the two points the kernel should be evaluated on.
----------	--

Returns

$K(t)$ using the bandwidth (μ) specified in the constructor.

Definition at line 90 of file laplacian_kernel.hpp.

39.320.3.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the kernel.

Definition at line 101 of file laplacian_kernel.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **laplacian_kernel.hpp**

39.321 LinearKernel Class Reference

The simple linear kernel (dot product).

Public Member Functions

- **LinearKernel** ()
This constructor does nothing; the linear kernel has no parameters to store.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialize the kernel (it has no members... do nothing).

Static Public Member Functions

- template<typename VecTypeA , typename VecTypeB >
static double **Evaluate** (const VecTypeA &a, const VecTypeB &b)
Simple evaluation of the dot product.

39.321.1 Detailed Description

The simple linear kernel (dot product).

For any two vectors x and y ,

$$K(x, y) = x^T y$$

This kernel has no parameters and therefore the evaluation can be static.

Definition at line 32 of file linear_kernel.hpp.

39.321.2 Constructor & Destructor Documentation

39.321.2.1 LinearKernel()

```
LinearKernel ( ) [inline]
```

This constructor does nothing; the linear kernel has no parameters to store.

Definition at line 39 of file linear_kernel.hpp.

39.321.3 Member Function Documentation

39.321.3.1 Evaluate()

```
static double Evaluate (
    const VecTypeA & a,
    const VecTypeB & b ) [inline], [static]
```

Simple evaluation of the dot product.

This evaluation uses Armadillo's dot() function.

Template Parameters

<i>VecTypeA</i>	Type of first vector (should be arma::vec or arma::sp_vec).
<i>VecTypeB</i>	Type of second vector (arma::vec / arma::sp_vec).

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Returns

$K(a, b)$.

Definition at line 53 of file linear_kernel.hpp.

39.321.3.2 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serialize the kernel (it has no members... do nothing).

Definition at line 60 of file linear_kernel.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **linear_kernel.hpp**

39.322 NystroemMethod< KernelType, PointSelectionPolicy > Class Template Reference

Public Member Functions

- **NystroemMethod** (const arma::mat &data, KernelType &kernel, const size_t rank)
*Create the **NystroemMethod** (p. 1448) object.*
- void **Apply** (arma::mat &output)
*Apply the low-rank factorization to obtain an output matrix G such that $K' = G * G^T$.*
- void **GetKernelMatrix** (const arma::mat *data, arma::mat &miniKernel, arma::mat &semiKernel)
Construct the kernel matrix with matrix that contains the selected points.
- void **GetKernelMatrix** (const arma::Col< size_t > &selectedPoints, arma::mat &miniKernel, arma::mat &semiKernel)
Construct the kernel matrix with the selected points.

39.322.1 Detailed Description

```
template<typename KernelType, typename PointSelectionPolicy = KMeansSelection<>>
class mlpack::kernel::NystroemMethod< KernelType, PointSelectionPolicy >
```

Definition at line 28 of file nystroem_method.hpp.

39.322.2 Constructor & Destructor Documentation

39.322.2.1 NystroemMethod()

```
NystroemMethod (
    const arma::mat & data,
    KernelType & kernel,
    const size_t rank )
```

Create the **NystroemMethod** (p. 1448) object.

The constructor here does not really do anything.

Parameters

<i>data</i>	Data matrix.
<i>kernel</i>	Kernel to be used for computation.
<i>rank</i>	Rank to be used for matrix approximation.

39.322.3 Member Function Documentation

39.322.3.1 Apply()

```
void Apply (
    arma::mat & output )
```

Apply the low-rank factorization to obtain an output matrix G such that $K' = G * G^T$.

Parameters

<i>output</i>	Matrix to store kernel approximation into.
---------------	--

Referenced by NystroemKernelRule< KernelType, PointSelectionPolicy >::ApplyKernelMatrix().

39.322.3.2 GetKernelMatrix() [1/2]

```
void GetKernelMatrix (
    const arma::mat & data,
```

```
arma::mat & miniKernel,
arma::mat & semiKernel )
```

Construct the kernel matrix with matrix that contains the selected points.

Parameters

<i>data</i>	Data matrix pointer.
<i>miniKernel</i>	to store the constructed mini-kernel matrix in.
<i>miniKernel</i>	to store the constructed semi-kernel matrix in.

39.322.3.3 GetKernelMatrix() [2/2]

```
void GetKernelMatrix (
    const arma::Col< size_t > & selectedPoints,
    arma::mat & miniKernel,
    arma::mat & semiKernel )
```

Construct the kernel matrix with the selected points.

Parameters

<i>points</i>	Indices of selected points.
<i>miniKernel</i>	to store the constructed mini-kernel matrix in.
<i>miniKernel</i>	to store the constructed semi-kernel matrix in.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/nystroem_method/ **nystroem_method.hpp**

39.323 OrderedSelection Class Reference

Static Public Member Functions

- static const arma::Col< size_t > **Select** (const arma::mat &, const size_t m)
Select the specified number of points in the dataset.

39.323.1 Detailed Description

Definition at line 22 of file ordered_selection.hpp.

39.323.2 Member Function Documentation

39.323.2.1 Select()

```
static const arma::Col<size_t> Select (
    const arma::mat & ,
    const size_t m ) [inline], [static]
```

Select the specified number of points in the dataset.

Parameters

<i>data</i>	Dataset to sample from.
<i>m</i>	Number of points to select.

Returns

Indices of selected points from the dataset.

Definition at line 32 of file `ordered_selection.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/nystroem_method/ ordered_selection.hpp`

39.324 PolynomialKernel Class Reference

The simple polynomial kernel.

Public Member Functions

- **PolynomialKernel** (const double degree=2.0, const double offset=0.0)
Construct the Polynomial Kernel with the given offset and degree.
- const double & **Degree** () const
Get the degree of the polynomial.
- double & **Degree** ()
Modify the degree of the polynomial.
- template<typename VecTypeA , typename VecTypeB >
double **Evaluate** (const VecTypeA &a, const VecTypeB &b) const
Simple evaluation of the dot product.
- const double & **Offset** () const
Get the offset of the dot product of the arguments.
- double & **Offset** ()
Modify the offset of the dot product of the arguments.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the kernel.

39.324.1 Detailed Description

The simple polynomial kernel.

For any two vectors x , y , *degree* and *offset*,

$$K(x, y) = (x^T * y + offset)^{degree}.$$

Definition at line 28 of file polynomial_kernel.hpp.

39.324.2 Constructor & Destructor Documentation

39.324.2.1 PolynomialKernel()

```
PolynomialKernel (
    const double degree = 2.0,
    const double offset = 0.0 ) [inline]
```

Construct the Polynomial Kernel with the given offset and degree.

If the arguments are omitted, the default degree is 2 and the default offset is 0.

Parameters

<i>offset</i>	Offset of the dot product of the arguments.
<i>degree</i>	Degree of the polynomial.

Definition at line 38 of file polynomial_kernel.hpp.

39.324.3 Member Function Documentation

39.324.3.1 Degree() [1/2]

```
const double& Degree ( ) const [inline]
```

Get the degree of the polynomial.

Definition at line 61 of file polynomial_kernel.hpp.

39.324.3.2 Degree() [2/2]

```
double& Degree ( ) [inline]
```

Modify the degree of the polynomial.

Definition at line 63 of file polynomial_kernel.hpp.

39.324.3.3 Evaluate()

```
double Evaluate (
    const VecTypeA & a,
    const VecTypeB & b ) const [inline]
```

Simple evaluation of the dot product.

This evaluation uses Armadillo's dot() function.

Template Parameters

<i>VecTypeA</i>	Type of first vector (should be arma::vec or arma::sp_vec).
<i>VecTypeB</i>	Type of second vector (arma::vec / arma::sp_vec).

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Returns

K(a, b).

Definition at line 55 of file polynomial_kernel.hpp.

39.324.3.4 Offset() [1/2]

```
const double& Offset ( ) const [inline]
```

Get the offset of the dot product of the arguments.

Definition at line 66 of file polynomial_kernel.hpp.

39.324.3.5 Offset() [2/2]

```
double& Offset ( ) [inline]
```

Modify the offset of the dot product of the arguments.

Definition at line 68 of file polynomial_kernel.hpp.

39.324.3.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the kernel.

Definition at line 72 of file polynomial_kernel.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **polynomial_kernel.hpp**

39.325 PSpectrumStringKernel Class Reference

The p-spectrum string kernel.

Public Member Functions

- **PSpectrumStringKernel** (const std::vector< std::vector< std::string > > &datasets, const size_t p)
*Initialize the **PSpectrumStringKernel** (p. 1454) with the given string datasets.*
- const std::vector< std::vector< std::map< std::string, int > > > & **Counts** () const
Access the lists of substrings.
- std::vector< std::vector< std::map< std::string, int > > > & **Counts** ()
Modify the lists of substrings.
- template<typename VecType >
double **Evaluate** (const VecType &a, const VecType &b) const
Evaluate the kernel for the string indices given.
- size_t **P** () const
Access the value of p.
- size_t & **P** ()
Modify the value of p.

39.325.1 Detailed Description

The p-spectrum string kernel.

Given a length p , the p-spectrum kernel finds the contiguous subsequence match count between two strings. The kernel will take every possible substring of length p of one string and count how many times it appears in the other string.

The string kernel, when created, must be passed a reference to a series of string datasets (`std::vector<std::vector<std::string>>&`). This is because mlpack only supports datasets which are Armadillo matrices – and a dataset of variable-length strings cannot be easily cast into an Armadillo matrix.

Therefore, once the **PSpectrumStringKernel** (p. 1454) is created with a reference to the string datasets, a "fake" Armadillo data matrix must be created, which simply holds indices to the strings they represent. This "fake" matrix has two rows and n columns (where n is the number of strings in the dataset). The first row holds the index of the dataset (remember, the kernel can have multiple datasets), and the second row holds the index of the string. A fake matrix containing only strings from dataset 0 might look like this:

```
[[0 0 0 0 0 0 0 0] [0 1 2 3 4 5 6 7 8]]
```

This fake matrix is then given to the machine learning method, which will eventually call `PSpectrumStringKernel::Evaluate(a, b)`, where a and b are two columns of the fake matrix. The string kernel will then map these fake columns back to the strings they represent, and then correctly evaluate the kernel.

Unfortunately, not every machine learning method will work with this kernel. Only machine learning methods which do not ever operate on the explicit representation of points can use this kernel. So, for instance, one cannot build a kd-tree on strings, because the `BinarySpaceTree<>` class will split the data according to the fake data matrix – resulting in a meaningless tree. This kernel was originally written for the FastMKS method; so, at the very least, it will work with that.

Definition at line 65 of file `pspectrum_string_kernel.hpp`.

39.325.2 Constructor & Destructor Documentation

39.325.2.1 PSpectrumStringKernel()

```
PSpectrumStringKernel (
    const std::vector< std::vector< std::string > > & datasets,
    const size_t p )
```

Initialize the **PSpectrumStringKernel** (p. 1454) with the given string datasets.

For more information on this, see the general class documentation.

Parameters

<i>datasets</i>	Sets of string data.
<i>p</i>	The length of substrings to search.

39.325.3 Member Function Documentation

39.325.3.1 Counts() [1/2]

```
const std::vector<std::vector<std::map<std::string, int> > >> Counts ( ) const [inline]
```

Access the lists of substrings.

Definition at line 93 of file pspectrum_string_kernel.hpp.

39.325.3.2 Counts() [2/2]

```
std::vector<std::vector<std::map<std::string, int> > >> Counts ( ) [inline]
```

Modify the lists of substrings.

Definition at line 96 of file pspectrum_string_kernel.hpp.

39.325.3.3 Evaluate()

```
double Evaluate (
    const VecType & a,
    const VecType & b ) const
```

Evaluate the kernel for the string indices given.

As mentioned in the class documentation, a and b should be 2-element vectors, where the first element contains the index of the dataset and the second element contains the index of the string. Therefore, if [2 3] is passed for a, the string used will be datasets[2][3] (datasets is of type std::vector<std::vector<std::string> >&).

Parameters

<i>a</i>	Index of string and dataset for first string.
<i>b</i>	Index of string and dataset for second string.

39.325.3.4 P() [1/2]

```
size_t P ( ) const [inline]
```

Access the value of `p`.

Definition at line 100 of file `pspectrum_string_kernel.hpp`.

39.325.3.5 `P()` [2/2]

```
size_t& P ( ) [inline]
```

Modify the value of `p`.

Definition at line 102 of file `pspectrum_string_kernel.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ pspectrum_string_kernel.hpp`

39.326 RandomSelection Class Reference

Static Public Member Functions

- static const arma::Col< size_t > **Select** (const arma::mat &data, const size_t m)
Randomly select the specified number of points in the dataset.

39.326.1 Detailed Description

Definition at line 22 of file `random_selection.hpp`.

39.326.2 Member Function Documentation

39.326.2.1 `Select()`

```
static const arma::Col<size_t> Select (
    const arma::mat & data,
    const size_t m ) [inline], [static]
```

Randomly select the specified number of points in the dataset.

Parameters

<i>data</i>	Dataset to sample from.
<i>m</i>	Number of points to select.

Returns

Indices of selected points from the dataset.

Definition at line 32 of file random_selection.hpp.

References `mlpack::math::RandInt()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/nystroem_method/ random_selection.hpp`

39.327 SphericalKernel Class Reference

The spherical kernel, which is 1 when the distance between the two argument points is less than or equal to the bandwidth, or 0 otherwise.

Public Member Functions

- **SphericalKernel** (const double bandwidth=1.0)
*Construct the **SphericalKernel** (p. 1458) with the given bandwidth.*
- `template<typename VecTypeA , typename VecTypeB >`
`double ConvolutionIntegral (const VecTypeA &a, const VecTypeB &b) const`
Obtains the convolution integral $[\int K(\|x-a\|)K(\|b-x\|)dx]$ for the two vectors.
- `template<typename VecTypeA , typename VecTypeB >`
`double Evaluate (const VecTypeA &a, const VecTypeB &b) const`
Evaluate the spherical kernel with the given two vectors.
- `double Evaluate (const double t) const`
Evaluate the kernel when only a distance is given, not two points.
- `double Gradient (double t)`
- `double Normalizer (size_t dimension) const`
- `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialize the object.

39.327.1 Detailed Description

The spherical kernel, which is 1 when the distance between the two argument points is less than or equal to the bandwidth, or 0 otherwise.

Definition at line 23 of file spherical_kernel.hpp.

39.327.2 Constructor & Destructor Documentation

39.327.2.1 SphericalKernel()

```
SphericalKernel (
    const double bandwidth = 1.0 ) [inline]
```

Construct the **SphericalKernel** (p. 1458) with the given bandwidth.

Definition at line 29 of file spherical_kernel.hpp.

39.327.3 Member Function Documentation

39.327.3.1 ConvolutionIntegral()

```
double ConvolutionIntegral (
    const VecTypeA & a,
    const VecTypeB & b ) const [inline]
```

Obtains the convolution integral $[\text{integral } K(\|x-a\|)K(\|b-x\|)dx]$ for the two vectors.

Template Parameters

<i>VecTypeA</i>	Type of first vector (arma::vec, arma::sp_vec should be expected).
<i>VecTypeB</i>	Type of second vector.

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Returns

the convolution integral value.

Definition at line 62 of file spherical_kernel.hpp.

References `LMetric< TPower, TTakeRoot >::Evaluate()`, `Log::Fatal`, and `SphericalKernel::Normalizer()`.

39.327.3.2 Evaluate() [1/2]

```
double Evaluate (
    const VecTypeA & a,
    const VecTypeB & b ) const [inline]
```

Evaluate the spherical kernel with the given two vectors.

Template Parameters

<i>VecTypeA</i>	Type of first vector.
<i>VecTypeB</i>	Type of second vector.

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Returns

The kernel evaluation between the two vectors.

Definition at line 44 of file spherical_kernel.hpp.

References `LMetric< TPower, TTakeRoot >::Evaluate()`.

39.327.3.3 Evaluate() [2/2]

```
double Evaluate (
    const double t ) const [inline]
```

Evaluate the kernel when only a distance is given, not two points.

Parameters

<i>t</i>	Argument to kernel.
----------	---------------------

Definition at line 99 of file spherical_kernel.hpp.

39.327.3.4 Gradient()

```
double Gradient (
    double t ) [inline]
```

Definition at line 103 of file spherical_kernel.hpp.

39.327.3.5 Normalizer()

```
double Normalizer (
    size_t dimension ) const [inline]
```

Definition at line 88 of file spherical_kernel.hpp.

References `M_PI`.

Referenced by `SphericalKernel::ConvolutionIntegral()`.

39.327.3.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the object.

Definition at line 110 of file spherical_kernel.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **spherical_kernel.hpp**

39.328 TriangularKernel Class Reference

The trivially simple triangular kernel, defined by.

Public Member Functions

- **TriangularKernel** (const double bandwidth=1.0)
Initialize the triangular kernel with the given bandwidth (default 1.0).
- double **Bandwidth** () const
Get the bandwidth of the kernel.
- double & **Bandwidth** ()
Modify the bandwidth of the kernel.
- template<typename VecTypeA , typename VecTypeB >
double **Evaluate** (const VecTypeA &a, const VecTypeB &b) const
Evaluate the triangular kernel for the two given vectors.
- double **Evaluate** (const double distance) const
Evaluate the triangular kernel given that the distance between the two points is known.
- double **Gradient** (const double distance) const
Evaluate the gradient of triangular kernel given that the distance between the two points is known.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the kernel.

39.328.1 Detailed Description

The trivially simple triangular kernel, defined by.

$$K(x, y) = \max\{0, 1 - \frac{\|x - y\|_2}{b}\}$$

where b is the bandwidth of the kernel.

Definition at line 30 of file triangular_kernel.hpp.

39.328.2 Constructor & Destructor Documentation

39.328.2.1 TriangularKernel()

```
TriangularKernel (
    const double bandwidth = 1.0 ) [inline]
```

Initialize the triangular kernel with the given bandwidth (default 1.0).

Parameters

<i>bandwidth</i>	Bandwidth of the triangular kernel.
------------------	-------------------------------------

Definition at line 38 of file triangular_kernel.hpp.

39.328.3 Member Function Documentation

39.328.3.1 Bandwidth() [1/2]

```
double Bandwidth ( ) const [inline]
```

Get the bandwidth of the kernel.

Definition at line 90 of file triangular_kernel.hpp.

39.328.3.2 Bandwidth() [2/2]

```
double& Bandwidth ( ) [inline]
```

Modify the bandwidth of the kernel.

Definition at line 92 of file triangular_kernel.hpp.

39.328.3.3 Evaluate() [1/2]

```
double Evaluate (
    const VecTypeA & a,
    const VecTypeB & b ) const [inline]
```

Evaluate the triangular kernel for the two given vectors.

Template Parameters

<i>VecTypeA</i>	Type of first vector.
<i>VecTypeB</i>	Type of second vector.

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Definition at line 49 of file triangular_kernel.hpp.

References `LMetric< TPower, TTakeRoot >::Evaluate()`.

39.328.3.4 Evaluate() [2/2]

```
double Evaluate (
    const double distance ) const [inline]
```

Evaluate the triangular kernel given that the distance between the two points is known.

Parameters

<i>distance</i>	The distance between the two points.
-----------------	--------------------------------------

Definition at line 61 of file triangular_kernel.hpp.

39.328.3.5 Gradient()

```
double Gradient (
    const double distance ) const [inline]
```

Evaluate the gradient of triangular kernel given that the distance between the two points is known.

Parameters

<i>distance</i>	The distance between the two points.
-----------------	--------------------------------------

Definition at line 73 of file triangular_kernel.hpp.

39.328.3.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the kernel.

Definition at line 96 of file triangular_kernel.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/ **triangular_kernel.hpp**

39.329 AllowEmptyClusters Class Reference

Policy which allows K-Means to create empty clusters without any error being reported.

Public Member Functions

- **AllowEmptyClusters** ()
Default constructor required by EmptyClusterPolicy policy.
- `template<typename Archive >`
`void serialize (Archive &, const unsigned int)`
Serialize the empty cluster policy (nothing to do).

Static Public Member Functions

- `template<typename MetricType , typename MatType >`
`static force_inline void EmptyCluster (const MatType &, const size_t emptyCluster, const arma::mat &oldCentroids, arma::mat &newCentroids, arma::Col< size_t > &, MetricType &, const size_t)`

This function allows empty clusters to persist simply by leaving the empty cluster in its last position.

39.329.1 Detailed Description

Policy which allows K-Means to create empty clusters without any error being reported.

Definition at line 25 of file `allow_empty_clusters.hpp`.

39.329.2 Constructor & Destructor Documentation

39.329.2.1 AllowEmptyClusters()

```
AllowEmptyClusters ( ) [inline]
```

Default constructor required by EmptyClusterPolicy policy.

Definition at line 29 of file `allow_empty_clusters.hpp`.

39.329.3 Member Function Documentation

39.329.3.1 EmptyCluster()

```
static force_inline void EmptyCluster (
    const MatType & ,
    const size_t emptyCluster,
    const arma::mat & oldCentroids,
    arma::mat & newCentroids,
    arma::Col< size_t > & ,
    MetricType & ,
    const size_t ) [inline], [static]
```

This function allows empty clusters to persist simply by leaving the empty cluster in its last position.

Template Parameters

<i>MatType</i>	Type of data (arma::mat or arma::spmat).
----------------	--

Parameters

<i>data</i>	Dataset on which clustering is being performed.
<i>emptyCluster</i>	Index of cluster which is empty.
<i>oldCentroids</i>	Centroids of each cluster (one per column) at the start of the iteration.
<i>newCentroids</i>	Centroids of each cluster (one per column) at the end of the iteration.
<i>clusterCounts</i>	Number of points in each cluster.
<i>assignments</i>	Cluster assignments of each point.
<i>iteration</i>	Number of iteration.

Returns

Number of points changed (0).

Definition at line 49 of file allow_empty_clusters.hpp.

39.329.3.2 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serialize the empty cluster policy (nothing to do).

Definition at line 64 of file allow_empty_clusters.hpp.

The documentation for this class was generated from the following file:

39.330 DualTreeKMeans< MetricType, MatType, TreeType > Class Template Reference

An algorithm for an exact Lloyd iteration which simply uses dual-tree nearest-neighbor search to find the nearest centroid for each point in the dataset.

Public Types

- `template<typename TreeMetricType, typename IgnoredStatType, typename TreeMatType > using NNSTreeType = TreeType< TreeMetricType, DualTreeKMeansStatistic, TreeMatType >`
- `typedef TreeType< MetricType, DualTreeKMeansStatistic, MatType > Tree`
Convenience typedef.

Public Member Functions

- **DualTreeKMeans** (const MatType &dataset, MetricType &metric)
*Construct the **DualTreeKMeans** (p. 1466) object, which will construct a tree on the points.*
- **~DualTreeKMeans** ()
*Delete the tree constructed by the **DualTreeKMeans** (p. 1466) object.*
- `size_t DistanceCalculations () const`
Return the number of distance calculations.
- `size_t & DistanceCalculations ()`
Modify the number of distance calculations.
- `double Iterate (const arma::mat ¢roids, arma::mat &newCentroids, arma::Col< size_t > &counts)`
Run a single iteration of the dual-tree nearest neighbor algorithm for k-means, updating the given centroids into the new← Centroids matrix.

39.330.1 Detailed Description

```
template<typename MetricType, typename MatType, template< typename TreeMetricType, typename TreeStatType, typename Tree←
MatType > class TreeType = tree::KDTree>
class mlpack::kmeans::DualTreeKMeans< MetricType, MatType, TreeType >
```

An algorithm for an exact Lloyd iteration which simply uses dual-tree nearest-neighbor search to find the nearest centroid for each point in the dataset.

The conditions under which this will perform best are probably limited to the case where k is close to the number of points in the dataset, and the number of iterations of the k-means algorithm will be few.

Definition at line 41 of file dual_tree_kmeans.hpp.

39.330.2 Member Typedef Documentation

39.330.2.1 NNSTreeType

```
using NNSTreeType = TreeType<TreeMetricType, DualTreeKMeansStatistic, TreeMatType>
```

Definition at line 51 of file dual_tree_kmeans.hpp.

39.330.2.2 Tree

```
typedef TreeType<MetricType, DualTreeKMeansStatistic, MatType> Tree
```

Convenience typedef.

Definition at line 45 of file dual_tree_kmeans.hpp.

39.330.3 Constructor & Destructor Documentation

39.330.3.1 DualTreeKMeans()

```
DualTreeKMeans (  
    const MatType & dataset,  
    MetricType & metric )
```

Construct the **DualTreeKMeans** (p. 1466) object, which will construct a tree on the points.

39.330.3.2 ~DualTreeKMeans()

```
~ DualTreeKMeans ( )
```

Delete the tree constructed by the **DualTreeKMeans** (p. 1466) object.

39.330.4 Member Function Documentation

39.330.4.1 DistanceCalculations() [1/2]

```
size_t DistanceCalculations ( ) const [inline]
```

Return the number of distance calculations.

Definition at line 77 of file dual_tree_kmeans.hpp.

39.330.4.2 DistanceCalculations() [2/2]

```
size_t& DistanceCalculations ( ) [inline]
```

Modify the number of distance calculations.

Definition at line 79 of file dual_tree_kmeans.hpp.

References `mlpack::kmeans::HideChild()`, and `mlpack::kmeans::RestoreChildren()`.

39.330.4.3 Iterate()

```
double Iterate (
    const arma::mat & centroids,
    arma::mat & newCentroids,
    arma::Col< size_t > & counts )
```

Run a single iteration of the dual-tree nearest neighbor algorithm for k-means, updating the given centroids into the `newCentroids` matrix.

Parameters

<i>centroids</i>	Current cluster centroids.
<i>newCentroids</i>	New cluster centroids.
<i>counts</i>	Current counts, to be overwritten with new counts.

39.335 KillEmptyClusters Class Reference

Policy which allows K-Means to "kill" empty clusters without any error being reported.

Public Member Functions

- **KillEmptyClusters** ()
Default constructor required by EmptyClusterPolicy policy.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialize the empty cluster policy (nothing to do).

Static Public Member Functions

- template<typename MetricType , typename MatType >
static **force_inline** void **EmptyCluster** (const MatType &, const size_t emptyCluster, const arma::mat &, arma::mat &newCentroids, arma::Col< size_t > &clusterCounts, MetricType &, const size_t)
This function sets an empty cluster found during k-means to all DBL_MAX (i.e.

39.335.1 Detailed Description

Policy which allows K-Means to "kill" empty clusters without any error being reported.

This means the centroids will be filled with DBL_MAX.

Definition at line 25 of file kill_empty_clusters.hpp.

39.335.2 Constructor & Destructor Documentation

39.335.2.1 KillEmptyClusters()

```
KillEmptyClusters ( ) [inline]
```

Default constructor required by EmptyClusterPolicy policy.

Definition at line 29 of file kill_empty_clusters.hpp.

39.335.3 Member Function Documentation

39.335.3.1 EmptyCluster()

```
static force_inline void EmptyCluster (
    const MatType & ,
    const size_t emptyCluster,
    const arma::mat & ,
    arma::mat & newCentroids,
    arma::Col< size_t > & clusterCounts,
    MetricType & ,
    const size_t ) [inline], [static]
```

This function sets an empty cluster found during k-means to all DBL_MAX (i.e.

an invalid "dead" cluster).

Template Parameters

<i>MatType</i>	Type of data (arma::mat or arma::spmat).
----------------	--

Parameters

<i>data</i>	Dataset on which clustering is being performed.
<i>emptyCluster</i>	Index of cluster which is empty.
<i>oldCentroids</i>	Centroids of each cluster (one per column) at the start of the iteration.
<i>newCentroids</i>	Centroids of each cluster (one per column) at the end of the iteration.
<i>clusterCounts</i>	Number of points in each cluster.
<i>assignments</i>	Cluster assignments of each point.
<i>iteration</i>	Number of iteration.

Returns

Number of points changed (0).

Definition at line 49 of file kill_empty_clusters.hpp.

39.335.3.2 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serialize the empty cluster policy (nothing to do).

Definition at line 68 of file kill_empty_clusters.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/ **kill_empty_clusters.hpp**

39.336 KMeans< MetricType, InitialPartitionPolicy, EmptyClusterPolicy, LloydStepType, MatType > Class Template Reference

This class implements K-Means clustering, using a variety of possible implementations of Lloyd's algorithm.

Public Member Functions

- **KMeans** (const size_t maxIterations=1000, const MetricType metric=MetricType(), const InitialPartitionPolicy partitioner=InitialPartitionPolicy(), const EmptyClusterPolicy emptyClusterAction=EmptyClusterPolicy())
Create a K-Means object and (optionally) set the parameters which K-Means will be run with.
- void **Cluster** (const MatType &data, const size_t clusters, arma::Row< size_t > &assignments, const bool initialGuess=false)
Perform k-means clustering on the data, returning a list of cluster assignments.
- void **Cluster** (const MatType &data, size_t clusters, arma::mat ¢roids, const bool initialGuess=false)
Perform k-means clustering on the data, returning the centroids of each cluster in the centroids matrix.
- void **Cluster** (const MatType &data, const size_t clusters, arma::Row< size_t > &assignments, arma::mat ¢roids, const bool initialAssignmentGuess=false, const bool initialCentroidGuess=false)
Perform k-means clustering on the data, returning a list of cluster assignments and also the centroids of each cluster.
- const EmptyClusterPolicy & **EmptyClusterAction** () const
Get the empty cluster policy.
- EmptyClusterPolicy & **EmptyClusterAction** ()
Modify the empty cluster policy.
- size_t **MaxIterations** () const
Get the maximum number of iterations.
- size_t & **MaxIterations** ()
Set the maximum number of iterations.
- const MetricType & **Metric** () const
Get the distance metric.
- MetricType & **Metric** ()

Modify the distance metric.

- `const InitialPartitionPolicy & Partitioner () const`

Get the initial partitioning policy.

- `InitialPartitionPolicy & Partitioner ()`

Modify the initial partitioning policy.

- `template<typename Archive >
void serialize (Archive &ar, const unsigned int version)`

Serialize the k-means object.

39.336.1 Detailed Description

```
template<typename MetricType = metric::EuclideanDistance, typename InitialPartitionPolicy = SampleInitialization, typename EmptyClusterPolicy = MaxVarianceNewCluster, template< class, class > class LloydStepType = NaiveKMeans, typename MatType = arma::mat>
class mlpack::kmeans::KMeans< MetricType, InitialPartitionPolicy, EmptyClusterPolicy, LloydStepType, MatType >
```

This class implements K-Means clustering, using a variety of possible implementations of Lloyd's algorithm.

Four template parameters can (optionally) be supplied: the distance metric to use, the policy for how to find the initial partition of the data, the actions to be taken when an empty cluster is encountered, and the implementation of a single Lloyd step to use.

A simple example of how to run K-Means clustering is shown below.

```
extern arma::mat data; // Dataset we want to run K-Means on.
arma::Row<size_t> assignments; // Cluster assignments.
arma::mat centroids; // Cluster centroids.

KMeans<> k; // Default options.
k.Cluster(data, 3, assignments, centroids); // 3 clusters.

// Cluster using the Manhattan distance, 100 iterations maximum, saving only
// the centroids.
KMeans<metric::ManhattanDistance> k(100);
k.Cluster(data, 6, centroids); // 6 clusters.
```

Template Parameters

<i>MetricType</i>	The distance metric to use for this KMeans (p. 1483); see metric::LMetric (p. 1569) for an example.
<i>InitialPartitionPolicy</i>	Initial partitioning policy; must implement a default constructor and either 'void Cluster(const arma::mat&, const size_t, arma::Row<size_t>&)' or 'void Cluster(const arma::mat&, const size_t, arma::mat&)'.
<i>EmptyClusterPolicy</i>	Policy for what to do on an empty cluster; must implement a default constructor and 'void EmptyCluster(const arma::mat& data, const size_t emptyCluster, const arma::mat& oldCentroids, arma::mat& newCentroids, arma::Col<size_t>& counts, MetricType& metric, const size_t iteration)'.
<i>LloydStepType</i>	Implementation of single Lloyd step to use.

See also

RandomPartition (p. 1500), **SampleInitialization** (p. 1506), **RefinedStart** (p. 1502), **AllowEmptyClusters** (p. 1464), **MaxVarianceNewCluster** (p. 1489), **NaiveKMeans** (p. 1491), **ElkanKMeans** (p. 1478)

Definition at line 73 of file kmeans.hpp.

39.336.2 Constructor & Destructor Documentation

39.336.2.1 KMeans()

```
KMeans (  
    const size_t maxIterations = 1000,  
    const MetricType metric = MetricType(),  
    const InitialPartitionPolicy partitioner = InitialPartitionPolicy(),  
    const EmptyClusterPolicy emptyClusterAction = EmptyClusterPolicy() )
```

Create a K-Means object and (optionally) set the parameters which K-Means will be run with.

Parameters

<i>maxIterations</i>	Maximum number of iterations allowed before giving up (0 is valid, but the algorithm may never terminate).
<i>metric</i>	Optional MetricType object; for when the metric has state it needs to store.
<i>partitioner</i>	Optional InitialPartitionPolicy object; for when a specially initialized partitioning policy is required.
<i>emptyClusterAction</i>	Optional EmptyClusterPolicy object; for when a specially initialized empty cluster policy is required.

39.336.3 Member Function Documentation

39.336.3.1 Cluster() [1/3]

```
void Cluster (  
    const MatType & data,  
    const size_t clusters,  
    arma::Row< size_t > & assignments,  
    const bool initialGuess = false )
```

Perform k-means clustering on the data, returning a list of cluster assignments.

Optionally, the vector of assignments can be set to an initial guess of the cluster assignments; to do this, set initialGuess to true.

Template Parameters

<i>MatType</i>	Type of matrix (arma::mat or arma::sp_mat).
----------------	---

Parameters

<i>data</i>	Dataset to cluster.
<i>clusters</i>	Number of clusters to compute.
<i>assignments</i>	Vector to store cluster assignments in.
<i>initialGuess</i>	If true, then it is assumed that assignments has a list of initial cluster assignments.

39.336.3.2 Cluster() [2/3]

```
void Cluster (
    const MatType & data,
    size_t clusters,
    arma::mat & centroids,
    const bool initialGuess = false )
```

Perform k-means clustering on the data, returning the centroids of each cluster in the centroids matrix.

Optionally, the initial centroids can be specified by filling the centroids matrix with the initial centroids and specifying initialGuess = true.

Template Parameters

<i>MatType</i>	Type of matrix (arma::mat or arma::sp_mat).
----------------	---

Parameters

<i>data</i>	Dataset to cluster.
<i>clusters</i>	Number of clusters to compute.
<i>centroids</i>	Matrix in which centroids are stored.
<i>initialGuess</i>	If true, then it is assumed that centroids contains the initial cluster centroids.

39.336.3.3 Cluster() [3/3]

```
void Cluster (
    const MatType & data,
    const size_t clusters,
```

```
arma::Row< size_t > & assignments,
arma::mat & centroids,
const bool initialAssignmentGuess = false,
const bool initialCentroidGuess = false )
```

Perform k-means clustering on the data, returning a list of cluster assignments and also the centroids of each cluster.

Optionally, the vector of assignments can be set to an initial guess of the cluster assignments; to do this, set `initialAssignmentGuess` to true. Another way to set initial cluster guesses is to fill the centroids matrix with the centroid guesses, and then set `initialCentroidGuess` to true. `initialAssignmentGuess` supersedes `initialCentroidGuess`, so if both are set to true, the assignments vector is used.

Template Parameters

<i>MatType</i>	Type of matrix (arma::mat or arma::sp_mat).
----------------	---

Parameters

<i>data</i>	Dataset to cluster.
<i>clusters</i>	Number of clusters to compute.
<i>assignments</i>	Vector to store cluster assignments in.
<i>centroids</i>	Matrix in which centroids are stored.
<i>initialAssignmentGuess</i>	If true, then it is assumed that assignments has a list of initial cluster assignments.
<i>initialCentroidGuess</i>	If true, then it is assumed that centroids contains the initial centroids of each cluster.

39.336.3.4 EmptyClusterAction() [1/2]

```
const EmptyClusterPolicy& EmptyClusterAction ( ) const [inline]
```

Get the empty cluster policy.

Definition at line 174 of file kmeans.hpp.

39.336.3.5 EmptyClusterAction() [2/2]

```
EmptyClusterPolicy& EmptyClusterAction ( ) [inline]
```

Modify the empty cluster policy.

Definition at line 177 of file kmeans.hpp.

References `KMeans< MetricType, InitialPartitionPolicy, EmptyClusterPolicy, LloydStepType, MatType >::serialize()`.

39.336.3.6 MaxIterations() [1/2]

```
size_t MaxIterations ( ) const [inline]
```

Get the maximum number of iterations.

Definition at line 159 of file kmeans.hpp.

39.336.3.7 MaxIterations() [2/2]

```
size_t& MaxIterations ( ) [inline]
```

Set the maximum number of iterations.

Definition at line 161 of file kmeans.hpp.

39.336.3.8 Metric() [1/2]

```
const MetricType& Metric ( ) const [inline]
```

Get the distance metric.

Definition at line 164 of file kmeans.hpp.

39.336.3.9 Metric() [2/2]

```
MetricType& Metric ( ) [inline]
```

Modify the distance metric.

Definition at line 166 of file kmeans.hpp.

39.336.3.10 Partitioner() [1/2]

```
const InitialPartitionPolicy& Partitioner ( ) const [inline]
```

Get the initial partitioning policy.

Definition at line 169 of file kmeans.hpp.

39.336.3.11 Partitioner() [2/2]

```
InitialPartitionPolicy& Partitioner ( ) [inline]
```

Modify the initial partitioning policy.

Definition at line 171 of file kmeans.hpp.

39.336.3.12 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int version )
```

Serialize the k-means object.

Referenced by `KMeans< MetricType, InitialPartitionPolicy, EmptyClusterPolicy, LloydStepType, MatType >::EmptyClusterAction()`.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/ **kmeans.hpp**

39.337 MaxVarianceNewCluster Class Reference

When an empty cluster is detected, this class takes the point furthest from the centroid of the cluster with maximum variance as a new cluster.

Public Member Functions

- **MaxVarianceNewCluster ()**

Default constructor required by EmptyClusterPolicy.

- `template<typename MetricType , typename MatType >`
void EmptyCluster (const MatType &data, const size_t emptyCluster, const arma::mat &oldCentroids, arma::mat &newCentroids, arma::Col< size_t > &clusterCounts, MetricType &metric, const size_t iteration)

Take the point furthest from the centroid of the cluster with maximum variance to be a new cluster.

- `template<typename Archive >`
void serialize (Archive &ar, const unsigned int version)

Serialize the object.

39.337.1 Detailed Description

When an empty cluster is detected, this class takes the point furthest from the centroid of the cluster with maximum variance as a new cluster.

Definition at line 26 of file `max_variance_new_cluster.hpp`.

39.337.2 Constructor & Destructor Documentation

39.337.2.1 MaxVarianceNewCluster()

```
MaxVarianceNewCluster ( ) [inline]
```

Default constructor required by EmptyClusterPolicy.

Definition at line 30 of file `max_variance_new_cluster.hpp`.

References `MaxVarianceNewCluster::EmptyCluster()`, and `MaxVarianceNewCluster::serialize()`.

39.337.3 Member Function Documentation

39.337.3.1 EmptyCluster()

```
void EmptyCluster (
    const MatType & data,
    const size_t emptyCluster,
    const arma::mat & oldCentroids,
    arma::mat & newCentroids,
    arma::Col< size_t > & clusterCounts,
    MetricType & metric,
    const size_t iteration )
```

Take the point furthest from the centroid of the cluster with maximum variance to be a new cluster.

Template Parameters

<i>MatType</i>	Type of data (arma::mat or arma::sp_mat).
----------------	---

Parameters

<i>data</i>	Dataset on which clustering is being performed.
<i>emptyCluster</i>	Index of cluster which is empty.
<i>oldCentroids</i>	Centroids of each cluster (one per column), at the start of the iteration.
<i>newCentroids</i>	Centroids of each cluster (one per column), at the end of the iteration. This will be modified!
<i>clusterCounts</i>	Number of points in each cluster.
<i>assignments</i>	Cluster assignments of each point.

Returns

Number of points changed.

Referenced by MaxVarianceNewCluster::MaxVarianceNewCluster().

39.337.3.2 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int version )
```

Serialize the object.

Referenced by MaxVarianceNewCluster::MaxVarianceNewCluster().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/ **max_variance_new_cluster.hpp**

39.338 NaiveKMeans< MetricType, MatType > Class Template Reference

This is an implementation of a single iteration of Lloyd's algorithm for k-means.

Public Member Functions

- **NaiveKMeans** (const MatType &dataset, MetricType &metric)
*Construct the **NaiveKMeans** (p. 1491) object with the given dataset and metric.*
- size_t **DistanceCalculations** () const
- double **Iterate** (const arma::mat ¢roids, arma::mat &newCentroids, arma::Col< size_t > &counts)
Run a single iteration of the Lloyd algorithm, updating the given centroids into the newCentroids matrix.

39.338.1 Detailed Description

```
template<typename MetricType, typename MatType>
class mlpack::kmeans::NaiveKMeans< MetricType, MatType >
```

This is an implementation of a single iteration of Lloyd's algorithm for k-means.

If your intention is to run the full k-means algorithm, you are looking for the **mlpack::kmeans::KMeans** (p. 1483) class instead of this one. This class is used by **KMeans** (p. 1483) as the actual implementation of the Lloyd iteration.

Parameters

<i>MetricType</i>	Type of metric used with this implementation.
<i>MatType</i>	Matrix type (arma::mat or arma::sp_mat).

Definition at line 32 of file naive_kmeans.hpp.

39.338.2 Constructor & Destructor Documentation

39.338.2.1 NaiveKMeans()

```
NaiveKMeans (
    const MatType & dataset,
    MetricType & metric )
```

Construct the **NaiveKMeans** (p. 1491) object with the given dataset and metric.

Parameters

<i>dataset</i>	Dataset.
<i>metric</i>	Instantiated metric.

39.338.3 Member Function Documentation

39.338.3.1 DistanceCalculations()

```
size_t DistanceCalculations ( ) const [inline]
```

Definition at line 57 of file naive_kmeans.hpp.

39.338.3.2 Iterate()

```
double Iterate (
    const arma::mat & centroids,
    arma::mat & newCentroids,
    arma::Col< size_t > & counts )
```

Run a single iteration of the Lloyd algorithm, updating the given centroids into the newCentroids matrix.

If any cluster is empty (that is, if any cluster has no points assigned to it), then the centroid associated with that cluster may be filled with invalid data (it will be corrected later).

Parameters

<i>centroids</i>	Current cluster centroids.
<i>newCentroids</i>	New cluster centroids.
<i>counts</i>	Number of points in each cluster at the end of the iteration.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/ **naive_kmeans.hpp**

39.339 PellegMooreKMeans< MetricType, MatType > Class Template Reference

An implementation of Pelleg-Moore's 'blacklist' algorithm for k-means clustering.

Public Types

- typedef **tree::KDTree**< MetricType, **PellegMooreKMeansStatistic**, MatType > **TreeType**
Convenience typedef for the tree.

Public Member Functions

- **PellegMooreKMeans** (const MatType &dataset, MetricType &metric)
*Construct the **PellegMooreKMeans** (p. 1493) object, which must construct a tree.*
- **~PellegMooreKMeans** ()
*Delete the tree constructed by the **PellegMooreKMeans** (p. 1493) object.*
- size_t **DistanceCalculations** () const
Return the number of distance calculations.
- size_t & **DistanceCalculations** ()
Modify the number of distance calculations.
- double **Iterate** (const arma::mat ¢roids, arma::mat &newCentroids, arma::Col< size_t > &counts)
Run a single iteration of the Pelleg-Moore blacklist algorithm, updating the given centroids into the newCentroids matrix.

39.339.1 Detailed Description

```
template<typename MetricType, typename MatType>
class mlpack::kmeans::PellegMooreKMeans< MetricType, MatType >
```

An implementation of Pelleg-Moore's 'blacklist' algorithm for k-means clustering.

This algorithm builds a kd-tree on the data points and traverses it in order to determine the closest clusters to each point.

For more information on the algorithm, see

```
@inproceedings{pelleg1999accelerating,
  title={Accelerating exact k-means algorithms with geometric reasoning},
  author={Pelleg, Dan and Moore, Andrew W.},

  organization={ACM}
}
```

Definition at line 42 of file pelleg_moore_kmeans.hpp.

39.339.2 Member Typedef Documentation

39.339.2.1 TreeType

```
typedef tree::KDTree<MetricType, PellegMooreKMeansStatistic, MatType> TreeType
```

Convenience typedef for the tree.

Definition at line 74 of file pelleg_moore_kmeans.hpp.

39.339.3 Constructor & Destructor Documentation

39.339.3.1 PellegMooreKMeans()

```
PellegMooreKMeans (  
    const MatType & dataset,  
    MetricType & metric )
```

Construct the **PellegMooreKMeans** (p. 1493) object, which must construct a tree.

39.339.3.2 ~PellegMooreKMeans()

```
~ PellegMooreKMeans ( )
```

Delete the tree constructed by the **PellegMooreKMeans** (p. 1493) object.

39.339.4 Member Function Documentation

39.339.4.1 DistanceCalculations() [1/2]

```
size_t DistanceCalculations ( ) const [inline]
```

Return the number of distance calculations.

Definition at line 68 of file pelleg_moore_kmeans.hpp.

39.339.4.2 DistanceCalculations() [2/2]

```
size_t& DistanceCalculations ( ) [inline]
```

Modify the number of distance calculations.

Definition at line 70 of file pelleg_moore_kmeans.hpp.

39.339.4.3 Iterate()

```
double Iterate (
    const arma::mat & centroids,
    arma::mat & newCentroids,
    arma::Col< size_t > & counts )
```

Run a single iteration of the Pelleg-Moore blacklist algorithm, updating the given centroids into the newCentroids matrix.

Parameters

<i>centroids</i>	Current cluster centroids.
<i>newCentroids</i>	New cluster centroids.
<i>counts</i>	Current counts, to be overwritten with new counts.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/ **pelleg_moore_kmeans.hpp**

39.340 PellegMooreKMeansRules< MetricType, TreeType > Class Template Reference

The rules class for the single-tree Pelleg-Moore kd-tree traversal for k-means clustering.

Public Member Functions

- **PellegMooreKMeansRules** (const typename TreeType::Mat &dataset, const arma::mat ¢roids, arma::mat &newCentroids, arma::Col< size_t > &counts, MetricType &metric)
*Create the **PellegMooreKMeansRules** (p. 1495) object.*
- double **BaseCase** (const size_t queryIndex, const size_t referenceIndex)
*The **BaseCase()** (p. 1496) function for this single-tree algorithm does nothing.*
- size_t **DistanceCalculations** () const
Get the number of distance calculations that have been performed.
- size_t & **DistanceCalculations** ()
Modify the number of distance calculations that have been performed.
- double **Rescore** (const size_t queryIndex, TreeType &referenceNode, const double oldScore)
Rescore to determine if a node can be pruned.
- double **Score** (const size_t queryIndex, TreeType &referenceNode)
Determine if a cluster can be pruned, and if not, perform point-to-cluster comparisons.

39.340.1 Detailed Description

```
template<typename MetricType, typename TreeType>
class mlpack::kmeans::PellegMooreKMeansRules< MetricType, TreeType >
```

The rules class for the single-tree Pelleg-Moore kd-tree traversal for k-means clustering.

Although `TreeType` is a free template parameter, this particular implementation is specialized to trees with hyper-rectangle bounds due to the pruning rule used to determine if one cluster dominates a node with respect to another cluster.

Our implementation here abuses the single-tree algorithm abstractions a little bit. Instead of doing a traversal for a particular query point, in this case we consider all clusters at once—so the query point is entirely ignored during in **BaseCase()** (p. 1496) and **Score()** (p. 1498).

Definition at line 33 of file `pelleg_moore_kmeans_rules.hpp`.

39.340.2 Constructor & Destructor Documentation

39.340.2.1 PellegMooreKMeansRules()

```
PellegMooreKMeansRules (
    const typename TreeType::Mat & dataset,
    const arma::mat & centroids,
    arma::mat & newCentroids,
    arma::Col< size_t > & counts,
    MetricType & metric )
```

Create the **PellegMooreKMeansRules** (p. 1495) object.

Parameters

<i>dataset</i>	The dataset that the tree is built on.
<i>centroids</i>	The current centroids.
<i>newCentroids</i>	New centroids after this iteration (output).
<i>counts</i>	Current cluster counts, to be replaced with new cluster counts.
<i>metric</i>	Instantiated metric.

39.340.3 Member Function Documentation

39.340.3.1 BaseCase()

```
double BaseCase (
    const size_t queryIndex,
    const size_t referenceIndex )
```

The **BaseCase()** (p. 1496) function for this single-tree algorithm does nothing.

Instead, point-to-cluster comparisons are handled as necessary in **Score()** (p. 1498).

Parameters

<i>queryIndex</i>	Index of query point (fake, will be ignored).
<i>referenceIndex</i>	Index of reference point.

39.340.3.2 DistanceCalculations() [1/2]

```
size_t DistanceCalculations ( ) const [inline]
```

Get the number of distance calculations that have been performed.

Definition at line 84 of file pelleg_moore_kmeans_rules.hpp.

39.340.3.3 DistanceCalculations() [2/2]

```
size_t& DistanceCalculations ( ) [inline]
```

Modify the number of distance calculations that have been performed.

Definition at line 86 of file pelleg_moore_kmeans_rules.hpp.

39.340.3.4 Rescore()

```
double Rescore (
    const size_t queryIndex,
    TreeType & referenceNode,
    const double oldScore )
```

Rescore to determine if a node can be pruned.

In this case, a node can never be pruned during rescoring, so this just returns oldScore.

Parameters

<i>queryIndex</i>	Index of query point (fake, will be ignored).
<i>referenceNode</i>	Node containing points in the dataset.
<i>oldScore</i>	Resulting score from Score() (p. 1498).

39.340.3.5 Score()

```
double Score (
    const size_t queryIndex,
    TreeType & referenceNode )
```

Determine if a cluster can be pruned, and if not, perform point-to-cluster comparisons.

The point-to-cluster comparisons are performed here and not in **BaseCase()** (p. 1496) because of the complexity of managing the blacklist.

Parameters

<i>queryIndex</i>	Index of query point (fake, will be ignored).
<i>referenceNode</i>	Node containing points in the dataset.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/ **pelleg_moore_kmeans_rules.hpp**

39.341 PellegMooreKMeansStatistic Class Reference

A statistic for trees which holds the blacklist for Pelleg-Moore k-means clustering (which represents the clusters that cannot possibly own any points in a node).

Public Member Functions

- **PellegMooreKMeansStatistic** ()
Initialize the statistic without a node (this does nothing).
- template<typename TreeType >
PellegMooreKMeansStatistic (TreeType &node)
Initialize the statistic for a node; this calculates the centroid and caches it.
- const arma::uvec & **Blacklist** () const
Get the cluster blacklist.
- arma::uvec & **Blacklist** ()

Modify the cluster blacklist.

- `const arma::vec & Centroid () const`

Get the node's centroid.

- `arma::vec & Centroid ()`

Modify the node's centroid (be careful!).

39.341.1 Detailed Description

A statistic for trees which holds the blacklist for Pelleg-Moore k-means clustering (which represents the clusters that cannot possibly own any points in a node).

Definition at line 24 of file `pelleg_moore_kmeans_statistic.hpp`.

39.341.2 Constructor & Destructor Documentation

39.341.2.1 PellegMooreKMeansStatistic() [1/2]

```
PellegMooreKMeansStatistic ( ) [inline]
```

Initialize the statistic without a node (this does nothing).

Definition at line 28 of file `pelleg_moore_kmeans_statistic.hpp`.

39.341.2.2 PellegMooreKMeansStatistic() [2/2]

```
PellegMooreKMeansStatistic (
    TreeType & node ) [inline]
```

Initialize the statistic for a node; this calculates the centroid and caches it.

Definition at line 33 of file `pelleg_moore_kmeans_statistic.hpp`.

39.341.3 Member Function Documentation

39.341.3.1 Blacklist() [1/2]

```
const arma::uvec& Blacklist ( ) const [inline]
```

Get the cluster blacklist.

Definition at line 57 of file `pelleg_moore_kmeans_statistic.hpp`.

39.341.3.2 Blacklist() [2/2]

```
arma::uvec& Blacklist ( ) [inline]
```

Modify the cluster blacklist.

Definition at line 59 of file `pelleg_moore_kmeans_statistic.hpp`.

39.341.3.3 Centroid() [1/2]

```
const arma::vec& Centroid ( ) const [inline]
```

Get the node's centroid.

Definition at line 62 of file `pelleg_moore_kmeans_statistic.hpp`.

39.341.3.4 Centroid() [2/2]

```
arma::vec& Centroid ( ) [inline]
```

Modify the node's centroid (be careful!).

Definition at line 64 of file `pelleg_moore_kmeans_statistic.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/pelleg_moore_kmeans_statistic.hpp`

39.342 RandomPartition Class Reference

A very simple partitioner which partitions the data randomly into the number of desired clusters.

Public Member Functions

- **RandomPartition** ()
Empty constructor, required by the InitialPartitionPolicy policy.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialize the partitioner (nothing to do).

Static Public Member Functions

- template<typename MatType >
static void **Cluster** (const MatType &data, const size_t clusters, arma::Row< size_t > &assignments)
Partition the given dataset into the given number of clusters.

39.342.1 Detailed Description

A very simple partitioner which partitions the data randomly into the number of desired clusters.

It has no parameters, and so an instance of the class is not even necessary.

Definition at line 26 of file random_partition.hpp.

39.342.2 Constructor & Destructor Documentation

39.342.2.1 RandomPartition()

```
RandomPartition ( ) [inline]
```

Empty constructor, required by the InitialPartitionPolicy policy.

Definition at line 30 of file random_partition.hpp.

39.342.3 Member Function Documentation

39.342.3.1 Cluster()

```
static void Cluster (  
    const MatType & data,  
    const size_t clusters,  
    arma::Row< size_t > & assignments ) [inline], [static]
```

Partition the given dataset into the given number of clusters.

Assignments are random, and the number of points in each cluster should be equal (or approximately equal).

Template Parameters

<i>MatType</i>	Type of data (arma::mat or arma::sp_mat).
----------------	---

Parameters

<i>data</i>	Dataset to partition.
<i>clusters</i>	Number of clusters to split dataset into.
<i>assignments</i>	Vector to store cluster assignments into. Values will be between 0 and (clusters - 1).

Definition at line 44 of file random_partition.hpp.

39.342.3.2 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serialize the partitioner (nothing to do).

Definition at line 55 of file random_partition.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/ **random_partition.hpp**

39.343 RefinedStart Class Reference

A refined approach for choosing initial points for k-means clustering.

Public Member Functions

- **RefinedStart** (const size_t samplings=100, const double percentage=0.02)
*Create the **RefinedStart** (p. 1502) object, optionally specifying parameters for the number of samplings to perform and the percentage of the dataset to use in each sampling.*
- template<typename MatType >
void **Cluster** (const MatType &data, const size_t clusters, arma::mat ¢roids) const
Partition the given dataset into the given number of clusters according to the random sampling scheme outlined in Bradley and Fayyad's paper, and return centroids.
- template<typename MatType >
void **Cluster** (const MatType &data, const size_t clusters, arma::Row< size_t > &assignments) const

Partition the given dataset into the given number of clusters according to the random sampling scheme outlined in Bradley and Fayyad's paper, and return point assignments.

- double **Percentage** () const
Get the percentage of the data used by each subsampling.
- double & **Percentage** ()
Modify the percentage of the data used by each subsampling.
- size_t **Samplings** () const
Get the number of samplings that will be performed.
- size_t & **Samplings** ()
Modify the number of samplings that will be performed.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the object.

39.343.1 Detailed Description

A refined approach for choosing initial points for k-means clustering.

This approach runs k-means several times on random subsets of the data, and then clusters those solutions to select refined initial cluster assignments. It is an implementation of the following paper:

```
{bradley1998refining, title={Refining initial points for k-means clustering}, author={Bradley, Paul S and Fayyad, Usama M}, booktitle={Proceedings of the Fifteenth International Conference on Machine Learning (ICML 1998)}, volume={66}, year={1998} }
```

Definition at line 37 of file refined_start.hpp.

39.343.2 Constructor & Destructor Documentation

39.343.2.1 RefinedStart()

```
RefinedStart (  
    const size_t samplings = 100,  
    const double percentage = 0.02 ) [inline]
```

Create the **RefinedStart** (p. 1502) object, optionally specifying parameters for the number of samplings to perform and the percentage of the dataset to use in each sampling.

Definition at line 45 of file refined_start.hpp.

References `RefinedStart::Cluster()`.

39.343.3 Member Function Documentation

39.343.3.1 Cluster() [1/2]

```
void Cluster (
    const MatType & data,
    const size_t clusters,
    arma::mat & centroids ) const
```

Partition the given dataset into the given number of clusters according to the random sampling scheme outlined in Bradley and Fayyad's paper, and return centroids.

Template Parameters

<i>MatType</i>	Type of data (arma::mat or arma::sp_mat).
----------------	---

Parameters

<i>data</i>	Dataset to partition.
<i>clusters</i>	Number of clusters to split dataset into.
<i>centroids</i>	Matrix to store centroids into.

Referenced by RefinedStart::RefinedStart().

39.343.3.2 Cluster() [2/2]

```
void Cluster (
    const MatType & data,
    const size_t clusters,
    arma::Row< size_t > & assignments ) const
```

Partition the given dataset into the given number of clusters according to the random sampling scheme outlined in Bradley and Fayyad's paper, and return point assignments.

Template Parameters

<i>MatType</i>	Type of data (arma::mat or arma::sp_mat).
----------------	---

Parameters

<i>data</i>	Dataset to partition.
<i>clusters</i>	Number of clusters to split dataset into.
<i>assignments</i>	Vector to store cluster assignments into. Values will be between 0 and (clusters - 1).

39.343.3.3 Percentage() [1/2]

```
double Percentage ( ) const [inline]
```

Get the percentage of the data used by each subsampling.

Definition at line 86 of file `refined_start.hpp`.

39.343.3.4 Percentage() [2/2]

```
double& Percentage ( ) [inline]
```

Modify the percentage of the data used by each subsampling.

Definition at line 88 of file `refined_start.hpp`.

39.343.3.5 Samplings() [1/2]

```
size_t Samplings ( ) const [inline]
```

Get the number of samplings that will be performed.

Definition at line 81 of file `refined_start.hpp`.

39.343.3.6 Samplings() [2/2]

```
size_t& Samplings ( ) [inline]
```

Modify the number of samplings that will be performed.

Definition at line 83 of file `refined_start.hpp`.

39.343.3.7 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the object.

Definition at line 92 of file `refined_start.hpp`.

39.345 KernelPCA< KernelType, KernelRule > Class Template Reference

This class performs kernel principal components analysis (Kernel PCA), for a given kernel.

Public Member Functions

- **KernelPCA** (const KernelType kernel=KernelType(), const bool centerTransformedData=false)
*Construct the **KernelPCA** (p. 1507) object, optionally passing a kernel.*
- void **Apply** (const arma::mat &data, arma::mat &transformedData, arma::vec &eigval, arma::mat &eigvec, const size_t newDimension)
Apply Kernel Principal Components Analysis to the provided data set.
- void **Apply** (const arma::mat &data, arma::mat &transformedData, arma::vec &eigval, arma::mat &eigvec)
Apply Kernel Principal Components Analysis to the provided data set.
- void **Apply** (const arma::mat &data, arma::mat &transformedData, arma::vec &eigval)
Apply Kernel Principal Component Analysis to the provided data set.
- void **Apply** (arma::mat &data, const size_t newDimension)
Apply dimensionality reduction using Kernel Principal Component Analysis to the provided data set.
- bool **CenterTransformedData** () const
Return whether or not the transformed data is centered.
- bool & **CenterTransformedData** ()
Return whether or not the transformed data is centered.
- const KernelType & **Kernel** () const
Get the kernel.
- KernelType & **Kernel** ()
Modify the kernel.

39.345.1 Detailed Description

```
template<typename KernelType, typename KernelRule = NaiveKernelRule<KernelType>>
class mlpack::kpca::KernelPCA< KernelType, KernelRule >
```

This class performs kernel principal components analysis (Kernel PCA), for a given kernel.

This is a standard machine learning technique and is well-documented on the Internet and in standard texts. It is often used as a dimensionality reduction technique, and can also be useful in mapping linearly inseparable classes of points to different spaces where they are linearly separable.

The performance of the method is highly dependent on the kernel choice. There are numerous available kernels in the **mlpack::kernel** (p. 401) namespace (see files in `mlpack/core/kernels/`) and it is easy to write your own; see other implementations for examples.

Definition at line 40 of file `kernel_pca.hpp`.

39.345.2 Constructor & Destructor Documentation

39.345.2.1 KernelPCA()

```
KernelPCA (
    const KernelType kernel = KernelType(),
    const bool centerTransformedData = false )
```

Construct the **KernelPCA** (p. 1507) object, optionally passing a kernel.

Optionally, the transformed data can be centered about the origin; to do this, pass 'true' for `centerTransformedData`. This will take slightly longer (but not much).

Parameters

<i>kernel</i>	Kernel to be used for computation.
<i>centerTransformedData</i>	Center transformed data.

39.345.3 Member Function Documentation

39.345.3.1 Apply() [1/4]

```
void Apply (
    const arma::mat & data,
```

```

    arma::mat & transformedData,
    arma::vec & eigval,
    arma::mat & eigvec,
    const size_t newDimension )

```

Apply Kernel Principal Components Analysis to the provided data set.

Parameters

<i>data</i>	Data matrix.
<i>transformedData</i>	Matrix to output results into.
<i>eigval</i>	KPCA eigenvalues will be written to this vector.
<i>eigvec</i>	KPCA eigenvectors will be written to this matrix.
<i>newDimension</i>	New dimension for the dataset.

39.345.3.2 Apply() [2/4]

```

void Apply (
    const arma::mat & data,
    arma::mat & transformedData,
    arma::vec & eigval,
    arma::mat & eigvec )

```

Apply Kernel Principal Components Analysis to the provided data set.

Parameters

<i>data</i>	Data matrix.
<i>transformedData</i>	Matrix to output results into.
<i>eigval</i>	KPCA eigenvalues will be written to this vector.
<i>eigvec</i>	KPCA eigenvectors will be written to this matrix.

39.345.3.3 Apply() [3/4]

```

void Apply (
    const arma::mat & data,
    arma::mat & transformedData,
    arma::vec & eigval )

```

Apply Kernel Principal Component Analysis to the provided data set.

Parameters

<i>data</i>	Data matrix.
<i>transformedData</i>	Matrix to output results into.
<i>eigval</i>	KPCA eigenvalues will be written to this vector.

39.345.3.4 Apply() [4/4]

```
void Apply (
    arma::mat & data,
    const size_t newDimension )
```

Apply dimensionality reduction using Kernel Principal Component Analysis to the provided data set.

The data matrix will be modified in-place. Note that the dimension can be larger than the existing dimension because KPCA works on the kernel matrix, not the covariance matrix. This means the new dimension can be as large as the number of points (columns) in the dataset. Note that if you specify newDimension to be larger than the current dimension of the data (the number of rows), then it's not really "dimensionality reduction"...

Parameters

<i>data</i>	Data matrix.
<i>newDimension</i>	New dimension for the dataset.

39.345.3.5 CenterTransformedData() [1/2]

```
bool CenterTransformedData ( ) const [inline]
```

Return whether or not the transformed data is centered.

Definition at line 115 of file kernel_pca.hpp.

39.345.3.6 CenterTransformedData() [2/2]

```
bool& CenterTransformedData ( ) [inline]
```

Return whether or not the transformed data is centered.

Definition at line 117 of file kernel_pca.hpp.

39.345.3.7 Kernel() [1/2]

```
const KernelType& Kernel ( ) const [inline]
```

Get the kernel.

Definition at line 110 of file kernel_pca.hpp.

39.345.3.8 Kernel() [2/2]

```
KernelType& Kernel ( ) [inline]
```

Modify the kernel.

Definition at line 112 of file kernel_pca.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kernel_pca/ **kernel_pca.hpp**

39.346 NaiveKernelRule< KernelType > Class Template Reference**Static Public Member Functions**

- static void **ApplyKernelMatrix** (const arma::mat &data, arma::mat &transformedData, arma::vec &eigval, arma::mat &eigvec, const size_t, KernelType kernel=KernelType())

Construct the exact kernel matrix.

39.346.1 Detailed Description

```
template<typename KernelType>
class mlpack::kpca::NaiveKernelRule< KernelType >
```

Definition at line 22 of file naive_method.hpp.

39.346.2 Member Function Documentation**39.346.2.1 ApplyKernelMatrix()**

```
static void ApplyKernelMatrix (
    const arma::mat & data,
    arma::mat & transformedData,
    arma::vec & eigval,
    arma::mat & eigvec,
    const size_t ,
    KernelType kernel = KernelType() ) [inline], [static]
```

Construct the exact kernel matrix.

Parameters

<i>data</i>	Input data points.
<i>transformedData</i>	Matrix to output results into.
<i>eigval</i>	KPCA eigenvalues will be written to this vector.
<i>eigvec</i>	KPCA eigenvectors will be written to this matrix.
<i>rank</i>	Rank to be used for matrix approximation.
<i>kernel</i>	Kernel to be used for computation.

Definition at line 35 of file `naive_method.hpp`.

The documentation for this class was generated from the following file:

39.347 NystroemKernelRule< KernelType, PointSelectionPolicy > Class Template Reference

Static Public Member Functions

- static void **ApplyKernelMatrix** (const arma::mat &data, arma::mat &transformedData, arma::vec &eigval, arma::mat &eigvec, const size_t rank, KernelType kernel=KernelType())
Construct the kernel matrix approximation using the nystroem method.

39.347.1 Detailed Description

```
template<typename KernelType, typename PointSelectionPolicy = kernel::KMeansSelection<>>
class mlpack::kcca::NystroemKernelRule< KernelType, PointSelectionPolicy >
```

Definition at line 27 of file `nystroem_method.hpp`.

39.347.2 Member Function Documentation

39.347.2.1 ApplyKernelMatrix()

```
static void ApplyKernelMatrix (
    const arma::mat & data,
    arma::mat & transformedData,
    arma::vec & eigval,
    arma::mat & eigvec,
    const size_t rank,
    KernelType kernel = KernelType() ) [inline], [static]
```

Construct the kernel matrix approximation using the nystroem method.

Parameters

<i>data</i>	Input data points.
<i>transformedData</i>	Matrix to output results into.
<i>eigval</i>	KPCA eigenvalues will be written to this vector.
<i>eigvec</i>	KPCA eigenvectors will be written to this matrix.
<i>rank</i>	Rank to be used for matrix approximation.
<i>kernel</i>	Kernel to be used for computation.

Definition at line 40 of file nystroem_method.hpp.

`double Train (const arma::mat &data, const DictionaryInitializer &initializer=DictionaryInitializer())`
 Run local coordinate coding.

39.348.1 Detailed Description

An implementation of Local Coordinate Coding (LCC) that codes data which approximately lives on a manifold using a variation of l1-norm regularized sparse coding; in LCC, the penalty on the absolute value of each point's coefficient for each atom is weighted by the squared distance of that point to that atom.

Let d be the number of dimensions in the original space, m the number of training points, and k the number of atoms in the dictionary (the dimension of the learned feature space). The training data X is a d -by- m matrix where each column is a point and each row is a dimension. The dictionary D is a d -by- k matrix, and the sparse codes matrix Z is a k -by- m matrix. This program seeks to minimize the objective: $\min_{\{D,Z\}} \|X - DZ\|_{\text{Fro}}^2$

- $\lambda \sum_{i=1}^m \sum_{j=1}^k \text{dist}(X_i, D_j)^2 Z_{ij}$ where $\lambda > 0$.

This problem is solved by an algorithm that alternates between a dictionary learning step and a sparse coding step. The dictionary learning step updates the dictionary D by solving a linear system (note that the objective is a positive definite quadratic program). The sparse coding step involves solving a large number of weighted l1-norm regularized linear regression problems; this can be done efficiently using LARS, an algorithm that can solve the LASSO (paper below).

The papers are listed below.

```

Definition at line 79 of file lcc.hpp.

39.348.2 Constructor & Destructor Documentation

39.348.2.1 LocalCoordinateCoding() [1/2]

```
LocalCoordinateCoding (
    const arma::mat & data,
    const size_t atoms,
    const double lambda,
    const size_t maxIterations = 0,
    const double tolerance = 0.01,
    const DictionaryInitializer & initializer = DictionaryInitializer() )
```

Set the parameters to **LocalCoordinateCoding** (p. 1513), and train the dictionary.

This constructor will also initialize the dictionary using the given DictionaryInitializer before training.

If you want to initialize the dictionary to a custom matrix, consider either writing your own DictionaryInitializer class (with void Initialize(const arma::mat& data, arma::mat& dictionary) function), or call the constructor that does not take a data matrix, then call **Dictionary()** (p. 1516) to set the dictionary matrix to a matrix of your choosing, and then call **Train()** (p. 1519) with **sparse_coding::NothingInitializer** (p. 1914) (i.e. Train<sparse_coding::NothingInitializer>(data)).

Parameters

<i>data</i>	Data matrix.
<i>atoms</i>	Number of atoms in dictionary.
<i>lambda</i>	Regularization parameter for weighted l1-norm penalty.
<i>maxIterations</i>	Maximum number of iterations for training (0 runs until convergence).
<i>tolerance</i>	Tolerance for the objective function.

39.348.2.2 LocalCoordinateCoding() [2/2]

```
LocalCoordinateCoding (
    const size_t atoms = 0,
```

```
const double lambda = 0.0,
const size_t maxIterations = 0,
const double tolerance = 0.01 )
```

Set the parameters to **LocalCoordinateCoding** (p. 1513).

This constructor will not train the model, and a subsequent call to **Train()** (p. 1519) will be required before the model can encode points with **Encode()** (p. 1517). The default values for atoms and lambda should be changed if you intend to train the model!

Parameters

<i>atoms</i>	Number of atoms in dictionary.
<i>lambda</i>	Regularization parameter for weighted l1-norm penalty.
<i>maxIterations</i>	Maximum number of iterations for training (0 runs until convergence).
<i>tolerance</i>	Tolerance for the objective function.

39.348.3 Member Function Documentation

39.348.3.1 Atoms() [1/2]

```
size_t Atoms ( ) const [inline]
```

Get the number of atoms.

Definition at line 175 of file lcc.hpp.

39.348.3.2 Atoms() [2/2]

```
size_t& Atoms ( ) [inline]
```

Modify the number of atoms.

Definition at line 177 of file lcc.hpp.

39.348.3.3 Dictionary() [1/2]

```
const arma::mat& Dictionary ( ) const [inline]
```

Accessor for dictionary.

Definition at line 180 of file lcc.hpp.

39.348.3.4 Dictionary() [2/2]

```
arma::mat& Dictionary ( ) [inline]
```

Mutator for dictionary.

Definition at line 182 of file lcc.hpp.

39.348.3.5 Encode()

```
void Encode (
    const arma::mat & data,
    arma::mat & codes )
```

Code each point via distance-weighted LARS.

Parameters

<i>data</i>	Matrix containing points to encode.
<i>codes</i>	Output matrix to store codes in.

39.348.3.6 Lambda() [1/2]

```
double Lambda ( ) const [inline]
```

Get the L1 regularization parameter.

Definition at line 185 of file lcc.hpp.

39.348.3.7 Lambda() [2/2]

```
double& Lambda ( ) [inline]
```

Modify the L1 regularization parameter.

Definition at line 187 of file lcc.hpp.

39.348.3.8 MaxIterations() [1/2]

```
size_t MaxIterations ( ) const [inline]
```

Get the maximum number of iterations.

Definition at line 190 of file lcc.hpp.

39.348.3.9 MaxIterations() [2/2]

```
size_t& MaxIterations ( ) [inline]
```

Modify the maximum number of iterations.

Definition at line 192 of file lcc.hpp.

39.348.3.10 Objective()

```
double Objective (
    const arma::mat & data,
    const arma::mat & codes,
    const arma::uvec & adjacencies ) const
```

Compute objective function given the list of adjacencies.

39.348.3.11 OptimizeDictionary()

```
void OptimizeDictionary (
    const arma::mat & data,
    const arma::mat & codes,
    const arma::uvec & adjacencies )
```

Learn dictionary by solving linear system.

Parameters

<i>adjacencies</i>	Indices of entries (unrolled column by column) of the coding matrix Z that are non-zero (the adjacency matrix for the bipartite graph of points and atoms)
--------------------	--

39.348.3.12 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the model.

Referenced by LocalCoordinateCoding::Tolerance().

39.348.3.13 Tolerance() [1/2]

```
double Tolerance ( ) const [inline]
```

Get the objective tolerance.

Definition at line 195 of file lcc.hpp.

39.348.3.14 Tolerance() [2/2]

```
double& Tolerance ( ) [inline]
```

Modify the objective tolerance.

Definition at line 197 of file lcc.hpp.

References LocalCoordinateCoding::serialize().

39.348.3.15 Train()

```
double Train (
    const arma::mat & data,
    const DictionaryInitializer & initializer = DictionaryInitializer() )
```

Run local coordinate coding.

Parameters

<i>nIterations</i>	Maximum number of iterations to run algorithm.
<i>objTolerance</i>	Tolerance of objective function. When the objective function changes by a value lower than this tolerance, the optimization terminates.

Returns

The final objective value.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/local_coordinate_coding/ **lcc.hpp**

39.349 Constraints< MetricType > Class Template Reference

Interface for generating distance based constraints on a given dataset, provided corresponding true labels and a quantity parameter (k) are specified.

Public Types

- typedef **neighbor::NeighborSearch**< **neighbor::NearestNeighborSort**, MetricType > **KNN**
Convenience typedef.

Public Member Functions

- **Constraints** (const arma::mat &dataset, const arma::Row< size_t > &labels, const size_t k)
*Constructor for creating a **Constraints** (p. 1520) instance.*
- void **Impostors** (arma::Mat< size_t > &outputMatrix, const arma::mat &dataset, const arma::Row< size_t > &labels, const arma::vec &norms)
Calculates k differently labeled nearest neighbors for each datapoint and writes them back to passed matrix.
- void **Impostors** (arma::Mat< size_t > &outputNeighbors, arma::mat &outputDistance, const arma::mat &dataset, const arma::Row< size_t > &labels, const arma::vec &norms)
Calculates k differently labeled nearest neighbors & distances to impostors for each datapoint and writes them back to passed matrices.
- void **Impostors** (arma::Mat< size_t > &outputMatrix, const arma::mat &dataset, const arma::Row< size_t > &labels, const arma::vec &norms, const size_t begin, const size_t batchSize)
Calculates k differently labeled nearest neighbors for a batch of dataset and writes them back to passed matrix.
- void **Impostors** (arma::Mat< size_t > &outputNeighbors, arma::mat &outputDistance, const arma::mat &dataset, const arma::Row< size_t > &labels, const arma::vec &norms, const size_t begin, const size_t batchSize)
Calculates k differently labeled nearest neighbors & distances to impostors for a batch of dataset and writes them back to passed matrices.
- void **Impostors** (arma::Mat< size_t > &outputNeighbors, arma::mat &outputDistance, const arma::mat &dataset, const arma::Row< size_t > &labels, const arma::vec &norms, const arma::uvec &points, const size_t numPoints)
Calculates k differently labeled nearest neighbors & distances to impostors for some points of dataset and writes them back to passed matrices.
- const size_t & **K** () const
Get the number of target neighbors (k).
- size_t & **K** ()
Modify the number of target neighbors (k).

- const bool & **PreCalulated** () const
Access the boolean value of precalculated.
- bool & **PreCalulated** ()
Modify the value of precalculated.
- void **TargetNeighbors** (arma::Mat< size_t > &outputMatrix, const arma::mat &dataset, const arma::Row< size_t > &labels, const arma::vec &norms)
Calculates k similar labeled nearest neighbors and stores them into the passed matrix.
- void **TargetNeighbors** (arma::Mat< size_t > &outputMatrix, const arma::mat &dataset, const arma::Row< size_t > &labels, const arma::vec &norms, const size_t begin, const size_t batchSize)
Calculates k similar labeled nearest neighbors for a batch of dataset and stores them into the passed matrix.
- void **Triplets** (arma::Mat< size_t > &outputMatrix, const arma::mat &dataset, const arma::Row< size_t > &labels, const arma::vec &norms)
Generate triplets {i, j, l} for each datapoint i and writes back generated triplets to matrix passed.

39.349.1 Detailed Description

```
template<typename MetricType = metric::SquaredEuclideanDistance>
```

```
class mlpack::lmnn::Constraints< MetricType >
```

Interface for generating distance based constraints on a given dataset, provided corresponding true labels and a quantity parameter (k) are specified.

Class provides **TargetNeighbors()** (p. 1525) (Used for calculating target neighbors of each data point), **Impostors()** (p. 1522) (used for calculating impostors of each data point) and **Triplets()** (p. 1526) (Generates sets of {dataset, target neighbors, impostors} triplets.)

Definition at line 31 of file constraints.hpp.

39.349.2 Member Typedef Documentation

39.349.2.1 KNN

```
typedef neighbor::NeighborSearch< neighbor::NearestNeighborSort, MetricType> KNN
```

Convenience typedef.

Definition at line 36 of file constraints.hpp.

39.349.3 Constructor & Destructor Documentation

39.349.3.1 Constraints()

```
Constraints (
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    const size_t k )
```

Constructor for creating a **Constraints** (p. 1520) instance.

Parameters

<i>dataset</i>	Input dataset.
<i>labels</i>	Input dataset labels.
<i>k</i>	Number of target neighbors, impostors & triplets.

39.349.4 Member Function Documentation

39.349.4.1 `Impostors()` [1/5]

```
void Impostors (
    arma::Mat< size_t > & outputMatrix,
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    const arma::vec & norms )
```

Calculates k differently labeled nearest neighbors for each datapoint and writes them back to passed matrix.

Parameters

<i>outputMatrix</i>	Coordinates matrix to store impostors.
<i>dataset</i>	Input dataset.
<i>labels</i>	Input dataset labels.

39.349.4.2 `Impostors()` [2/5]

```
void Impostors (
    arma::Mat< size_t > & outputNeighbors,
    arma::mat & outputDistance,
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    const arma::vec & norms )
```

Calculates k differently labeled nearest neighbors & distances to impostors for each datapoint and writes them back to passed matrices.

Parameters

<i>outputNeighbors</i>	Coordinates matrix to store impostors.
<i>outputDistance</i>	matrix to store distance.
<i>dataset</i>	Input dataset.
<i>labels</i>	Input dataset labels.

39.349.4.3 Impostors() [3/5]

```
void Impostors (
    arma::Mat< size_t > & outputMatrix,
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    const arma::vec & norms,
    const size_t begin,
    const size_t batchSize )
```

Calculates k differently labeled nearest neighbors for a batch of dataset and writes them back to passed matrix.

Parameters

<i>outputMatrix</i>	Coordinates matrix to store impostors.
<i>dataset</i>	Input dataset.
<i>labels</i>	Input dataset labels.
<i>begin</i>	Index of the initial point of dataset.
<i>batchSize</i>	Number of data points to use.

39.349.4.4 Impostors() [4/5]

```
void Impostors (
    arma::Mat< size_t > & outputNeighbors,
    arma::mat & outputDistance,
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    const arma::vec & norms,
    const size_t begin,
    const size_t batchSize )
```

Calculates k differently labeled nearest neighbors & distances to impostors for a batch of dataset and writes them back to passed matrices.

Parameters

<i>outputNeighbors</i>	Coordinates matrix to store impostors.
<i>outputDistance</i>	matrix to store distance.
<i>dataset</i>	Input dataset.
<i>labels</i>	Input dataset labels.
<i>begin</i>	Index of the initial point of dataset.
<i>batchSize</i>	Number of data points to use.

39.349.4.5 Impostors() [5/5]

```

void Impostors (
    arma::Mat< size_t > & outputNeighbors,
    arma::mat & outputDistance,
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    const arma::vec & norms,
    const arma::uvec & points,
    const size_t numPoints )

```

Calculates k differently labeled nearest neighbors & distances to impostors for some points of dataset and writes them back to passed matrices.

Parameters

<i>outputNeighbors</i>	Coordinates matrix to store impostors.
<i>outputDistance</i>	matrix to store distance.
<i>dataset</i>	Input dataset.
<i>labels</i>	Input dataset labels.
<i>points</i>	Indices of data points to calculate impostors on.
<i>numPoints</i>	Number of points to actually calculate impostors on.

39.349.4.6 K() [1/2]

```
const size_t& K ( ) const [inline]
```

Get the number of target neighbors (k).

Definition at line 177 of file constraints.hpp.

39.349.4.7 K() [2/2]

```
size_t& K ( ) [inline]
```

Modify the number of target neighbors (k).

Definition at line 179 of file constraints.hpp.

39.349.4.8 PreCalulated() [1/2]

```
const bool& PreCalulated ( ) const [inline]
```

Access the boolean value of precalculated.

Definition at line 182 of file constraints.hpp.

39.349.4.9 PreCalulated() [2/2]

```
bool& PreCalulated ( ) [inline]
```

Modify the value of precalculated.

Definition at line 184 of file constraints.hpp.

39.349.4.10 TargetNeighbors() [1/2]

```
void TargetNeighbors (
    arma::Mat< size_t > & outputMatrix,
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    const arma::vec & norms )
```

Calculates k similar labeled nearest neighbors and stores them into the passed matrix.

Parameters

<i>outputMatrix</i>	Coordinates matrix to store target neighbors.
<i>dataset</i>	Input dataset.
<i>labels</i>	Input dataset labels.

39.349.4.11 TargetNeighbors() [2/2]

```
void TargetNeighbors (
    arma::Mat< size_t > & outputMatrix,
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    const arma::vec & norms,
```

```
const size_t begin,
const size_t batchSize )
```

Calculates k similar labeled nearest neighbors for a batch of dataset and stores them into the passed matrix.

Parameters

<i>outputMatrix</i>	Coordinates matrix to store target neighbors.
<i>dataset</i>	Input dataset.
<i>labels</i>	Input dataset labels.
<i>begin</i>	Index of the initial point of dataset.
<i>batchSize</i>	Number of data points to use.

39.349.4.12 Triplets()

```
void Triplets (
    arma::Mat< size_t > & outputMatrix,
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    const arma::vec & norms )
```

Generate triplets {i, j, l} for each datapoint i and writes back generated triplets to matrix passed.

Parameters

<i>outputMatrix</i>	Coordinates matrix to store triplets.
<i>dataset</i>	Input dataset.
<i>labels</i>	Input dataset labels.

The documentation for this class was generated from the following file:

39.350 LMNN< MetricType, OptimizerType > Class Template Reference

An implementation of Large Margin nearest neighbor metric learning technique.

Public Member Functions

- **LMNN** (const arma::mat &dataset, const arma::Row< size_t > &labels, const size_t k, const MetricType metric=MetricType())

Initialize the **LMNN** (p. 1526) object, passing a dataset (distance metric is learned using this dataset) and labels.

- `const arma::mat & Dataset () const`
Get the dataset reference.
- `const size_t & K () const`
Access the value of *k*.
- `size_t K ()`
Modify the value of *k*.
- `const arma::Row< size_t > & Labels () const`
Get the labels reference.
- `void LearnDistance (arma::mat &outputMatrix)`
Perform Large Margin Nearest Neighbors metric learning.
- `const OptimizerType & Optimizer () const`
Get the optimizer.
- `OptimizerType & Optimizer ()`
- `const size_t & Range () const`
Access the range value.
- `size_t & Range ()`
Modify the range value.
- `const double & Regularization () const`
Access the regularization value.
- `double & Regularization ()`
Modify the regularization value.

39.350.1 Detailed Description

```
template<typename MetricType = metric::SquaredEuclideanDistance, typename OptimizerType = ens::AMSGrad>
class mlpack::lmnn::LMNN< MetricType, OptimizerType >
```

An implementation of Large Margin nearest neighbor metric learning technique.

The method seeks to improve clustering & classification algorithms on a dataset by transforming the dataset representation in a more convenient form for them. It introduces the concept of target neighbors and impostors, focusing on the idea that the distance between impostors and the perimeters established by target neighbors should be large and that between target neighbors and data point should be small. It requires the knowledge of target neighbors beforehand. Moreover, target neighbors once initialized remain same.

For more details, see the following published paper:

```
@ARTICLE{weinberger09distance,
  author = {Weinberger, K.Q. and Saul, L.K.},
  title = {{Distance metric learning for large margin nearest neighbor
    classification}},
  journal = {The Journal of Machine Learning Research},
  year = {2009},
  volume = {10},
  pages = {207--244},
  publisher = {MIT Press}
}
```

Template Parameters

<i>MetricType</i>	The type of metric to use for computation.
<i>OptimizerType</i>	Optimizer to use for developing distance.

Definition at line 55 of file `lmnn.hpp`.

39.350.2 Constructor & Destructor Documentation

39.350.2.1 LMNN()

```
LMNN (
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    const size_t k,
    const MetricType metric = MetricType() )
```

Initialize the **LMNN** (p. 1526) object, passing a dataset (distance metric is learned using this dataset) and labels.

Initialization will copy both dataset and labels matrices to internal copies.

Parameters

<i>dataset</i>	Input dataset.
<i>labels</i>	Input dataset labels.
<i>k</i>	Number of targets to consider.
<i>metric</i>	Type of metric used for computation.

39.350.3 Member Function Documentation

39.350.3.1 Dataset()

```
const arma::mat& Dataset ( ) const [inline]
```

Get the dataset reference.

Definition at line 86 of file `lmnn.hpp`.

39.350.3.2 K() [1/2]

```
const size_t& K ( ) const [inline]
```

Access the value of k.

Definition at line 102 of file `lmnn.hpp`.

39.350.3.3 K() [2/2]

```
size_t K ( ) [inline]
```

Modify the value of k.

Definition at line 104 of file `lmnn.hpp`.

39.350.3.4 Labels()

```
const arma::Row<size_t>& Labels ( ) const [inline]
```

Get the labels reference.

Definition at line 89 of file `lmnn.hpp`.

39.350.3.5 LearnDistance()

```
void LearnDistance (
    arma::mat & outputMatrix )
```

Perform Large Margin Nearest Neighbors metric learning.

The output distance matrix is written into the passed reference. If the **LearnDistance()** (p. 1529) is called with an `outputMatrix` with correct dimensions, then that matrix will be used as the starting point for optimization.

Parameters

<i>outputMatrix</i>	Covariance matrix of Mahalanobis distance.
---------------------	--

39.350.3.6 Optimizer() [1/2]

```
const OptimizerType& Optimizer ( ) const [inline]
```

Get the optimizer.

Definition at line 107 of file Imnn.hpp.

39.350.3.7 Optimizer() [2/2]

```
OptimizerType& Optimizer ( ) [inline]
```

Definition at line 108 of file Imnn.hpp.

39.350.3.8 Range() [1/2]

```
const size_t& Range ( ) const [inline]
```

Access the range value.

Definition at line 97 of file Imnn.hpp.

39.350.3.9 Range() [2/2]

```
size_t& Range ( ) [inline]
```

Modify the range value.

Definition at line 99 of file Imnn.hpp.

39.350.3.10 Regularization() [1/2]

```
const double& Regularization ( ) const [inline]
```

Access the regularization value.

Definition at line 92 of file Imnn.hpp.

39.350.3.11 Regularization() [2/2]

```
double& Regularization ( ) [inline]
```

Modify the regularization value.

Definition at line 94 of file lmnn.hpp.

The documentation for this class was generated from the following file:

39.351 LMNNFunction< MetricType > Class Template Reference

The Large Margin Nearest Neighbors function.

Public Member Functions

- **LMNNFunction** (const arma::mat &dataset, const arma::Row< size_t > &labels, size_t k, double regularization, size_t range, MetricType metric=MetricType())
*Constructor for **LMNNFunction** (p. 1531) class.*
- const arma::mat & **Dataset** () const
Return the dataset passed into the constructor.
- double **Evaluate** (const arma::mat &transformation)
*Evaluate the **LMNN** (p. 1526) function for the given transformation matrix.*
- double **Evaluate** (const arma::mat &transformation, const size_t begin, const size_t batchSize=1)
*Evaluate the **LMNN** (p. 1526) objective function for the given transformation matrix on the given batch size from a given initial point of the dataset.*
- template<typename GradType >
double **EvaluateWithGradient** (const arma::mat &transformation, GradType &gradient)
*Evaluate the **LMNN** (p. 1526) objective function together with gradient for the given transformation matrix.*
- template<typename GradType >
double **EvaluateWithGradient** (const arma::mat &transformation, const size_t begin, GradType &gradient, const size_t batchSize=1)
*Evaluate the **LMNN** (p. 1526) objective function together with gradient for the given transformation matrix on the given batch size, from a given initial point of the dataset.*
- const arma::mat & **GetInitialPoint** () const
Return the initial point for the optimization.
- template<typename GradType >
void **Gradient** (const arma::mat &transformation, GradType &gradient)
*Evaluate the gradient of the **LMNN** (p. 1526) function for the given transformation matrix.*
- template<typename GradType >
void **Gradient** (const arma::mat &transformation, const size_t begin, GradType &gradient, const size_t batchSize=1)
*Evaluate the gradient of the **LMNN** (p. 1526) function for the given transformation matrix on the given batch size, from a given initial point of the dataset.*
- const size_t & **K** () const

- *Access the value of k.*
- `size_t & K ()`
- *Modify the value of k.*
- `size_t NumFunctions () const`
- *Get the number of functions the objective function can be decomposed into.*
- `const size_t & Range () const`
- *Access the value of range.*
- `size_t & Range ()`
- *Modify the value of k.*
- `const double & Regularization () const`
- *Access the regularization value.*
- `double & Regularization ()`
- *Modify the regularization value.*
- `void Shuffle ()`
- *Shuffle the points in the dataset.*

39.351.1 Detailed Description

```
template<typename MetricType = metric::SquaredEuclideanDistance>
class mlpack::lmnn::LMNNFunction< MetricType >
```

The Large Margin Nearest Neighbors function.

The actual function is

$$(M) = \{ij\} \{ij\} \|L x_i - L x_j\|^2 + c_{ij} \{ij\} (1 - y_{ij}) [1 + \|L x_i - L x_j\|^2 - \|L x_i - L x_l\|^2]_{+}$$

where x_n represents a point and A is the current scaling matrix.

This class is more flexible than the original paper, allowing an arbitrary metric function to be used in place of $\|A x_i - A x_j\|^2$, meaning that the squared Euclidean distance is not the only allowed metric for **LMNN** (p. 1526). However, that is probably the best way to use this class.

In addition to the standard **Evaluate()** (p. 1533) and **Gradient()** (p. 1535) functions which mlpack optimizers use, overloads of **Evaluate()** (p. 1533) and **Gradient()** (p. 1535) are given which only operate on one point in the dataset. This is useful for optimizers like stochastic gradient descent (see `ens::SGD`).

Definition at line 46 of file `lmnn_function.hpp`.

39.351.2 Constructor & Destructor Documentation

39.351.2.1 LMNNFunction()

```
LMNNFunction (
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    size_t k,
    double regularization,
    size_t range,
    MetricType metric = MetricType() )
```

Constructor for **LMNNFunction** (p. 1531) class.

Parameters

<i>dataset</i>	Input dataset.
<i>labels</i>	Input dataset labels.
<i>k</i>	Number of target neighbors to be used.
<i>regularization</i>	Regularization value.
<i>range</i>	Range after which impostors need to be recalculated.
<i>metric</i>	Type of metric used for computation.

39.351.3 Member Function Documentation

39.351.3.1 Dataset()

```
const arma::mat& Dataset ( ) const [inline]
```

Return the dataset passed into the constructor.

Definition at line 175 of file `lmnn_function.hpp`.

39.351.3.2 Evaluate() [1/2]

```
double Evaluate (
    const arma::mat & transformation )
```

Evaluate the **LMNN** (p. 1526) function for the given transformation matrix.

This is the non-separable implementation, where the objective function is not decomposed into the sum of several objective functions.

Parameters

<i>transformation</i>	Transformation matrix of Mahalanobis distance.
-----------------------	--

39.351.3.3 Evaluate() [2/2]

```
double Evaluate (
    const arma::mat & transformation,
```

```
const size_t begin,
const size_t batchSize = 1 )
```

Evaluate the **LMNN** (p. 1526) objective function for the given transformation matrix on the given batch size from a given initial point of the dataset.

This is the separable implementation, where the objective function is decomposed into the sum of many objective functions, and here, only one of those constituent objective functions is returned.

Parameters

<i>transformation</i>	Transformation matrix of Mahalanobis distance.
<i>begin</i>	Index of the initial point to use for objective function.
<i>batchSize</i>	Number of points to use for objective function.

39.351.3.4 EvaluateWithGradient() [1/2]

```
double EvaluateWithGradient (
    const arma::mat & transformation,
    GradType & gradient )
```

Evaluate the **LMNN** (p. 1526) objective function together with gradient for the given transformation matrix.

This is the non-separable implementation, where the objective function is not decomposed into the sum of several objective functions.

Template Parameters

<i>GradType</i>	The type of the gradient out-param.
-----------------	-------------------------------------

Parameters

<i>transformation</i>	Transformation matrix of Mahalanobis distance.
<i>gradient</i>	Matrix to store the calculated gradient in.

39.351.3.5 EvaluateWithGradient() [2/2]

```
double EvaluateWithGradient (
    const arma::mat & transformation,
    const size_t begin,
    GradType & gradient,
    const size_t batchSize = 1 )
```

Evaluate the **LMNN** (p. 1526) objective function together with gradient for the given transformation matrix on the given batch size, from a given initial point of the dataset.

This is the separable implementation, where the objective function is decomposed into the sum of many objective functions, and here, only one of those constituent objective functions is returned. The type of the gradient parameter is a template argument to allow the computation of a sparse gradient.

Template Parameters

<i>GradType</i>	The type of the gradient out-param.
-----------------	-------------------------------------

Parameters

<i>transformation</i>	Transformation matrix of Mahalanobis distance.
<i>begin</i>	Index of the initial point to use for objective function.
<i>gradient</i>	Matrix to store the calculated gradient in.
<i>batchSize</i>	Number of points to use for objective function.

39.351.3.6 GetInitialPoint()

```
const arma::mat& GetInitialPoint ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 166 of file `lmnn_function.hpp`.

39.351.3.7 Gradient() [1/2]

```
void Gradient (
    const arma::mat & transformation,
    GradType & gradient )
```

Evaluate the gradient of the **LMNN** (p. 1526) function for the given transformation matrix.

This is the non-separable implementation, where the objective function is not decomposed into the sum of several objective functions.

Template Parameters

<i>GradType</i>	The type of the gradient out-param.
-----------------	-------------------------------------

Parameters

<i>transformation</i>	Transformation matrix of Mahalanobis distance.
<i>gradient</i>	Matrix to store the calculated gradient in.

39.351.3.8 Gradient() [2/2]

```
void Gradient (
    const arma::mat & transformation,
    const size_t begin,
    GradType & gradient,
    const size_t batchSize = 1 )
```

Evaluate the gradient of the **LMNN** (p. 1526) function for the given transformation matrix on the given batch size, from a given initial point of the dataset.

This is the separable implementation, where the objective function is decomposed into the sum of many objective functions, and here, only one of those constituent objective functions is returned. The type of the gradient parameter is a template argument to allow the computation of a sparse gradient.

Template Parameters

<i>GradType</i>	The type of the gradient out-param.
-----------------	-------------------------------------

Parameters

<i>transformation</i>	Transformation matrix of Mahalanobis distance.
<i>begin</i>	Index of the initial point to use for objective function.
<i>gradient</i>	Matrix to store the calculated gradient in.
<i>batchSize</i>	Number of points to use for objective function.

39.351.3.9 K() [1/2]

```
const size_t& K ( ) const [inline]
```

Access the value of k.

Definition at line 183 of file `lmnn_function.hpp`.

39.351.3.10 K() [2/2]

```
size_t& K ( ) [inline]
```

Modify the value of k.

Definition at line 185 of file lmnn_function.hpp.

39.351.3.11 NumFunctions()

```
size_t NumFunctions ( ) const [inline]
```

Get the number of functions the objective function can be decomposed into.

This is just the number of points in the dataset.

Definition at line 172 of file lmnn_function.hpp.

39.351.3.12 Range() [1/2]

```
const size_t& Range ( ) const [inline]
```

Access the value of range.

Definition at line 188 of file lmnn_function.hpp.

39.351.3.13 Range() [2/2]

```
size_t& Range ( ) [inline]
```

Modify the value of k.

Definition at line 190 of file lmnn_function.hpp.

39.351.3.14 Regularization() [1/2]

```
const double& Regularization ( ) const [inline]
```

Access the regularization value.

Definition at line 178 of file lmnn_function.hpp.

39.351.3.15 Regularization() [2/2]

```
double& Regularization ( ) [inline]
```

Modify the regularization value.

Definition at line 180 of file `lmnn_function.hpp`.

39.351.3.16 Shuffle()

```
void Shuffle ( )
```

Shuffle the points in the dataset.

This may be used by optimizers.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/lmnn/lmnn_function.hpp`

39.352 Log Class Reference

Provides a convenient way to give formatted output.

Static Public Member Functions

- static void **Assert** (bool condition, const std::string &message="Assert Failed.")
Checks if the specified condition is true.

Static Public Attributes

- static std::ostream & **cout**
Reference to cout, if necessary.
- static MLPACK_EXPORT **util::NullOutputStream Debug**
MLPACK_EXPORT is required for global variables, so that they are properly exported by the Windows compiler.
- static MLPACK_EXPORT **util::PrefixedOutputStream Fatal**
Prints fatal messages prefixed with [FATAL], then terminates the program.
- static MLPACK_EXPORT **util::PrefixedOutputStream Info**
Prints informational messages if -verbose is specified, prefixed with [INFO].
- static MLPACK_EXPORT **util::PrefixedOutputStream Warn**
Prints warning messages prefixed with [WARN].

39.352.1 Detailed Description

Provides a convenient way to give formatted output.

The **Log** (p. 1538) class has four members which can be used in the same way ostream can be used:

- **Log::Debug** (p. 1540)
- **Log::Info** (p. 1540)
- **Log::Warn** (p. 1541)
- **Log::Fatal** (p. 1540)

Each of these will prefix a tag to the output (for easy filtering), and the fatal output will terminate the program when a newline is encountered. An example is given below.

```
Log::Info << "Checking a condition." << std::endl;
if (!someCondition())
    Log::Warn << "someCondition() is not satisfied!" << std::endl;
Log::Info << "Checking an important condition." << std::endl;
if (!someImportantCondition())
{
    Log::Fatal << "someImportantCondition() is not satisfied! Terminating.";
    Log::Fatal << std::endl;
}
```

Any messages sent to **Log::Debug** (p. 1540) will not be shown when compiling in non-debug mode. Messages to **Log::Info** (p. 1540) will only be shown when the `-verbose` flag is given to the program (or rather, the **CLI** (p. 1117) class).

See also

PrefixOutputStream, NullOutputStream, **CLI** (p. 1117)

Definition at line 56 of file log.hpp.

39.352.2 Member Function Documentation

39.352.2.1 Assert()

```
static void Assert (
    bool condition,
    const std::string & message = "Assert Failed." ) [static]
```

Checks if the specified condition is true.

If not, halts program execution and prints a custom error message. Does nothing in non-debug mode.

Referenced by `EdgePair::EdgePair()`, and `mlpack::tree::split::PerformSplit()`.

39.352.3 Member Data Documentation

39.352.3.1 cout

```
std::ostream& cout [static]
```

Reference to cout, if necessary.

Definition at line 93 of file log.hpp.

39.352.3.2 Debug

```
MLPACK_EXPORT util::NullOutputStream Debug [static]
```

MLPACK_EXPORT is required for global variables, so that they are properly exported by the Windows compiler.

Dumps debug output into the bit nether regions.

Definition at line 79 of file log.hpp.

Referenced by DiagonalGMM::DiagonalGMM(), GMM::GMM(), and mlpack::bindings::cli::ParseCommandLine().

39.352.3.3 Fatal

```
MLPACK_EXPORT util::PrefixedOutputStream Fatal [static]
```

Prints fatal messages prefixed with [FATAL], then terminates the program.

Definition at line 90 of file log.hpp.

Referenced by SphericalKernel::ConvolutionIntegral(), mlpack::util::DisableBacktrace(), EigenvalueRatioConstraint::EigenvalueRatioConstraint(), AverageInterpolation::GetWeights(), SimilarityInterpolation::GetWeights(), RegressionInterpolation::GetWeights(), MeanImputation< T >::Impute(), GivenInitialization::Initialize(), ZScoreNormalization::Normalize(), mlpack::bindings::cli::ParseCommandLine(), and DiscreteDistribution::Probability().

39.352.3.4 Info

```
MLPACK_EXPORT util::PrefixedOutputStream Info [static]
```

Prints informational messages if `--verbose` is specified, prefixed with `[INFO]`.

Definition at line 84 of file `log.hpp`.

Referenced by `mlpack::util::DisableVerbose()`, `mlpack::util::EnableVerbose()`, `mlpack::bindings::cli::EndProgram()`, `SimpleResidueTermination::IsConverged()`, `SimpleToleranceTermination< MatType >::IsConverged()`, and `mlpack::bindings::cli::ParseCommandLine()`.

39.352.3.5 Warn

```
MLPACK_EXPORT util::PrefixedOutputStream Warn [static]
```

Prints warning messages prefixed with `[WARN]`.

Definition at line 87 of file `log.hpp`.

Referenced by `EigenvalueRatioConstraint::EigenvalueRatioConstraint()`, `RandomAcolInitialization< columnsToAverage >::Initialize()`, `MaxIterationTermination::MaxIterationTermination()`, and `CFTYPE< DecompositionPolicy, NormalizationType >::NumUsersForSimilarity()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/util/ log.hpp`

39.353 ColumnsToBlocks Class Reference

Transform the columns of the given matrix into a block format.

Public Member Functions

- **ColumnsToBlocks** (size_t rows, size_t cols, size_t blockHeight=0, size_t blockWidth=0)
*Constructor a **ColumnsToBlocks** (p. 1541) object with the given parameters.*
- void **BlockHeight** (const size_t value)
Set the height of each block; see the constructor for more details.
- size_t **BlockHeight** () const
Get the block height.
- void **BlockWidth** (size_t value)
Set the width of each block; see the constructor for more details.
- size_t **BlockWidth** () const
Get the block width.
- void **BufSize** (const size_t value)
Modify the buffer size (the size of the margin around each column of the input).
- size_t **BufSize** () const
Get the buffer size.
- void **BufValue** (const double value)
Modify the value used for buffer cells; the default is -1.
- double **BufValue** () const
Get the value used for buffer cells.
- void **Cols** (const size_t value)
Set the number of blocks per column.
- size_t **Cols** () const
Return the number of blocks per column.
- void **MaxRange** (const double value)
*Set the maximum of the range the input will be scaled to, if scaling is enabled (see **Scale()** (p. 1548)).*
- double **MaxRange** () const
*Get the maximum of the range the input will be scaled to, if scaling is enabled (see **Scale()** (p. 1548)).*
- void **MinRange** (const double value)
*Set the minimum of the range the input will be scaled to, if scaling is enabled (see **Scale()** (p. 1548)).*
- double **MinRange** () const
*Get the minimum of the range the input will be scaled to, if scaling is enabled (see **Scale()** (p. 1548)).*
- void **Rows** (const size_t value)
Set the number of blocks per row.
- size_t **Rows** () const
Modify the number of blocks per row.
- void **Scale** (const bool value)
*Set whether or not scaling is enabled (see also **MaxRange()** (p. 1546) and **MinRange()** (p. 1547)).*
- bool **Scale** () const
*Get whether or not scaling is enabled (see also **MaxRange()** (p. 1546) and **MinRange()** (p. 1547)).*
- void **Transform** (const arma::mat &maximallInputs, arma::mat &output)
Transform the columns of the input matrix into blocks.

39.353.1 Detailed Description

Transform the columns of the given matrix into a block format.

This could be useful with the `mlpack::nn::MaximalInputs()` (p. 436) function, if your training samples are images. Roughly speaking, given a matrix

`[[A] [B] [C] [D]]`

then the **ColumnsToBlocks** (p. 1541) class can transform this to something like

`[[m m m m m] [m A m B m] [m m m m m] [m C m D m] [m m m m m]]`

where A through D are vectors and may themselves be reshaped by **ColumnsToBlocks** (p. 1541).

An example usage of the **ColumnsToBlocks** (p. 1541) class with the output of **MaximalInputs()** (p. 436) is given below; this assumes that the images are square, and will return a matrix with a one-element margin, with each maximal input (that is, each column of the maximalInput matrix) as a square block in the output matrix. 5 rows and columns of blocks will be in the output matrix.

```
// We assume we have a sparse autoencoder 'encoder'.
arma::mat maximalInput; // Store the features learned by sparse autoencoder
mlpack::nn::MaximalInputs(encoder.Parameters(), maximalInput);

arma::mat outputs;
const bool scale = true;

ColumnsToBlocks ctb(5, 5);
arma::mat output;
ctb.Transform(maximalInput, output);
// You can save the output as a pgm, this may help you visualize the training
// results.
output.save(fileName, arma::pgm_binary);
```

Another example of usage is given below, on a sample matrix.

```
// This matrix has two columns.
arma::mat input;
input << -1.0000 << 0.1429 << arma::endr
      << -0.7143 << 0.4286 << arma::endr
      << -0.4286 << 0.7143 << arma::endr
      << -0.1429 << 1.0000 << arma::endr;

arma::mat output;
ColumnsToBlocks ctb(1, 2);
ctb.Transform(input, output);

// The columns of the input will be reshaped as a square which is
// surrounded by padding value -1 (this value could be changed with the
// BufValue() method):
// -1.0000 -1.0000 -1.0000 -1.0000 -1.0000 -1.0000 -1.0000
// -1.0000 -1.0000 -1.0000 -0.4286 -1.0000 0.1429 0.7143 -1.0000
// -1.0000 -0.7143 -0.1429 -1.0000 0.4286 1.0000 -1.0000
// -1.0000 -1.0000 -1.0000 -1.0000 -1.0000 -1.0000 -1.0000

// Now, let's change some parameters; let's have each input column output not
// as a square, but as a 4x1 vector.
ctb.BlockWidth(1);
ctb.BlockHeight(4);
ctb.Transform(input, output);

// The output here will be similar, but each maximal input is 4x1:
// -1.0000 -1.0000 -1.0000 -1.0000 -1.0000
// -1.0000 -1.0000 -1.0000 0.1429 -1.0000
// -1.0000 -0.7143 -1.0000 0.4286 -1.0000
// -1.0000 -0.4286 -1.0000 0.7143 -1.0000
// -1.0000 -0.1429 -1.0000 1.0000 -1.0000
// -1.0000 -1.0000 -1.0000 -1.0000 -1.0000
```

The **ColumnsToBlocks** (p. 1541) class can also, depending on the parameters, scale the input to a given range (useful for exporting to PGM, for instance), and also set the buffer size and value. See the **Scale()** (p. 1548), **MinRange()** (p. 1547), **MaxRange()** (p. 1546), **BufSize()** (p. 1545), and **BufValue()** (p. 1546) methods for more details.

Definition at line 106 of file `columns_to_blocks.hpp`.

39.353.2 Constructor & Destructor Documentation

39.353.2.1 ColumnsToBlocks()

```
ColumnsToBlocks (
    size_t rows,
    size_t cols,
    size_t blockHeight = 0,
    size_t blockWidth = 0 )
```

Constructor a **ColumnsToBlocks** (p. 1541) object with the given parameters.

The rows and cols parameters control the number of blocks per row and column of the output matrix, respectively, and the blockHeight and blockWidth parameters control the size of the individual blocks. If blockHeight and blockWidth are specified, then (blockHeight * blockWidth) must be equal to the number of rows in the input matrix when **Transform()** (p. 1548) is called. If blockHeight and blockWidth are not specified, then the square root of the number of rows of the input matrix will be taken when **Transform()** (p. 1548) is called and that will be used as the block width and height.

Note that the **ColumnsToBlocks** (p. 1541) object can also scale the inputs to a given range; see **Scale()** (p. 1548), **MinRange()** (p. 1547), and **MaxRange()** (p. 1546), and the buffer (margin) size can also be set with **BufSize()** (p. 1545), and the value used for the buffer can be set with **BufValue()** (p. 1546).

Parameters

<i>rows</i>	Number of blocks in each column of the output matrix.
<i>cols</i>	Number of blocks in each row of the output matrix.
<i>blockHeight</i>	Height of each block.
<i>blockWidth</i>	Width of each block.

Warning

blockHeight * blockWidth must be equal to maximalInputs.n_rows.

39.353.3 Member Function Documentation

39.353.3.1 BlockHeight() [1/2]

```
void BlockHeight (
    const size_t value ) [inline]
```

Set the height of each block; see the constructor for more details.

Definition at line 149 of file columns_to_blocks.hpp.

39.353.3.2 BlockHeight() [2/2]

```
size_t BlockHeight ( ) const [inline]
```

Get the block height.

Definition at line 151 of file columns_to_blocks.hpp.

39.353.3.3 BlockWidth() [1/2]

```
void BlockWidth (
    size_t value ) [inline]
```

Set the width of each block; see the constructor for more details.

Definition at line 154 of file columns_to_blocks.hpp.

39.353.3.4 BlockWidth() [2/2]

```
size_t BlockWidth ( ) const [inline]
```

Get the block width.

Definition at line 156 of file columns_to_blocks.hpp.

39.353.3.5 BufSize() [1/2]

```
void BufSize (
    const size_t value ) [inline]
```

Modify the buffer size (the size of the margin around each column of the input).

The default value is 1.

Definition at line 160 of file columns_to_blocks.hpp.

39.353.3.6 BufSize() [2/2]

```
size_t BufSize ( ) const [inline]
```

Get the buffer size.

Definition at line 162 of file columns_to_blocks.hpp.

39.353.3.7 BufValue() [1/2]

```
void BufValue (
    const double value ) [inline]
```

Modify the value used for buffer cells; the default is -1.

Definition at line 165 of file columns_to_blocks.hpp.

39.353.3.8 BufValue() [2/2]

```
double BufValue ( ) const [inline]
```

Get the value used for buffer cells.

Definition at line 167 of file columns_to_blocks.hpp.

39.353.3.9 Cols() [1/2]

```
void Cols (
    const size_t value ) [inline]
```

Set the number of blocks per column.

Definition at line 196 of file columns_to_blocks.hpp.

39.353.3.10 Cols() [2/2]

```
size_t Cols ( ) const [inline]
```

Return the number of blocks per column.

Definition at line 198 of file columns_to_blocks.hpp.

39.353.3.11 MaxRange() [1/2]

```
void MaxRange (
    const double value ) [inline]
```

Set the maximum of the range the input will be scaled to, if scaling is enabled (see **Scale()** (p. 1548)).

Definition at line 171 of file columns_to_blocks.hpp.

39.353.3.12 MaxRange() [2/2]

```
double MaxRange ( ) const [inline]
```

Get the maximum of the range the input will be scaled to, if scaling is enabled (see **Scale()** (p. 1548)).

Definition at line 174 of file columns_to_blocks.hpp.

39.353.3.13 MinRange() [1/2]

```
void MinRange (
    const double value ) [inline]
```

Set the minimum of the range the input will be scaled to, if scaling is enabled (see **Scale()** (p. 1548)).

Definition at line 178 of file columns_to_blocks.hpp.

39.353.3.14 MinRange() [2/2]

```
double MinRange ( ) const [inline]
```

Get the minimum of the range the input will be scaled to, if scaling is enabled (see **Scale()** (p. 1548)).

Definition at line 181 of file columns_to_blocks.hpp.

39.353.3.15 Rows() [1/2]

```
void Rows (
    const size_t value ) [inline]
```

Set the number of blocks per row.

Definition at line 191 of file columns_to_blocks.hpp.

39.353.3.16 Rows() [2/2]

```
size_t Rows ( ) const [inline]
```

Modify the number of blocks per row.

Definition at line 193 of file columns_to_blocks.hpp.

39.353.3.17 Scale() [1/2]

```
void Scale (
    const bool value ) [inline]
```

Set whether or not scaling is enabled (see also **MaxRange()** (p. 1546) and **MinRange()** (p. 1547)).

Definition at line 185 of file columns_to_blocks.hpp.

39.353.3.18 Scale() [2/2]

```
bool Scale ( ) const [inline]
```

Get whether or not scaling is enabled (see also **MaxRange()** (p. 1546) and **MinRange()** (p. 1547)).

Definition at line 188 of file columns_to_blocks.hpp.

39.353.3.19 Transform()

```
void Transform (
    const arma::mat & maximalInputs,
    arma::mat & output )
```

Transform the columns of the input matrix into blocks.

If blockHeight and blockWidth were not specified in the constructor (and **BlockHeight()** (p. 1544) and **BlockWidth()** (p. 1545) were not called), then the number of rows in the input matrix must be a perfect square.

Parameters

<i>input</i>	Input matrix to transform.
<i>output</i>	Matrix to store transformed output in.

39.354 RangeType< T > Class Template Reference

Simple real-valued range.

Inheritance diagram for RangeType< T >:

Public Member Functions

- **RangeType** ()
The upper bound.
- **RangeType** (const T point)
- **RangeType** (const T lo, const T hi)
Initializes to specified range.
- bool **Contains** (const T d) const
Determines if a point is contained within the range.
- bool **Contains** (const **RangeType** &r) const
Determines if another range overlaps with this one.
- T **Hi** () const
Get the upper bound.
- T & **Hi** ()
Modify the upper bound.
- T **Lo** () const
Get the lower bound.
- T & **Lo** ()
Modify the lower bound.
- T **Mid** () const

Gets the midpoint of this range.

- **RangeType operator &** (const **RangeType** &rhs) const

Shrinks this range to be the overlap with another range; this makes an empty set if there is no overlap.

- **RangeType & operator &=** (const **RangeType** &rhs)

Shrinks this range to be the overlap with another range; this makes an empty set if there is no overlap.

- bool **operator!=** (const **RangeType** &rhs) const

Compare with another range for strict equality.

- **RangeType operator*** (const T d) const

Scale the bounds by the given double.

- **RangeType & operator*=** (const T d)

Scale the bounds by the given double.

- bool **operator<** (const **RangeType** &rhs) const

Compare with another range.

- bool **operator==** (const **RangeType** &rhs) const

Compare with another range for strict equality.

- bool **operator>** (const **RangeType** &rhs) const

Compare with another range.

- **RangeType operator|** (const **RangeType** &rhs) const

Expands this range to include another range.

- **RangeType & operator|=** (const **RangeType** &rhs)

Expands this range to include another range.

- template<typename Archive >

void **serialize** (Archive &ar, const unsigned int version)

Serialize the range object.

- T **Width** () const

Gets the span of the range (hi - lo).

Friends

- template<typename TT >

RangeType< TT > operator* (const TT d, const **RangeType< TT >** &r)

Scale the bounds by the given double.

39.354.1 Detailed Description

```
template<typename T = double>
class mpack::math::RangeType< T >
```

Simple real-valued range.

It contains an upper and lower bound.

Note that until mpack 3.0.0, this class is named `RangeType<>` and for the specification where T is double, you can use `math::Range` (p. 409). As of mpack 3.0.0, this class will be renamed `math::Range<>` (p. 409).

Template Parameters

<i>T</i>	type of element held by this range.
----------	-------------------------------------

Definition at line 19 of file range.hpp.

39.354.2 Constructor & Destructor Documentation

39.354.2.1 RangeType() [1/3]

```
RangeType ( ) [inline]
```

The upper bound.

Initialize to an empty set (where lo > hi).

39.354.2.2 RangeType() [2/3]

```
RangeType (
    const T point ) [inline]
```

39.354.2.3 RangeType() [3/3]

```
RangeType (
    const T lo,
    const T hi ) [inline]
```

Initializes to specified range.

Parameters

<i>lo</i>	Lower bound of the range.
<i>hi</i>	Upper bound of the range.

39.354.3 Member Function Documentation

39.354.3.1 Contains() [1/2]

```
bool Contains (
    const T d ) const [inline]
```

Determines if a point is contained within the range.

Parameters

<i>d</i>	Point to check.
----------	-----------------

Referenced by `RangeType< ElemType >::Hi()`.

39.354.3.2 Contains() [2/2]

```
bool Contains (
    const RangeType< T > & r ) const [inline]
```

Determines if another range overlaps with this one.

Parameters

<i>r</i>	Other range.
----------	--------------

Returns

true if ranges overlap at all.

39.354.3.3 Hi() [1/2]

```
T Hi ( ) const [inline]
```

Get the upper bound.

Definition at line 66 of file range.hpp.

Referenced by `HollowBallBound< TMetricType, ElemType >::Diameter()`, `HollowBallBound< TMetricType, ElemType >::MinWidth()`, and `HollowBallBound< TMetricType, ElemType >::OuterRadius()`.

39.354.3.4 Hi() [2/2]

```
T& Hi ( ) [inline]
```

Modify the upper bound.

Definition at line 68 of file range.hpp.

39.354.3.5 Lo() [1/2]

```
T Lo ( ) const [inline]
```

Get the lower bound.

Definition at line 61 of file range.hpp.

Referenced by HollowBallBound< TMetricType, ElemType >::InnerRadius().

39.354.3.6 Lo() [2/2]

```
T& Lo ( ) [inline]
```

Modify the lower bound.

Definition at line 63 of file range.hpp.

39.354.3.7 Mid()

```
T Mid ( ) const [inline]
```

Gets the midpoint of this range.

Referenced by RangeType< ElemType >::Hi().

39.354.3.8 operator &()

```
RangeType operator& (  
    const RangeType< T > & rhs ) const [inline]
```

Shrinks this range to be the overlap with another range; this makes an empty set if there is no overlap.

Parameters

<i>rhs</i>	Other range.
------------	--------------

Referenced by `RangeType< ElemType >::Hi()`.

39.354.3.9 `operator &=()`

```
RangeType& operator&= (
    const RangeType< T > & rhs ) [inline]
```

Shrinks this range to be the overlap with another range; this makes an empty set if there is no overlap.

Parameters

<i>rhs</i>	Other range.
------------	--------------

Referenced by `RangeType< ElemType >::Hi()`.

39.354.3.10 `operator !=()`

```
bool operator!= (
    const RangeType< T > & rhs ) const [inline]
```

Compare with another range for strict equality.

Parameters

<i>rhs</i>	Other range.
------------	--------------

Referenced by `RangeType< ElemType >::Hi()`.

39.354.3.11 `operator*()`

```
RangeType operator* (
    const T d ) const [inline]
```

Scale the bounds by the given double.

Parameters

<i>d</i>	Scaling factor.
----------	-----------------

Referenced by RangeType< ElemType >::Hi().

39.354.3.12 operator*=()

```
RangeType& operator*= (
    const T d ) [inline]
```

Scale the bounds by the given double.

Parameters

<i>d</i>	Scaling factor.
----------	-----------------

Referenced by RangeType< ElemType >::Hi().

39.354.3.13 operator<()

```
bool operator< (
    const RangeType< T > & rhs ) const [inline]
```

Compare with another range.

For Range objects x and y, $x < y$ means that x is strictly less than y and does not overlap at all.

Parameters

<i>rhs</i>	Other range.
------------	--------------

Referenced by RangeType< ElemType >::Hi().

39.354.3.14 operator==()

```
bool operator== (
    const RangeType< T > & rhs ) const [inline]
```

Compare with another range for strict equality.

Parameters

<i>rhs</i>	Other range.
------------	--------------

Referenced by `RangeType< ElemType >::Hi()`.

39.354.3.15 `operator>()`

```
bool operator> (
    const RangeType< T > & rhs ) const [inline]
```

Compare with another range.

For Range objects x and y, $x < y$ means that x is strictly less than y and does not overlap at all.

Parameters

<i>rhs</i>	Other range.
------------	--------------

Referenced by `RangeType< ElemType >::Hi()`.

39.354.3.16 `operator" |()`

```
RangeType operator| (
    const RangeType< T > & rhs ) const [inline]
```

Expands this range to include another range.

Parameters

<i>rhs</i>	Range to include.
------------	-------------------

Referenced by `RangeType< ElemType >::Hi()`.

39.354.3.17 `operator" |=()`

```
RangeType& operator|= (
    const RangeType< T > & rhs ) [inline]
```

Expands this range to include another range.

Parameters

<i>rhs</i>	Range to include.
------------	-------------------

Referenced by RangeType< ElemType >::Hi().

39.354.3.18 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int version )
```

Serialize the range object.

Referenced by RangeType< ElemType >::Hi().

39.354.3.19 Width()

```
T Width ( ) const [inline]
```

Gets the span of the range (hi - lo).

Referenced by RangeType< ElemType >::Hi().

39.354.4 Friends And Related Function Documentation

39.354.4.1 operator*

```
RangeType<TT> operator* (
    const TT d,
    const RangeType< TT > & r ) [friend]
```

Scale the bounds by the given double.

Parameters

<i>d</i>	Scaling factor.
----------	-----------------

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/math/ **range.hpp**

39.355 MatrixCompletion Class Reference

This class implements the popular nuclear norm minimization heuristic for matrix completion problems.

Public Member Functions

- **MatrixCompletion** (const size_t m, const size_t n, const arma::umat &indices, const arma::vec &values, const size_t r)
Construct a matrix completion problem, specifying the maximum rank of the solution.
- **MatrixCompletion** (const size_t m, const size_t n, const arma::umat &indices, const arma::vec &values, const arma::mat &initialPoint)
Construct a matrix completion problem, specifying the initial point of the optimization.
- **MatrixCompletion** (const size_t m, const size_t n, const arma::umat &indices, const arma::vec &values)
Construct a matrix completion problem.
- void **Recover** (arma::mat &recovered)
Solve the underlying SDP to fill in the remaining values.
- const ens::LRSDP< ens::SDP< arma::sp_mat > > & **Sdp** () const
Return the underlying SDP.
- ens::LRSDP< ens::SDP< arma::sp_mat > > & **Sdp** ()
Modify the underlying SDP.

39.355.1 Detailed Description

This class implements the popular nuclear norm minimization heuristic for matrix completion problems.

That is, given known values M_{ij} 's, the following optimization problem (semi-definite program) is solved to fill in the remaining unknown values of X

$$\min ||X||_* \text{ subj to } X_{ij} = M_{ij}$$

where $||X||_*$ denotes the nuclear norm (sum of singular values of X).

For a theoretical treatment of the conditions necessary for exact recovery, see the following paper:

A Simpler Approach to Matrix Completion. Benjamin Recht. JMLR 11. <http://arxiv.org/pdf/0910.0651v2.pdf>

An example of how to use this class is shown below:

```
size_t m, n;           // size of unknown matrix
arma::umat indices;    // contains the known indices [2 x n_entries]
arma::vec values;      // contains the known values [n_entries]
arma::mat recovered;   // will contain the completed matrix

MatrixCompletion mc(m, n, indices, values);
mc.Recover(recovered);
```

See also

LRSDP

Definition at line 52 of file matrix_completion.hpp.

39.355.2 Constructor & Destructor Documentation

39.355.2.1 MatrixCompletion() [1/3]

```
MatrixCompletion (
    const size_t m,
    const size_t n,
    const arma::umat & indices,
    const arma::vec & values,
    const size_t r )
```

Construct a matrix completion problem, specifying the maximum rank of the solution.

Parameters

<i>m</i>	Number of rows of original matrix.
<i>n</i>	Number of columns of original matrix.
<i>indices</i>	Matrix containing the indices of the known entries (must be [2 x p]).
<i>values</i>	Vector containing the values of the known entries (must be length p).
<i>r</i>	Maximum rank of solution.

39.355.2.2 MatrixCompletion() [2/3]

```
MatrixCompletion (
    const size_t m,
    const size_t n,
    const arma::umat & indices,
    const arma::vec & values,
    const arma::mat & initialPoint )
```

Construct a matrix completion problem, specifying the initial point of the optimization.

Parameters

<i>m</i>	Number of rows of original matrix.
<i>n</i>	Number of columns of original matrix.
<i>indices</i>	Matrix containing the indices of the known entries (must be [2 x p]).
<i>values</i>	Vector containing the values of the known entries (must be length p).
<i>initialPoint</i>	Starting point for the SDP optimization.

39.355.2.3 MatrixCompletion() [3/3]

```

MatrixCompletion (
    const size_t m,
    const size_t n,
    const arma::umat & indices,
    const arma::vec & values )

```

Construct a matrix completion problem.

Parameters

<i>m</i>	Number of rows of original matrix.
<i>n</i>	Number of columns of original matrix.
<i>indices</i>	Matrix containing the indices of the known entries (must be [2 x p]).
<i>values</i>	Vector containing the values of the known entries (must be length p).

39.355.3 Member Function Documentation**39.355.3.1 Recover()**

```

void Recover (
    arma::mat & recovered )

```

Solve the underlying SDP to fill in the remaining values.

Parameters

<i>recovered</i>	Will contain the completed matrix.
------------------	------------------------------------

39.355.3.2 Sdp() [1/2]

```

const ens::LRSDP<ens::SDP<arma::sp_mat> >& Sdp ( ) const [inline]

```

Return the underlying SDP.

Definition at line 114 of file `matrix_completion.hpp`.

39.355.3.3 Sdp() [2/2]

```
ens::LRSDP<ens::SDP<arma::sp_mat> >& Sdp ( ) [inline]
```

Modify the underlying SDP.

Definition at line 119 of file matrix_completion.hpp.

The documentation for this class was generated from the following file:

39.356 MeanShift< UseKernel, KernelType, MatType > Class Template Reference

This class implements mean shift clustering.

Public Member Functions

- **MeanShift** (const double radius=0, const size_t maxIterations=1000, const KernelType kernel=KernelType())
Create a mean shift object and set the parameters which mean shift will be run with.
- void **Cluster** (const MatType &data, arma::Row< size_t > &assignments, arma::mat ¢roids, bool force←
Convergence=true, bool useSeeds=true)
Perform mean shift clustering on the data, returning a list of cluster assignments and centroids.
- double **EstimateRadius** (const MatType &data, const double ratio=0.2)
Give an estimation of radius based on given dataset.
- const KernelType & **Kernel** () const
Get the kernel.
- KernelType & **Kernel** ()
Modify the kernel.
- size_t **MaxIterations** () const
Get the maximum number of iterations.
- size_t & **MaxIterations** ()
Set the maximum number of iterations.
- double **Radius** () const
Get the radius.
- void **Radius** (double radius)
Set the radius.

39.356.1 Detailed Description

```
template<bool UseKernel = false, typename KernelType = kernel::GaussianKernel, typename MatType = arma::mat>
class mlpack::meanshift::MeanShift< UseKernel, KernelType, MatType >
```

This class implements mean shift clustering.

For each point in dataset, apply mean shift algorithm until maximum iterations or convergence. Then remove duplicate centroids.

A simple example of how to run mean shift clustering is shown below.

```
extern arma::mat data; // Dataset we want to run mean shift on.
arma::Row<size_t> assignments; // Cluster assignments.
arma::mat centroids; // Cluster centroids.
bool forceConvergence = true; // Flag whether to force each centroid seed
to converge regardless of maxIterations.
```

```
MeanShift<> meanShift();
meanShift.Cluster(dataset, assignments, centroids, forceConvergence);
```

Template Parameters

<i>UseKernel</i>	Use kernel or mean to calculate new centroid. If false, KernelType will be ignored.
<i>KernelType</i>	The kernel to use.
<i>MatType</i>	The type of matrix the data is stored in.

Definition at line 51 of file mean_shift.hpp.

39.356.2 Constructor & Destructor Documentation

39.356.2.1 MeanShift()

```
MeanShift (
    const double radius = 0,
    const size_t maxIterations = 1000,
    const KernelType kernel = KernelType() )
```

Create a mean shift object and set the parameters which mean shift will be run with.

Parameters

<i>radius</i>	If distance of two centroids is less than it, one will be removed. If this value isn't positive, an estimation will be given when clustering.
<i>maxIterations</i>	Maximum number of iterations allowed before giving up iterations will terminate.
<i>kernel</i>	Optional KernelType object.

39.356.3 Member Function Documentation

39.356.3.1 Cluster()

```
void Cluster (
    const MatType & data,
    arma::Row< size_t > & assignments,
    arma::mat & centroids,
    bool forceConvergence = true,
    bool useSeeds = true )
```

Perform mean shift clustering on the data, returning a list of cluster assignments and centroids.

Template Parameters

<i>MatType</i>	Type of matrix.
----------------	-----------------

Parameters

<i>data</i>	Dataset to cluster.
<i>assignments</i>	Vector to store cluster assignments in.
<i>centroids</i>	Matrix in which centroids are stored.
<i>forceConvergence</i>	Flag whether to force each centroid seed to converge regardless of maxIterations.

39.356.3.2 EstimateRadius()

```
double EstimateRadius (
    const MatType & data,
    const double ratio = 0.2 )
```

Give an estimation of radius based on given dataset.

Parameters

<i>data</i>	Dataset for estimation.
<i>ratio</i>	Percentage of dataset to use for nearest neighbor search.

39.356.3.3 Kernel() [1/2]

```
const KernelType& Kernel ( ) const [inline]
```

Get the kernel.

Definition at line 105 of file mean_shift.hpp.

39.356.3.4 Kernel() [2/2]

```
KernelType& Kernel ( ) [inline]
```

Modify the kernel.

Definition at line 107 of file mean_shift.hpp.

39.356.3.5 MaxIterations() [1/2]

```
size_t MaxIterations ( ) const [inline]
```

Get the maximum number of iterations.

Definition at line 95 of file mean_shift.hpp.

39.356.3.6 MaxIterations() [2/2]

```
size_t& MaxIterations ( ) [inline]
```

Set the maximum number of iterations.

Definition at line 97 of file mean_shift.hpp.

39.356.3.7 Radius() [1/2]

```
double Radius ( ) const [inline]
```

Get the radius.

Definition at line 100 of file mean_shift.hpp.

39.356.3.8 Radius() [2/2]

```
void Radius (
    double radius )
```

Set the radius.

39.357 IPMetric< KernelType > Class Template Reference

The inner product metric, **IPMetric** (p. 1565), takes a given Mercer kernel (KernelType), and when **Evaluate()** (p. 1567) is called, returns the distance between the two points in kernel space:

Inheritance diagram for IPMetric< KernelType >:

Public Member Functions

- **IPMetric** ()
Create the **IPMetric** (p. 1565) without an instantiated kernel.
- **IPMetric** (KernelType &kernel)
Create the **IPMetric** (p. 1565) with an instantiated kernel.

- **IPMetric** (const **IPMetric** &other)
Copy the parameters of the given metric.
- **~IPMetric** ()
*Destroy the **IPMetric** (p. 1565) object.*
- template<typename VecTypeA , typename VecTypeB >
VecTypeA::elem_type **Evaluate** (const VecTypeA &a, const VecTypeB &b)
Evaluate the metric.
- const KernelType & **Kernel** () const
Get the kernel.
- KernelType & **Kernel** ()
Modify the kernel.
- **IPMetric** & **operator=** (const **IPMetric** &other)
Assign this metric to be a copy of the given metric.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int version)
Serialize the metric.

39.357.1 Detailed Description

```
template<typename KernelType>
class mlpack::metric::IPMetric< KernelType >
```

The inner product metric, **IPMetric** (p. 1565), takes a given Mercer kernel (KernelType), and when **Evaluate()** (p. 1567) is called, returns the distance between the two points in kernel space:

$$d(x, y) = \sqrt{K(x, x) + K(y, y) - 2K(x, y)}.$$

Template Parameters

<i>KernelType</i>	Type of Kernel to use. This must be a Mercer kernel (positive definite), otherwise the metric may not be valid.
-------------------	---

Definition at line 32 of file ip_metric.hpp.

39.357.2 Constructor & Destructor Documentation

39.357.2.1 IPMetric() [1/3]

```
IPMetric ( )
```

Create the **IPMetric** (p. 1565) without an instantiated kernel.

39.357.2.2 IPMetric() [2/3]

```
IPMetric (
    KernelType & kernel )
```

Create the **IPMetric** (p. 1565) with an instantiated kernel.

39.357.2.3 ~IPMetric()

```
~ IPMetric ( )
```

Destroy the **IPMetric** (p. 1565) object.

39.357.2.4 IPMetric() [3/3]

```
IPMetric (
    const IPMetric< KernelType > & other )
```

Copy the parameters of the given metric.

39.357.3 Member Function Documentation

39.357.3.1 Evaluate()

```
VecTypeA::elem_type Evaluate (
    const VecTypeA & a,
    const VecTypeB & b )
```

Evaluate the metric.

Template Parameters

<i>VecTypeA</i>	Type of first vector.
<i>VecTypeB</i>	Type of second vector.

Parameters

<i>a</i>	First vector.
----------	---------------

Parameters

<i>b</i>	Second vector.
----------	----------------

Returns

Distance between the two points in kernel space.

39.357.3.2 Kernel() [1/2]

```
const KernelType& Kernel ( ) const [inline]
```

Get the kernel.

39.358 LMetric< TPower, TTakeRoot > Class Template Reference

The L_p metric for arbitrary integer p, with an option to take the root.

Inheritance diagram for LMetric< TPower, TTakeRoot >:

Public Member Functions

- **LMetric** ()
- `template<typename Archive >`
`void serialize (Archive &, const unsigned int)`
Serialize the metric (nothing to do).

Static Public Member Functions

- `template<typename VecTypeA , typename VecTypeB >`
`static VecTypeA::elem_type Evaluate (const VecTypeA &a, const VecTypeB &b)`
Computes the distance between two points.

Static Public Attributes

- static const int **Power** = TPower
The power of the metric.
- static const bool **TakeRoot** = TTakeRoot
Whether or not the root is taken.

39.358.1 Detailed Description

```
template<int TPower, bool TTakeRoot = true>
class mlpack::metric::LMetric< TPower, TTakeRoot >
```

The L_p metric for arbitrary integer p , with an option to take the root.

This class implements the standard L_p metric for two arbitrary vectors x and y of dimensionality n :

$$d(x, y) = \left(\sum_{i=1}^n |x_i - y_i|^p \right)^{\frac{1}{p}}.$$

The value of p is given as a template parameter.

In addition, the function $d(x, y)$ can be simplified, neglecting the p -root calculation. This is done by specifying the `TakeRoot` template parameter to be false. Then,

$$d(x, y) = \sum_{i=1}^n |x_i - y_i|^p$$

It is faster to compute that distance, so `TakeRoot` is by default off. However, when `TakeRoot` is false, the distance given is not actually a true metric – it does not satisfy the triangle inequality. Some `mlpack` methods do not require the triangle inequality to operate correctly (such as the `BinarySpaceTree`), but setting `TakeRoot = false` in some cases will cause incorrect results.

A few convenience typedefs are given:

- `ManhattanDistance`
- `EuclideanDistance`
- `SquaredEuclideanDistance`

Template Parameters

<i>Power</i>	Power of metric; i.e. <code>Power = 1</code> gives the L1-norm (Manhattan distance).
<i>TakeRoot</i>	If true, the <code>Power</code> 'th root of the result is taken before it is returned. Setting this to false causes the metric to not satisfy the Triangle Inequality (be careful!).

Definition at line 63 of file `lmetric.hpp`.

39.359 MahalanobisDistance< TakeRoot > Class Template Reference

The Mahalanobis distance, which is essentially a stretched Euclidean distance.

Public Member Functions

- **MahalanobisDistance** ()
Initialize the Mahalanobis distance with the empty matrix as covariance.
- **MahalanobisDistance** (const size_t dimensionality)
Initialize the Mahalanobis distance with the identity matrix of the given dimensionality.
- **MahalanobisDistance** (arma::mat covariance)
Initialize the Mahalanobis distance with the given covariance matrix.
- const arma::mat & **Covariance** () const
Access the covariance matrix.
- arma::mat & **Covariance** ()
Modify the covariance matrix.
- template<typename VecTypeA , typename VecTypeB >
double **Evaluate** (const VecTypeA &a, const VecTypeB &b)
Evaluate the distance between the two given points using this Mahalanobis distance.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int version)
Serialize the Mahalanobis distance.

39.359.1 Detailed Description

```
template<bool TakeRoot = true>
class mlpack::metric::MahalanobisDistance< TakeRoot >
```

The Mahalanobis distance, which is essentially a stretched Euclidean distance.

Given a square covariance matrix Q of size $d \times d$, where d is the dimensionality of the points it will be evaluating, and given two vectors x and y also of dimensionality d ,

$$d(x, y) = \sqrt{(x - y)^T Q (x - y)}$$

where Q is the covariance matrix.

Because each evaluation multiplies $(x_1 - x_2)$ by the covariance matrix, it is typically much quicker to use an **LMetric** (p. 1569) and simply stretch the actual dataset itself before performing any evaluations. However, this class is provided for convenience.

If you wish to use the KNN class or other tree-based algorithms with this distance, it is recommended to instead stretch the dataset first, by decomposing $Q = L^T L$ (perhaps via a Cholesky decomposition), and then multiply the data by L . If you still wish to use the KNN class with a custom distance anyway, you will need to use a different tree type than the default KDTree, which only works with the **LMetric** (p. 1569) class.

Similar to the **LMetric** (p. 1569) class, this offers a template parameter `TakeRoot` which, when set to false, will instead evaluate the distance

$$d(x, y) = (x - y)^T Q (x - y)$$

which is faster to evaluate.

Template Parameters

<i>TakeRoot</i>	If true, takes the root of the output. It is slightly faster to leave this at the default of false, but this means the metric may not satisfy the triangle inequality and may not be usable for methods that expect a true metric.

Definition at line 60 of file mahalanobis_distance.hpp.

39.359.2 Constructor & Destructor Documentation

39.359.2.1 MahalanobisDistance() [1/3]

```
MahalanobisDistance ( ) [inline]
```

Initialize the Mahalanobis distance with the empty matrix as covariance.

Don't call **Evaluate()** (p. 1575) until you set the covariance with **Covariance()** (p. 1575)!

Definition at line 67 of file mahalanobis_distance.hpp.

39.359.2.2 MahalanobisDistance() [2/3]

```
MahalanobisDistance (
    const size_t dimensionality ) [inline]
```

Initialize the Mahalanobis distance with the identity matrix of the given dimensionality.

Parameters

<i>dimensionality</i>	Dimesnsionality of the covariance matrix.
-----------------------	---

Definition at line 75 of file mahalanobis_distance.hpp.

39.359.2.3 MahalanobisDistance() [3/3]

```
MahalanobisDistance (
    arma::mat covariance ) [inline]
```

Initialize the Mahalanobis distance with the given covariance matrix.

The given covariance matrix will be copied (this is not optimal).

Parameters

<i>covariance</i>	The covariance matrix to use for this distance.
-------------------	---

Definition at line 84 of file mahalanobis_distance.hpp.

References MahalanobisDistance< TakeRoot >::Evaluate().

39.359.3 Member Function Documentation

39.359.3.1 Covariance() [1/2]

```
const arma::mat& Covariance ( ) const [inline]
```

Access the covariance matrix.

Returns

Constant reference to the covariance matrix.

Definition at line 104 of file mahalanobis_distance.hpp.

39.359.3.2 Covariance() [2/2]

```
arma::mat& Covariance ( ) [inline]
```

Modify the covariance matrix.

Returns

Reference to the covariance matrix.

Definition at line 111 of file mahalanobis_distance.hpp.

References MahalanobisDistance< TakeRoot >::serialize().

39.359.3.3 Evaluate()

```
double Evaluate (
    const VecTypeA & a,
    const VecTypeB & b )
```

Evaluate the distance between the two given points using this Mahalanobis distance.

If the covariance matrix has not been set (i.e. if you used the empty constructor and did not later modify the covariance matrix), calling this method will probably result in a crash.

Parameters

<i>a</i>	First vector.
<i>b</i>	Second vector.

Referenced by MahalanobisDistance< TakeRoot >::MahalanobisDistance().

39.359.3.4 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int version )
```

Serialize the Mahalanobis distance.

Referenced by MahalanobisDistance< TakeRoot >::Covariance().

- `ModelMatType & Variances ()`
Modify the sample variances for each class.

39.360.1 Detailed Description

```
template<typename ModelMatType = arma::mat>
class mlpack::naive_bayes::NaiveBayesClassifier< ModelMatType >
```

The simple Naive Bayes classifier.

This class trains on the data by calculating the sample mean and variance of the features with respect to each of the labels, and also the class probabilities. The class labels are assumed to be positive integers (starting with 0), and are expected to be the last row of the data input to the constructor.

Mathematically, it computes $P(X_i = x_i \mid Y = y_j)$ for each feature X_i for each of the labels y_j . Along with this, it also computes the class probabilities $P(Y = y_j)$.

For classifying a data point (x_1, x_2, \dots, x_n) , it computes the following: $\arg \max_y (P(Y = y) * P(X_1 = x_1 \mid Y = y) * \dots * P(X_n = x_n \mid Y = y))$

Example use:

```
extern arma::mat training_data, testing_data;
NaiveBayesClassifier<> nbc(training_data, 5);
arma::vec results;

nbc.Classify(testing_data, results);
```

The `ModelMatType` template parameter specifies the internal matrix type that **NaiveBayesClassifier** (p. 1576) will use to hold the means, variances, and weights that make up the Naive Bayes model. This can be `arma::mat`, `arma::fmat`, or any other Armadillo (or Armadillo-compatible) object. Because `ModelMatType` may be different than the type of the data the model is trained on, now training is possible with subviews, sparse matrices, or anything else, while still storing the model as a `ModelMatType` internally.

Template Parameters

<i>ModelMatType</i>	Internal matrix type to use to store the model.
---------------------	---

Definition at line 58 of file `naive_bayes_classifier.hpp`.

39.360.2 Member Typedef Documentation

39.360.2.1 ElemType

```
typedef ModelMatType::elem_type ElemType
```

Definition at line 62 of file `naive_bayes_classifier.hpp`.

39.360.3 Constructor & Destructor Documentation

39.360.3.1 NaiveBayesClassifier() [1/2]

```
NaiveBayesClassifier (
    const MatType & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const bool incrementalVariance = false )
```

Initializes the classifier as per the input and then trains it by calculating the sample mean and variances.

Example use:

```
extern arma::mat training_data, testing_data;
extern arma::Row<size_t> labels;
NaiveBayesClassifier nbc(training_data, labels, 5);
```

Parameters

<i>data</i>	Training data points.
<i>labels</i>	Labels corresponding to training data points.
<i>numClasses</i>	Number of classes in this classifier.
<i>incrementalVariance</i>	If true, an incremental algorithm is used to calculate the variance; this can prevent loss of precision in some cases, but will be somewhat slower to calculate.

39.360.3.2 NaiveBayesClassifier() [2/2]

```
NaiveBayesClassifier (
    const size_t dimensionality = 0,
    const size_t numClasses = 0 )
```

Initialize the Naive Bayes classifier without performing training.

All of the parameters of the model will be initialized to zero. Be sure to use **Train()** (p. 1582) before calling **Classify()** (p. 1579), otherwise the results may be meaningless.

39.360.4 Member Function Documentation

39.360.4.1 Classify() [1/4]

```
size_t Classify (
    const VecType & point ) const
```

Classify the given point, using the trained **NaiveBayesClassifier** (p. 1576) model.

The predicted label is returned.

Parameters

<i>point</i>	Point to classify.
--------------	--------------------

39.360.4.2 Classify() [2/4]

```
void Classify (
    const VecType & point,
```

```
size_t & prediction,
ProbabilitiesVecType & probabilities ) const
```

Classify the given point using the trained **NaiveBayesClassifier** (p. 1576) model and also return estimates of the probability for each class in the given vector.

Parameters

<i>point</i>	Point to classify.
<i>prediction</i>	This will be set to the predicted class of the point.
<i>probabilities</i>	This will be filled with class probabilities for the point.

39.360.4.3 Classify() [3/4]

```
void Classify (
    const MatType & data,
    arma::Row< size_t > & predictions ) const
```

Classify the given points using the trained **NaiveBayesClassifier** (p. 1576) model.

The predicted labels for each point are stored in the given vector.

```
arma::mat test_data; // each column is a test point
arma::Row<size_t> results;
...
nbc.Classify(test_data, results);
```

Parameters

<i>data</i>	List of data points.
<i>predictions</i>	Vector that class predictions will be placed into.

39.360.4.4 Classify() [4/4]

```
void Classify (
    const MatType & data,
    arma::Row< size_t > & predictions,
    ProbabilitiesMatType & probabilities ) const
```

Classify the given points using the trained **NaiveBayesClassifier** (p. 1576) model and also return estimates of the probabilities for each class in the given matrix.

The predicted labels for each point are stored in the given vector.

```
arma::mat test_data; // each column is a test point
arma::Row<size_t> results;
arma::mat resultsProbs;
...
nbc.Classify(test_data, results, resultsProbs);
```

Parameters

<i>data</i>	Set of points to classify.
<i>predictions</i>	This will be filled with predictions for each point.
<i>probabilities</i>	This will be filled with class probabilities for each point. Each row represents a point.

Template Parameters

<i>MatType</i>	Type of data to be classified.
<i>ProbabilitiesMatType</i>	Type to store output probabilities in.

39.360.4.5 Means() [1/2]

```
const ModelMatType& Means ( ) const [inline]
```

Get the sample means for each class.

Definition at line 200 of file naive_bayes_classifier.hpp.

Modify the prior probabilities for each class.

Definition at line 212 of file `naive_bayes_classifier.hpp`.

References `NaiveBayesClassifier< ModelMatType >::serialize()`.

39.360.4.9 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the classifier.

Referenced by `NaiveBayesClassifier< ModelMatType >::Probabilities()`.

39.360.4.10 Train() [1/2]

```
void Train (
    const MatType & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const bool incremental = true )
```

Train the Naive Bayes classifier on the given dataset.

If the incremental algorithm is used, the current model is used as a starting point (this is the default). If the incremental algorithm is not used, then the current model is ignored and the new model will be trained only on the given data. Note that even if the incremental algorithm is not used, the data must have the same dimensionality and number of classes that the model was initialized with. If you want to change the dimensionality or number of classes, either re-initialize or call **Means()** (p. 1581), **Variances()** (p. 1583), and **Probabilities()** (p. 1581) individually to set them to the right size.

Parameters

<i>data</i>	The dataset to train on.
<i>labels</i>	The labels for the dataset.
<i>numClasses</i>	The numbe of classes in the dataset.
<i>incremental</i>	Whether or not to use the incremental algorithm for training.

39.360.4.11 Train() [2/2]

```
void Train (
    const VecType & point,
    const size_t label )
```

Train the Naive Bayes classifier on the given point.

This will use the incremental algorithm for updating the model parameters. The data must be the same dimensionality as the existing model parameters.

Parameters

<i>point</i>	Data point to train on.
<i>label</i>	Label of data point.

39.360.4.12 Variances() [1/2]

```
const ModelMatType& Variances ( ) const [inline]
```

Get the sample variances for each class.

Definition at line 205 of file naive_bayes_classifier.hpp.

39.360.4.13 Variances() [2/2]

```
ModelMatType& Variances ( ) [inline]
```

Modify the sample variances for each class.

Definition at line 207 of file naive_bayes_classifier.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/naive_bayes/ **naive_bayes_classifier.hpp**

39.361 NCA< MetricType, OptimizerType > Class Template Reference

An implementation of Neighborhood Components Analysis, both a linear dimensionality reduction technique and a distance learning technique.

Public Member Functions

- **NCA** (const arma::mat &dataset, const arma::Row< size_t > &labels, MetricType metric=MetricType())
Construct the Neighborhood Components Analysis object.
- const arma::mat & **Dataset** () const
Get the dataset reference.
- const arma::Row< size_t > & **Labels** () const
Get the labels reference.
- void **LearnDistance** (arma::mat &outputMatrix)
Perform Neighborhood Components Analysis.
- const OptimizerType & **Optimizer** () const
Get the optimizer.
- OptimizerType & **Optimizer** ()

39.361.1 Detailed Description

```
template<typename MetricType = metric::SquaredEuclideanDistance, typename OptimizerType = ens::StandardSGD>
class mlpack::nca::NCA< MetricType, OptimizerType >
```

An implementation of Neighborhood Components Analysis, both a linear dimensionality reduction technique and a distance learning technique.

The method seeks to improve k-nearest-neighbor classification on a dataset by scaling the dimensions. The method is nonparametric, and does not require a value of k. It works by using stochastic ("soft") neighbor assignments and using optimization techniques over the gradient of the accuracy of the neighbor assignments.

For more details, see the following published paper:

```
@inproceedings{Goldberger2004,
  author = {Goldberger, Jacob and Roweis, Sam and Hinton, Geoff and
    Salakhutdinov, Ruslan},
  booktitle = {Advances in Neural Information Processing Systems 17},
  pages = {513--520},
  publisher = {MIT Press},
  title = {{Neighbourhood Components Analysis}},
  year = {2004}
}
```

Definition at line 49 of file nca.hpp.

39.361.2 Constructor & Destructor Documentation

39.361.2.1 NCA()

```
NCA (
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    MetricType metric = MetricType() )
```

Construct the Neighborhood Components Analysis object.

This simply stores the reference to the dataset and labels as well as the parameters for optimization before the actual optimization is performed.

Parameters

<i>dataset</i>	Input dataset.
<i>labels</i>	Input dataset labels.
<i>stepSize</i>	Step size for stochastic gradient descent.
<i>maxIterations</i>	Maximum iterations for stochastic gradient descent.
<i>tolerance</i>	Tolerance for termination of stochastic gradient descent.
<i>shuffle</i>	Whether or not to shuffle the dataset during SGD.
<i>metric</i>	Instantiated metric to use.

39.361.3 Member Function Documentation

39.361.3.1 Dataset()

```
const arma::mat& Dataset ( ) const [inline]
```

Get the dataset reference.

Definition at line 81 of file nca.hpp.

39.361.3.2 Labels()

```
const arma::Row<size_t>& Labels ( ) const [inline]
```

Get the labels reference.

Definition at line 83 of file nca.hpp.

39.361.3.3 LearnDistance()

```
void LearnDistance (
    arma::mat & outputMatrix )
```

Perform Neighborhood Components Analysis.

The output distance learning matrix is written into the passed reference. If **LearnDistance()** (p. 1585) is called with an outputMatrix which has the correct size (dataset.n_rows x dataset.n_rows), that matrix will be used as the starting point for optimization.

Parameters

<i>output_matrix</i>	Covariance matrix of Mahalanobis distance.
----------------------	--

39.361.3.4 **Optimizer()** [1/2]

```
const OptimizerType& Optimizer ( ) const [inline]
```

Get the optimizer.

Definition at line 86 of file nca.hpp.

39.361.3.5 **Optimizer()** [2/2]

```
OptimizerType& Optimizer ( ) [inline]
```

Definition at line 87 of file nca.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/nca/ **nca.hpp**

39.362 **SoftmaxErrorFunction< MetricType > Class Template Reference**

The "softmax" stochastic neighbor assignment probability function.

Public Member Functions

- **SoftmaxErrorFunction** (const arma::mat &dataset, const arma::Row< size_t > &labels, MetricType metric=MetricType())
Initialize with the given kernel; useful when the kernel has some state to store, which is set elsewhere.
- double **Evaluate** (const arma::mat &covariance)
Evaluate the softmax function for the given covariance matrix.
- double **Evaluate** (const arma::mat &covariance, const size_t begin, const size_t batchSize=1)
Evaluate the softmax objective function for the given covariance matrix on the given batch size from a given initial point of the dataset.
- const arma::mat **GetInitialPoint** () const
Get the initial point.
- void **Gradient** (const arma::mat &covariance, arma::mat &gradient)
Evaluate the gradient of the softmax function for the given covariance matrix.
- template<typename GradType >
void **Gradient** (const arma::mat &covariance, const size_t begin, GradType &gradient, const size_t batchSize=1)
Evaluate the gradient of the softmax function for the given covariance matrix on the given batch size, from a given initial point of the dataset.
- size_t **NumFunctions** () const
Get the number of functions the objective function can be decomposed into.
- void **Shuffle** ()
Shuffle the dataset.

39.362.1 Detailed Description

```
template<typename MetricType = metric::SquaredEuclideanDistance>
class mlpack::nca::SoftmaxErrorFunction< MetricType >
```

The "softmax" stochastic neighbor assignment probability function.

The actual function is

$$p_{ij} = (\exp(-\|A x_i - A x_j\|^2)) / (\sum_{k \neq i} (\exp(-\|A x_i - A x_k\|^2)))$$

where x_n represents a point and A is the current scaling matrix.

This class is more flexible than the original paper, allowing an arbitrary metric function to be used in place of $\|A x_i - A x_j\|^2$, meaning that the squared Euclidean distance is not the only allowed metric for **NCA** (p. 1583). However, that is probably the best way to use this class.

In addition to the standard **Evaluate()** (p. 1588) and **Gradient()** (p. 1588) functions which mlpack optimizers use, overloads of **Evaluate()** (p. 1588) and **Gradient()** (p. 1588) are given which only operate on one point in the dataset. This is useful for optimizers like stochastic gradient descent (see `mlpack::optimization::SGD`).

Definition at line 43 of file `nca_softmax_error_function.hpp`.

39.362.2 Constructor & Destructor Documentation

39.362.2.1 SoftmaxErrorFunction()

```
SoftmaxErrorFunction (
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    MetricType metric = MetricType() )
```

Initialize with the given kernel; useful when the kernel has some state to store, which is set elsewhere.

If no kernel is given, an empty kernel is used; this way, you can call the constructor with no arguments. A reference to the dataset we will be optimizing over is also required.

Parameters

<i>dataset</i>	Matrix containing the dataset.
<i>labels</i>	Vector of class labels for each point in the dataset.
<i>kernel</i>	Instantiated kernel (optional).

39.362.3 Member Function Documentation

39.362.3.1 Evaluate() [1/2]

```
double Evaluate (
    const arma::mat & covariance )
```

Evaluate the softmax function for the given covariance matrix.

This is the non-separable implementation, where the objective function is not decomposed into the sum of several objective functions.

Parameters

<i>covariance</i>	Covariance matrix of Mahalanobis distance.
-------------------	--

39.362.3.2 Evaluate() [2/2]

```
double Evaluate (
    const arma::mat & covariance,
    const size_t begin,
    const size_t batchSize = 1 )
```

Evaluate the softmax objective function for the given covariance matrix on the given batch size from a given initial point of the dataset.

This is the separable implementation, where the objective function is decomposed into the sum of many objective functions, and here, only one of those constituent objective functions is returned.

Parameters

<i>covariance</i>	Covariance matrix of Mahalanobis distance.
<i>begin</i>	Index of the initial point to use for objective function.
<i>batchSize</i>	Number of points to use for objective function.

39.362.3.3 GetInitialPoint()

```
const arma::mat GetInitialPoint ( ) const
```

Get the initial point.

39.362.3.4 Gradient() [1/2]

```
void Gradient (
    const arma::mat & covariance,
    arma::mat & gradient )
```

Evaluate the gradient of the softmax function for the given covariance matrix.

This is the non-separable implementation, where the objective function is not decomposed into the sum of several objective functions.

Parameters

<i>covariance</i>	Covariance matrix of Mahalanobis distance.
<i>gradient</i>	Matrix to store the calculated gradient in.

39.362.3.5 Gradient() [2/2]

```
void Gradient (
    const arma::mat & covariance,
    const size_t begin,
    GradType & gradient,
    const size_t batchSize = 1 )
```

Evaluate the gradient of the softmax function for the given covariance matrix on the given batch size, from a given initial point of the dataset.

This is the separable implementation, where the objective function is decomposed into the sum of many objective functions, and here, only one of those constituent objective functions is returned. The type of the gradient parameter is a template argument to allow the computation of a sparse gradient.

Template Parameters

<i>GradType</i>	The type of the gradient out-param.
-----------------	-------------------------------------

Parameters

<i>covariance</i>	Covariance matrix of Mahalanobis distance.
<i>begin</i>	Index of the initial point to use for objective function.
<i>batchSize</i>	Number of points to use for objective function.
<i>gradient</i>	Matrix to store the calculated gradient in.

39.362.3.6 NumFunctions()

```
size_t NumFunctions ( ) const [inline]
```

Get the number of functions the objective function can be decomposed into.

This is just the number of points in the dataset.

Definition at line 130 of file `nca_softmax_error_function.hpp`.

39.362.3.7 Shuffle()

```
void Shuffle ( )
```

Shuffle the dataset.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/nca/ nca_softmax_error_function.hpp`

39.363 AlphaVisitor Class Reference

Exposes the `Alpha()` method of the given `RAType`.

Inheritance diagram for `AlphaVisitor`:

**Public Member Functions**

- `template<typename RAType >`
`double & operator() (RAType *ra) const`
Return Alpha parameter.

39.363.1 Detailed Description

Exposes the Alpha() method of the given RAType.

Definition at line 198 of file ra_model.hpp.

39.363.2 Member Function Documentation

39.363.2.1 operator()()

```
double& operator() (
    RAType * ra ) const
```

Return Alpha parameter.

The documentation for this class was generated from the following file:

39.364 BiSearchVisitor< SortPolicy > Class Template Reference

BiSearchVisitor (p. 1591) executes a bichromatic neighbor search on the given NSType.

Inheritance diagram for BiSearchVisitor< SortPolicy >:

Public Types

- `template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType> using NSTypeT = NSType< SortPolicy, TreeType >`
Alias template necessary for visual c++ compiler.
- `template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType> using RATypeT = RAType< SortPolicy, TreeType >`
Alias template necessary for visual c++ compiler.

Public Member Functions

- **BiSearchVisitor** (const arma::mat &querySet, const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances, const size_t leafSize)
*Construct the **BiSearchVisitor** (p. 1591).*
- **BiSearchVisitor** (const arma::mat &querySet, const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances, const size_t leafSize, const double tau, const double rho)
*Construct the **BiSearchVisitor** (p. 1591).*
- template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType>
void **operator()** (**RATypeT**< TreeType > *ra) const
Default Bichromatic neighbor search on the given RAType instance.
- void **operator()** (**RATypeT**< **tree::KDTree** > *ra) const
Bichromatic search on the given RAType specialized for KDTrees.
- void **operator()** (**RATypeT**< **tree::Octree** > *ra) const
Bichromatic search on the given RAType specialized for octrees.
- template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType>
void **operator()** (**NSTypeT**< TreeType > *ns) const
Default Bichromatic neighbor search on the given NSType instance.
- void **operator()** (**NSTypeT**< **tree::KDTree** > *ns) const
Bichromatic neighbor search on the given NSType specialized for KDTrees.
- void **operator()** (**NSTypeT**< **tree::BallTree** > *ns) const
Bichromatic neighbor search on the given NSType specialized for BallTrees.
- void **operator()** (**SpillKNN** *ns) const
Bichromatic neighbor search specialized for SPTrees.
- void **operator()** (**NSTypeT**< **tree::Octree** > *ns) const
Bichromatic neighbor search specialized for octrees.

39.364.1 Detailed Description

```
template<typename SortPolicy>
class mlpack::neighbor::BiSearchVisitor< SortPolicy >
```

BiSearchVisitor (p. 1591) executes a bichromatic neighbor search on the given NSType.

BiSearchVisitor (p. 1591) executes a bichromatic neighbor search on the given RAType.

We use template specialization to differentiate those tree types that accept leafSize as a parameter. In these cases, before doing neighbor search, a query tree with proper leafSize is built from the querySet.

We use template specialization to differentiate those tree types types that accept leafSize as a parameter. In these cases, before doing neighbor search a query tree with proper leafSize is built from the querySet.

Definition at line 80 of file ns_model.hpp.

39.364.2 Member Typedef Documentation

39.366 DrusillaSelect< MatType > Class Template Reference

Public Member Functions

- **DrusillaSelect** (const MatType &referenceSet, const size_t l, const size_t m)
*Construct the **DrusillaSelect** (p. 1597) object with the given reference set (this is the set that will be searched).*
- **DrusillaSelect** (const size_t l, const size_t m)
*Construct the **DrusillaSelect** (p. 1597) object with no given reference set.*
- const arma::Col< size_t > & **CandidateIndices** () const
Access the indices of points in the candidate set.
- arma::Col< size_t > & **CandidateIndices** ()
Modify the indices of points in the candidate set. Be careful!
- const MatType & **CandidateSet** () const
Access the candidate set.
- MatType & **CandidateSet** ()
Modify the candidate set. Be careful!
- void **Search** (const MatType &querySet, const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances)
Search for the k furthest neighbors of the given query set.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the model.
- void **Train** (const MatType &referenceSet, const size_t l=0, const size_t m=0)
Build the set of candidate points on the given reference set.

39.366.1 Detailed Description

```
template<typename MatType = arma::mat>
class mpack::neighbor::DrusillaSelect< MatType >
```

Definition at line 39 of file drusilla_select.hpp.

39.366.2 Constructor & Destructor Documentation

39.366.2.1 DrusillaSelect() [1/2]

```
DrusillaSelect (
    const MatType & referenceSet,
    const size_t l,
    const size_t m )
```

Construct the **DrusillaSelect** (p. 1597) object with the given reference set (this is the set that will be searched).

The resulting set of candidate points that will be searched at query time will have size l*m.

Parameters

<i>referenceSet</i>	Set of reference data.
<i>l</i>	Number of projections.
<i>m</i>	Number of elements to store for each projection.

39.366.2.2 **DrusillaSelect()** [2/2]

```
DrusillaSelect (
    const size_t l,
    const size_t m )
```

Construct the **DrusillaSelect** (p. 1597) object with no given reference set.

Be sure to call **Train()** (p. 1600) before calling **Search()** (p. 1599)!

Parameters

<i>l</i>	Number of projections.
<i>m</i>	Number of elements to store for each projection.

39.366.3 Member Function Documentation

39.366.3.1 **CandidateIndices()** [1/2]

```
const arma::Col<size_t>& CandidateIndices ( ) const [inline]
```

Access the indices of points in the candidate set.

Definition at line 108 of file drusilla_select.hpp.

39.366.3.2 **CandidateIndices()** [2/2]

```
arma::Col<size_t>& CandidateIndices ( ) [inline]
```

Modify the indices of points in the candidate set. Be careful!

Definition at line 110 of file drusilla_select.hpp.

39.366.3.3 CandidateSet() [1/2]

```
const MatType& CandidateSet ( ) const [inline]
```

Access the candidate set.

Definition at line 103 of file drusilla_select.hpp.

39.366.3.4 CandidateSet() [2/2]

```
MatType& CandidateSet ( ) [inline]
```

Modify the candidate set. Be careful!

Definition at line 105 of file drusilla_select.hpp.

39.366.3.5 Search()

```
void Search (
    const MatType & querySet,
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & distances )
```

Search for the k furthest neighbors of the given query set.

(The query set can contain just one point: that is okay.) The results will be stored in the given neighbors and distances matrices, in the same format as the **NeighborSearch** (p. 1627) and **LSHSearch** (p. 1609) classes. That is, each column in the neighbors and distances matrices will refer to a single query point, and the k'th row in that column will refer to the k'th candidate neighbor or distance for that query point.

Parameters

<i>querySet</i>	Set of query points to search.
<i>k</i>	Number of furthest neighbors to search for.
<i>neighbors</i>	Matrix to store resulting neighbors in.
<i>distances</i>	Matrix to store resulting distances in.

39.366.3.6 serialize()

```
void serialize (
```

```
Archive & ar,
const unsigned int )
```

Serialize the model.

39.366.3.7 Train()

```
void Train (
    const MatType & referenceSet,
    const size_t l = 0,
    const size_t m = 0 )
```

Build the set of candidate points on the given reference set.

If *l* and *m* are left unspecified, then the values set in the constructor will be used instead.

Parameters

<i>referenceSet</i>	Set to extract candidate points from.
<i>l</i>	Number of projections.
<i>m</i>	Number of elements to store for each projection.

39.369 FurthestNS Class Reference

This class implements the necessary methods for the SortPolicy template parameter of the **NeighborSearch** (p. 1627) class.

Static Public Member Functions

- static double **BestDistance** ()
Return what should represent the best possible distance with this particular sort policy.
- template<typename TreeType >
static double **BestNodeToNodeDistance** (const TreeType *queryNode, const TreeType *referenceNode)
Return the best possible distance between two nodes.
- template<typename TreeType >
static double **BestNodeToNodeDistance** (const TreeType *queryNode, const TreeType *referenceNode, const double centerToCenterDistance)
Return the best possible distance between two nodes, given that the distance between the centers of the two nodes has already been calculated.

- `template<typename TreeType >`
`static double BestNodeToNodeDistance (const TreeType *queryNode, const TreeType *referenceNode, const TreeType *referenceChildNode, const double centerToCenterDistance)`
Return the best possible distance between the query node and the reference child node given the base case distance between the query node and the reference node.
- `template<typename VecType , typename TreeType >`
`static double BestPointToNodeDistance (const VecType &queryPoint, const TreeType *referenceNode)`
Return the best possible distance between a node and a point.
- `template<typename VecType , typename TreeType >`
`static double BestPointToNodeDistance (const VecType &queryPoint, const TreeType *referenceNode, const double pointToCenterDistance)`
Return the best possible distance between a point and a node, given that the distance between the point and the center of the node has already been calculated.
- `static double CombineBest (const double a, const double b)`
Return the best combination of the two distances.
- `static double CombineWorst (const double a, const double b)`
Return the worst combination of the two distances.
- `static double ConvertToDistance (const double score)`
Convert the given score back to a distance.
- `static double ConvertToScore (const double distance)`
Convert the given distance to a score.
- `template<typename VecType , typename TreeType >`
`static size_t GetBestChild (const VecType &queryPoint, TreeType &referenceNode)`
Return the best child according to this sort policy.
- `template<typename TreeType >`
`static size_t GetBestChild (const TreeType &queryNode, TreeType &referenceNode)`
Return the best child according to this sort policy.
- `static bool IsBetter (const double value, const double ref)`
Return whether or not value is "better" than ref.
- `static double Relax (const double value, const double epsilon)`
Return the given value relaxed.
- `static double WorstDistance ()`
Return what should represent the worst possible distance with this particular sort policy.

39.369.1 Detailed Description

This class implements the necessary methods for the SortPolicy template parameter of the **NeighborSearch** (p. 1627) class.

The sorting policy here is that the minimum distance is the best (so, when used with **NeighborSearch** (p. 1627), the output is furthest neighbors).

Definition at line 27 of file `furthest_neighbor_sort.hpp`.

39.369.2 Member Function Documentation

39.369.2.1 BestDistance()

```
static double BestDistance ( ) [inline], [static]
```

Return what should represent the best possible distance with this particular sort policy.

In our case, this should be the maximum possible distance, DBL_MAX.

Returns

DBL_MAX

Definition at line 138 of file `furthest_neighbor_sort.hpp`.

39.369.2.2 BestNodeToNodeDistance() [1/3]

```
static double BestNodeToNodeDistance (
    const TreeType * queryNode,
    const TreeType * referenceNode ) [static]
```

Return the best possible distance between two nodes.

In our case, this is the maximum distance between the two tree nodes using the given distance function.

Referenced by `FurthestNS::IsBetter()`.

39.369.2.3 BestNodeToNodeDistance() [2/3]

```
static double BestNodeToNodeDistance (
    const TreeType * queryNode,
    const TreeType * referenceNode,
    const double centerToCenterDistance ) [static]
```

Return the best possible distance between two nodes, given that the distance between the centers of the two nodes has already been calculated.

This is used in conjunction with trees that have self-children (like cover trees).

39.369.2.4 BestNodeToNodeDistance() [3/3]

```
static double BestNodeToNodeDistance (
    const TreeType * queryNode,
    const TreeType * referenceNode,
    const TreeType * referenceChildNode,
    const double centerToCenterDistance ) [static]
```

Return the best possible distance between the query node and the reference child node given the base case distance between the query node and the reference node.

`TreeType::ParentDistance()` must be implemented to use this.

Parameters

<i>queryNode</i>	Query node.
<i>referenceNode</i>	Reference node.
<i>referenceChildNode</i>	Child of reference node which is being inspected.
<i>centerToCenterDistance</i>	Distance between centers of query node and reference node.

39.369.2.5 BestPointToNodeDistance() [1/2]

```
static double BestPointToNodeDistance (
    const VecType & queryPoint,
    const TreeType * referenceNode ) [static]
```

Return the best possible distance between a node and a point.

In our case, this is the maximum distance between the tree node and the point using the given distance function.

Referenced by FurthestNS::IsBetter().

39.369.2.6 BestPointToNodeDistance() [2/2]

```
static double BestPointToNodeDistance (
    const VecType & queryPoint,
    const TreeType * referenceNode,
    const double pointToCenterDistance ) [static]
```

Return the best possible distance between a point and a node, given that the distance between the point and the center of the node has already been calculated.

This is used in conjunction with trees that have self-children (like cover trees).

39.369.2.7 CombineBest()

```
static double CombineBest (
    const double a,
    const double b ) [inline], [static]
```

Return the best combination of the two distances.

Definition at line 143 of file furthest_neighbor_sort.hpp.

39.369.2.8 CombineWorst()

```
static double CombineWorst (  
    const double a,  
    const double b ) [inline], [static]
```

Return the worst combination of the two distances.

Definition at line 153 of file furthest_neighbor_sort.hpp.

39.369.2.9 ConvertToDistance()

```
static double ConvertToDistance (  
    const double score ) [inline], [static]
```

Convert the given score back to a distance.

This is the inverse of the operation of converting a distance to a score, and again, for furthest neighbor search, corresponds to inverting the value.

Definition at line 193 of file furthest_neighbor_sort.hpp.

References FurthestNS::ConvertToScore().

39.369.2.10 ConvertToScore()

```
static double ConvertToScore (  
    const double distance ) [inline], [static]
```

Convert the given distance to a score.

Lower scores are better, but for furthest neighbor search, larger distances are better. Therefore we must invert the given distance.

Definition at line 178 of file furthest_neighbor_sort.hpp.

Referenced by FurthestNS::ConvertToDistance().

39.369.2.11 GetBestChild() [1/2]

```
static size_t GetBestChild (
    const VecType & queryPoint,
    TreeType & referenceNode ) [inline], [static]
```

Return the best child according to this sort policy.

In this case it will return the one with the maximum distance.

Definition at line 107 of file furthest_neighbor_sort.hpp.

39.369.2.12 GetBestChild() [2/2]

```
static size_t GetBestChild (
    const TreeType & queryNode,
    TreeType & referenceNode ) [inline], [static]
```

Return the best child according to this sort policy.

In this case it will return the one with the maximum distance.

Definition at line 117 of file furthest_neighbor_sort.hpp.

39.369.2.13 IsBetter()

```
static bool IsBetter (
    const double value,
    const double ref ) [inline], [static]
```

Return whether or not value is "better" than ref.

In this case, that means that the value is greater than or equal to the reference.

Parameters

<i>value</i>	Value to compare
<i>ref</i>	Value to compare with

Returns

bool indicating whether or not (value >= ref).

Definition at line 39 of file furthest_neighbor_sort.hpp.

References `FurthestNS::BestNodeToNodeDistance()`, and `FurthestNS::BestPointToNodeDistance()`.

39.369.2.14 `Relax()`

```
static double Relax (
    const double value,
    const double epsilon ) [inline], [static]
```

Return the given value relaxed.

Parameters

<i>value</i>	Value to relax.
<i>epsilon</i>	Relative error (non-negative).

Returns

double Value relaxed.

Definition at line 164 of file `furthest_neighbor_sort.hpp`.

39.369.2.15 `WorstDistance()`

```
static double WorstDistance ( ) [inline], [static]
```

Return what should represent the worst possible distance with this particular sort policy.

In our case, this should be the minimum possible distance, 0.

Returns

0

Definition at line 129 of file `furthest_neighbor_sort.hpp`.

39.370 LSHSearch< SortPolicy > Class Template Reference

The **LSHSearch** (p. 1609) class; this class builds a hash on the reference set and uses this hash to compute the distance-approximate nearest-neighbors of the given queries.

Public Member Functions

- **LSHSearch** (arma::mat referenceSet, const arma::cube &projections, const double hashWidth=0.0, const size_t secondHashSize=99901, const size_t bucketSize=500)
This function initializes the LSH class.
- **LSHSearch** (arma::mat referenceSet, const size_t numProj, const size_t numTables, const double hashWidth=0.0, const size_t secondHashSize=99901, const size_t bucketSize=500)
This function initializes the LSH class.
- **LSHSearch** ()
Create an untrained LSH model.
- **LSHSearch** (const **LSHSearch** &other)
Copy the given LSH model.
- **LSHSearch** (**LSHSearch** &&other)
Take ownership of the given LSH model.
- size_t **BucketSize** () const
Get the bucket size of the second hash.
- size_t **DistanceEvaluations** () const
Return the number of distance evaluations performed.
- size_t & **DistanceEvaluations** ()
Modify the number of distance evaluations performed.
- size_t **NumProjections** () const
Get the number of projections.
- const arma::mat & **Offsets** () const
Get the offsets 'b' for each of the projections. (One 'b' per column.)
- **LSHSearch** & **operator=** (const **LSHSearch** &other)
Copy the given LSH model.
- **LSHSearch** & **operator=** (**LSHSearch** &&other)
Take ownership of the given LSH model.
- const arma::cube & **Projections** ()
Get the projection tables.
- void **Projections** (const arma::cube &projTables)
Change the projection tables (this retrains the LSH model).
- const arma::mat & **ReferenceSet** () const
Return the reference dataset.
- void **Search** (const arma::mat &querySet, const size_t k, arma::Mat< size_t > &resultingNeighbors, arma::mat &distances, const size_t numTablesToSearch=0, const size_t T=0)
Compute the nearest neighbors of the points in the given query set and store the output in the given matrices.
- void **Search** (const size_t k, arma::Mat< size_t > &resultingNeighbors, arma::mat &distances, const size_t numTablesToSearch=0, size_t T=0)
Compute the nearest neighbors and store the output in the given matrices.
- const std::vector< arma::Col< size_t > > & **SecondHashTable** () const

Get the second hash table.

- const arma::vec & **SecondHashWeights** () const

Get the weights of the second hash.

- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int version)

Serialize the LSH model.

- void **Train** (arma::mat referenceSet, const size_t numProj, const size_t numTables, const double hashWidth=0.0, const size_t secondHashSize=99901, const size_t bucketSize=500, const arma::cube &projection=arma::cube())

Train the LSH model on the given dataset.

Static Public Member Functions

- static double **ComputeRecall** (const arma::Mat< size_t > &foundNeighbors, const arma::Mat< size_t > &realNeighbors)

*Compute the recall (% of neighbors found) given the neighbors returned by **LSHSearch::Search** (p. 1615) and a "ground truth" set of neighbors.*

39.370.1 Detailed Description

```
template<typename SortPolicy = NearestNeighborSort>
class mlpack::neighbor::LSHSearch< SortPolicy >
```

The **LSHSearch** (p. 1609) class; this class builds a hash on the reference set and uses this hash to compute the distance-approximate nearest-neighbors of the given queries.

Template Parameters

<i>SortPolicy</i>	The sort policy for distances; see NearestNeighborSort.
-------------------	---

Definition at line 64 of file lsh_search.hpp.

39.370.2 Constructor & Destructor Documentation

39.370.2.1 LSHSearch() [1/5]

```
LSHSearch (
    arma::mat referenceSet,
    const arma::cube & projections,
    const double hashWidth = 0.0,
    const size_t secondHashSize = 99901,
    const size_t bucketSize = 500 )
```

This function initializes the LSH class.

It builds the hash on the reference set with 2-stable distributions. See the individual functions performing the hashing for details on how the hashing is done. In order to avoid copying the reference set, it is suggested to pass that parameter with `std::move()`.

Parameters

<i>referenceSet</i>	Set of reference points and the set of queries.
<i>projections</i>	Cube of projection tables. For a cube of size (a, b, c) we set numProj = a, numTables = c. b is the reference set dimensionality.
<i>hashWidth</i>	The width of hash for every table. If 0 (the default) is provided, then the hash width is automatically obtained by computing the average pairwise distance of 25 pairs. This should be a reasonable upper bound on the nearest-neighbor distance in general.
<i>secondHashSize</i>	The size of the second hash table. This should be a large prime number.
<i>bucketSize</i>	The size of the bucket in the second hash table. This is the maximum number of points that can be hashed into single bucket. A value of 0 indicates that there is no limit (so the second hash table can be arbitrarily large—be careful!).

39.370.2.2 LSHSearch() [2/5]

```

LSHSearch (
    arma::mat referenceSet,
    const size_t numProj,
    const size_t numTables,
    const double hashWidth = 0.0,
    const size_t secondHashSize = 99901,
    const size_t bucketSize = 500 )

```

This function initializes the LSH class.

It builds the hash one the reference set using the provided projections. See the individual functions performing the hashing for details on how the hashing is done. In order to avoid copying the reference set, consider passing the set with `std::move()`.

Parameters

<i>referenceSet</i>	Set of reference points and the set of queries.
<i>numProj</i>	Number of projections in each hash table (anything between 10-50 might be a decent choice).
<i>numTables</i>	Total number of hash tables (anything between 10-20 should suffice).
<i>hashWidth</i>	The width of hash for every table. If 0 (the default) is provided, then the hash width is automatically obtained by computing the average pairwise distance of 25 pairs. This should be a reasonable upper bound on the nearest-neighbor distance in general.
<i>secondHashSize</i>	The size of the second hash table. This should be a large prime number.
<i>bucketSize</i>	The size of the bucket in the second hash table. This is the maximum number of points that can be hashed into single bucket. A value of 0 indicates that there is no limit (so the second hash table can be arbitrarily large—be careful!).

39.370.2.3 LSHSearch() [3/5]

```
LSHSearch ( )
```

Create an untrained LSH model.

Be sure to call **Train()** (p. 1617) before calling **Search()** (p. 1615); otherwise, an exception will be thrown when **Search()** (p. 1615) is called.

39.370.2.4 LSHSearch() [4/5]

```
LSHSearch (
    const LSHSearch< SortPolicy > & other )
```

Copy the given LSH model.

Parameters

<i>other</i>	Other LSH model to copy.
--------------	--------------------------

39.370.2.5 LSHSearch() [5/5]

```
LSHSearch (
    LSHSearch< SortPolicy > && other )
```

Take ownership of the given LSH model.

Parameters

<i>other</i>	Other LSH model to take ownership of.
--------------	---------------------------------------

39.370.3 Member Function Documentation**39.370.3.1 BucketSize()**

```
size_t BucketSize ( ) const [inline]
```

Get the bucket size of the second hash.

Definition at line 281 of file lsh_search.hpp.

39.370.3.2 ComputeRecall()

```
static double ComputeRecall (
    const arma::Mat< size_t > & foundNeighbors,
    const arma::Mat< size_t > & realNeighbors ) [static]
```

Compute the recall (% of neighbors found) given the neighbors returned by **LSHSearch::Search** (p. 1615) and a "ground truth" set of neighbors.

The recall returned will be in the range [0, 1].

Parameters

<i>foundNeighbors</i>	Set of neighbors to compute recall of.
<i>realNeighbors</i>	Set of "ground truth" neighbors to compute recall against.

39.370.3.3 DistanceEvaluations() [1/2]

```
size_t DistanceEvaluations ( ) const [inline]
```

Return the number of distance evaluations performed.

Definition at line 264 of file lsh_search.hpp.

39.370.3.4 DistanceEvaluations() [2/2]

```
size_t& DistanceEvaluations ( ) [inline]
```

Modify the number of distance evaluations performed.

Definition at line 266 of file lsh_search.hpp.

39.370.3.5 NumProjections()

```
size_t NumProjections ( ) const [inline]
```

Get the number of projections.

Definition at line 272 of file lsh_search.hpp.

39.370.3.6 Offsets()

```
const arma::mat& Offsets ( ) const [inline]
```

Get the offsets 'b' for each of the projections. (One 'b' per column.)

Definition at line 275 of file lsh_search.hpp.

39.370.3.7 operator=() [1/2]

```
LSHSearch& operator= (
    const LSHSearch< SortPolicy > & other )
```

Copy the given LSH model.

Parameters

<i>other</i>	Other LSH model to copy.
--------------	--------------------------

39.370.3.8 operator=() [2/2]

```
LSHSearch& operator= (
    LSHSearch< SortPolicy > && other )
```

Take ownership of the given LSH model.

Parameters

<i>other</i>	Other LSH model to take ownership of.
--------------	---------------------------------------

39.370.3.9 Projections() [1/2]

```
const arma::cube& Projections ( ) [inline]
```

Get the projection tables.

Definition at line 288 of file lsh_search.hpp.

39.370.3.10 Projections() [2/2]

```
void Projections (
    const arma::cube & projTables ) [inline]
```

Change the projection tables (this retrains the LSH model).

Definition at line 291 of file lsh_search.hpp.

References BOOST_TEMPLATE_CLASS_VERSION(), and LSHSearch< SortPolicy >::Train().

39.370.3.11 ReferenceSet()

```
const arma::mat& ReferenceSet ( ) const [inline]
```

Return the reference dataset.

Definition at line 269 of file lsh_search.hpp.

39.370.3.12 Search() [1/2]

```
void Search (
    const arma::mat & querySet,
    const size_t k,
    arma::Mat< size_t > & resultingNeighbors,
    arma::mat & distances,
    const size_t numTablesToSearch = 0,
    const size_t T = 0 )
```

Compute the nearest neighbors of the points in the given query set and store the output in the given matrices.

The matrices will be set to the size of n columns by k rows, where n is the number of points in the query dataset and k is the number of neighbors being searched for.

Parameters

<i>querySet</i>	Set of query points.
<i>k</i>	Number of neighbors to search for.
<i>resultingNeighbors</i>	Matrix storing lists of neighbors for each query point.
<i>distances</i>	Matrix storing distances of neighbors for each query point.
<i>numTablesToSearch</i>	This parameter allows the user to have control over the number of hash tables to be searched. This allows the user to pick the number of tables it can afford for the time available without having to build hashing for every table size. By default, this is set to zero in which case all tables are considered.
<i>T</i>	The number of additional probing bins to examine with multiprobe LSH. If $T = 0$, classic single-probe LSH is run (default).

39.370.3.13 Search() [2/2]

```
void Search (
    const size_t k,
    arma::Mat< size_t > & resultingNeighbors,
    arma::mat & distances,
    const size_t numTablesToSearch = 0,
    size_t T = 0 )
```

Compute the nearest neighbors and store the output in the given matrices.

The matrices will be set to the size of n columns by k rows, where n is the number of points in the query dataset and k is the number of neighbors being searched for.

Parameters

<i>k</i>	Number of neighbors to search for.
<i>resultingNeighbors</i>	Matrix storing lists of neighbors for each query point.
<i>distances</i>	Matrix storing distances of neighbors for each query point.
<i>numTablesToSearch</i>	This parameter allows the user to have control over the number of hash tables to be searched. This allows the user to pick the number of tables it can afford for the time available without having to build hashing for every table size. By default, this is set to zero in which case all tables are considered.

39.370.3.14 SecondHashTable()

```
const std::vector<arma::Col<size_t> >& SecondHashTable ( ) const [inline]
```

Get the second hash table.

Definition at line 284 of file `lsh_search.hpp`.

39.370.3.15 SecondHashWeights()

```
const arma::vec& SecondHashWeights ( ) const [inline]
```

Get the weights of the second hash.

Definition at line 278 of file lsh_search.hpp.

39.370.3.16 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int version )
```

Serialize the LSH model.

Parameters

<i>ar</i>	Archive to serialize to.
-----------	--------------------------

39.370.3.17 Train()

```
void Train (
    arma::mat referenceSet,
    const size_t numProj,
    const size_t numTables,
    const double hashWidth = 0.0,
    const size_t secondHashSize = 99901,
    const size_t bucketSize = 500,
    const arma::cube & projection = arma::cube() )
```

Train the LSH model on the given dataset.

If a correctly-sized projection cube is not provided, this means building new hash tables. Otherwise, we use the projections provided by the user. In order to avoid copying the reference set, consider passing that parameter with `std::move()`.

Parameters

<i>referenceSet</i>	Set of reference points and the set of queries.
<i>numProj</i>	Number of projections in each hash table (anything between 10-50 might be a decent choice).
<i>numTables</i>	Total number of hash tables (anything between 10-20 should suffice).
<i>hashWidth</i>	The width of hash for every table. If 0 (the default) is provided, then the hash width is automatically obtained by computing the average pairwise distance of 25 pairs. This should be a reasonable upper bound on the nearest-neighbor distance in general.

Parameters

<i>secondHashSize</i>	The size of the second hash table. This should be a large prime number.
<i>bucketSize</i>	The size of the bucket in the second hash table. This is the maximum number of points that can be hashed into single bucket. A value of 0 indicates that there is no limit (so the second hash table can be arbitrarily large—be careful!).
<i>projections</i>	Cube of projection tables. For a cube of size (a, b, c) we set numProj = a, numTables = c. b is the reference set dimensionality.

Referenced by LSHSearch< SortPolicy >::Projections().

*Get a reference to the naive parameter of the given **RASearch** (p. 1681) object.*

39.372.1 Detailed Description

NaiveVisitor (p. 1620) exposes the `Naive()` method of the given `RAType`.

Definition at line 252 of file `ra_model.hpp`.

39.372.2 Member Function Documentation

39.372.2.1 `operator()()`

```
bool& operator() (
    RAType * ra ) const
```

Get a reference to the naive parameter of the given **RASearch** (p. 1681) object.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/rann/ ra_model.hpp`

39.373 NearestNS Class Reference

This class implements the necessary methods for the `SortPolicy` template parameter of the **NeighborSearch** (p. 1627) class.

Static Public Member Functions

- static double **BestDistance** ()
Return what should represent the best possible distance with this particular sort policy.
- template<typename TreeType >
static double **BestNodeToNodeDistance** (const TreeType *queryNode, const TreeType *referenceNode)
Return the best possible distance between two nodes.
- template<typename TreeType >
static double **BestNodeToNodeDistance** (const TreeType *queryNode, const TreeType *referenceNode, const double centerToCenterDistance)
Return the best possible distance between two nodes, given that the distance between the centers of the two nodes has already been calculated.
- template<typename TreeType >
static double **BestNodeToNodeDistance** (const TreeType *queryNode, const TreeType *referenceNode, const TreeType *referenceChildNode, const double centerToCenterDistance)
Return the best possible distance between the query node and the reference child node given the base case distance between the query node and the reference node.

- `template<typename VecType , typename TreeType >`
`static double BestPointToNodeDistance (const VecType &queryPoint, const TreeType *referenceNode)`
Return the best possible distance between a node and a point.
- `template<typename VecType , typename TreeType >`
`static double BestPointToNodeDistance (const VecType &queryPoint, const TreeType *referenceNode, const double pointToCenterDistance)`
Return the best possible distance between a point and a node, given that the distance between the point and the center of the node has already been calculated.
- `static double CombineBest (const double a, const double b)`
Return the best combination of the two distances.
- `static double CombineWorst (const double a, const double b)`
Return the worst combination of the two distances.
- `static double ConvertToDistance (const double score)`
Convert the given score to a distance.
- `static double ConvertToScore (const double distance)`
Convert the given distance into a score.
- `template<typename VecType , typename TreeType >`
`static size_t GetBestChild (const VecType &queryPoint, TreeType &referenceNode)`
Return the best child according to this sort policy.
- `template<typename TreeType >`
`static size_t GetBestChild (const TreeType &queryNode, TreeType &referenceNode)`
Return the best child according to this sort policy.
- `static bool IsBetter (const double value, const double ref)`
Return whether or not value is "better" than ref.
- `static double Relax (const double value, const double epsilon)`
Return the given value relaxed.
- `static double WorstDistance ()`
Return what should represent the worst possible distance with this particular sort policy.

39.373.1 Detailed Description

This class implements the necessary methods for the SortPolicy template parameter of the **NeighborSearch** (p. 1627) class.

The sorting policy here is that the minimum distance is the best (so, when used with **NeighborSearch** (p. 1627), the output is nearest neighbors).

This class is also meant to serve as a guide to implement a custom SortPolicy. All of the methods implemented here must be implemented by any other SortPolicy classes.

Definition at line 31 of file nearest_neighbor_sort.hpp.

39.373.2 Member Function Documentation

39.373.2.1 BestDistance()

```
static double BestDistance ( ) [inline], [static]
```

Return what should represent the best possible distance with this particular sort policy.

In our case, this should be the minimum possible distance, 0.0.

Returns

0.0

Definition at line 142 of file nearest_neighbor_sort.hpp.

39.373.2.2 BestNodeToNodeDistance() [1/3]

```
static double BestNodeToNodeDistance (
    const TreeType * queryNode,
    const TreeType * referenceNode ) [static]
```

Return the best possible distance between two nodes.

In our case, this is the minimum distance between the two tree nodes using the given distance function.

Referenced by NearestNS::IsBetter().

39.373.2.3 BestNodeToNodeDistance() [2/3]

```
static double BestNodeToNodeDistance (
    const TreeType * queryNode,
    const TreeType * referenceNode,
    const double centerToCenterDistance ) [static]
```

Return the best possible distance between two nodes, given that the distance between the centers of the two nodes has already been calculated.

This is used in conjunction with trees that have self-children (like cover trees).

39.373.2.4 BestNodeToNodeDistance() [3/3]

```
static double BestNodeToNodeDistance (
    const TreeType * queryNode,
    const TreeType * referenceNode,
    const TreeType * referenceChildNode,
    const double centerToCenterDistance ) [static]
```

Return the best possible distance between the query node and the reference child node given the base case distance between the query node and the reference node.

TreeType::ParentDistance() must be implemented to use this.

Parameters

<i>queryNode</i>	Query node.
<i>referenceNode</i>	Reference node.
<i>referenceChildNode</i>	Child of reference node which is being inspected.
<i>centerToCenterDistance</i>	Distance between centers of query node and reference node.

39.373.2.5 BestPointToNodeDistance() [1/2]

```
static double BestPointToNodeDistance (
    const VecType & queryPoint,
    const TreeType * referenceNode ) [static]
```

Return the best possible distance between a node and a point.

In our case, this is the minimum distance between the tree node and the point using the given distance function.

Referenced by NearestNS::IsBetter().

39.373.2.6 BestPointToNodeDistance() [2/2]

```
static double BestPointToNodeDistance (
    const VecType & queryPoint,
    const TreeType * referenceNode,
    const double pointToCenterDistance ) [static]
```

Return the best possible distance between a point and a node, given that the distance between the point and the center of the node has already been calculated.

This is used in conjunction with trees that have self-children (like cover trees).

39.373.2.7 CombineBest()

```
static double CombineBest (
    const double a,
    const double b ) [inline], [static]
```

Return the best combination of the two distances.

Definition at line 147 of file nearest_neighbor_sort.hpp.

39.373.2.8 CombineWorst()

```
static double CombineWorst (
    const double a,
    const double b ) [inline], [static]
```

Return the worst combination of the two distances.

Definition at line 155 of file nearest_neighbor_sort.hpp.

39.373.2.9 ConvertToDistance()

```
static double ConvertToDistance (
    const double score ) [inline], [static]
```

Convert the given score to a distance.

This is the inverse of the operation provided by **ConvertToScore()** (p. 1625). For nearest neighbor search, there is no need for any change.

Definition at line 192 of file nearest_neighbor_sort.hpp.

39.373.2.10 ConvertToScore()

```
static double ConvertToScore (
    const double distance ) [inline], [static]
```

Convert the given distance into a score.

Lower scores are better, so in the case of nearest neighbor sort where lower distances are better, we just return the distance.

Definition at line 182 of file nearest_neighbor_sort.hpp.

39.373.2.11 GetBestChild() [1/2]

```
static size_t GetBestChild (
    const VecType & queryPoint,
    TreeType & referenceNode ) [inline], [static]
```

Return the best child according to this sort policy.

In this case it will return the one with the minimum distance.

Definition at line 111 of file nearest_neighbor_sort.hpp.

39.373.2.12 GetBestChild() [2/2]

```
static size_t GetBestChild (
    const TreeType & queryNode,
    TreeType & referenceNode ) [inline], [static]
```

Return the best child according to this sort policy.

In this case it will return the one with the minimum distance.

Definition at line 121 of file nearest_neighbor_sort.hpp.

39.373.2.13 IsBetter()

```
static bool IsBetter (
    const double value,
    const double ref ) [inline], [static]
```

Return whether or not value is "better" than ref.

In this case, that means that the value is less than or equal to the reference.

Parameters

<i>value</i>	Value to compare
<i>ref</i>	Value to compare with

Returns

bool indicating whether or not ($value \leq ref$).

Definition at line 43 of file nearest_neighbor_sort.hpp.

References NearestNS::BestNodeToNodeDistance(), and NearestNS::BestPointToNodeDistance().

39.373.2.14 Relax()

```
static double Relax (
    const double value,
    const double epsilon ) [inline], [static]
```

Return the given value relaxed.

Parameters

<i>value</i>	Value to relax.
<i>epsilon</i>	Relative error (non-negative).

Returns

double Value relaxed.

Definition at line 170 of file nearest_neighbor_sort.hpp.

39.373.2.15 WorstDistance()

```
static double WorstDistance ( ) [inline], [static]
```

Return what should represent the worst possible distance with this particular sort policy.

In our case, this should be the maximum possible distance, DBL_MAX.

Returns

DBL_MAX

Definition at line 133 of file nearest_neighbor_sort.hpp.

_sort.hpp**

39.374 NeighborSearch< SortPolicy, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTreeTraversalType > Class Template Reference↵

The **NeighborSearch** (p. 1627) class is a template class for performing distance-based neighbor searches.

Inheritance diagram for NeighborSearch< SortPolicy, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTreeTraversalType >:

Public Types

- typedef TreeType< MetricType, **NeighborSearchStat**< SortPolicy >, MatType > **Tree**
Convenience typedef.

Public Member Functions

- **NeighborSearch** (MatType referenceSet, const **NeighborSearchMode** mode= **DUAL_TREE_MODE**, const double epsilon=0, const MetricType metric=MetricType())
*Initialize the **NeighborSearch** (p. 1627) object, passing a reference dataset (this is the dataset which is searched).*
- **NeighborSearch** (**Tree** referenceTree, const **NeighborSearchMode** mode= **DUAL_TREE_MODE**, const double epsilon=0, const MetricType metric=MetricType())
*Initialize the **NeighborSearch** (p. 1627) object with a copy of the given pre-constructed reference tree (this is the tree built on the points that will be searched).*
- **NeighborSearch** (const **NeighborSearchMode** mode= **DUAL_TREE_MODE**, const double epsilon=0, const MetricType metric=MetricType())
*Create a **NeighborSearch** (p. 1627) object without any reference data.*
- **NeighborSearch** (const **NeighborSearch** &other)
*Construct the **NeighborSearch** (p. 1627) object by copying the given **NeighborSearch** (p. 1627) object.*
- **NeighborSearch** (**NeighborSearch** &&other)
*Construct the **NeighborSearch** (p. 1627) object by taking ownership of the given **NeighborSearch** (p. 1627) object.*
- **~NeighborSearch** ()
*Delete the **NeighborSearch** (p. 1627) object.*
- size_t **BaseCases** () const
Return the total number of base case evaluations performed during the last search.
- double **Epsilon** () const
Access the relative error to be considered in approximate search.

- double & **Epsilon** ()
Modify the relative error to be considered in approximate search.
- **NeighborSearch** & **operator=** (const **NeighborSearch** &other)
*Copy the given **NeighborSearch** (p. 1627) object.*
- **NeighborSearch** & **operator=** (**NeighborSearch** &&other)
*Take ownership of the given **NeighborSearch** (p. 1627) object.*
- const MatType & **ReferenceSet** () const
Access the reference dataset.
- const **Tree** & **ReferenceTree** () const
Access the reference tree.
- **Tree** & **ReferenceTree** ()
Modify the reference tree.
- size_t **Scores** () const
Return the number of node combination scores during the last search.
- void **Search** (const MatType &querySet, const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances)
For each point in the query set, compute the nearest neighbors and store the output in the given matrices.
- void **Search** (**Tree** &queryTree, const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances, bool sameSet=false)
Given a pre-built query tree, search for the nearest neighbors of each point in the query tree, storing the output in the given matrices.
- void **Search** (const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances)
Search for the nearest neighbors of every point in the reference set.
- **NeighborSearchMode** **SearchMode** () const
Access the search mode.
- **NeighborSearchMode** & **SearchMode** ()
Modify the search mode.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
*Serialize the **NeighborSearch** (p. 1627) model.*
- void **Train** (MatType referenceSet)
Set the reference set to a new reference set, and build a tree if necessary.
- void **Train** (**Tree** referenceTree)
Set the reference tree to a new reference tree.

Static Public Member Functions

- static double **EffectiveError** (arma::mat &foundDistances, arma::mat &realDistances)
Calculate the average relative error (effective error) between the distances calculated and the true distances provided.
- static double **Recall** (arma::Mat< size_t > &foundNeighbors, arma::Mat< size_t > &realNeighbors)
Calculate the recall (% of neighbors found) given the list of found neighbors and the true set of neighbors.

39.374.1 Detailed Description

```
template<typename SortPolicy = NearestNeighborSort, typename MetricType = mlpack::metric::EuclideanDistance, typename MatType = arma::mat, template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType = tree::KDTree, template< typename RuleType > class DualTreeTraversalType = TreeType<MetricType, NeighborSearchStat<SortPolicy>, MatType>::template DualTreeTraverser, template< typename RuleType > class SingleTreeTraversalType = TreeType<MetricType, NeighborSearchStat<SortPolicy>, MatType>::template SingleTreeTraverser>
class mlpack::neighbor::NeighborSearch< SortPolicy, MetricType, MatType, TreeType, DualTreeTraversalType, SingleTreeTraversalType >
```

The **NeighborSearch** (p. 1627) class is a template class for performing distance-based neighbor searches.

It takes a query dataset and a reference dataset (or just a reference dataset) and, for each point in the query dataset, finds the *k* neighbors in the reference dataset which have the 'best' distance according to a given sorting policy. A constructor is given which takes only a reference dataset, and if that constructor is used, the given reference dataset is also used as the query dataset.

The template parameters *SortPolicy* and *Metric* define the sort function used and the metric (distance function) used. More information on those classes can be found in the *NearestNeighborSort* class and the **kernel::ExampleKernel** (p. 1421) class.

Template Parameters

<i>SortPolicy</i>	The sort policy for distances; see <i>NearestNeighborSort</i> .
<i>MetricType</i>	The metric to use for computation.
<i>MatType</i>	The type of data matrix.
<i>TreeType</i>	The tree type to use; must adhere to the <i>TreeType</i> API.
<i>DualTreeTraversalType</i>	The type of dual tree traversal to use (defaults to the tree's default traverser).
<i>SingleTreeTraversalType</i>	The type of single tree traversal to use (defaults to the tree's default traverser).

Definition at line 83 of file *neighbor_search.hpp*.

39.374.2 Member Typedef Documentation

39.374.2.1 Tree

```
typedef TreeType<MetricType, NeighborSearchStat<SortPolicy>, MatType> Tree
```

Convenience typedef.

Definition at line 87 of file *neighbor_search.hpp*.

39.374.3 Constructor & Destructor Documentation

39.374.3.1 NeighborSearch() [1/5]

```
NeighborSearch (
    MatType referenceSet,
    const NeighborSearchMode mode = DUAL_TREE_MODE,
    const double epsilon = 0,
    const MetricType metric = MetricType() )
```

Initialize the **NeighborSearch** (p. 1627) object, passing a reference dataset (this is the dataset which is searched).

Optionally, perform the computation in a different mode. An initialized distance metric can be given, for cases where the metric has internal data (i.e. the distance::MahalanobisDistance class).

This method will move the matrices to internal copies, which are rearranged during tree-building. You can avoid creating an extra copy by pre-constructing the trees, passing std::move(yourReferenceSet).

Parameters

<i>referenceSet</i>	Set of reference points.
<i>mode</i>	Neighbor search mode.
<i>epsilon</i>	Relative approximate error (non-negative).
<i>metric</i>	An optional instance of the MetricType class.

39.374.3.2 NeighborSearch() [2/5]

```
NeighborSearch (
    Tree referenceTree,
    const NeighborSearchMode mode = DUAL_TREE_MODE,
    const double epsilon = 0,
    const MetricType metric = MetricType() )
```

Initialize the **NeighborSearch** (p. 1627) object with a copy of the given pre-constructed reference tree (this is the tree built on the points that will be searched).

Optionally, choose to use single-tree mode. Naive mode is not available as an option for this constructor. Additionally, an instantiated distance metric can be given, for cases where the distance metric holds data.

This method will copy the given tree. When copies must absolutely be avoided, you can avoid this copy, while taking ownership of the given tree, by passing std::move(yourReferenceTree)

Note

Mapping the points of the matrix back to their original indices is not done when this constructor is used, so if the tree type you are using maps points (like BinarySpaceTree), then you will have to perform the re-mapping manually.

Parameters

<i>referenceTree</i>	Pre-built tree for reference points.
<i>mode</i>	Neighbor search mode.
<i>epsilon</i>	Relative approximate error (non-negative).
<i>metric</i>	Instantiated distance metric.

39.374.3.3 NeighborSearch() [3/5]

```

NeighborSearch (
    const NeighborSearchMode mode = DUAL_TREE_MODE,
    const double epsilon = 0,
    const MetricType metric = MetricType() )

```

Create a **NeighborSearch** (p. 1627) object without any reference data.

If **Search()** (p. 1636) is called before a reference set is set with **Train()** (p. 1638), an exception will be thrown.

Parameters

<i>mode</i>	Neighbor search mode.
<i>epsilon</i>	Relative approximate error (non-negative).
<i>metric</i>	Instantiated metric.

39.374.3.4 NeighborSearch() [4/5]

```

NeighborSearch (
    const NeighborSearch< SortPolicy, MetricType, MatType, TreeType, DualTreeTraversal↵
Type, SingleTreeTraversalType > & other )

```

Construct the **NeighborSearch** (p. 1627) object by copying the given **NeighborSearch** (p. 1627) object.

Parameters

<i>other</i>	NeighborSearch (p. 1627) object to copy.
--------------	---

39.374.3.5 NeighborSearch() [5/5]

```

NeighborSearch (

```

```
NeighborSearch< SortPolicy, MetricType, MatType, TreeType, DualTreeTraversalType,
SingleTreeTraversalType > && other )
```

Construct the **NeighborSearch** (p. 1627) object by taking ownership of the given **NeighborSearch** (p. 1627) object.

Parameters

<i>other</i>	NeighborSearch (p. 1627) object to take ownership of.
--------------	--

39.374.3.6 ~NeighborSearch()

```
~ NeighborSearch ( )
```

Delete the **NeighborSearch** (p. 1627) object.

The tree is the only member we are responsible for deleting. The others will take care of themselves.

39.374.4 Member Function Documentation

39.374.4.1 BaseCases()

```
size_t BaseCases ( ) const [inline]
```

Return the total number of base case evaluations performed during the last search.

Definition at line 310 of file neighbor_search.hpp.

39.374.4.2 EffectiveError()

```
static double EffectiveError (
    arma::mat & foundDistances,
    arma::mat & realDistances ) [static]
```

Calculate the average relative error (effective error) between the distances calculated and the true distances provided.

The input matrices must have the same size.

Cases where the true distance is zero (the same point) or the calculated distance is SortPolicy::WorstDistance() (didn't find enough points) will be ignored.

Parameters

<i>foundDistances</i>	Matrix storing lists of calculated distances for each query point.
<i>realDistances</i>	Matrix storing lists of true best distances for each query point.

Returns

Average relative error.

39.374.4.3 Epsilon() [1/2]

```
double Epsilon ( ) const [inline]
```

Access the relative error to be considered in approximate search.

Definition at line 321 of file neighbor_search.hpp.

39.374.4.4 Epsilon() [2/2]

```
double& Epsilon ( ) [inline]
```

Modify the relative error to be considered in approximate search.

Definition at line 323 of file neighbor_search.hpp.

39.374.4.5 operator=() [1/2]

```
NeighborSearch& operator= (
    const NeighborSearch< SortPolicy, MetricType, MatType, TreeType, DualTreeTraversal↔
Type, SingleTreeTraversalType > & other )
```

Copy the given **NeighborSearch** (p. 1627) object.

Parameters

<i>other</i>	NeighborSearch (p. 1627) object to copy.
--------------	---

39.374.4.6 operator=() [2/2]

```
NeighborSearch& operator= (
    NeighborSearch< SortPolicy, MetricType, MatType, TreeType, DualTreeTraversalType,
    SingleTreeTraversalType > && other )
```

Take ownership of the given **NeighborSearch** (p. 1627) object.

Parameters

<i>other</i>	NeighborSearch (p. 1627) object to take ownership of.
--------------	--

39.374.4.7 Recall()

```
static double Recall (
    arma::Mat< size_t > & foundNeighbors,
    arma::Mat< size_t > & realNeighbors ) [static]
```

Calculate the recall (% of neighbors found) given the list of found neighbors and the true set of neighbors.

The recall returned will be in the range [0, 1].

Parameters

<i>foundNeighbors</i>	Matrix storing lists of calculated neighbors for each query point.
<i>realNeighbors</i>	Matrix storing lists of true best neighbors for each query point.

Returns

Recall.

39.374.4.8 ReferenceSet()

```
const MatType& ReferenceSet ( ) const [inline]
```

Access the reference dataset.

Definition at line 326 of file neighbor_search.hpp.

39.374.4.9 ReferenceTree() [1/2]

```
const Tree& ReferenceTree ( ) const [inline]
```

Access the reference tree.

Definition at line 329 of file neighbor_search.hpp.

39.374.4.10 ReferenceTree() [2/2]

```
Tree& ReferenceTree ( ) [inline]
```

Modify the reference tree.

Definition at line 331 of file neighbor_search.hpp.

39.374.4.11 Scores()

```
size_t Scores ( ) const [inline]
```

Return the number of node combination scores during the last search.

Definition at line 313 of file neighbor_search.hpp.

39.374.4.12 Search() [1/3]

```
void Search (
    const MatType & querySet,
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & distances )
```

For each point in the query set, compute the nearest neighbors and store the output in the given matrices.

The matrices will be set to the size of n columns by k rows, where n is the number of points in the query dataset and k is the number of neighbors being searched for.

If querySet contains only a few query points, the extra cost of building a tree on the points for dual-tree search may not be warranted, and it may be worthwhile to set singleMode = false (either in the constructor or with SingleMode()).

Parameters

<i>querySet</i>	Set of query points (can be just one point).
<i>k</i>	Number of neighbors to search for.
<i>neighbors</i>	Matrix storing lists of neighbors for each query point.
<i>distances</i>	Matrix storing distances of neighbors for each query point.

Referenced by LMetricSearch< TPower >::Search(), CosineSearch::Search(), and PearsonSearch::Search().

39.374.4.13 Search() [2/3]

```
void Search (
    Tree & queryTree,
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & distances,
    bool sameSet = false )
```

Given a pre-built query tree, search for the nearest neighbors of each point in the query tree, storing the output in the given matrices.

The matrices will be set to the size of n columns by k rows, where n is the number of points in the query dataset and k is the number of neighbors being searched for.

Note that if you are calling **Search()** (p. 1636) multiple times with a single query tree, you need to reset the bounds in the statistic of each query node, otherwise the result may be wrong! You can do this by calling TreeType::Stat()::Reset() on each node in the query tree.

Parameters

<i>queryTree</i>	Tree built on query points.
<i>k</i>	Number of neighbors to search for.
<i>neighbors</i>	Matrix storing lists of neighbors for each query point.
<i>distances</i>	Matrix storing distances of neighbors for each query point.
<i>sameSet</i>	Denotes whether or not the reference and query sets are the same.

39.374.4.14 Search() [3/3]

```
void Search (
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & distances )
```

Search for the nearest neighbors of every point in the reference set.

This is basically equivalent to calling any other overload of **Search()** (p. 1636) with the reference set as the query set; so, this lets you do all-k-nearest-neighbors search. The results are stored in the given matrices. The matrices will be set to the size of n columns by k rows, where n is the number of points in the query dataset and k is the number of neighbors being searched for.

Parameters

<i>k</i>	Number of neighbors to search for.
<i>neighbors</i>	Matrix storing lists of neighbors for each query point.
<i>distances</i>	Matrix storing distances of neighbors for each query point.

39.374.4.15 SearchMode() [1/2]

```
NeighborSearchMode SearchMode ( ) const [inline]
```

Access the search mode.

Definition at line 316 of file neighbor_search.hpp.

39.374.4.16 SearchMode() [2/2]

```
NeighborSearchMode& SearchMode ( ) [inline]
```

Modify the search mode.

Definition at line 318 of file neighbor_search.hpp.

39.374.4.17 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the **NeighborSearch** (p. 1627) model.

Referenced by NeighborSearch< neighbor::NearestNeighborSort, metric::LMetric< TPower, true > >::Reference←Tree().

39.374.4.18 Train() [1/2]

```
void Train (
    MatType referenceSet )
```

Set the reference set to a new reference set, and build a tree if necessary.

The dataset is copied by default, but the copy can be avoided by transferring the ownership of the dataset using `std::move()`. This method is called '**Train()** (p. 1638)' in order to match the rest of the mlpack abstractions, even though calling this "training" is maybe a bit of a stretch.

Parameters

<i>referenceSet</i>	New set of reference data.
---------------------	----------------------------

Referenced by `CosineSearch::CosineSearch()`, and `PearsonSearch::PearsonSearch()`.

39.374.4.19 `Train()` [2/2]

```
void Train (
    Tree referenceTree )
```

Set the reference tree to a new reference tree.

The tree is copied by default, but the copy can be avoided by using `std::move()` to transfer the ownership of the tree. This method is called '**Train()**' (p. 1638) in order to match the rest of the `mlpack` abstractions, even though calling this "training" is maybe a bit of a stretch.

Parameters

<i>referenceTree</i>	Pre-built tree for reference points.
----------------------	--------------------------------------

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/neighbor_search/neighbor_search.hpp`

39.375 `NeighborSearchRules< SortPolicy, MetricType, TreeType >` Class Template Reference

The **NeighborSearchRules** (p. 1640) class is a template helper class used by **NeighborSearch** (p. 1627) class when performing distance-based neighbor searches.

Classes

- struct **CandidateCmp**
Compare two candidates based on the distance.

Public Types

- typedef **tree::TraversallInfo< TreeType >** **TraversallInfoType**
Convenience typedef.

Public Member Functions

- **NeighborSearchRules** (const typename TreeType::Mat & **referenceSet**, const typename TreeType::Mat & **querySet**, const size_t **k**, MetricType & **metric**, const double **epsilon**=0, const bool **sameSet**=false)
*Construct the **NeighborSearchRules** (p. 1640) object.*
- double **BaseCase** (const size_t queryIndex, const size_t referenceIndex)
Get the distance from the query point to the reference point.
- size_t **BaseCases** () const
Get the number of base cases that have been performed.
- size_t & **BaseCases** ()
Modify the number of base cases that have been performed.
- size_t **GetBestChild** (const size_t queryIndex, TreeType &referenceNode)
Get the child node with the best score.
- size_t **GetBestChild** (const TreeType &queryNode, TreeType &referenceNode)
Get the child node with the best score.
- void **GetResults** (arma::Mat< size_t > &neighbors, arma::mat &distances)
Store the list of candidates for each query point in the given matrices.
- double **Rescore** (const size_t queryIndex, TreeType &referenceNode, const double oldScore) const
Re-evaluate the score for recursion order.
- double **Rescore** (TreeType &queryNode, TreeType &referenceNode, const double oldScore) const
Re-evaluate the score for recursion order.
- double **Score** (const size_t queryIndex, TreeType &referenceNode)
Get the score for recursion order.
- double **Score** (TreeType &queryNode, TreeType &referenceNode)
Get the score for recursion order.
- size_t **Scores** () const
Get the number of scores that have been performed.
- size_t & **Scores** ()
Modify the number of scores that have been performed.
- const **TraversallInfoType** & **TraversallInfo** () const
Get the traversal info.
- **TraversallInfoType** & **TraversallInfo** ()
Modify the traversal info.

Protected Types

- typedef std::pair< double, size_t > **Candidate**
Candidate represents a possible candidate neighbor (distance, index).
- typedef std::priority_queue< **Candidate**, std::vector< **Candidate** >, **CandidateCmp** > **CandidateList**
Use a priority queue to represent the list of candidate neighbors.

Protected Member Functions

- double **CalculateBound** (TreeType &queryNode) const
Recalculate the bound for a given query node.
- void **InsertNeighbor** (const size_t queryIndex, const size_t neighbor, const double distance)
Helper function to insert a point into the list of candidate points.

Protected Attributes

- `size_t` **baseCases**
The number of base cases that have been performed.
- `std::vector< CandidateList >` **candidates**
Set of candidate neighbors for each point.
- `const double` **epsilon**
Relative error to be considered in approximate search.
- `const size_t` **k**
Number of neighbors to search for.
- `double` **lastBaseCase**
The last base case result.
- `size_t` **lastQueryIndex**
*The last query point **BaseCase()** (p. 1644) was called with.*
- `size_t` **lastReferenceIndex**
*The last reference point **BaseCase()** (p. 1644) was called with.*
- `MetricType` & **metric**
The instantiated metric.
- `const TreeType::Mat` & **querySet**
The query set.
- `const TreeType::Mat` & **referenceSet**
The reference set.
- `bool` **sameSet**
Denotes whether or not the reference and query sets are the same.
- `size_t` **scores**
The number of scores that have been performed.
- `TraversalInfoType` **traversalInfo**
*Traversal info for the parent combination; this is updated by the traversal before each call to **Score()** (p. 1647).*

39.375.1 Detailed Description

```
template<typename SortPolicy, typename MetricType, typename TreeType>
class mlpack::neighbor::NeighborSearchRules< SortPolicy, MetricType, TreeType >
```

The **NeighborSearchRules** (p. 1640) class is a template helper class used by **NeighborSearch** (p. 1627) class when performing distance-based neighbor searches.

For each point in the query dataset, it keeps track of the k neighbors in the reference dataset which have the 'best' distance according to a given sorting policy.

Template Parameters

<i>SortPolicy</i>	The sort policy for distances.
<i>MetricType</i>	The metric to use for computation.
<i>TreeType</i>	The tree type to use; must adhere to the <code>TreeType</code> API.

Definition at line 35 of file neighbor_search_rules.hpp.

39.375.2 Member Typedef Documentation

39.375.2.1 Candidate

```
typedef std::pair<double, size_t> Candidate [protected]
```

Candidate represents a possible candidate neighbor (distance, index).

Definition at line 168 of file neighbor_search_rules.hpp.

39.375.2.2 CandidateList

```
typedef std::priority_queue< Candidate, std::vector< Candidate>, CandidateCmp> CandidateList [protected]
```

Use a priority queue to represent the list of candidate neighbors.

Definition at line 180 of file neighbor_search_rules.hpp.

39.375.2.3 TraversalInfoType

```
typedef tree::TraversalInfo<TreeType> TraversalInfoType
```

Convenience typedef.

Definition at line 153 of file neighbor_search_rules.hpp.

39.375.3 Constructor & Destructor Documentation

39.375.3.1 NeighborSearchRules()

```
NeighborSearchRules (  
    const typename TreeType::Mat & referenceSet,  
    const typename TreeType::Mat & querySet,  
    const size_t k,  
    MetricType & metric,  
    const double epsilon = 0,  
    const bool sameSet = false )
```

Construct the **NeighborSearchRules** (p. 1640) object.

This is usually done from within the **NeighborSearch** (p. 1627) class at search time.

Parameters

<i>referenceSet</i>	Set of reference data.
<i>querySet</i>	Set of query data.
<i>k</i>	Number of neighbors to search for.
<i>metric</i>	Instantiated metric.
<i>epsilon</i>	Relative approximate error.
<i>sameSet</i>	If true, the query and reference set are taken to be the same, and a query point will not return itself in the results.

39.375.4 Member Function Documentation

39.375.4.1 BaseCase()

```
double BaseCase (
    const size_t queryIndex,
    const size_t referenceIndex )
```

Get the distance from the query point to the reference point.

This will update the list of candidates with the new point if appropriate and will track the number of base cases (number of points evaluated).

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceIndex</i>	Index of reference point.

39.375.4.2 BaseCases() [1/2]

```
size_t BaseCases ( ) const [inline]
```

Get the number of base cases that have been performed.

Definition at line 143 of file neighbor_search_rules.hpp.

References NeighborSearchRules< SortPolicy, MetricType, TreeType >::baseCases.

39.375.4.3 BaseCases() [2/2]

```
size_t& BaseCases ( ) [inline]
```

Modify the number of base cases that have been performed.

Definition at line 145 of file neighbor_search_rules.hpp.

References NeighborSearchRules< SortPolicy, MetricType, TreeType >::baseCases.

39.375.4.4 CalculateBound()

```
double CalculateBound (
    TreeType & queryNode ) const [protected]
```

Recalculate the bound for a given query node.

39.375.4.5 GetBestChild() [1/2]

```
size_t GetBestChild (
    const size_t queryIndex,
    TreeType & referenceNode )
```

Get the child node with the best score.

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceNode</i>	Candidate node to be recursed into.

39.375.4.6 GetBestChild() [2/2]

```
size_t GetBestChild (
    const TreeType & queryNode,
    TreeType & referenceNode )
```

Get the child node with the best score.

Parameters

<i>queryNode</i>	Node to be considered.
<i>referenceNode</i>	Candidate node to be recursed into.

39.375.4.7 GetResults()

```
void GetResults (
    arma::Mat< size_t > & neighbors,
    arma::mat & distances )
```

Store the list of candidates for each query point in the given matrices.

Parameters

<i>neighbors</i>	Matrix storing lists of neighbors for each query point.
<i>distances</i>	Matrix storing distances of neighbors for each query point.

39.375.4.8 InsertNeighbor()

```
void InsertNeighbor (
    const size_t queryIndex,
    const size_t neighbor,
    const double distance ) [protected]
```

Helper function to insert a point into the list of candidate points.

Parameters

<i>queryIndex</i>	Index of point whose neighbors we are inserting into.
<i>neighbor</i>	Index of reference point which is being inserted.
<i>distance</i>	Distance from query point to reference point.

39.375.4.9 Rescore() [1/2]

```
double Rescore (
    const size_t queryIndex,
```

```
TreeType & referenceNode,
const double oldScore ) const
```

Re-evaluate the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned). This is used when the score has already been calculated, but another recursion may have modified the bounds for pruning. So the old score is checked against the new pruning bound.

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceNode</i>	Candidate node to be recursed into.
<i>oldScore</i>	Old score produced by Score() (p. 1647) (or Rescore() (p. 1646)).

39.375.4.10 Rescore() [2/2]

```
double Rescore (
    TreeType & queryNode,
    TreeType & referenceNode,
    const double oldScore ) const
```

Re-evaluate the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned). This is used when the score has already been calculated, but another recursion may have modified the bounds for pruning. So the old score is checked against the new pruning bound.

Parameters

<i>queryNode</i>	Candidate query node to recurse into.
<i>referenceNode</i>	Candidate reference node to recurse into.
<i>oldScore</i>	Old score produced by Socre() (or Rescore() (p. 1646)).

39.375.4.11 Score() [1/2]

```
double Score (
    const size_t queryIndex,
    TreeType & referenceNode )
```

Get the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned).

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceNode</i>	Candidate node to be recursed into.

39.375.4.12 Score() [2/2]

```
double Score (
    TreeType & queryNode,
    TreeType & referenceNode )
```

Get the score for recursion order.

A low score indicates priority for recursionm while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned).

Parameters

<i>queryNode</i>	Candidate query node to recurse into.
<i>referenceNode</i>	Candidate reference node to recurse into.

39.375.4.13 Scores() [1/2]

```
size_t Scores ( ) const [inline]
```

Get the number of scores that have been performed.

Definition at line 148 of file neighbor_search_rules.hpp.

References NeighborSearchRules< SortPolicy, MetricType, TreeType >::scores.

39.375.4.14 Scores() [2/2]

```
size_t& Scores ( ) [inline]
```

Modify the number of scores that have been performed.

Definition at line 150 of file neighbor_search_rules.hpp.

References NeighborSearchRules< SortPolicy, MetricType, TreeType >::scores.

39.375.4.15 TraversalInfo() [1/2]

```
const TraversalInfoType& TraversalInfo ( ) const [inline]
```

Get the traversal info.

Definition at line 156 of file neighbor_search_rules.hpp.

References NeighborSearchRules< SortPolicy, MetricType, TreeType >::traversalInfo.

39.375.4.16 TraversalInfo() [2/2]

```
TraversalInfoType& TraversalInfo ( ) [inline]
```

Modify the traversal info.

Definition at line 158 of file neighbor_search_rules.hpp.

References NeighborSearchRules< SortPolicy, MetricType, TreeType >::traversalInfo.

39.375.5 Member Data Documentation

39.375.5.1 baseCases

```
size_t baseCases [protected]
```

The number of base cases that have been performed.

Definition at line 205 of file neighbor_search_rules.hpp.

Referenced by NeighborSearchRules< SortPolicy, MetricType, TreeType >::BaseCases().

39.375.5.2 candidates

```
std::vector< CandidateList> candidates [protected]
```

Set of candidate neighbors for each point.

Definition at line 183 of file neighbor_search_rules.hpp.

39.375.5.3 epsilon

```
const double epsilon [protected]
```

Relative error to be considered in approximate search.

Definition at line 195 of file neighbor_search_rules.hpp.

39.375.5.4 k

```
const size_t k [protected]
```

Number of neighbors to search for.

Definition at line 186 of file neighbor_search_rules.hpp.

39.375.5.5 lastBaseCase

```
double lastBaseCase [protected]
```

The last base case result.

Definition at line 202 of file neighbor_search_rules.hpp.

39.375.5.6 lastQueryIndex

```
size_t lastQueryIndex [protected]
```

The last query point **BaseCase()** (p. 1644) was called with.

Definition at line 198 of file neighbor_search_rules.hpp.

39.375.5.7 lastReferenceIndex

```
size_t lastReferenceIndex [protected]
```

The last reference point **BaseCase()** (p. 1644) was called with.

Definition at line 200 of file neighbor_search_rules.hpp.

39.375.5.8 metric

```
MetricType& metric [protected]
```

The instantiated metric.

Definition at line 189 of file neighbor_search_rules.hpp.

39.375.5.9 querySet

```
const TreeType::Mat& querySet [protected]
```

The query set.

Definition at line 165 of file neighbor_search_rules.hpp.

39.375.5.10 referenceSet

```
const TreeType::Mat& referenceSet [protected]
```

The reference set.

Definition at line 162 of file neighbor_search_rules.hpp.

39.375.5.11 sameSet

```
bool sameSet [protected]
```

Denotes whether or not the reference and query sets are the same.

Definition at line 192 of file neighbor_search_rules.hpp.

39.375.5.12 scores

```
size_t scores [protected]
```

The number of scores that have been performed.

Definition at line 207 of file neighbor_search_rules.hpp.

Referenced by NeighborSearchRules< SortPolicy, MetricType, TreeType >::Scores().

39.375.5.13 traversalInfo

TraversalInfoType traversalInfo [protected]

Traversal info for the parent combination; this is updated by the traversal before each call to **Score()** (p. 1647).

Definition at line 211 of file neighbor_search_rules.hpp.

Referenced by NeighborSearchRules< SortPolicy, MetricType, TreeType >::TraversalInfo().

The documentation for this class was generated from the following file:

39.376 NeighborSearchRules< SortPolicy, MetricType, TreeType >::CandidateCmp Struct Reference

Compare two candidates based on the distance.

Public Member Functions

- bool **operator()** (const **Candidate** &c1, const **Candidate** &c2)

39.376.1 Detailed Description

```
template<typename SortPolicy, typename MetricType, typename TreeType>
struct mlpack::neighbor::NeighborSearchRules< SortPolicy, MetricType, TreeType >::CandidateCmp
```

Compare two candidates based on the distance.

Definition at line 171 of file neighbor_search_rules.hpp.

39.376.2 Member Function Documentation

39.376.2.1 operator()()

```
bool operator() (
    const Candidate & c1,
    const Candidate & c2 ) [inline]
```

Definition at line 172 of file neighbor_search_rules.hpp.

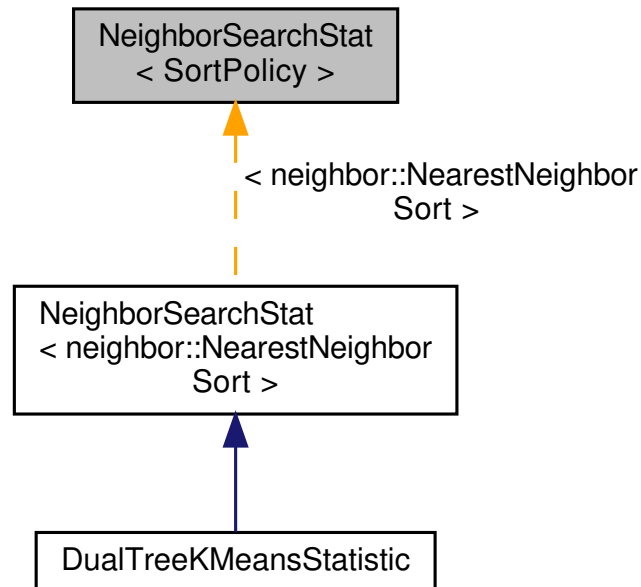

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/neighbor_search/ **neighbor_search_rules.hpp**

39.377 NeighborSearchStat< SortPolicy > Class Template Reference

Extra data for each node in the tree.

Inheritance diagram for NeighborSearchStat< SortPolicy >:

Public Member Functions

- **NeighborSearchStat** ()
Initialize the statistic with the worst possible distance according to our sorting policy.
- template<typename TreeType >
NeighborSearchStat (TreeType &)
Initialization for a fully initialized node.
- double **AuxBound** () const
Get the aux bound.
- double & **AuxBound** ()
Modify the aux bound.
- double **FirstBound** () const
Get the first bound.
- double & **FirstBound** ()
Modify the first bound.
- double **LastDistance** () const
Get the last distance calculation.
- double & **LastDistance** ()
Modify the last distance calculation.
- void **Reset** ()
Reset statistic parameters to initial values.
- double **SecondBound** () const

Get the second bound.

- double & **SecondBound** ()

Modify the second bound.

- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)

Serialize the statistic to/from an archive.

39.377.1 Detailed Description

```
template<typename SortPolicy>
class mlpack::neighbor::NeighborSearchStat< SortPolicy >
```

Extra data for each node in the tree.

For neighbor searches, each node only needs to store a bound on neighbor distances.

Definition at line 26 of file neighbor_search_stat.hpp.

39.377.2 Constructor & Destructor Documentation

39.377.2.1 NeighborSearchStat() [1/2]

```
NeighborSearchStat ( ) [inline]
```

Initialize the statistic with the worst possible distance according to our sorting policy.

Definition at line 48 of file neighbor_search_stat.hpp.

39.377.2.2 NeighborSearchStat() [2/2]

```
NeighborSearchStat (
    TreeType & ) [inline]
```

Initialization for a fully initialized node.

In this case, we don't need to worry about the node.

Definition at line 59 of file neighbor_search_stat.hpp.

39.377.3 Member Function Documentation

39.378 NSModel< SortPolicy > Class Template Reference

The **NSModel** (p. 1657) class provides an easy way to serialize a model, abstracts away the different types of trees, and also reflects the **NeighborSearch** (p. 1627) API.

Public Types

- enum **TreeTypes** {
 KD_TREE,
 COVER_TREE,
 R_TREE,
 R_STAR_TREE,
 BALL_TREE,
 X_TREE,
 HILBERT_R_TREE,
 R_PLUS_TREE,
 R_PLUS_PLUS_TREE,
 VP_TREE,
 RP_TREE,
 MAX_RP_TREE,
 SPILL_TREE,
 UB_TREE,
 OCTREE }

Enum type to identify each accepted tree type.

Public Member Functions

- **NSModel** (**TreeTypes** treeType=TreeTypes::KD_TREE, bool randomBasis=false)
*Initialize the **NSModel** (p. 1657) with the given type and whether or not a random basis should be used.*
- **NSModel** (const **NSModel** &other)
*Copy the given **NSModel** (p. 1657).*
- **NSModel** (**NSModel** &&other)
*Take ownership of the given **NSModel** (p. 1657).*
- **~NSModel** ()
Clean memory, if necessary.
- void **BuildModel** (arma::mat &&referenceSet, const size_t leafSize, const **NeighborSearchMode** searchMode, const double epsilon=0)
Build the reference tree.
- const arma::mat & **Dataset** () const
Expose the dataset.
- double **Epsilon** () const
Expose Epsilon.
- double & **Epsilon** ()
- size_t **LeafSize** () const
Expose leafSize.
- size_t & **LeafSize** ()
- **NSModel** & **operator=** (const **NSModel** &other)
*Copy the given **NSModel** (p. 1657).*
- **NSModel** & **operator=** (**NSModel** &&other)
*Take ownership of the given **NSModel** (p. 1657).*
- bool **RandomBasis** () const
Expose randomBasis.
- bool & **RandomBasis** ()
- double **Rho** () const
Expose rho.
- double & **Rho** ()
- void **Search** (arma::mat &&querySet, const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances)
Perform neighbor search. The query set will be reordered.
- void **Search** (const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances)
Perform monochromatic neighbor search.
- **NeighborSearchMode** **SearchMode** () const
Expose SearchMode.
- **NeighborSearchMode** & **SearchMode** ()
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the neighbor search model.
- double **Tau** () const
Expose tau.
- double & **Tau** ()
- std::string **TreeName** () const
Return a string representation of the current tree type.
- **TreeTypes** **TreeType** () const
Expose treeType.
- **TreeTypes** & **TreeType** ()

39.378.1 Detailed Description

```
template<typename SortPolicy>
class mlpack::neighbor::NSModel< SortPolicy >
```

The **NSModel** (p. 1657) class provides an easy way to serialize a model, abstracts away the different types of trees, and also reflects the **NeighborSearch** (p. 1627) API.

This class is meant to be used by the command-line `mlpack_knn` and `mlpack_kfn` programs, and thus does not have the same complete functionality and flexibility as the **NeighborSearch** (p. 1627) class. So if you are using it outside of `mlpack_knn` and `mlpack_kfn`, be aware that it is limited!

Template Parameters

<i>SortPolicy</i>	The sort policy for distances; see <code>NearestNeighborSort</code> .
-------------------	---

Definition at line 248 of file `ns_model.hpp`.

39.378.2 Member Enumeration Documentation

39.378.2.1 TreeTypes

Definition at line 252 of file ns_model.hpp.

39.378.3 Constructor & Destructor Documentation

39.378.3.1 NSModel() [1/3]

```
NSModel (
    TreeTypes treeType = TreeTypes::KD_TREE,
    bool randomBasis = false )
```

Initialize the **NSModel** (p. 1657) with the given type and whether or not a random basis should be used.

Parameters

<i>treeType</i>	Type of tree to use.
<i>randomBasis</i>	Whether or not to project the points onto a random basis before searching.

39.378.3.2 NSModel() [2/3]

```
NSModel (
    const NSModel< SortPolicy > & other )
```

Copy the given **NSModel** (p. 1657).

Parameters

<i>other</i>	Model to copy.
--------------	----------------

39.378.3.3 NSModel() [3/3]

```
NSModel (
    NSModel< SortPolicy > && other )
```

Take ownership of the given **NSModel** (p. 1657).

Parameters

<i>other</i>	Model to take ownership of.
--------------	-----------------------------

39.378.3.4 ~NSModel()

`~ NSModel ()`

Clean memory, if necessary.

39.378.4 Member Function Documentation

39.378.4.1 BuildModel()

```
void BuildModel (
    arma::mat && referenceSet,
    const size_t leafSize,
    const NeighborSearchMode searchMode,
    const double epsilon = 0 )
```

Build the reference tree.

39.378.4.2 Dataset()

```
const arma::mat& Dataset ( ) const
```

Expose the dataset.

39.378.4.3 Epsilon() [1/2]

```
double Epsilon ( ) const
```

Expose Epsilon.

39.378.4.4 Epsilon() [2/2]

```
double& Epsilon ( )
```

39.378.4.5 LeafSize() [1/2]

```
size_t LeafSize ( ) const [inline]
```

Expose leafSize.

Definition at line 367 of file ns_model.hpp.

39.378.4.6 LeafSize() [2/2]

```
size_t& LeafSize ( ) [inline]
```

Definition at line 368 of file ns_model.hpp.

39.378.4.7 operator=() [1/2]

```
NSModel& operator= (
    const NSModel< SortPolicy > & other )
```

Copy the given **NSModel** (p. 1657).

Parameters

<i>other</i>	Model to copy.
--------------	----------------

39.378.4.8 operator=() [2/2]

```
NSModel& operator= (
    NSModel< SortPolicy > && other )
```

Take ownership of the given **NSModel** (p. 1657).

Parameters

<i>other</i>	Model to take ownership of.
--------------	-----------------------------

39.378.4.9 RandomBasis() [1/2]

```
bool RandomBasis ( ) const [inline]
```

Expose randomBasis.

Definition at line 383 of file ns_model.hpp.

39.378.4.10 RandomBasis() [2/2]

```
bool& RandomBasis ( ) [inline]
```

Definition at line 384 of file ns_model.hpp.

References BOOST_TEMPLATE_CLASS_VERSION().

39.378.4.11 Rho() [1/2]

```
double Rho ( ) const [inline]
```

Expose rho.

Definition at line 375 of file ns_model.hpp.

39.378.4.12 Rho() [2/2]

```
double& Rho ( ) [inline]
```

Definition at line 376 of file ns_model.hpp.

39.378.4.13 Search() [1/2]

```
void Search (
    arma::mat && querySet,
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & distances )
```

Perform neighbor search. The query set will be reordered.

39.378.4.14 Search() [2/2]

```
void Search (
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & distances )
```

Perform monochromatic neighbor search.

39.378.4.15 SearchMode() [1/2]

```
NeighborSearchMode SearchMode ( ) const
```

Expose SearchMode.

39.378.4.16 SearchMode() [2/2]

```
NeighborSearchMode& SearchMode ( )
```

39.378.4.17 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the neighbor search model.

39.378.4.18 `Tau()` [1/2]

```
double Tau ( ) const [inline]
```

Expose tau.

Definition at line 371 of file ns_model.hpp.

39.378.4.19 `Tau()` [2/2]

```
double& Tau ( ) [inline]
```

Definition at line 372 of file ns_model.hpp.

39.378.4.20 `TreeName()`

```
std::string TreeName ( ) const
```

Return a string representation of the current tree type.

39.378.4.21 `TreeType()` [1/2]

```
TreeTypes TreeType ( ) const [inline]
```

Expose treeType.

Definition at line 379 of file ns_model.hpp.

39.378.4.22 `TreeType()` [2/2]

```
TreeTypes& TreeType ( ) [inline]
```

Definition at line 380 of file ns_model.hpp.

39.379 QDAFN< MatType > Class Template Reference

Public Member Functions

- **QDAFN** (const size_t l, const size_t m)
*Construct the **QDAFN** (p. 1666) object but do not train it.*
- **QDAFN** (const MatType &referenceSet, const size_t l, const size_t m)
*Construct the **QDAFN** (p. 1666) object with the given reference set (this is the set that will be searched).*
- const MatType & **CandidateSet** (const size_t t) const
Get the candidate set for the given projection table.
- MatType & **CandidateSet** (const size_t t)
Modify the candidate set for the given projection table. Careful!
- size_t **NumProjections** () const
Get the number of projections.
- void **Search** (const MatType &querySet, const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances)
Search for the k furthest neighbors of the given query set.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the model.
- void **Train** (const MatType &referenceSet, const size_t l=0, const size_t m=0)
*Train the **QDAFN** (p. 1666) model on the given reference set, optionally setting new parameters for the number of projections/tables (l) and the number of elements stored for each projection/table (m).*

39.379.1 Detailed Description

```
template<typename MatType = arma::mat>
class mlpack::neighbor::QDAFN< MatType >
```

Definition at line 34 of file qdafn.hpp.

39.379.2 Constructor & Destructor Documentation

39.379.2.1 QDAFN() [1/2]

```
QDAFN (
    const size_t l,
    const size_t m )
```

Construct the **QDAFN** (p. 1666) object but do not train it.

Be sure to call **Train()** (p. 1668) before calling **Search()** (p. 1668).

Parameters

<i>l</i>	Number of projections.
<i>m</i>	Number of elements to store for each projection.

39.379.2.2 QDAFN() [2/2]

```
QDAFN (
    const MatType & referenceSet,
    const size_t l,
    const size_t m )
```

Construct the **QDAFN** (p. 1666) object with the given reference set (this is the set that will be searched).

Parameters

<i>referenceSet</i>	Set of reference data.
<i>l</i>	Number of projections.
<i>m</i>	Number of elements to store for each projection.

39.379.3 Member Function Documentation

39.379.3.1 CandidateSet() [1/2]

```
const MatType& CandidateSet (
    const size_t t ) const [inline]
```

Get the candidate set for the given projection table.

Definition at line 90 of file qdafn.hpp.

39.379.3.2 CandidateSet() [2/2]

```
MatType& CandidateSet (
    const size_t t ) [inline]
```

Modify the candidate set for the given projection table. Careful!

Definition at line 92 of file qdafn.hpp.

39.379.3.3 NumProjections()

```
size_t NumProjections ( ) const [inline]
```

Get the number of projections.

Definition at line 87 of file qdafn.hpp.

39.379.3.4 Search()

```
void Search (
    const MatType & querySet,
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & distances )
```

Search for the k furthest neighbors of the given query set.

(The query set can contain just one point, that is okay.) The results will be stored in the given neighbors and distances matrices, in the same format as the mlpack **NeighborSearch** (p. 1627) and **LSHSearch** (p. 1609) classes.

39.379.3.5 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the model.

39.379.3.6 Train()

```
void Train (
    const MatType & referenceSet,
    const size_t l = 0,
    const size_t m = 0 )
```

Train the **QDAFN** (p. 1666) model on the given reference set, optionally setting new parameters for the number of projections/tables (l) and the number of elements stored for each projection/table (m).

Parameters

<i>referenceSet</i>	Reference set to train on.
<i>l</i>	Number of projections.
<i>m</i>	Number of elements to store for each projection.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/approx_kfn/ **qdafn.hpp**

39.380 RAModel< SortPolicy > Class Template Reference

The **RAModel** (p. 1669) class provides an abstraction for the **RASearch** (p. 1681) class, abstracting away the `TreeType` parameter and allowing it to be specified at runtime in this class.

Public Types

- enum **TreeTypes** {
KD_TREE,
COVER_TREE,
R_TREE,
R_STAR_TREE,
X_TREE,
HILBERT_R_TREE,
R_PLUS_TREE,
R_PLUS_PLUS_TREE,
UB_TREE,
OCTREE }

*The list of tree types we can use with **RASearch** (p. 1681).*

Public Member Functions

- **RAModel** (**TreeTypes** treeType=`TreeTypes::KD_TREE`, bool randomBasis=false)
*Initialize the **RAModel** (p. 1669) with the given type and whether or not a random basis should be used.*
- **RAModel** (const **RAModel** &other)
*Copy the given **RAModel** (p. 1669).*
- **RAModel** (**RAModel** &&other)
*Take ownership of the given **RAModel** (p. 1669).*
- **~RAModel** ()
Clean memory, if necessary.
- double **Alpha** () const
Get the desired success probability.
- double & **Alpha** ()
Modify the desired success probability.
- void **BuildModel** (arma::mat &&referenceSet, const size_t leafSize, const bool naive, const bool singleMode)
Build the reference tree.
- const arma::mat & **Dataset** () const
Expose the dataset.
- bool **FirstLeafExact** () const
Get whether or not we traverse to the first leaf without approximation.
- bool & **FirstLeafExact** ()

- Modify whether or not we traverse to the first leaf without approximation.*

 - `size_t LeafSize () const`
Get the leaf size (only relevant when the kd-tree is used).
 - `size_t & LeafSize ()`
Modify the leaf size (only relevant when the kd-tree is used).
 - `bool Naive () const`
Get whether or not naive search is being used.
 - `bool & Naive ()`
Modify whether or not naive search is being used.
 - `RAModel & operator= (const RAModel &other)`
Copy the given RAModel (p. 1669).
 - `RAModel & operator= (RAModel &&other)`
Take ownership of the given RAModel (p. 1669).
 - `bool RandomBasis () const`
Get whether or not a random basis is being used.
 - `bool & RandomBasis ()`
Modify whether or not a random basis is being used.
 - `bool SampleAtLeaves () const`
Get whether or not sampling is done at the leaves.
 - `bool & SampleAtLeaves ()`
Modify whether or not sampling is done at the leaves.
 - `void Search (arma::mat &&querySet, const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances)`
Perform rank-approximate neighbor search, taking ownership of the query set.
 - `void Search (const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances)`
Perform rank-approximate neighbor search, using the reference set as the query set.
 - `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialize the model.
 - `bool SingleMode () const`
Get whether or not single-tree search is being used.
 - `bool & SingleMode ()`
Modify whether or not single-tree search is being used.
 - `size_t SingleSampleLimit () const`
Get the limit on the size of a node that can be approximated.
 - `size_t & SingleSampleLimit ()`
Modify the limit on the size of a node that can be approximation.
 - `double Tau () const`
Get the rank-approximation in percentile of the data.
 - `double & Tau ()`
Modify the rank-approximation in percentile of the data.
 - `std::string TreeName () const`
Get the name of the tree type.
 - `TreeTypes TreeType () const`
Get the type of tree being used.
 - `TreeTypes & TreeType ()`
Modify the type of tree being used.

39.380.1 Detailed Description

```
template<typename SortPolicy>
class mlpack::neighbor::RAModel< SortPolicy >
```

The **RAModel** (p. 1669) class provides an abstraction for the **RASearch** (p. 1681) class, abstracting away the `TreeType` parameter and allowing it to be specified at runtime in this class.

This class is written for the sake of the 'allkrann' program, but is not necessarily restricted to that use.

Parameters

<i>SortPolicy</i>	Sorting policy for neighbor searching (see RASearch (p. 1681)).
-------------------	--

Definition at line 271 of file `ra_model.hpp`.

39.380.2 Member Enumeration Documentation

39.380.2.1 TreeTypes

```
enum TreeTypes
```

The list of tree types we can use with **RASearch** (p. 1681).

Does not include ball trees; see #338.

Enumerator

KD_TREE	
COVER_TREE	
R_TREE	
R_STAR_TREE	
X_TREE	
HILBERT_R_TREE	
R_PLUS_TREE	
R_PLUS_PLUS_TREE	
UB_TREE	
OCTREE	

Definition at line 278 of file `ra_model.hpp`.

39.380.3 Constructor & Destructor Documentation

39.380.3.1 **RAModel**() [1/3]

```
RAModel (
    TreeTypes treeType = TreeTypes::KD_TREE,
    bool randomBasis = false )
```

Initialize the **RAModel** (p. 1669) with the given type and whether or not a random basis should be used.

39.380.3.2 **RAModel**() [2/3]

```
RAModel (
    const RAModel< SortPolicy > & other )
```

Copy the given **RAModel** (p. 1669).

Parameters

<i>other</i>	RAModel (p. 1669) to copy.
--------------	-----------------------------------

39.380.3.3 **RAModel**() [3/3]

```
RAModel (
    RAModel< SortPolicy > && other )
```

Take ownership of the given **RAModel** (p. 1669).

Parameters

<i>other</i>	RAModel (p. 1669) to take ownership of.
--------------	--

39.380.3.4 **~RAModel**()

```
~RAModel ( )
```

Clean memory, if necessary.

39.380.4 Member Function Documentation

39.380.4.1 Alpha() [1/2]

```
double Alpha ( ) const
```

Get the desired success probability.

39.380.4.2 Alpha() [2/2]

```
double& Alpha ( )
```

Modify the desired success probability.

39.380.4.3 BuildModel()

```
void BuildModel (
    arma::mat && referenceSet,
    const size_t leafSize,
    const bool naive,
    const bool singleMode )
```

Build the reference tree.

39.380.4.4 Dataset()

```
const arma::mat& Dataset ( ) const
```

Expose the dataset.

39.380.4.5 FirstLeafExact() [1/2]

```
bool FirstLeafExact ( ) const
```

Get whether or not we traverse to the first leaf without approximation.

39.380.4.6 FirstLeafExact() [2/2]

```
bool& FirstLeafExact ( )
```

Modify whether or not we traverse to the first leaf without approximation.

39.380.4.7 LeafSize() [1/2]

```
size_t LeafSize ( ) const
```

Get the leaf size (only relevant when the kd-tree is used).

39.380.4.8 LeafSize() [2/2]

```
size_t& LeafSize ( )
```

Modify the leaf size (only relevant when the kd-tree is used).

39.380.4.9 Naive() [1/2]

```
bool Naive ( ) const
```

Get whether or not naive search is being used.

39.380.4.10 Naive() [2/2]

```
bool& Naive ( )
```

Modify whether or not naive search is being used.

39.380.4.11 operator=() [1/2]

```
RAModel& operator= (
    const RAModel< SortPolicy > & other )
```

Copy the given **RAModel** (p. 1669).

Parameters

<i>other</i>	RAModel (p. 1669) to copy.
--------------	-----------------------------------

39.380.4.12 operator=() [2/2]

```
RAModel& operator= (
    RAModel< SortPolicy > && other )
```

Take ownership of the given **RAModel** (p. 1669).

Parameters

<i>other</i>	RAModel (p. 1669) to take ownership of.
--------------	--

39.380.4.13 RandomBasis() [1/2]

```
bool RandomBasis ( ) const
```

Get whether or not a random basis is being used.

39.380.4.14 RandomBasis() [2/2]

```
bool& RandomBasis ( )
```

Modify whether or not a random basis is being used.

Be sure to rebuild the model using **BuildModel()** (p. 1673).

39.380.4.15 SampleAtLeaves() [1/2]

```
bool SampleAtLeaves ( ) const
```

Get whether or not sampling is done at the leaves.

39.380.4.16 SampleAtLeaves() [2/2]

```
bool& SampleAtLeaves ( )
```

Modify whether or not sampling is done at the leaves.

39.380.4.17 Search() [1/2]

```
void Search (
    arma::mat && querySet,
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & distances )
```

Perform rank-approximate neighbor search, taking ownership of the query set.

39.380.4.18 Search() [2/2]

```
void Search (
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & distances )
```

Perform rank-approximate neighbor search, using the reference set as the query set.

39.380.4.19 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the model.

39.380.4.20 SingleMode() [1/2]

```
bool SingleMode ( ) const
```

Get whether or not single-tree search is being used.

39.380.4.21 SingleMode() [2/2]

```
bool& SingleMode ( )
```

Modify whether or not single-tree search is being used.

39.380.4.22 SingleSampleLimit() [1/2]

```
size_t SingleSampleLimit ( ) const
```

Get the limit on the size of a node that can be approximated.

39.380.4.23 SingleSampleLimit() [2/2]

```
size_t& SingleSampleLimit ( )
```

Modify the limit on the size of a node that can be approximation.

39.380.4.24 Tau() [1/2]

```
double Tau ( ) const
```

Get the rank-approximation in percentile of the data.

39.380.4.25 Tau() [2/2]

```
double& Tau ( )
```

Modify the rank-approximation in percentile of the data.

39.380.4.26 TreeName()

```
std::string TreeName ( ) const
```

Get the name of the tree type.

39.380.4.27 **TreeType()** [1/2]

```
TreeTypes TreeType ( ) const
```

Get the type of tree being used.

39.380.4.28 **TreeType()** [2/2]

```
TreeTypes& TreeType ( )
```

Modify the type of tree being used.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/rann/ **ra_model.hpp**

39.381 **RAQueryStat< SortPolicy >** Class Template Reference

Extra data for each node in the tree.

Public Member Functions

- **RAQueryStat** ()
Initialize the statistic with the worst possible distance according to our sorting policy.
- template<typename TreeType >
RAQueryStat (const TreeType &)
Initialization for a node.
- double **Bound** () const
Get the bound.
- double & **Bound** ()
Modify the bound.
- size_t **NumSamplesMade** () const
Get the number of samples made.
- size_t & **NumSamplesMade** ()
Modify the number of samples made.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the statistic.

39.381.1 Detailed Description

```
template<typename SortPolicy>
class mlpack::neighbor::RAQueryStat< SortPolicy >
```

Extra data for each node in the tree.

For neighbor searches, each node only needs to store a bound on neighbor distances.

Every query is required to make a minimum number of samples to guarantee the desired approximation error. The 'numSamplesMade' keeps track of the minimum number of samples made by all queries in the node in question.

Definition at line 35 of file ra_query_stat.hpp.

39.381.2 Constructor & Destructor Documentation

39.381.2.1 RAQueryStat() [1/2]

```
RAQueryStat ( ) [inline]
```

Initialize the statistic with the worst possible distance according to our sorting policy.

Definition at line 42 of file ra_query_stat.hpp.

39.381.2.2 RAQueryStat() [2/2]

```
RAQueryStat (
    const TreeType & ) [inline]
```

Initialization for a node.

Definition at line 48 of file ra_query_stat.hpp.

39.381.3 Member Function Documentation

39.381.3.1 Bound() [1/2]

```
double Bound ( ) const [inline]
```

Get the bound.

Definition at line 54 of file `ra_query_stat.hpp`.

39.381.3.2 Bound() [2/2]

```
double& Bound ( ) [inline]
```

Modify the bound.

Definition at line 56 of file `ra_query_stat.hpp`.

39.381.3.3 NumSamplesMade() [1/2]

```
size_t NumSamplesMade ( ) const [inline]
```

Get the number of samples made.

Definition at line 59 of file `ra_query_stat.hpp`.

39.381.3.4 NumSamplesMade() [2/2]

```
size_t& NumSamplesMade ( ) [inline]
```

Modify the number of samples made.

Definition at line 61 of file `ra_query_stat.hpp`.

39.381.3.5 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the statistic.

Definition at line 65 of file `ra_query_stat.hpp`.

39.382 RASearch< SortPolicy, MetricType, MatType, TreeType > Class Template Reference

The **RASearch** (p. 1681) class: This class provides a generic manner to perform rank-approximate search via random-sampling.

Public Types

- typedef TreeType< MetricType, **RAQueryStat**< SortPolicy >, MatType > **Tree**
Convenience typedef.

Public Member Functions

- **RASearch** (MatType referenceSet, const bool naive=false, const bool singleMode=false, const double tau=5, const double alpha=0.95, const bool sampleAtLeaves=false, const bool firstLeafExact=false, const size_t singleSampleLimit=20, const MetricType metric=MetricType())
*Initialize the **RASearch** (p. 1681) object, passing both a reference dataset (this is the dataset that will be searched).*
- **RASearch** (**Tree** *referenceTree, const bool singleMode=false, const double tau=5, const double alpha=0.95, const bool sampleAtLeaves=false, const bool firstLeafExact=false, const size_t singleSampleLimit=20, const MetricType metric=MetricType())
*Initialize the **RASearch** (p. 1681) object with the given pre-constructed reference tree.*
- **RASearch** (const bool naive=false, const bool singleMode=false, const double tau=5, const double alpha=0.95, const bool sampleAtLeaves=false, const bool firstLeafExact=false, const size_t singleSampleLimit=20, const MetricType metric=MetricType())
*Create an **RASearch** (p. 1681) object with no reference data.*
- **~RASearch** ()
*Delete the **RASearch** (p. 1681) object.*
- double **Alpha** () const
Get the desired success probability.
- double & **Alpha** ()
Modify the desired success probability.
- bool **FirstLeafExact** () const
Get whether or not we traverse to the first leaf without approximation.
- bool & **FirstLeafExact** ()
Modify whether or not we traverse to the first leaf without approximation.
- bool **Naive** () const
Get whether or not naive (brute-force) search is used.
- bool & **Naive** ()
Modify whether or not naive (brute-force) search is used.
- const MatType & **ReferenceSet** () const
Access the reference set.
- void **ResetQueryTree** (**Tree** *queryTree) const
*This function recursively resets the **RAQueryStat** (p. 1678) of the given query tree to set 'bound' to SortPolicy::WorstDistance and 'numSamplesMade' to 0.*
- bool **SampleAtLeaves** () const
Get whether or not sampling is done at the leaves.
- bool & **SampleAtLeaves** ()

- Modify whether or not sampling is done at the leaves.*
- void **Search** (const MatType &querySet, const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances)
Compute the rank approximate nearest neighbors of each query point in the query set and store the output in the given matrices.
- void **Search** (**Tree** *queryTree, const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances)
Compute the rank approximate nearest neighbors of each point in the pre-built query tree and store the output in the given matrices.
- void **Search** (const size_t k, arma::Mat< size_t > &neighbors, arma::mat &distances)
Compute the rank approximate nearest neighbors of each point in the reference set (that is, the query set is taken to be the reference set), and store the output in the given matrices.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the object.
- bool **SingleMode** () const
Get whether or not single-tree search is used.
- bool & **SingleMode** ()
Modify whether or not single-tree search is used.
- size_t **SingleSampleLimit** () const
Get the limit on the size of a node that can be approximated.
- size_t & **SingleSampleLimit** ()
Modify the limit on the size of a node that can be approximation.
- double **Tau** () const
Get the rank-approximation in percentile of the data.
- double & **Tau** ()
Modify the rank-approximation in percentile of the data.
- void **Train** (MatType referenceSet)
"Train" the model on the given reference set.
- void **Train** (**Tree** *referenceTree)
Set the reference tree to a new reference tree.

39.382.1 Detailed Description

```
template<typename SortPolicy = NearestNeighborSort, typename MetricType = metric::EuclideanDistance, typename MatType =
arma::mat, template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType = tree::KDTree>
class mlpack::neighbor::RASearch< SortPolicy, MetricType, MatType, TreeType >
```

The **RASearch** (p. 1681) class: This class provides a generic manner to perform rank-approximate search via random-sampling.

If the 'naive' option is chosen, this rank-approximate search will be done by randomly sampling from the whole set. If the 'naive' option is not chosen, the sampling is done in a stratified manner in the tree as mentioned in the algorithms in Figure 2 of the following paper:

```
{ram2009rank, title={{Rank-Approximate Nearest Neighbor Search: Retaining Meaning and Speed in High Dimen-
sions}}, author={{Ram, P. and Lee, D. and Ouyang, H. and Gray, A. G.}}, booktitle={{Advances of Neural Information
Processing Systems}}, year={2009} }
```

RASearch (p. 1681) is currently known to not work with ball trees (#356).

Template Parameters

<i>SortPolicy</i>	The sort policy for distances; see NearestNeighborSort.
<i>MetricType</i>	The metric to use for computation.
<i>TreeType</i>	The tree type to use.

Definition at line 71 of file ra_search.hpp.

39.382.2 Member Typedef Documentation

39.382.2.1 Tree

```
typedef TreeType<MetricType, RAQueryStat<SortPolicy>, MatType> Tree
```

Convenience typedef.

Definition at line 75 of file ra_search.hpp.

39.382.3 Constructor & Destructor Documentation

39.382.3.1 RASearch() [1/3]

```
RASearch (
    MatType referenceSet,
    const bool naive = false,
    const bool singleMode = false,
    const double tau = 5,
    const double alpha = 0.95,
    const bool sampleAtLeaves = false,
    const bool firstLeafExact = false,
    const size_t singleSampleLimit = 20,
    const MetricType metric = MetricType() )
```

Initialize the **RASearch** (p. 1681) object, passing both a reference dataset (this is the dataset that will be searched).

Optionally, perform the computation in naive mode or single-tree mode. An initialized distance metric can be given, for cases where the metric has internal data (i.e. the distance::MahalanobisDistance class).

This method will copy the matrices to internal copies, which are rearranged during tree-building. If you don't need to keep the reference dataset, you can use std::move() to remove the overhead of making copies. Using std::move() transfers the ownership of the dataset.

tau, the rank-approximation parameter, specifies that we are looking for k neighbors with probability alpha of being in the top tau percent of nearest neighbors. So, as an example, if our dataset has 1000 points, and we want 5 nearest neighbors with 95% probability of being in the top 5% of nearest neighbors (or, the top 50 nearest neighbors), we set k = 5, tau = 5, and alpha = 0.95.

The method will fail (and throw a std::invalid_argument exception) if the value of tau is too low: tau must be set such that the number of points in the corresponding percentile of the data is greater than k. Thus, if we choose tau = 0.1 with a dataset of 1000 points and k = 5, then we are attempting to choose 5 nearest neighbors out of the closest 1 point – this is invalid.

Parameters

<i>referenceSet</i>	Set of reference points.
<i>naive</i>	If true, the rank-approximate search will be performed by directly sampling the whole set instead of using the stratified sampling on the tree.
<i>singleMode</i>	If true, single-tree search will be used (as opposed to dual-tree search). This is useful when Search() (p. 1688) will be called with few query points.
<i>metric</i>	An optional instance of the MetricType class.
<i>tau</i>	The rank-approximation in percentile of the data. The default value is 5%.
<i>alpha</i>	The desired success probability. The default value is 0.95.
<i>sampleAtLeaves</i>	Sample at leaves for faster but less accurate computation. This defaults to 'false'.
<i>firstLeafExact</i>	Traverse to the first leaf without approximation. This can ensure that the query definitely finds its (near) duplicate if there exists one. This defaults to 'false' for now.
<i>singleSampleLimit</i>	The limit on the largest node that can be approximated by sampling. This defaults to 20.

39.382.3.2 **RASearch()** [2/3]

```

RASearch (
    Tree * referenceTree,
    const bool singleMode = false,
    const double tau = 5,
    const double alpha = 0.95,
    const bool sampleAtLeaves = false,
    const bool firstLeafExact = false,
    const size_t singleSampleLimit = 20,
    const MetricType metric = MetricType() )

```

Initialize the **RASearch** (p. 1681) object with the given pre-constructed reference tree.

It is assumed that the points in the tree's dataset correspond to the reference set. Optionally, choose to use single-tree mode. Naive mode is not available as an option for this constructor; instead, to run naive computation, use a different constructor. Additionally, an instantiated distance metric can be given, for cases where the distance metric holds data.

There is no copying of the data matrices in this constructor (because tree-building is not necessary), so this is the constructor to use when copies absolutely must be avoided.

tau, the rank-approximation parameter, specifies that we are looking for k neighbors with probability alpha of being in the top tau percent of nearest neighbors. So, as an example, if our dataset has 1000 points, and we want 5 nearest neighbors with 95% probability of being in the top 5% of nearest neighbors (or, the top 50 nearest neighbors), we set k = 5, tau = 5, and alpha = 0.95.

The method will fail (and throw a `std::invalid_argument` exception) if the value of tau is too low: tau must be set such that the number of points in the corresponding percentile of the data is greater than k. Thus, if we choose tau = 0.1 with a dataset of 1000 points and k = 5, then we are attempting to choose 5 nearest neighbors out of the closest 1 point – this is invalid.

Note

Tree-building may (at least with `BinarySpaceTree`) modify the ordering of a matrix, so be aware that the results you get from **Search()** (p. 1688) will correspond to the modified matrix.

Parameters

<i>referenceTree</i>	Pre-built tree for reference points.
<i>singleMode</i>	Whether single-tree computation should be used (as opposed to dual-tree computation).
<i>tau</i>	The rank-approximation in percentile of the data. The default value is 5%.
<i>alpha</i>	The desired success probability. The default value is 0.95.
<i>sampleAtLeaves</i>	Sample at leaves for faster but less accurate computation. This defaults to 'false'.
<i>firstLeafExact</i>	Traverse to the first leaf without approximation. This can ensure that the query definitely finds its (near) duplicate if there exists one. This defaults to 'false' for now.
<i>singleSampleLimit</i>	The limit on the largest node that can be approximated by sampling. This defaults to 20.
<i>metric</i>	Instantiated distance metric.

39.382.3.3 RASearch() [3/3]

```

RASearch (
    const bool naive = false,
    const bool singleMode = false,
    const double tau = 5,
    const double alpha = 0.95,
    const bool sampleAtLeaves = false,
    const bool firstLeafExact = false,
    const size_t singleSampleLimit = 20,
    const MetricType metric = MetricType() )

```

Create an **RASearch** (p. 1681) object with no reference data.

If **Search()** (p. 1688) is called before a reference set is set with **Train()** (p. 1691), an exception will be thrown.

Parameters

<i>naive</i>	Whether naive (brute-force) search should be used.
<i>singleMode</i>	Whether single-tree computation should be used (as opposed to dual-tree computation).
<i>tau</i>	The rank-approximation in percentile of the data. The default value is 5%.
<i>alpha</i>	The desired success probability. The default value is 0.95.
<i>sampleAtLeaves</i>	Sample at leaves for faster but less accurate computation. This defaults to 'false'.
<i>firstLeafExact</i>	Traverse to the first leaf without approximation. This can ensure that the query definitely finds its (near) duplicate if there exists one. This defaults to 'false' for now.
<i>singleSampleLimit</i>	The limit on the largest node that can be approximated by sampling. This defaults to 20.
<i>metric</i>	Instantiated distance metric.

39.382.3.4 ~RASearch()

```

~ RASearch ( )

```

Delete the **RASearch** (p. 1681) object.

The tree is the only member we are responsible for deleting. The others will take care of themselves.

39.382.4 Member Function Documentation

39.382.4.1 Alpha() [1/2]

```
double Alpha ( ) const [inline]
```

Get the desired success probability.

Definition at line 338 of file ra_search.hpp.

39.382.4.2 Alpha() [2/2]

```
double& Alpha ( ) [inline]
```

Modify the desired success probability.

Definition at line 340 of file ra_search.hpp.

39.382.4.3 FirstLeafExact() [1/2]

```
bool FirstLeafExact ( ) const [inline]
```

Get whether or not we traverse to the first leaf without approximation.

Definition at line 348 of file ra_search.hpp.

39.382.4.4 FirstLeafExact() [2/2]

```
bool& FirstLeafExact ( ) [inline]
```

Modify whether or not we traverse to the first leaf without approximation.

Definition at line 350 of file ra_search.hpp.

39.382.4.5 Naive() [1/2]

```
bool Naive ( ) const [inline]
```

Get whether or not naive (brute-force) search is used.

Definition at line 323 of file ra_search.hpp.

39.382.4.6 Naive() [2/2]

```
bool& Naive ( ) [inline]
```

Modify whether or not naive (brute-force) search is used.

Definition at line 325 of file ra_search.hpp.

39.382.4.7 ReferenceSet()

```
const MatType& ReferenceSet ( ) const [inline]
```

Access the reference set.

Definition at line 320 of file ra_search.hpp.

39.382.4.8 ResetQueryTree()

```
void ResetQueryTree (
    Tree * queryTree ) const
```

This function recursively resets the **RAQueryStat** (p. 1678) of the given query tree to set 'bound' to SortPolicy::Worst↔ Distance and 'numSamplesMade' to 0.

This allows a user to perform multiple searches with the same query tree, possibly with different levels of approximation without requiring to build a new pair of trees for every new (approximate) search.

If **Search()** (p. 1688) is called multiple times with the same query tree without calling **ResetQueryTree()** (p. 1687), the results may not satisfy the theoretical guarantees provided by the rank-approximate neighbor search algorithm.

Parameters

<i>queryTree</i>	Tree whose statistics should be reset.
------------------	--

39.382.4.9 SampleAtLeaves() [1/2]

```
bool SampleAtLeaves ( ) const [inline]
```

Get whether or not sampling is done at the leaves.

Definition at line 343 of file `ra_search.hpp`.

39.382.4.10 SampleAtLeaves() [2/2]

```
bool& SampleAtLeaves ( ) [inline]
```

Modify whether or not sampling is done at the leaves.

Definition at line 345 of file `ra_search.hpp`.

39.382.4.11 Search() [1/3]

```
void Search (
    const MatType & querySet,
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & distances )
```

Compute the rank approximate nearest neighbors of each query point in the query set and store the output in the given matrices.

The matrices will be set to the size of n columns by k rows, where n is the number of points in the query dataset and k is the number of neighbors being searched for.

If `querySet` is small or only contains one point, it can be faster to do single-tree search; single-tree search can be set with the **SingleMode()** (p. 1690) function or in the constructor.

Parameters

<i>querySet</i>	Set of query points (can be a single point).
<i>k</i>	Number of neighbors to search for.
<i>neighbors</i>	Matrix storing lists of neighbors for each query point.
<i>distances</i>	Matrix storing distances of neighbors for each query point.

39.382.4.12 Search() [2/3]

```
void Search (
    Tree * queryTree,
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & distances )
```

Compute the rank approximate nearest neighbors of each point in the pre-built query tree and store the output in the given matrices.

The matrices will be set to the size of n columns by k rows, where n is the number of points in the query dataset and k is the number of neighbors being searched for.

If singleMode or naive is enabled, then this method will throw a `std::invalid_argument` exception; calling this function implies a dual-tree algorithm.

Note

If the tree type you are using modifies the data matrix, be aware that the results returned from this function will be with respect to the modified data matrix.

Parameters

<i>queryTree</i>	Tree built on query points.
<i>k</i>	Number of neighbors to search for.
<i>neighbors</i>	Matrix storing lists of neighbors for each query point.
<i>distances</i>	Matrix storing distances of neighbors for each query point.

39.382.4.13 Search() [3/3]

```
void Search (
    const size_t k,
    arma::Mat< size_t > & neighbors,
    arma::mat & distances )
```

Compute the rank approximate nearest neighbors of each point in the reference set (that is, the query set is taken to be the reference set), and store the output in the given matrices.

The matrices will be set to the size of n columns by k rows, where n is the number of points in the query dataset and k is the number of neighbors being searched for.

Parameters

<i>k</i>	Number of neighbors to search for.
<i>neighbors</i>	Matrix storing lists of neighbors for each point.
<i>distances</i>	Matrix storing distances of neighbors for each query point.

39.382.4.14 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the object.

Referenced by `RASearch< SortPolicy, MetricType, MatType, TreeType >::SingleSampleLimit()`.

39.382.4.15 `SingleMode()` [1/2]

```
bool SingleMode ( ) const [inline]
```

Get whether or not single-tree search is used.

Definition at line 328 of file `ra_search.hpp`.

39.382.4.16 `SingleMode()` [2/2]

```
bool& SingleMode ( ) [inline]
```

Modify whether or not single-tree search is used.

Definition at line 330 of file `ra_search.hpp`.

39.382.4.17 `SingleSampleLimit()` [1/2]

```
size_t SingleSampleLimit ( ) const [inline]
```

Get the limit on the size of a node that can be approximated.

Definition at line 353 of file `ra_search.hpp`.

39.382.4.18 SingleSampleLimit() [2/2]

```
size_t& SingleSampleLimit ( ) [inline]
```

Modify the limit on the size of a node that can be approximation.

Definition at line 355 of file ra_search.hpp.

References RASearch< SortPolicy, MetricType, MatType, TreeType >::serialize().

39.382.4.19 Tau() [1/2]

```
double Tau ( ) const [inline]
```

Get the rank-approximation in percentile of the data.

Definition at line 333 of file ra_search.hpp.

39.382.4.20 Tau() [2/2]

```
double& Tau ( ) [inline]
```

Modify the rank-approximation in percentile of the data.

Definition at line 335 of file ra_search.hpp.

39.382.4.21 Train() [1/2]

```
void Train (
    MatType referenceSet )
```

"Train" the model on the given reference set.

If tree-based search is being used (if **Naive()** (p. 1687) is false), the reference tree is rebuilt. Thus, a copy of the reference dataset is made. If you don't need to keep the dataset, you can avoid copying by using `std::move()`. This transfers the ownership of the dataset.

Parameters

<i>referenceSet</i>	New reference set to use.
---------------------	---------------------------

39.382.4.22 Train() [2/2]

```
void Train (
    Tree * referenceTree )
```

Set the reference tree to a new reference tree.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/rann/ **ra_search.hpp**

39.383 RASearchRules< SortPolicy, MetricType, TreeType > Class Template Reference

The **RASearchRules** (p. 1692) class is a template helper class used by **RASearch** (p. 1681) class when performing rank-approximate search via random-sampling.

Public Types

- typedef **tree::TraversallInfo**< TreeType > **TraversallInfoType**

Public Member Functions

- **RASearchRules** (const arma::mat &referenceSet, const arma::mat &querySet, const size_t k, MetricType &metric, const double tau=5, const double **alpha**=0.95, const bool naive=false, const bool sampleAtLeaves=false, const bool firstLeafExact=false, const size_t singleSampleLimit=20, const bool sameSet=false)
*Construct the **RASearchRules** (p. 1692) object.*
- double **BaseCase** (const size_t queryIndex, const size_t referenceIndex)
Get the distance from the query point to the reference point.
- void **GetResults** (arma::Mat< size_t > &neighbors, arma::mat &distances)
Store the list of candidates for each query point in the given matrices.
- size_t **NumDistComputations** ()
- size_t **NumEffectiveSamples** ()
- double **Rescore** (const size_t queryIndex, TreeType &referenceNode, const double oldScore)
Re-evaluate the score for recursion order.
- double **Rescore** (TreeType &queryNode, TreeType &referenceNode, const double oldScore)
Re-evaluate the score for recursion order.
- double **Score** (const size_t queryIndex, TreeType &referenceNode)
Get the score for recursion order.
- double **Score** (const size_t queryIndex, TreeType &referenceNode, const double baseCaseResult)
Get the score for recursion order.
- double **Score** (TreeType &queryNode, TreeType &referenceNode)
Get the score for recursion order.
- double **Score** (TreeType &queryNode, TreeType &referenceNode, const double baseCaseResult)
Get the score for recursion order, passing the base case result (in the situation where it may be needed to calculate the recursion order).
- const **TraversallInfoType** & **TraversallInfo** () const
- **TraversallInfoType** & **TraversallInfo** ()

39.383.1 Detailed Description

```
template<typename SortPolicy, typename MetricType, typename TreeType>
class mlpack::neighbor::RASearchRules< SortPolicy, MetricType, TreeType >
```

The **RASearchRules** (p. 1692) class is a template helper class used by **RASearch** (p. 1681) class when performing rank-approximate search via random-sampling.

Template Parameters

<i>SortPolicy</i>	The sort policy for distances.
<i>MetricType</i>	The metric to use for computation.
<i>TreeType</i>	The tree type to use; must adhere to the TreeType API.

Definition at line 33 of file ra_search_rules.hpp.

39.383.2 Member Typedef Documentation

39.383.2.1 TraversalInfoType

```
typedef tree::TraversalInfo<TreeType> TraversalInfoType
```

Definition at line 239 of file ra_search_rules.hpp.

39.383.3 Constructor & Destructor Documentation

39.383.3.1 RASearchRules()

```
RASearchRules (
    const arma::mat & referenceSet,
    const arma::mat & querySet,
    const size_t k,
    MetricType & metric,
    const double tau = 5,
    const double alpha = 0.95,
    const bool naive = false,
    const bool sampleAtLeaves = false,
    const bool firstLeafExact = false,
    const size_t singleSampleLimit = 20,
    const bool sameSet = false )
```

Construct the **RASearchRules** (p. 1692) object.

This is usually done from within the **RASearch** (p. 1681) class at search time.

Parameters

<i>referenceSet</i>	Set of reference data.
<i>querySet</i>	Set of query data.
<i>k</i>	Number of neighbors to search for.
<i>metric</i>	Instantiated metric.
<i>tau</i>	The rank-approximation in percentile of the data.
<i>alpha</i>	The desired success probability.
<i>naive</i>	If true, the rank-approximate search will be performed by directly sampling the whole set instead of using the stratified sampling on the tree.
<i>sampleAtLeaves</i>	Sample at leaves for faster but less accurate computation.
<i>firstLeafExact</i>	Traverse to the first leaf without approximation.
<i>singleSampleLimit</i>	The limit on the largest node that can be approximated by sampling.
<i>sameSet</i>	If true, the query and reference set are taken to be the same, and a query point will not return itself in the results.

39.383.4 Member Function Documentation

39.383.4.1 BaseCase()

```
double BaseCase (
    const size_t queryIndex,
    const size_t referenceIndex )
```

Get the distance from the query point to the reference point.

This will update the list of candidates with the new point if appropriate.

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceIndex</i>	Index of reference point.

39.383.4.2 GetResults()

```
void GetResults (
    arma::Mat< size_t > & neighbors,
    arma::mat & distances )
```

Store the list of candidates for each query point in the given matrices.

Parameters

<i>neighbors</i>	Matrix storing lists of neighbors for each query point.
<i>distances</i>	Matrix storing distances of neighbors for each query point.

39.383.4.3 NumDistComputations()

```
size_t NumDistComputations ( ) [inline]
```

Definition at line 230 of file `ra_search_rules.hpp`.

39.383.4.4 NumEffectiveSamples()

```
size_t NumEffectiveSamples ( ) [inline]
```

Definition at line 231 of file `ra_search_rules.hpp`.

39.383.4.5 Rescore() [1/2]

```
double Rescore (
    const size_t queryIndex,
    TreeType & referenceNode,
    const double oldScore )
```

Re-evaluate the score for recursion order.

A low score indicates priority for recursion, while `DBL_MAX` indicates that the node should not be recursed into at all (it should be pruned). This is used when the score has already been calculated, but another recursion may have modified the bounds for pruning. So the old score is checked against the new pruning bound.

For rank-approximation, it also checks if the number of samples left for a query to satisfy the rank constraint is small enough at this point of the algorithm, then this node is approximated by sampling and given a new score of '`DBL_MAX`'.

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceNode</i>	Candidate node to be recursed into.
<i>oldScore</i>	Old score produced by Score() (p. 1696) (or Rescore() (p. 1695)).

39.383.4.6 Rescore() [2/2]

```
double Rescore (
    TreeType & queryNode,
    TreeType & referenceNode,
    const double oldScore )
```

Re-evaluate the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned). This is used when the score has already been calculated, but another recursion may have modified the bounds for pruning. So the old score is checked against the new pruning bound.

For the rank-approximation, we check if the referenceNode can be approximated by sampling. If it can be, enough samples are made for every query in the queryNode. No further query-tree traversal is performed.

The 'NumSamplesMade' query stat is propagated up the tree. And then if pruning occurs (by distance or by sampling), the 'NumSamplesMade' stat is not propagated down the tree. If no pruning occurs, the stat is propagated down the tree.

Parameters

<i>queryNode</i>	Candidate query node to recurse into.
<i>referenceNode</i>	Candidate reference node to recurse into.
<i>oldScore</i>	Old score produced by Socre() (or Rescore() (p. 1695)).

39.383.4.7 Score() [1/4]

```
double Score (
    const size_t queryIndex,
    TreeType & referenceNode )
```

Get the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned).

For rank-approximation, the scoring function first checks if pruning by distance is possible. If yes, then the node is given the score of 'DBL_MAX' and the expected number of samples from that node are added to the number of samples made for the query.

If no, then the function tries to see if the node can be pruned by approximation. If number of samples required from this node is small enough, then that number of samples are acquired from this node and the score is set to be 'DBL_MAX'.

If the pruning by approximation is not possible either, the algorithm continues with the usual tree-traversal.

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceNode</i>	Candidate node to be recursed into.

Referenced by RASearchRules< SortPolicy, MetricType, TreeType >::TraverseAllInfo().

39.383.4.8 Score() [2/4]

```
double Score (
    const size_t queryIndex,
    TreeType & referenceNode,
    const double baseCaseResult )
```

Get the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned).

For rank-approximation, the scoring function first checks if pruning by distance is possible. If yes, then the node is given the score of 'DBL_MAX' and the expected number of samples from that node are added to the number of samples made for the query.

If no, then the function tries to see if the node can be pruned by approximation. If number of samples required from this node is small enough, then that number of samples are acquired from this node and the score is set to be 'DBL_MAX'.

If the pruning by approximation is not possible either, the algorithm continues with the usual tree-traversal.

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceNode</i>	Candidate node to be recursed into.
<i>baseCaseResult</i>	Result of BaseCase(queryIndex, referenceNode).

39.383.4.9 Score() [3/4]

```
double Score (
    TreeType & queryNode,
    TreeType & referenceNode )
```

Get the score for recursion order.

A low score indicates priority for recursion while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned).

For the rank-approximation, we check if the `referenceNode` can be approximated by sampling. If it can be, enough samples are made for every query in the `queryNode`. No further query-tree traversal is performed.

The 'NumSamplesMade' query stat is propagated up the tree. And then if pruning occurs (by distance or by sampling), the 'NumSamplesMade' stat is not propagated down the tree. If no pruning occurs, the stat is propagated down the tree.

Parameters

<i>queryNode</i>	Candidate query node to recurse into.
<i>referenceNode</i>	Candidate reference node to recurse into.

39.383.4.10 Score() [4/4]

```
double Score (
    TreeType & queryNode,
    TreeType & referenceNode,
    const double baseCaseResult )
```

Get the score for recursion order, passing the base case result (in the situation where it may be needed to calculate the recursion order).

A low score indicates priority for recursion, while `DBL_MAX` indicates that the node should not be recursed into at all (it should be pruned).

For the rank-approximation, we check if the `referenceNode` can be approximated by sampling. If it can be, enough samples are made for every query in the `queryNode`. No further query-tree traversal is performed.

The 'NumSamplesMade' query stat is propagated up the tree. And then if pruning occurs (by distance or by sampling), the 'NumSamplesMade' stat is not propagated down the tree. If no pruning occurs, the stat is propagated down the tree.

Parameters

<i>queryNode</i>	Candidate query node to recurse into.
<i>referenceNode</i>	Candidate reference node to recurse into.
<i>baseCaseResult</i>	Result of <code>BaseCase(queryIndex, referenceNode)</code> .

39.383.4.11 TraversalInfo() [1/2]

```
const TraversalInfoType& TraversalInfo ( ) const [inline]
```

39.384 RAUtil Class Reference

Static Public Member Functions

- static size_t **MinimumSamplesReqd** (const size_t n, const size_t k, const double tau, const double **alpha**)
Compute the minimum number of samples required to guarantee the given rank-approximation and success probability.
- static void **ObtainDistinctSamples** (const size_t numSamples, const size_t rangeUpperBound, arma::uvec &distinctSamples)
Pick up desired number of samples (with replacement) from a given range of integers so that only the distinct samples are returned from the range [0 - specified upper bound)
- static double **SuccessProbability** (const size_t n, const size_t k, const size_t m, const size_t t)
Compute the success probability of obtaining 'k'-neighbors from a set of size 'n' within the top 't' neighbors if 'm' samples are made.

39.384.1 Detailed Description

Definition at line 21 of file ra_util.hpp.

39.384.2 Member Function Documentation

39.384.2.1 MinimumSamplesReqd()

```
static size_t MinimumSamplesReqd (
    const size_t n,
    const size_t k,
    const double tau,
    const double alpha ) [static]
```

Compute the minimum number of samples required to guarantee the given rank-approximation and success probability.

Parameters

<i>n</i>	Size of the set to be sampled from.
<i>k</i>	The number of neighbors required within the rank-approximation.
<i>tau</i>	The rank-approximation in percentile of the data.
<i>alpha</i>	The success probability desired.

39.384.2.2 ObtainDistinctSamples()

```
static void ObtainDistinctSamples (
    const size_t numSamples,
    const size_t rangeUpperBound,
    arma::uvec & distinctSamples ) [static]
```

Pick up desired number of samples (with replacement) from a given range of integers so that only the distinct samples are returned from the range [0 - specified upper bound)

Parameters

<i>numSamples</i>	Number of random samples.
<i>rangeUpperBound</i>	The upper bound on the range of integers.
<i>distinctSamples</i>	The list of the distinct samples.

39.384.2.3 SuccessProbability()

```
static double SuccessProbability (
    const size_t n,
    const size_t k,
    const size_t m,
    const size_t t ) [static]
```

Compute the success probability of obtaining 'k'-neighbors from a set of size 'n' within the top 't' neighbors if 'm' samples are made.

Parameters

<i>n</i>	Size of the set being sampled from.
<i>k</i>	The number of neighbors required within the rank-approximation.
<i>m</i>	The number of random samples.
<i>t</i>	The desired rank-approximation.

39.385 ReferenceSetVisitor Class Reference

ReferenceSetVisitor (p. 1701) exposes the referenceSet of the given NType.

Inheritance diagram for ReferenceSetVisitor:

Public Member Functions

- `template<typename NType >`
`const arma::mat & operator() (NType *ns) const`
Return the reference set.
- `template<typename RType >`
`const arma::mat & operator() (RType *ra) const`
Return the reference set.

39.385.1 Detailed Description

ReferenceSetVisitor (p. 1701) exposes the referenceSet of the given NType.

Exposes the referenceSet of the given RType.

Definition at line 218 of file `ns_model.hpp`.

39.385.2 Member Function Documentation

39.385.2.1 operator>() [1/2]

```
const arma::mat& operator() (
    NSType * ns ) const
```

Return the reference set.

39.385.2.2 operator>() [2/2]

```
const arma::mat& operator() (
    RAType * ra ) const
```

Return the reference set.

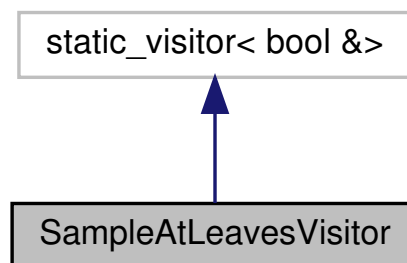

The documentation for this class was generated from the following files:

39.386 SampleAtLeavesVisitor Class Reference

Exposes the SampleAtLeaves() method of the given RAType.

Inheritance diagram for SampleAtLeavesVisitor:

**Public Member Functions**

- template<typename RAType >
bool & **operator()** (**RAType** *) const
Return SampleAtLeaves (whether or not sampling is done at leaves).

39.386.1 Detailed Description

Exposes the SampleAtLeaves() method of the given RType.

Definition at line 187 of file ra_model.hpp.

39.386.2 Member Function Documentation

39.386.2.1 operator()()

```
bool& operator() (
    RType * ) const
```

Return SampleAtLeaves (whether or not sampling is done at leaves).

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/rann/ **ra_model.hpp**

39.387 SearchModeVisitor Class Reference

SearchModeVisitor (p. 1703) exposes the SearchMode() method of the given NType.

Inheritance diagram for SearchModeVisitor:

Public Member Functions

- `template<typename NType >`
NeighborSearchMode & operator() (NType *ns) const
Return the search mode.

39.387.1 Detailed Description

SearchModeVisitor (p. 1703) exposes the `SearchMode()` method of the given `NSType`.

Definition at line 196 of file `ns_model.hpp`.

39.387.2 Member Function Documentation

39.387.2.1 `operator()()`

```
NeighborSearchMode& operator() (
    NSType * ns ) const
```

Return the search mode.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/neighbor_search/ ns_model.hpp`

39.388 SingleModeVisitor Class Reference

Exposes the `SingleMode()` method of the given `RAType`.

Inheritance diagram for `SingleModeVisitor`:

Public Member Functions

- `template<typename RAType >`
`bool & operator() (RAType *ra) const`

*Get a reference to the `SingleMode` parameter of the given **RASearch** (p. 1681) object.*

39.388.1 Detailed Description

Exposes the SingleMode() method of the given RAType.

Definition at line 220 of file ra_model.hpp.

39.388.2 Member Function Documentation

39.388.2.1 operator()()

```
bool& operator() (
    RAType * ra ) const
```

Get a reference to the SingleMode parameter of the given **RASearch** (p. 1681) object.

The documentation for this class was generated from the following file:

39.389 SingleSampleLimitVisitor Class Reference

Exposes the SingleSampleLimit() method of the given RAType.

Inheritance diagram for SingleSampleLimitVisitor:

Public Member Functions

- template<typename RAType >
size_t & **operator()** (**RAType** *ra) const

39.389.1 Detailed Description

Exposes the SingleSampleLimit() method of the given RAType.

Definition at line 167 of file ra_model.hpp.

39.389.2 Member Function Documentation

39.389.2.1 operator()()

```
size_t& operator() (
    RAType * ra ) const
```

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/rann/ ra_model.hpp

39.390 TauVisitor Class Reference

Exposes the Tau() method of the given RAType.

Inheritance diagram for TauVisitor:

Public Member Functions

- template<typename RAType >
double & **operator()** (RAType *ra) const
Get a reference to the Tau parameter.

39.390.1 Detailed Description

Exposes the Tau() method of the given RAType.

Definition at line 209 of file ra_model.hpp.

39.390.2 Member Function Documentation

39.390.2.1 operator()()

```
double& operator() (
    RAType * ra ) const
```

Get a reference to the Tau parameter.

The documentation for this class was generated from the following file:

39.391 TrainVisitor< SortPolicy > Class Template Reference

TrainVisitor (p. 1707) sets the reference set to a new reference set on the given NSType.

Inheritance diagram for TrainVisitor< SortPolicy >:

Public Types

- `template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType> using NSTypeT = NSType< SortPolicy, TreeType >`
Alias template necessary for visual c++ compiler.
- `template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType> using RATypeT = RAType< SortPolicy, TreeType >`
Alias template necessary for visual c++ compiler.

Public Member Functions

- **TrainVisitor** (arma::mat &&referenceSet, const size_t leafSize)
Construct the **TrainVisitor** (p. 1707) object with the given reference set, leafSize for BinarySpaceTrees.
- **TrainVisitor** (arma::mat &&referenceSet, const size_t leafSize, const double tau, const double rho)
Construct the **TrainVisitor** (p. 1707) object with the given reference set, leafSize for BinarySpaceTrees, and tau and rho for spill trees.
- template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType>
void **operator()** (**RATypeT**< TreeType > *ra) const
Default Train on the given RAType instance.
- void **operator()** (**RATypeT**< **tree::KDTree** > *ra) const
Train on the given RAType specialized for KDTrees.
- void **operator()** (**RATypeT**< **tree::Octree** > *ra) const
Train on the given RAType specialized for Octrees.
- template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType>
void **operator()** (**NSTypeT**< TreeType > *ns) const
Default Train on the given NSType instance.
- void **operator()** (**NSTypeT**< **tree::KDTree** > *ns) const
Train on the given NSType specialized for KDTrees.
- void **operator()** (**NSTypeT**< **tree::BallTree** > *ns) const
Train on the given NSType specialized for BallTrees.
- void **operator()** (**SpillKNN** *ns) const
Train specialized for SPTrees.
- void **operator()** (**NSTypeT**< **tree::Octree** > *ns) const
Train specialized for octrees.

39.391.1 Detailed Description

```
template<typename SortPolicy>
class mlpack::neighbor::TrainVisitor< SortPolicy >
```

TrainVisitor (p. 1707) sets the reference set to a new reference set on the given NSType.

TrainVisitor (p. 1707) sets the reference set to a new reference set on the given RAType.

We use template specialization to differentiate those tree types that accept leafSize as a parameter. In these cases, a reference tree with proper leafSize is built from the referenceSet.

We use template specialization to differentiate those trees that accept leafSize as a parameter. In these cases, a reference tree with proper leafSize is built from the referenceSet.

Definition at line 35 of file neighbor_search.hpp.

39.391.2 Member Typedef Documentation

39.391.2.1 NTypeT

```
using NTypeT = NType<SortPolicy, TreeType>
```

Alias template necessary for visual c++ compiler.

Definition at line 165 of file ns_model.hpp.

39.391.2.2 RTypeT

```
using RTypeT = RType<SortPolicy, TreeType>
```

Alias template necessary for visual c++ compiler.

Definition at line 144 of file ra_model.hpp.

39.391.3 Constructor & Destructor Documentation

39.391.3.1 TrainVisitor() [1/2]

```
TrainVisitor (
    arma::mat && referenceSet,
    const size_t leafSize,
    const double tau,
    const double rho )
```

Construct the **TrainVisitor** (p. 1707) object with the given reference set, leafSize for BinarySpaceTrees, and tau and rho for spill trees.

39.391.3.2 TrainVisitor() [2/2]

```
TrainVisitor (
    arma::mat && referenceSet,
    const size_t leafSize )
```

Construct the **TrainVisitor** (p. 1707) object with the given reference set, leafSize for BinarySpaceTrees.

39.391.4 Member Function Documentation

39.391.4.1 operator() [1/8]

```
void operator() (
    RATypeT< TreeType > * ra ) const
```

Default Train on the given RAType instance.

39.391.4.2 operator() [2/8]

```
void operator() (
    RATypeT< tree::KDTree > * ra ) const
```

Train on the given RAType specialized for KDTrees.

39.391.4.3 operator() [3/8]

```
void operator() (
    RATypeT< tree::Octree > * ra ) const
```

Train on the given RAType specialized for Octrees.

39.391.4.4 operator() [4/8]

```
void operator() (
    NSTypeT< TreeType > * ns ) const
```

Default Train on the given NSType instance.

39.391.4.5 operator() [5/8]

```
void operator() (
    NSTypeT< tree::KDTree > * ns ) const
```

Train on the given NSType specialized for KDTrees.

39.391.4.6 operator>() [6/8]

```
void operator() (
    NSTypeT< tree::BallTree > * ns ) const
```

Train on the given NSType specialized for BallTrees.

39.391.4.7 operator>() [7/8]

```
void operator() (
    SpillKNN * ns ) const
```

Train specialized for SPTrees.

39.391.4.8 operator>() [8/8]

```
void operator() (
    NSTypeT< tree::Octree > * ns ) const
```

Train specialized for octrees.

39.392 SparseAutoencoder Class Reference

A sparse autoencoder is a neural network whose aim to learn compressed representations of the data, typically for dimensionality reduction, with a constraint on the activity of the neurons in the network.

Public Member Functions

- `template<typename OptimizerType = ens::L_BFGS>`
SparseAutoencoder (const arma::mat &data, const size_t visibleSize, const size_t hiddenSize, const double lambda=0.0001, const double beta=3, const double rho=0.01, OptimizerType optimizer=OptimizerType())
Construct the sparse autoencoder model with the given training data.
- `void Beta (const double b)`
Sets the KL divergence parameter.
- `double Beta () const`
Gets the KL divergence parameter.
- `void GetNewFeatures (arma::mat &data, arma::mat &features)`
Transforms the provided data into the representation learned by the sparse autoencoder.
- `void HiddenSize (const size_t hidden)`
Sets size of the hidden layer.
- `size_t HiddenSize () const`
Gets the size of the hidden layer.
- `void Lambda (const double l)`
Sets the L2-regularization parameter.
- `double Lambda () const`
Gets the L2-regularization parameter.
- `void Rho (const double r)`
Sets the sparsity parameter.
- `double Rho () const`
Gets the sparsity parameter.
- `void Sigmoid (const arma::mat &x, arma::mat &output) const`
Returns the elementwise sigmoid of the passed matrix, where the sigmoid function of a real number 'x' is $1 / (1 + \exp(-x))$.
- `void VisibleSize (const size_t visible)`
Sets size of the visible layer.
- `size_t VisibleSize () const`
Gets size of the visible layer.

39.392.1 Detailed Description

A sparse autoencoder is a neural network whose aim to learn compressed representations of the data, typically for dimensionality reduction, with a constraint on the activity of the neurons in the network.

Sparse autoencoders can be stacked together to learn a hierarchy of features, which provide a better representation of the data for classification. This is a method used in the recently developed field of deep learning. More technical details about the model can be found on the following webpage:

http://deeplearning.stanford.edu/wiki/index.php/UFLDL_Tutorial

An example of how to use the interface is shown below:

```

arma::mat data; // Data matrix.
const size_t vSize = 64; // Size of visible layer, depends on the data.
const size_t hSize = 25; // Size of hidden layer, depends on requirements.

// Train the model using default options.
SparseAutoencoder encoder1(data, vSize, hSize);

const size_t numBasis = 5; // Parameter required for L-BFGS algorithm.
const size_t numIterations = 100; // Maximum number of iterations.

// Use an instantiated optimizer for the training.
SparseAutoencoderFunction saf(data, vSize, hSize);
L_BFGS<SparseAutoencoderFunction> optimizer(saf, numBasis, numIterations);
SparseAutoencoder<L_BFGS> encoder2(optimizer);

arma::mat features1, features2; // Matrices for storing new representations.

// Get new representations from the trained models.
encoder1.GetNewFeatures(data, features1);
encoder2.GetNewFeatures(data, features2);

```

This implementation allows the use of arbitrary mlpack optimizers via the `OptimizerType` template parameter.

Definition at line 63 of file `sparse_autoencoder.hpp`.

39.392.2 Constructor & Destructor Documentation

39.392.2.1 SparseAutoencoder()

```

SparseAutoencoder (
    const arma::mat & data,
    const size_t visibleSize,
    const size_t hiddenSize,
    const double lambda = 0.0001,
    const double beta = 3,
    const double rho = 0.01,
    OptimizerType optimizer = OptimizerType() )

```

Construct the sparse autoencoder model with the given training data.

This will train the model. The parameters 'lambda', 'beta' and 'rho' can be set optionally. Changing these parameters will have an effect on regularization and sparsity of the model.

Template Parameters

<i>OptimizerType</i>	The optimizer to use.
----------------------	-----------------------

Parameters

<i>data</i>	Input data with each column as one example.
<i>visibleSize</i>	Size of input vector expected at the visible layer.
<i>hiddenSize</i>	Size of input vector expected at the hidden layer.

Parameters

<i>lambda</i>	L2-regularization parameter.
<i>beta</i>	KL divergence parameter.
<i>rho</i>	Sparsity parameter.

39.392.3 Member Function Documentation**39.392.3.1 Beta()** [1/2]

```
void Beta (
    const double b ) [inline]
```

Sets the KL divergence parameter.

Definition at line 147 of file sparse_autoencoder.hpp.

39.392.3.2 Beta() [2/2]

```
double Beta ( ) const [inline]
```

Gets the KL divergence parameter.

Definition at line 153 of file sparse_autoencoder.hpp.

39.392.3.3 GetNewFeatures()

```
void GetNewFeatures (
    arma::mat & data,
    arma::mat & features )
```

Transforms the provided data into the representation learned by the sparse autoencoder.

The function basically performs a feedforward computation using the learned weights, and returns the hidden layer activations.

Parameters

<i>data</i>	Matrix of the provided data.
<i>features</i>	The hidden layer representation of the provided data.

39.392.3.4 HiddenSize() [1/2]

```
void HiddenSize (
    const size_t hidden ) [inline]
```

Sets size of the hidden layer.

Definition at line 123 of file sparse_autoencoder.hpp.

39.392.3.5 HiddenSize() [2/2]

```
size_t HiddenSize ( ) const [inline]
```

Gets the size of the hidden layer.

Definition at line 129 of file sparse_autoencoder.hpp.

39.392.3.6 Lambda() [1/2]

```
void Lambda (
    const double l ) [inline]
```

Sets the L2-regularization parameter.

Definition at line 135 of file sparse_autoencoder.hpp.

39.392.3.7 Lambda() [2/2]

```
double Lambda ( ) const [inline]
```

Gets the L2-regularization parameter.

Definition at line 141 of file sparse_autoencoder.hpp.

39.392.3.8 Rho() [1/2]

```
void Rho (
    const double r ) [inline]
```

Sets the sparsity parameter.

Definition at line 159 of file sparse_autoencoder.hpp.

39.392.3.9 Rho() [2/2]

```
double Rho ( ) const [inline]
```

Gets the sparsity parameter.

Definition at line 165 of file sparse_autoencoder.hpp.

39.392.3.10 Sigmoid()

```
void Sigmoid (
    const arma::mat & x,
    arma::mat & output ) const [inline]
```

Returns the elementwise sigmoid of the passed matrix, where the sigmoid function of a real number 'x' is $[1 / (1 + \exp(-x))]$.

Parameters

<i>x</i>	Matrix of real values for which we require the sigmoid activation.
----------	--

Definition at line 105 of file sparse_autoencoder.hpp.

39.392.3.11 VisibleSize() [1/2]

```
void VisibleSize (
    const size_t visible ) [inline]
```

Sets size of the visible layer.

Definition at line 111 of file sparse_autoencoder.hpp.

39.392.3.12 VisibleSize() [2/2]

```
size_t VisibleSize ( ) const [inline]
```

Gets size of the visible layer.

Definition at line 117 of file sparse_autoencoder.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/sparse_autoencoder/ **sparse_autoencoder.hpp**

39.393 SparseAutoencoderFunction Class Reference

This is a class for the sparse autoencoder objective function.

Public Member Functions

- **SparseAutoencoderFunction** (const arma::mat &data, const size_t visibleSize, const size_t hiddenSize, const double lambda=0.0001, const double beta=3, const double rho=0.01)
Construct the sparse autoencoder objective function with the given parameters.
- void **Beta** (const double b)
Sets the KL divergence parameter.
- double **Beta** () const
Gets the KL divergence parameter.
- double **Evaluate** (const arma::mat ¶meters) const
Evaluates the objective function of the sparse autoencoder model using the given parameters.
- const arma::mat & **GetInitialPoint** () const
Return the initial point for the optimization.
- void **Gradient** (const arma::mat ¶meters, arma::mat &gradient) const
Evaluates the gradient values of the objective function given the current set of parameters.
- void **HiddenSize** (const size_t hidden)
Sets size of the hidden layer.
- size_t **HiddenSize** () const
Gets the size of the hidden layer.
- const arma::mat **InitializeWeights** ()
Initializes the parameters of the model to suitable values.
- void **Lambda** (const double l)
Sets the L2-regularization parameter.
- double **Lambda** () const
Gets the L2-regularization parameter.
- void **Rho** (const double r)
Sets the sparsity parameter.
- double **Rho** () const
Gets the sparsity parameter.
- void **Sigmoid** (const arma::mat &x, arma::mat &output) const
Returns the elementwise sigmoid of the passed matrix, where the sigmoid function of a real number 'x' is $[1 / (1 + \exp(-x))]$.
- void **VisibleSize** (const size_t visible)
Sets size of the visible layer.
- size_t **VisibleSize** () const
Gets size of the visible layer.

39.393.1 Detailed Description

This is a class for the sparse autoencoder objective function.

It can be used to create learning models like self-taught learning, stacked autoencoders, conditional random fields (CRFs), and so forth.

Definition at line 26 of file `sparse_autoencoder_function.hpp`.

39.393.2 Constructor & Destructor Documentation

39.393.2.1 SparseAutoencoderFunction()

```
SparseAutoencoderFunction (
    const arma::mat & data,
    const size_t visibleSize,
    const size_t hiddenSize,
    const double lambda = 0.0001,
    const double beta = 3,
    const double rho = 0.01 )
```

Construct the sparse autoencoder objective function with the given parameters.

Parameters

<i>data</i>	The data matrix.
<i>visibleSize</i>	Size of input vector expected at the visible layer.
<i>hiddenSize</i>	Size of input vector expected at the hidden layer.
<i>lambda</i>	L2-regularization parameter.
<i>beta</i>	KL divergence parameter.
<i>rho</i>	Sparsity parameter.

39.393.3 Member Function Documentation

39.393.3.1 Beta() [1/2]

```
void Beta (
    const double b ) [inline]
```

Sets the KL divergence parameter.

Definition at line 124 of file `sparse_autoencoder_function.hpp`.

39.393.3.2 Beta() [2/2]

```
double Beta ( ) const [inline]
```

Gets the KL divergence parameter.

Definition at line 130 of file `sparse_autoencoder_function.hpp`.

39.393.3.3 Evaluate()

```
double Evaluate (
    const arma::mat & parameters ) const
```

Evaluates the objective function of the sparse autoencoder model using the given parameters.

The cost function has terms for the reconstruction error, regularization cost and the sparsity cost. The objective function takes a low value when the model is able to reconstruct the data well using weights which are low in value and when the average activations of neurons in the hidden layers agrees well with the sparsity parameter 'rho'.

Parameters

<i>parameters</i>	Current values of the model parameters.
-------------------	---

39.393.3.4 GetInitialPoint()

```
const arma::mat& GetInitialPoint ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 85 of file `sparse_autoencoder_function.hpp`.

39.393.3.5 Gradient()

```
void Gradient (
    const arma::mat & parameters,
    arma::mat & gradient ) const
```

Evaluates the gradient values of the objective function given the current set of parameters.

The function performs a feedforward pass and computes the error in reconstructing the data points. It then uses the backpropagation algorithm to compute the gradient values.

Parameters

<i>parameters</i>	Current values of the model parameters.
<i>gradient</i>	Matrix where gradient values will be stored.

39.393.3.6 HiddenSize() [1/2]

```
void HiddenSize (
    const size_t hidden ) [inline]
```

Sets size of the hidden layer.

Definition at line 100 of file sparse_autoencoder_function.hpp.

39.393.3.7 HiddenSize() [2/2]

```
size_t HiddenSize ( ) const [inline]
```

Gets the size of the hidden layer.

Definition at line 106 of file sparse_autoencoder_function.hpp.

39.393.3.8 InitializeWeights()

```
const arma::mat InitializeWeights ( )
```

Initializes the parameters of the model to suitable values.

39.393.3.9 Lambda() [1/2]

```
void Lambda (
    const double l ) [inline]
```

Sets the L2-regularization parameter.

Definition at line 112 of file sparse_autoencoder_function.hpp.

39.393.3.10 Lambda() [2/2]

```
double Lambda ( ) const [inline]
```

Gets the L2-regularization parameter.

Definition at line 118 of file `sparse_autoencoder_function.hpp`.

39.393.3.11 Rho() [1/2]

```
void Rho (
    const double r ) [inline]
```

Sets the sparsity parameter.

Definition at line 136 of file `sparse_autoencoder_function.hpp`.

39.393.3.12 Rho() [2/2]

```
double Rho ( ) const [inline]
```

Gets the sparsity parameter.

Definition at line 142 of file `sparse_autoencoder_function.hpp`.

39.393.3.13 Sigmoid()

```
void Sigmoid (
    const arma::mat & x,
    arma::mat & output ) const [inline]
```

Returns the elementwise sigmoid of the passed matrix, where the sigmoid function of a real number 'x' is $[1 / (1 + \exp(-x))]$.

Parameters

x	Matrix of real values for which we require the sigmoid activation.
---	--

Definition at line 79 of file `sparse_autoencoder_function.hpp`.

39.393.3.14 VisibleSize() [1/2]

```
void VisibleSize (
    const size_t visible ) [inline]
```

Sets size of the visible layer.

Definition at line 88 of file `sparse_autoencoder_function.hpp`.

39.393.3.15 VisibleSize() [2/2]

```
size_t VisibleSize ( ) const [inline]
```

Gets size of the visible layer.

Definition at line 94 of file `sparse_autoencoder_function.hpp`.

39.394 ExactSVDPolicy Class Reference

Implementation of the exact SVD policy.

Public Member Functions

- void **Apply** (const arma::mat &data, const arma::mat ¢eredData, arma::mat &transformedData, arma::vec &eigVal, arma::mat &eigvec, const size_t)

Apply Principal Component Analysis to the provided data set using the exact SVD method.

39.394.1 Detailed Description

Implementation of the exact SVD policy.

Definition at line 27 of file `exact_svd_method.hpp`.

39.394.2 Member Function Documentation**39.394.2.1 Apply()**

```
void Apply (
    const arma::mat & data,
    const arma::mat & centeredData,
    arma::mat & transformedData,
    arma::vec & eigVal,
    arma::mat & eigvec,
    const size_t ) [inline]
```

Apply Principal Component Analysis to the provided data set using the exact SVD method.

Parameters

<i>data</i>	Data matrix.
<i>centeredData</i>	Centered data matrix.
<i>transformedData</i>	Matrix to put results of PCA (p. 1723) into.
<i>eigVal</i>	Vector to put eigenvalues into.
<i>eigvec</i>	Matrix to put eigenvectors (loadings) into.
<i>rank</i>	Rank of the decomposition.

Definition at line 41 of file `exact_svd_method.hpp`.

39.395 PCA< DecompositionPolicy > Class Template Reference

This class implements principal components analysis (**PCA** (p. 1723)).

Public Member Functions

- **PCA** (const bool scaleData=false, const DecompositionPolicy &decomposition=DecompositionPolicy())
*Create the **PCA** (p. 1723) object, specifying if the data should be scaled in each dimension by standard deviation when **PCA** (p. 1723) is performed.*
- void **Apply** (const arma::mat &data, arma::mat &transformedData, arma::vec &eigVal, arma::mat &eigvec)
Apply Principal Component Analysis to the provided data set.
- void **Apply** (const arma::mat &data, arma::mat &transformedData, arma::vec &eigVal)
Apply Principal Component Analysis to the provided data set.
- double **Apply** (arma::mat &data, const size_t newDimension)
*Use **PCA** (p. 1723) for dimensionality reduction on the given dataset.*
- double **Apply** (arma::mat &data, const int newDimension)
This overload is here to make sure int gets casted right to size_t.
- double **Apply** (arma::mat &data, const double varRetained)
*Use **PCA** (p. 1723) for dimensionality reduction on the given dataset.*
- bool **ScaleData** () const
*Get whether or not this **PCA** (p. 1723) object will scale (by standard deviation) the data when **PCA** (p. 1723) is performed.*
- bool & **ScaleData** ()
*Modify whether or not this **PCA** (p. 1723) object will scale (by standard deviation) the data when **PCA** (p. 1723) is performed.*

39.395.1 Detailed Description

```
template<typename DecompositionPolicy = ExactSVDPolicy>
class mlpack::pca::PCA< DecompositionPolicy >
```

This class implements principal components analysis (**PCA** (p. 1723)).

This is a common, widely-used technique that is often used for either dimensionality reduction or transforming data into a better basis. Further information on **PCA** (p. 1723) can be found in almost any statistics or machine learning textbook, and all over the internet.

Definition at line 33 of file pca.hpp.

39.395.2 Constructor & Destructor Documentation

39.395.2.1 PCA()

```
PCA (
    const bool scaleData = false,
    const DecompositionPolicy & decomposition = DecompositionPolicy() )
```

Create the **PCA** (p. 1723) object, specifying if the data should be scaled in each dimension by standard deviation when **PCA** (p. 1723) is performed.

Parameters

<i>scaleData</i>	Whether or not to scale the data.
------------------	-----------------------------------

39.395.3 Member Function Documentation

39.395.3.1 Apply() [1/5]

```
void Apply (
    const arma::mat & data,
    arma::mat & transformedData,
    arma::vec & eigVal,
    arma::mat & eigvec )
```

Apply Principal Component Analysis to the provided data set.

It is safe to pass the same matrix reference for both data and transformedData.

Parameters

<i>data</i>	Data matrix.
<i>transformedData</i>	Matrix to put results of PCA (p. 1723) into.
<i>eigval</i>	Vector to put eigenvalues into.
<i>eigvec</i>	Matrix to put eigenvectors (loadings) into.

Referenced by PCA< DecompositionPolicy >::Apply().

39.395.3.2 Apply() [2/5]

```
void Apply (
    const arma::mat & data,
    arma::mat & transformedData,
    arma::vec & eigVal )
```

Apply Principal Component Analysis to the provided data set.

It is safe to pass the same matrix reference for both data and transformedData.

Parameters

<i>data</i>	Data matrix.
<i>transformedData</i>	Matrix to store results of PCA (p. 1723) in.
<i>eigVal</i>	Vector to put eigenvalues into.

39.395.3.3 Apply() [3/5]

```
double Apply (
    arma::mat & data,
    const size_t newDimension )
```

Use **PCA** (p. 1723) for dimensionality reduction on the given dataset.

This will save the newDimension largest principal components of the data and remove the rest. The parameter returned is the amount of variance of the data that is retained; this is a value between 0 and 1. For instance, a value of 0.9 indicates that 90% of the variance present in the data was retained.

Parameters

<i>data</i>	Data matrix.
<i>newDimension</i>	New dimension of the data.

Returns

Amount of the variance of the data retained (between 0 and 1).

39.395.3.4 Apply() [4/5]

```
double Apply (
    arma::mat & data,
    const int newDimension ) [inline]
```

This overload is here to make sure int gets casted right to size_t.

Definition at line 85 of file pca.hpp.

References `PCA< DecompositionPolicy >::Apply()`.

39.395.3.5 Apply() [5/5]

```
double Apply (
    arma::mat & data,
    const double varRetained )
```

Use **PCA** (p. 1723) for dimensionality reduction on the given dataset.

This will save as many dimensions as necessary to retain at least the given amount of variance (specified by parameter `varRetained`). The amount should be between 0 and 1; if the amount is 0, then only 1 dimension will be retained. If the amount is 1, then all dimensions will be retained.

The method returns the actual amount of variance retained, which will always be greater than or equal to the `varRetained` parameter.

Parameters

<i>data</i>	Data matrix.
<i>varRetained</i>	Lower bound on amount of variance to retain; should be between 0 and 1.

Returns

Actual amount of variance retained (between 0 and 1).

39.395.3.6 ScaleData() [1/2]

```
bool ScaleData ( ) const [inline]
```

Get whether or not this **PCA** (p. 1723) object will scale (by standard deviation) the data when **PCA** (p. 1723) is performed.

Definition at line 109 of file pca.hpp.

Referenced by PCA< DecompositionPolicy >::ScaleData().

39.395.3.7 ScaleData() [2/2]

```
bool& ScaleData ( ) [inline]
```

Modify whether or not this **PCA** (p. 1723) object will scale (by standard deviation) the data when **PCA** (p. 1723) is performed.

Definition at line 112 of file pca.hpp.

References PCA< DecompositionPolicy >::ScaleData().

39.396 QUICSVDPolicy Class Reference

Implementation of the QUIC-SVD policy.

Public Member Functions

- **QUICSVDPolicy** (const double epsilon=0.03, const double delta=0.1)
*Use QUIC-SVD method to perform the principal components analysis (**PCA** (p. 1723)).*
- void **Apply** (const arma::mat &data, const arma::mat ¢eredData, arma::mat &transformedData, arma::vec &eigVal, arma::mat &eigvec, const size_t)
Apply Principal Component Analysis to the provided data set using the QUIC-SVD method.
- double **Delta** () const
Get the cumulative probability for Monte Carlo error lower bound.
- double & **Delta** ()
Modify the cumulative probability for Monte Carlo error lower bound.
- double **Epsilon** () const
Get the error tolerance fraction for calculated subspace.
- double & **Epsilon** ()
Modify the error tolerance fraction for calculated subspace.

39.396.1 Detailed Description

Implementation of the QUIC-SVD policy.

Definition at line 26 of file quic_svd_method.hpp.

39.396.2 Constructor & Destructor Documentation

39.396.2.1 QUICSVDPolicy()

```
QUICSVDPolicy (
    const double epsilon = 0.03,
    const double delta = 0.1 ) [inline]
```

Use QUIC-SVD method to perform the principal components analysis (**PCA** (p. 1723)).

Parameters

<i>epsilon</i>	Error tolerance fraction for calculated subspace.
<i>delta</i>	Cumulative probability for Monte Carlo error lower bound.

Definition at line 35 of file quic_svd_method.hpp.

39.396.3 Member Function Documentation

39.396.3.1 Apply()

```
void Apply (
    const arma::mat & data,
    const arma::mat & centeredData,
    arma::mat & transformedData,
    arma::vec & eigVal,
    arma::mat & eigvec,
    const size_t ) [inline]
```

Apply Principal Component Analysis to the provided data set using the QUIC-SVD method.

Parameters

<i>data</i>	Data matrix.
-------------	--------------

Parameters

<i>centeredData</i>	Centered data matrix.
<i>transformedData</i>	Matrix to put results of PCA (p. 1723) into.
<i>eigVal</i>	Vector to put eigenvalues into.
<i>eigvec</i>	Matrix to put eigenvectors (loadings) into.
<i>rank</i>	Rank of the decomposition.

Definition at line 53 of file quic_svd_method.hpp.

39.396.3.2 Delta() [1/2]

```
double Delta ( ) const [inline]
```

Get the cumulative probability for Monte Carlo error lower bound.

Definition at line 81 of file quic_svd_method.hpp.

39.396.3.3 Delta() [2/2]

```
double& Delta ( ) [inline]
```

Modify the cumulative probability for Monte Carlo error lower bound.

Definition at line 83 of file quic_svd_method.hpp.

39.396.3.4 Epsilon() [1/2]

```
double Epsilon ( ) const [inline]
```

Get the error tolerance fraction for calculated subspace.

Definition at line 76 of file quic_svd_method.hpp.

39.396.3.5 Epsilon() [2/2]

```
double& Epsilon ( ) [inline]
```

Modify the error tolerance fraction for calculated subspace.

Definition at line 78 of file quic_svd_method.hpp.

39.397 RandomizedBlockKrylovSVDPolicy Class Reference

Implementation of the randomized block krylov SVD policy.

Public Member Functions

- **RandomizedBlockKrylovSVDPolicy** (const size_t maxIterations=2, const size_t blockSize=0)
*Use randomized block krylov SVD method to perform the principal components analysis (**PCA** (p. 1723)).*
- void **Apply** (const arma::mat &data, const arma::mat ¢eredData, arma::mat &transformedData, arma::vec &eigVal, arma::mat &eigvec, const size_t rank)
Apply Principal Component Analysis to the provided data set using the randomized block krylov SVD method.
- size_t **BlockSize** () const
Get the block size.
- size_t & **BlockSize** ()
Modify the block size.
- size_t **MaxIterations** () const
Get the number of iterations for the power method.
- size_t & **MaxIterations** ()
Modify the number of iterations for the power method.

39.397.1 Detailed Description

Implementation of the randomized block krylov SVD policy.

Definition at line 26 of file randomized_block_krylov_method.hpp.

39.397.2 Constructor & Destructor Documentation**39.397.2.1 RandomizedBlockKrylovSVDPolicy()**

```
RandomizedBlockKrylovSVDPolicy (
    const size_t maxIterations = 2,
    const size_t blockSize = 0 ) [inline]
```

Use randomized block krylov SVD method to perform the principal components analysis (**PCA** (p. 1723)).

Parameters

<i>maxIterations</i>	Number of iterations for the power method (Default: 2).
<i>blockSize</i>	The block size, must be \geq rank (Default: rank + 10).

Definition at line 37 of file randomized_block_krylov_method.hpp.

39.397.3 Member Function Documentation

39.397.3.1 Apply()

```
void Apply (
    const arma::mat & data,
    const arma::mat & centeredData,
    arma::mat & transformedData,
    arma::vec & eigVal,
    arma::mat & eigvec,
    const size_t rank ) [inline]
```

Apply Principal Component Analysis to the provided data set using the randomized block krylov SVD method.

Parameters

<i>data</i>	Data matrix.
<i>centeredData</i>	Centered data matrix.
<i>transformedData</i>	Matrix to put results of PCA (p. 1723) into.
<i>eigVal</i>	Vector to put eigenvalues into.
<i>eigvec</i>	Matrix to put eigenvectors (loadings) into.
<i>rank</i>	Rank of the decomposition.

39.399 Perceptron< LearnPolicy, WeightInitializationPolicy, MatType > Class Template Reference

This class implements a simple perceptron (i.e., a single layer neural network).

Public Member Functions

- **Perceptron** (const size_t numClasses=0, const size_t dimensionality=0, const size_t maxIterations=1000)
Constructor: create the perceptron with the given number of classes and initialize the weight matrix, but do not perform any training.
- **Perceptron** (const MatType &data, const arma::Row< size_t > &labels, const size_t numClasses, const size_t maxIterations=1000)
Constructor: constructs the perceptron by building the weights matrix, which is later used in classification.
- **Perceptron** (const **Perceptron** &other, const MatType &data, const arma::Row< size_t > &labels, const size_t numClasses, const arma::rowvec &instanceWeights)
Alternate constructor which copies parameters from an already initiated perceptron.
- const arma::vec & **Biases** () const
Get the biases.
- arma::vec & **Biases** ()
Modify the biases. You had better know what you are doing!
- void **Classify** (const MatType &test, arma::Row< size_t > &predictedLabels)
Classification function.
- size_t **MaxIterations** () const
Get the maximum number of iterations.
- size_t & **MaxIterations** ()
Modify the maximum number of iterations.
- size_t **NumClasses** () const
Get the number of classes this perceptron has been trained for.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the perceptron.
- void **Train** (const MatType &data, const arma::Row< size_t > &labels, const size_t numClasses, const arma::rowvec &instanceWeights=arma::rowvec())
*Train the perceptron on the given data for up to the maximum number of iterations (specified in the constructor or through **MaxIterations**() (p. 1738)).*
- const arma::mat & **Weights** () const
Get the weight matrix.
- arma::mat & **Weights** ()
Modify the weight matrix. You had better know what you are doing!

39.399.1 Detailed Description

```
template<typename LearnPolicy = SimpleWeightUpdate, typename WeightInitializationPolicy = ZeroInitialization, typename MatType = arma::mat>
class mlpack::perceptron::Perceptron< LearnPolicy, WeightInitializationPolicy, MatType >
```

This class implements a simple perceptron (i.e., a single layer neural network).

It converges if the supplied training dataset is linearly separable.

Template Parameters

<i>LearnPolicy</i>	Options of SimpleWeightUpdate (p. 1741) and GradientDescent .
<i>WeightInitializationPolicy</i>	Option of ZeroInitialization (p. 1742) and RandomInitialization (p. 1740).

Definition at line 36 of file perceptron.hpp.

39.399.2 Constructor & Destructor Documentation

39.399.2.1 Perceptron() [1/3]

```
Perceptron (
    const size_t numClasses = 0,
    const size_t dimensionality = 0,
    const size_t maxIterations = 1000 )
```

Constructor: create the perceptron with the given number of classes and initialize the weight matrix, but do not perform any training.

(Call the **Train()** (p. 1739) function to perform training.)

Parameters

<i>numClasses</i>	Number of classes in the dataset.
<i>dimensionality</i>	Dimensionality of the dataset.
<i>maxIterations</i>	Maximum number of iterations for the perceptron learning algorithm.

39.399.2.2 Perceptron() [2/3]

```
Perceptron (
    const MatType & data,
```

```
const arma::Row< size_t > & labels,
const size_t numClasses,
const size_t maxIterations = 1000 )
```

Constructor: constructs the perceptron by building the weights matrix, which is later used in classification.

The number of classes should be specified separately, and the labels vector should contain values in the range [0, numClasses - 1]. The **data::NormalizeLabels()** (p. 385) function can be used if the labels vector does not contain values in the required range.

Parameters

<i>data</i>	Input, training data.
<i>labels</i>	Labels of dataset.
<i>numClasses</i>	Number of classes in the dataset.
<i>maxIterations</i>	Maximum number of iterations for the perceptron learning algorithm.

39.399.2.3 Perceptron() [3/3]

```
Perceptron (
    const Perceptron< LearnPolicy, WeightInitializationPolicy, MatType > & other,
    const MatType & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const arma::rowvec & instanceWeights )
```

Alternate constructor which copies parameters from an already initiated perceptron.

Parameters

<i>other</i>	The other initiated Perceptron (p. 1735) object from which we copy the values from.
<i>data</i>	The data on which to train this Perceptron (p. 1735) object on.
<i>labels</i>	The labels of data.
<i>numClasses</i>	Number of classes in the data.
<i>instanceWeights</i>	Weight vector to use while training. For boosting purposes.

39.399.3 Member Function Documentation

39.399.3.1 Biases() [1/2]

```
const arma::vec& Biases ( ) const [inline]
```

Get the biases.

Definition at line 139 of file perceptron.hpp.

39.399.3.2 Biases() [2/2]

```
arma::vec& Biases ( ) [inline]
```

Modify the biases. You had better know what you are doing!

Definition at line 141 of file perceptron.hpp.

39.399.3.3 Classify()

```
void Classify (
    const MatType & test,
    arma::Row< size_t > & predictedLabels )
```

Classification function.

After training, use the weights matrix to classify test, and put the predicted classes in predictedLabels.

Parameters

<i>test</i>	Testing data or data to classify.
<i>predictedLabels</i>	Vector to store the predicted classes after classifying test.

39.399.3.4 MaxIterations() [1/2]

```
size_t MaxIterations ( ) const [inline]
```

Get the maximum number of iterations.

Definition at line 126 of file perceptron.hpp.

39.399.3.5 MaxIterations() [2/2]

```
size_t& MaxIterations ( ) [inline]
```

Modify the maximum number of iterations.

Definition at line 128 of file perceptron.hpp.

39.399.3.6 NumClasses()

```
size_t NumClasses ( ) const [inline]
```

Get the number of classes this perceptron has been trained for.

Definition at line 131 of file perceptron.hpp.

39.399.3.7 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the perceptron.

39.399.3.8 Train()

```
void Train (
    const MatType & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const arma::rowvec & instanceWeights = arma::rowvec() )
```

Train the perceptron on the given data for up to the maximum number of iterations (specified in the constructor or through **MaxIterations()** (p. 1738)).

A single iteration corresponds to a single pass through the data, so if you want to pass through the dataset only once, set **MaxIterations()** (p. 1738) to 1.

This training does not reset the model weights, so you can call **Train()** (p. 1739) on multiple datasets sequentially.

Parameters

<i>data</i>	Dataset on which training should be performed.
<i>labels</i>	Labels of the dataset.
<i>numClasses</i>	Number of classes in the data.
<i>instanceWeights</i>	Cost matrix. Stores the cost of mispredicting instances. This is useful for boosting.

39.399.3.9 Weights() [1/2]

```
const arma::mat& Weights ( ) const [inline]
```

Get the weight matrix.

Definition at line 134 of file perceptron.hpp.

39.399.3.10 Weights() [2/2]

```
arma::mat& Weights ( ) [inline]
```

Modify the weight matrix. You had better know what you are doing!

Definition at line 136 of file perceptron.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/perceptron/ **perceptron.hpp**

39.400 RandomInitialization Class Reference

This class is used to initialize weights for the weightVectors matrix in a random manner.

Public Member Functions

- **RandomInitialization** ()

Static Public Member Functions

- static void **Initialize** (arma::mat &weights, arma::vec &biases, const size_t numFeatures, const size_t num←
Classes)

39.400.1 Detailed Description

This class is used to initialize weights for the weightVectors matrix in a random manner.

Definition at line 24 of file random_init.hpp.

39.400.2 Constructor & Destructor Documentation

39.400.2.1 RandomInitialization()

```
RandomInitialization ( ) [inline]
```

Definition at line 27 of file random_init.hpp.

39.400.3 Member Function Documentation

39.400.3.1 Initialize()

```
static void Initialize (
    arma::mat & weights,
    arma::vec & biases,
    const size_t numFeatures,
    const size_t numClasses ) [inline], [static]
```

Definition at line 29 of file random_init.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/perceptron/initialization_methods/ **random_init.hpp**

39.401 SimpleWeightUpdate Class Reference

Public Member Functions

- template<typename VecType >
void **UpdateWeights** (const VecType &trainingPoint, arma::mat &weights, arma::vec &biases, const size_t incorrectClass, const size_t correctClass, const double instanceWeight=1.0)

This function is called to update the weightVectors matrix.

39.401.1 Detailed Description

Definition at line 30 of file `simple_weight_update.hpp`.

39.401.2 Member Function Documentation

39.401.2.1 UpdateWeights()

```
void UpdateWeights (
    const VecType & trainingPoint,
    arma::mat & weights,
    arma::vec & biases,
    const size_t incorrectClass,
    const size_t correctClass,
    const double instanceWeight = 1.0 ) [inline]
```

This function is called to update the `weightVectors` matrix.

It decreases the weights of the incorrectly classified class while increasing the weight of the correct class it should have been classified to.

Template Parameters

<i>Type</i>	of vector (should be an Armadillo vector like <code>arma::vec</code> or <code>arma::sp_vec</code> or something similar).
-------------	--

Parameters

<i>trainingPoint</i>	Point that was misclassified.
<i>weights</i>	Matrix of weights.
<i>biases</i>	Vector of biases.
<i>incorrectClass</i>	Index of class that the point was incorrectly classified as.
<i>correctClass</i>	Index of the true class of the point.
<i>instanceWeight</i>	Weight to be given to this particular point during training (this is useful for boosting).

Definition at line 50 of file `simple_weight_update.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/perceptron/learning_policies/simple_weight_update.hpp` ↩

39.402 ZeroInitialization Class Reference

This class is used to initialize the matrix `weightVectors` to zero.

Public Member Functions

- **ZeroInitialization** ()

Static Public Member Functions

- static void **Initialize** (arma::mat &weights, arma::vec &biases, const size_t numFeatures, const size_t numClasses)

39.402.1 Detailed Description

This class is used to initialize the matrix weightVectors to zero.

Definition at line 23 of file zero_init.hpp.

39.402.2 Constructor & Destructor Documentation

39.402.2.1 ZeroInitialization()

```
ZeroInitialization ( ) [inline]
```

Definition at line 26 of file zero_init.hpp.

39.403 Radical Class Reference

An implementation of RADICAL, an algorithm for independent component analysis (ICA).

Public Member Functions

- **Radical** (const double noiseStdDev=0.175, const size_t replicates=30, const size_t angles=150, const size_t sweeps=0, const size_t m=0)
Set the parameters to RADICAL.
- size_t **Angles** () const
Get the number of angles considered during brute-force search.
- size_t & **Angles** ()
Modify the number of angles considered during brute-force search.
- void **CopyAndPerturb** (arma::mat &xNew, const arma::mat &x) const
*Make replicates of each data point (the number of replicates is set in either the constructor or with **Replicates()** (p. 1747)) and perturb data with Gaussian noise with standard deviation noiseStdDev.*
- void **DoRadical** (const arma::mat &matX, arma::mat &matY, arma::mat &matW)
Run RADICAL.
- double **DoRadical2D** (const arma::mat &matX)
Two-dimensional version of RADICAL.
- double **NoiseStdDev** () const
Get the standard deviation of the additive Gaussian noise.
- double & **NoiseStdDev** ()
Modify the standard deviation of the additive Gaussian noise.
- size_t **Replicates** () const
Get the number of Gaussian-perturbed replicates used per point.
- size_t & **Replicates** ()
Modify the number of Gaussian-perturbed replicates used per point.
- size_t **Sweeps** () const
Get the number of sweeps.
- size_t & **Sweeps** ()
Modify the number of sweeps.
- double **Vasicek** (arma::vec &x) const
Vasicek's m-spacing estimator of entropy, with overlap modification from (Learned-Miller and Fisher, 2003).

39.403.1 Detailed Description

An implementation of RADICAL, an algorithm for independent component analysis (ICA).

Let X be a matrix where each column is a point and each row a dimension. The goal is to find a square unmixing matrix W such that $Y = W X$ and the rows of Y are independent components.

For more details, see the following paper:

```
@article{learned2003ica,
  title = {ICA Using Spacings Estimates of Entropy},
  author = {Learned-Miller, E.G. and Fisher III, J.W.},
  journal = {Journal of Machine Learning Research},
  volume = {4},
  pages = {1271--1295},
  year = {2003}
}
```

Definition at line 43 of file radical.hpp.

39.403.2 Constructor & Destructor Documentation

39.403.2.1 Radical()

```
Radical (
    const double noiseStdDev = 0.175,
    const size_t replicates = 30,
    const size_t angles = 150,
    const size_t sweeps = 0,
    const size_t m = 0 )
```

Set the parameters to RADICAL.

Parameters

<i>noiseStdDev</i>	Standard deviation of the Gaussian noise added to the replicates of the data points during Radical2D
<i>replicates</i>	Number of Gaussian-perturbed replicates to use (per point) in Radical2D
<i>angles</i>	Number of angles to consider in brute-force search during Radical2D
<i>sweeps</i>	Number of sweeps. Each sweep calls Radical2D once for each pair of dimensions
<i>m</i>	The variable m from Vasicek's m-spacing estimator of entropy.

39.403.3 Member Function Documentation

39.403.3.1 Angles() [1/2]

```
size_t Angles ( ) const [inline]
```

Get the number of angles considered during brute-force search.

Definition at line 105 of file radical.hpp.

39.403.3.2 Angles() [2/2]

```
size_t& Angles ( ) [inline]
```

Modify the number of angles considered during brute-force search.

Definition at line 107 of file radical.hpp.

39.403.3.3 CopyAndPerturb()

```
void CopyAndPerturb (
    arma::mat & xNew,
    const arma::mat & x ) const
```

Make replicates of each data point (the number of replicates is set in either the constructor or with **Replicates()** (p. 1747)) and perturb data with Gaussian noise with standard deviation noiseStdDev.

39.403.3.4 DoRadical()

```
void DoRadical (
    const arma::mat & matX,
    arma::mat & matY,
    arma::mat & matW )
```

Run RADICAL.

Parameters

<i>matX</i>	Input data into the algorithm - a matrix where each column is a point and each row is a dimension.
<i>matY</i>	Estimated independent components - a matrix where each column is a point and each row is an estimated independent component.
<i>matW</i>	Estimated unmixing matrix, where $\text{matY} = \text{matW} * \text{matX}$.

39.403.3.5 DoRadical2D()

```
double DoRadical2D (
    const arma::mat & matX )
```

Two-dimensional version of RADICAL.

39.403.3.6 NoiseStdDev() [1/2]

```
double NoiseStdDev ( ) const [inline]
```

Get the standard deviation of the additive Gaussian noise.

Definition at line 95 of file radical.hpp.

39.403.3.7 NoiseStdDev() [2/2]

```
double& NoiseStdDev ( ) [inline]
```

Modify the standard deviation of the additive Gaussian noise.

Definition at line 97 of file radical.hpp.

39.403.3.8 Replicates() [1/2]

```
size_t Replicates ( ) const [inline]
```

Get the number of Gaussian-perturbed replicates used per point.

Definition at line 100 of file radical.hpp.

39.403.3.9 Replicates() [2/2]

```
size_t& Replicates ( ) [inline]
```

Modify the number of Gaussian-perturbed replicates used per point.

Definition at line 102 of file radical.hpp.

39.403.3.10 Sweeps() [1/2]

```
size_t Sweeps ( ) const [inline]
```

Get the number of sweeps.

Definition at line 110 of file radical.hpp.

39.403.3.11 Sweeps() [2/2]

```
size_t& Sweeps ( ) [inline]
```

Modify the number of sweeps.

Definition at line 112 of file radical.hpp.

References `mlpack::radical::WhitenFeatureMajorMatrix()`.

39.403.3.12 Vasicek()

```
double Vasicek (
    arma::vec & x ) const
```

Vasicek's m-spacing estimator of entropy, with overlap modification from (Learned-Miller and Fisher, 2003).

Parameters

x	Empirical sample (one-dimensional) over which to estimate entropy.
---	--

The documentation for this class was generated from the following file:

39.404 BiSearchVisitor Class Reference

BiSearchVisitor (p. 1748) executes a bichromatic range search on the given RSType.

Inheritance diagram for BiSearchVisitor:

Public Types

- `template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType> using RSTypeT = RSType< TreeType >`
Alias template necessary for visual c++ compiler.

Public Member Functions

- **BiSearchVisitor** (const arma::mat &querySet, const **math::Range** &range, std::vector< std::vector< size_t >> &neighbors, std::vector< std::vector< double >> &distances, const size_t leafSize)
*Construct the **BiSearchVisitor** (p. 1748).*
- `template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType> void operator() (RSTypeT< TreeType > *rs) const`
Default Bichromatic range search on the given RSType instance.
- `void operator() (RSTypeT< tree::KDTree > *rs) const`
Bichromatic range search on the given RSType specialized for KDTrees.
- `void operator() (RSTypeT< tree::BallTree > *rs) const`
Bichromatic range search on the given RSType specialized for BallTrees.
- `void operator() (RSTypeT< tree::Octree > *rs) const`
Bichromatic range search specialized for octrees.

39.404.1 Detailed Description

BiSearchVisitor (p. 1748) executes a bichromatic range search on the given RSType.

We use template specialization to differentiate those tree types that accept leafSize as a parameter. In these cases, before doing range search, a query tree with proper leafSize is built from the querySet.

Definition at line 71 of file rs_model.hpp.

39.404.2 Member Typedef Documentation

39.404.2.1 RSTypeT

```
using RSTypeT = RSType<TreeType>
```

Alias template necessary for visual c++ compiler.

Definition at line 94 of file rs_model.hpp.

39.404.3 Constructor & Destructor Documentation

39.404.3.1 BiSearchVisitor()

```
BiSearchVisitor (  
    const arma::mat & querySet,  
    const math::Range & range,  
    std::vector< std::vector< size_t >> & neighbors,  
    std::vector< std::vector< double >> & distances,  
    const size_t leafSize )
```

Construct the **BiSearchVisitor** (p. 1748).

39.404.4 Member Function Documentation

39.404.4.1 operator>() [1/4]

```
void operator() (
    RSTypeT< TreeType > * rs ) const
```

Default Bichromatic range search on the given RSType instance.

39.404.4.2 operator>() [2/4]

```
void operator() (
    RSTypeT< tree::KDTree > * rs ) const
```

Bichromatic range search on the given RSType specialized for KDTrees.

39.404.4.3 operator>() [3/4]

```
void operator() (
    RSTypeT< tree::BallTree > * rs ) const
```

Bichromatic range search on the given RSType specialized for BallTrees.

39.404.4.4 operator>() [4/4]

```
void operator() (
    RSTypeT< tree::Octree > * rs ) const
```

Bichromatic range search specialized for octrees.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/ **rs_model.hpp**

39.405 DeleteVisitor Class Reference

DeleteVisitor (p. 1751) deletes the given RSType instance.

Inheritance diagram for DeleteVisitor:

Public Member Functions

- `template<typename RSType >`
`void operator() (RSType *rs) const`
Delete the RSType object.

39.405.1 Detailed Description

DeleteVisitor (p. 1751) deletes the given RSType instance.

Definition at line 177 of file `rs_model.hpp`.

39.405.2 Member Function Documentation

39.405.2.1 `operator()()`

```
void operator() (  
    RSType * rs ) const
```

Delete the RSType object.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/ rs_model.hpp`

39.406 MonoSearchVisitor Class Reference

MonoSearchVisitor (p. 1752) executes a monochromatic range search on the given RSType.

Inheritance diagram for MonoSearchVisitor:

Public Member Functions

- **MonoSearchVisitor** (const **math::Range** &range, std::vector< std::vector< size_t >> &neighbors, std::vector< std::vector< double >> &distances)
Construct the **MonoSearchVisitor** (p. 1752) with the given parameters.
- template<typename RSType >
void **operator()** (**RSType** *rs) const
Perform monochromatic search with the given **RangeSearch** (p. 1754) object.

39.406.1 Detailed Description

MonoSearchVisitor (p. 1752) executes a monochromatic range search on the given RSType.

Range Search is performed on the reference set itself, no querySet.

Definition at line 40 of file rs_model.hpp.

39.406.2 Constructor & Destructor Documentation

39.406.2.1 MonoSearchVisitor()

```

MonoSearchVisitor (
    const math::Range & range,
    std::vector< std::vector< size_t >> & neighbors,
    std::vector< std::vector< double >> & distances ) [inline]

```

Construct the **MonoSearchVisitor** (p. 1752) with the given parameters.

Definition at line 56 of file rs_model.hpp.

39.406.3 Member Function Documentation

39.406.3.1 operator>()

```
void operator() (
    RSType * rs ) const
```

Perform monochromatic search with the given **RangeSearch** (p. 1754) object.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/ **rs_model.hpp**

39.407 NaiveVisitor Class Reference

NaiveVisitor (p. 1753) exposes the Naive() method of the given RSType.

Inheritance diagram for NaiveVisitor:

Public Member Functions

- template<typename RSType >
bool & **operator()** (RSType *rs) const
*Get a reference to the naive parameter of the given **RangeSearch** (p. 1754) object.*

39.407.1 Detailed Description

NaiveVisitor (p. 1753) exposes the Naive() method of the given RSType.

Definition at line 202 of file rs_model.hpp.

39.407.2 Member Function Documentation

39.407.2.1 operator{ }()

```
bool& operator() (
    RSType * rs ) const
```

Get a reference to the naive parameter of the given **RangeSearch** (p. 1754) object.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/ **rs_model.hpp**

39.408 RangeSearch< MetricType, MatType, TreeType > Class Template Reference

The **RangeSearch** (p. 1754) class is a template class for performing range searches.

Public Types

- typedef TreeType< MetricType, **RangeSearchStat**, MatType > **Tree**
Convenience typedef.

Public Member Functions

- **RangeSearch** (MatType referenceSet, const bool naive=false, const bool singleMode=false, const MetricType metric=MetricType())
*Initialize the **RangeSearch** (p. 1754) object with a given reference dataset (this is the dataset which is searched).*
- **RangeSearch** (**Tree** *referenceTree, const bool singleMode=false, const MetricType metric=MetricType())
*Initialize the **RangeSearch** (p. 1754) object with the given pre-constructed reference tree (this is the tree built on the reference set, which is the set that is searched).*
- **RangeSearch** (const bool naive=false, const bool singleMode=false, const MetricType metric=MetricType())
*Initialize the **RangeSearch** (p. 1754) object without any reference data.*
- **RangeSearch** (const **RangeSearch** &other)
*Construct the **RangeSearch** (p. 1754) model as a copy of the given model.*
- **RangeSearch** (**RangeSearch** &&other)
*Construct the **RangeSearch** (p. 1754) model by taking ownership of the given model.*
- **~RangeSearch** ()
*Destroy the **RangeSearch** (p. 1754) object.*
- size_t **BaseCases** () const
Get the number of base cases during the last search.
- bool **Naive** () const

- Get whether naive search is being used.*

 - `bool & Naive ()`

Modify whether naive search is being used.
- `RangeSearch & operator= (RangeSearch other)`

Copy the given RangeSearch (p. 1754) model.
- `const MatType & ReferenceSet () const`

Return the reference set.
- `Tree * ReferenceTree ()`

Return the reference tree (or NULL if in naive mode).
- `size_t Scores () const`

Get the number of scores during the last search.
- `void Search (const MatType &querySet, const math::Range &range, std::vector< std::vector< size_t >> &neighbors, std::vector< std::vector< double >> &distances)`

Search for all reference points in the given range for each point in the query set, returning the results in the neighbors and distances objects.
- `void Search (Tree *queryTree, const math::Range &range, std::vector< std::vector< size_t >> &neighbors, std::vector< std::vector< double >> &distances)`

Given a pre-built query tree, search for all reference points in the given range for each point in the query set, returning the results in the neighbors and distances objects.
- `void Search (const math::Range &range, std::vector< std::vector< size_t >> &neighbors, std::vector< std::vector< double >> &distances)`

Search for all points in the given range for each point in the reference set (which was passed to the constructor), returning the results in the neighbors and distances objects.
- `template<typename Archive > void serialize (Archive &ar, const unsigned int version)`

Serialize the model.
- `bool SingleMode () const`

Get whether single-tree search is being used.
- `bool & SingleMode ()`

Modify whether single-tree search is being used.
- `void Train (MatType referenceSet)`

Set the reference set to a new reference set, and build a tree if necessary.
- `void Train (Tree *referenceTree)`

Set the reference tree to a new reference tree.

39.408.1 Detailed Description

```
template<typename MetricType = metric::EuclideanDistance, typename MatType = arma::mat, template< typename TreeMetricType,
typename TreeStatType, typename TreeMatType > class TreeType = tree::KDTree>
class mlpack::range::RangeSearch< MetricType, MatType, TreeType >
```

The **RangeSearch** (p. 1754) class is a template class for performing range searches.

It is implemented in the style of a generalized tree-independent dual-tree algorithm; for more details on the actual algorithm, see the **RangeSearchRules** (p. 1764) class.

Template Parameters

<i>MetricType</i>	Metric to use for range search calculations.
<i>MatType</i>	Type of data to use.
<i>TreeType</i>	Type of tree to use; must satisfy the <i>TreeType</i> policy API.

Definition at line 42 of file `range_search.hpp`.

39.408.2 Member Typedef Documentation

39.408.2.1 Tree

```
typedef TreeType<MetricType, RangeSearchStat, MatType> Tree
```

Convenience typedef.

Definition at line 46 of file `range_search.hpp`.

39.408.3 Constructor & Destructor Documentation

39.408.3.1 RangeSearch() [1/5]

```
RangeSearch (
    MatType referenceSet,
    const bool naive = false,
    const bool singleMode = false,
    const MetricType metric = MetricType() )
```

Initialize the **RangeSearch** (p. 1754) object with a given reference dataset (this is the dataset which is searched).

Optionally, perform the computation in naive mode or single-tree mode. Additionally, an instantiated metric can be given, for cases where the distance metric holds data.

This method will move the matrices to internal copies, which are rearranged during tree-building. You can avoid creating an extra copy by pre-constructing the trees and passing them in using `std::move`.

Parameters

<i>referenceSet</i>	Reference dataset.
<i>naive</i>	Whether the computation should be done in $O(n^2)$ naive mode.
<i>singleMode</i>	Whether single-tree computation should be used (as opposed to dual-tree computation).
<i>metric</i>	Instantiated distance metric.

39.408.3.2 RangeSearch() [2/5]

```

RangeSearch (
    Tree * referenceTree,
    const bool singleMode = false,
    const MetricType metric = MetricType() )

```

Initialize the **RangeSearch** (p. 1754) object with the given pre-constructed reference tree (this is the tree built on the reference set, which is the set that is searched).

Optionally, choose to use single-tree mode, which will not build a tree on query points. Naive mode is not available as an option for this constructor. Additionally, an instantiated distance metric can be given, for cases where the distance metric holds data.

There is no copying of the data matrices in this constructor (because tree-building is not necessary), so this is the constructor to use when copies absolutely must be avoided.

Note

Because tree-building (at least with BinarySpaceTree) modifies the ordering of a matrix, be aware that mapping of the points back to their original indices is not done when this constructor is used.

Parameters

<i>referenceTree</i>	Pre-built tree for reference points.
<i>referenceSet</i>	Set of reference points corresponding to referenceTree.
<i>singleMode</i>	Whether single-tree computation should be used (as opposed to dual-tree computation).
<i>metric</i>	Instantiated distance metric.

39.408.3.3 RangeSearch() [3/5]

```

RangeSearch (
    const bool naive = false,
    const bool singleMode = false,
    const MetricType metric = MetricType() )

```

Initialize the **RangeSearch** (p. 1754) object without any reference data.

If the monochromatic **Search()** (p. 1760) is called before a reference set is set with **Train()** (p. 1763), no results will be returned (since the reference set is empty).

Parameters

<i>naive</i>	Whether to use naive search.
<i>singleMode</i>	Whether single-tree computation should be used (as opposed to dual-tree computation).
<i>metric</i>	Instantiated metric.

39.408.3.4 **RangeSearch()** [4/5]

```
RangeSearch (
    const RangeSearch< MetricType, MatType, TreeType > & other )
```

Construct the **RangeSearch** (p. 1754) model as a copy of the given model.

Note that this may be computationally intensive!

Parameters

<i>other</i>	RangeSearch (p. 1754) model to copy.
--------------	---

39.408.3.5 **RangeSearch()** [5/5]

```
RangeSearch (
    RangeSearch< MetricType, MatType, TreeType > && other )
```

Construct the **RangeSearch** (p. 1754) model by taking ownership of the given model.

Parameters

<i>other</i>	RangeSearch (p. 1754) model to take ownership of.
--------------	--

39.408.3.6 **~RangeSearch()**

```
~ RangeSearch ( )
```

Destroy the **RangeSearch** (p. 1754) object.

If trees were created, they will be deleted.

39.408.4 **Member Function Documentation**

39.408.4.1 BaseCases()

```
size_t BaseCases ( ) const [inline]
```

Get the number of base cases during the last search.

Definition at line 276 of file range_search.hpp.

39.408.4.2 Naive() [1/2]

```
bool Naive ( ) const [inline]
```

Get whether naive search is being used.

Definition at line 271 of file range_search.hpp.

39.408.4.3 Naive() [2/2]

```
bool& Naive ( ) [inline]
```

Modify whether naive search is being used.

Definition at line 273 of file range_search.hpp.

39.408.4.4 operator=()

```
RangeSearch& operator= (
    RangeSearch< MetricType, MatType, TreeType > other )
```

Copy the given **RangeSearch** (p. 1754) model.

Use std::move to pass in the model if the old copy is no longer needed.

Parameters

<i>other</i>	RangeSearch (p. 1754) model to copy.
--------------	---

39.408.4.5 ReferenceSet()

```
const MatType& ReferenceSet ( ) const [inline]
```

Return the reference set.

Definition at line 285 of file range_search.hpp.

39.408.4.6 ReferenceTree()

```
Tree* ReferenceTree ( ) [inline]
```

Return the reference tree (or NULL if in naive mode).

Definition at line 288 of file range_search.hpp.

39.408.4.7 Scores()

```
size_t Scores ( ) const [inline]
```

Get the number of scores during the last search.

Definition at line 278 of file range_search.hpp.

References RangeSearch< MetricType, MatType, TreeType >::serialize().

39.408.4.8 Search() [1/3]

```
void Search (
    const MatType & querySet,
    const math::Range & range,
    std::vector< std::vector< size_t >> & neighbors,
    std::vector< std::vector< double >> & distances )
```

Search for all reference points in the given range for each point in the query set, returning the results in the neighbors and distances objects.

Each entry in the external vector corresponds to a query point. Each of these entries holds a vector which contains the indices and distances of the reference points falling into the given range.

That is:

- neighbors.size() and distances.size() both equal the number of query points.
- neighbors[i] contains the indices of all the points in the reference set which have distances inside the given range to query point i.
- distances[i] contains all of the distances corresponding to the indices contained in neighbors[i].
- neighbors[i] and distances[i] are not sorted in any particular order.

Parameters

<i>querySet</i>	Set of query points to search with.
<i>range</i>	Range of distances in which to search.
<i>neighbors</i>	Object which will hold the list of neighbors for each point which fell into the given range, for each query point.
<i>distances</i>	Object which will hold the list of distances for each point which fell into the given range, for each query point.

39.408.4.9 Search() [2/3]

```
void Search (
    Tree * queryTree,
    const math::Range & range,
    std::vector< std::vector< size_t >> & neighbors,
    std::vector< std::vector< double >> & distances )
```

Given a pre-built query tree, search for all reference points in the given range for each point in the query set, returning the results in the neighbors and distances objects.

Each entry in the external vector corresponds to a query point. Each of these entries holds a vector which contains the indices and distances of the reference points falling into the given range.

That is:

- neighbors.size() and distances.size() both equal the number of query points.
- neighbors[i] contains the indices of all the points in the reference set which have distances inside the given range to query point i.
- distances[i] contains all of the distances corresponding to the indices contained in neighbors[i].
- neighbors[i] and distances[i] are not sorted in any particular order.

If either naive or singleMode are set to true, this will throw an invalid_argument exception; passing in a query tree implies dual-tree search.

If you want to use the reference tree as the query tree, instead call the overload of **Search()** (p. 1760) that does not take a query set.

Parameters

<i>queryTree</i>	Tree built on query points.
<i>range</i>	Range of distances in which to search.
<i>neighbors</i>	Object which will hold the list of neighbors for each point which fell into the given range, for each query point.
<i>distances</i>	Object which will hold the list of distances for each point which fell into the given range, for each query point.

39.408.4.10 Search() [3/3]

```
void Search (
    const math::Range & range,
    std::vector< std::vector< size_t >> & neighbors,
    std::vector< std::vector< double >> & distances )
```

Search for all points in the given range for each point in the reference set (which was passed to the constructor), returning the results in the neighbors and distances objects.

This means that the query set and the reference set are the same.

Each entry in the external vector corresponds to a query point. Each of these entries holds a vector which contains the indices and distances of the reference points falling into the given range.

That is:

- neighbors.size() and distances.size() both equal the number of query points.
- neighbors[i] contains the indices of all the points in the reference set which have distances inside the given range to query point i.
- distances[i] contains all of the distances corresponding to the indices contained in neighbors[i].
- neighbors[i] and distances[i] are not sorted in any particular order.

Parameters

<i>queryTree</i>	Tree built on query points.
<i>range</i>	Range of distances in which to search.
<i>neighbors</i>	Object which will hold the list of neighbors for each point which fell into the given range, for each query point.
<i>distances</i>	Object which will hold the list of distances for each point which fell into the given range, for each query point.

39.408.4.11 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int version )
```

Serialize the model.

Referenced by RangeSearch< MetricType, MatType, TreeType >::Scores().

39.408.4.12 SingleMode() [1/2]

```
bool SingleMode ( ) const [inline]
```

Get whether single-tree search is being used.

Definition at line 266 of file range_search.hpp.

39.408.4.13 SingleMode() [2/2]

```
bool& SingleMode ( ) [inline]
```

Modify whether single-tree search is being used.

Definition at line 268 of file range_search.hpp.

39.408.4.14 Train() [1/2]

```
void Train (
    MatType referenceSet )
```

Set the reference set to a new reference set, and build a tree if necessary.

This method is called '**Train()** (p. 1763)' in order to match the rest of the mlpack abstractions, even though calling this "training" is maybe a bit of a stretch.

Use std::move to pass in the reference set if the old copy is no longer needed.

Parameters

<i>referenceSet</i>	New set of reference data.
---------------------	----------------------------

39.408.4.15 Train() [2/2]

```
void Train (
    Tree * referenceTree )
```

Set the reference tree to a new reference tree.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/ **range_search.hpp**

39.409 RangeSearchRules< MetricType, TreeType > Class Template Reference

The **RangeSearchRules** (p. 1764) class is a template helper class used by **RangeSearch** (p. 1754) class when performing range searches.

Public Types

- typedef **tree::TraversallInfo**< TreeType > **TraversallInfoType**

Public Member Functions

- **RangeSearchRules** (const arma::mat &referenceSet, const arma::mat &querySet, const **math::Range** &range, std::vector< std::vector< size_t > > &neighbors, std::vector< std::vector< double > > &distances, MetricType &metric, const bool sameSet=false)
*Construct the **RangeSearchRules** (p. 1764) object.*
- double **BaseCase** (const size_t queryIndex, const size_t referenceIndex)
Compute the base case between the given query point and reference point.
- size_t **BaseCases** () const
Get the number of base cases.
- double **Rescore** (const size_t queryIndex, TreeType &referenceNode, const double oldScore) const
Re-evaluate the score for recursion order.
- double **Rescore** (TreeType &queryNode, TreeType &referenceNode, const double oldScore) const
Re-evaluate the score for recursion order.
- double **Score** (const size_t queryIndex, TreeType &referenceNode)
Get the score for recursion order.
- double **Score** (TreeType &queryNode, TreeType &referenceNode)
Get the score for recursion order.
- size_t **Scores** () const
Get the number of scores (that is, calls to RangeDistance()).
- const **TraversallInfoType** & **TraversallInfo** () const
- **TraversallInfoType** & **TraversallInfo** ()

39.409.1 Detailed Description

```
template<typename MetricType, typename TreeType>
class mpack::range::RangeSearchRules< MetricType, TreeType >
```

The **RangeSearchRules** (p. 1764) class is a template helper class used by **RangeSearch** (p. 1754) class when performing range searches.

Template Parameters

<i>MetricType</i>	The metric to use for computation.
<i>TreeType</i>	The tree type to use; must adhere to the TreeType API.

Definition at line 28 of file range_search_rules.hpp.

39.409.2 Member Typedef Documentation

39.409.2.1 TraversalInfoType

```
typedef tree::TraversalInfo<TreeType> TraversalInfoType
```

Definition at line 110 of file range_search_rules.hpp.

39.409.3 Constructor & Destructor Documentation

39.409.3.1 RangeSearchRules()

```
RangeSearchRules (
    const arma::mat & referenceSet,
    const arma::mat & querySet,
    const math::Range & range,
    std::vector< std::vector< size_t > > & neighbors,
    std::vector< std::vector< double > > & distances,
    MetricType & metric,
    const bool sameSet = false )
```

Construct the **RangeSearchRules** (p. 1764) object.

This is usually done from within the **RangeSearch** (p. 1754) class at search time.

Parameters

<i>referenceSet</i>	Set of reference data.
<i>querySet</i>	Set of query data.
<i>range</i>	Range to search for.
<i>neighbors</i>	Vector to store resulting neighbors in.
<i>distances</i>	Vector to store resulting distances in.
<i>metric</i>	Instantiated metric.
<i>sameSet</i>	If true, the query and reference set are taken to be the same, and a query point will not return itself in the results.

39.409.4 Member Function Documentation

39.409.4.1 BaseCase()

```
double BaseCase (
    const size_t queryIndex,
    const size_t referenceIndex )
```

Compute the base case between the given query point and reference point.

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceIndex</i>	Index of reference point.

39.409.4.2 BaseCases()

```
size_t BaseCases ( ) const [inline]
```

Get the number of base cases.

Definition at line 116 of file range_search_rules.hpp.

39.409.4.3 Rescore() [1/2]

```
double Rescore (
    const size_t queryIndex,
    TreeType & referenceNode,
    const double oldScore ) const
```

Re-evaluate the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned). This is used when the score has already been calculated, but another recursion may have modified the bounds for pruning. So the old score is checked against the new pruning bound.

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceNode</i>	Candidate node to be recursed into.
<i>oldScore</i>	Old score produced by Score() (p. 1767) (or Rescore() (p. 1766)).

39.409.4.4 Rescore() [2/2]

```
double Rescore (
    TreeType & queryNode,
    TreeType & referenceNode,
    const double oldScore ) const
```

Re-evaluate the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned). This is used when the score has already been calculated, but another recursion may have modified the bounds for pruning. So the old score is checked against the new pruning bound.

Parameters

<i>queryNode</i>	Candidate query node to recurse into.
<i>referenceNode</i>	Candidate reference node to recurse into.
<i>oldScore</i>	Old score produced by Score() (p. 1767) (or Rescore() (p. 1766)).

39.409.4.5 Score() [1/2]

```
double Score (
    const size_t queryIndex,
    TreeType & referenceNode )
```

Get the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned).

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceNode</i>	Candidate node to be recursed into.

39.409.4.6 Score() [2/2]

```
double Score (
    TreeType & queryNode,
    TreeType & referenceNode )
```

Get the score for recursion order.

A low score indicates priority for recursion, while DBL_MAX indicates that the node should not be recursed into at all (it should be pruned).

Parameters

<i>queryNode</i>	Candidate query node to recurse into.
<i>referenceNode</i>	Candidate reference node to recurse into.

39.409.4.7 Scores()

```
size_t Scores ( ) const [inline]
```

Get the number of scores (that is, calls to RangeDistance()).

Definition at line 118 of file range_search_rules.hpp.

39.409.4.8 TraversalInfo() [1/2]

```
const TraversalInfoType& TraversalInfo ( ) const [inline]
```

Definition at line 112 of file range_search_rules.hpp.

39.409.4.9 TraversalInfo() [2/2]

```
TraversalInfoType& TraversalInfo ( ) [inline]
```

Definition at line 113 of file range_search_rules.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/ **range_search_rules.hpp**

39.410 RangeSearchStat Class Reference

Statistic class for **RangeSearch** (p. 1754), to be set to the `StatisticType` of the tree type that range search is being performed with.

Public Member Functions

- **RangeSearchStat** ()
Initialize the statistic.
- template<typename TreeType >
RangeSearchStat (TreeType &)
Initialize the statistic given a tree node that this statistic belongs to.
- double **LastDistance** () const
Get the last distance evaluation.
- double & **LastDistance** ()
Modify the last distance evaluation.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the statistic.

39.410.1 Detailed Description

Statistic class for **RangeSearch** (p. 1754), to be set to the StatisticType of the tree type that range search is being performed with.

This class just holds the last visited node and the corresponding base case result.

Definition at line 26 of file range_search_stat.hpp.

39.410.2 Constructor & Destructor Documentation

39.410.2.1 RangeSearchStat() [1/2]

```
RangeSearchStat ( ) [inline]
```

Initialize the statistic.

Definition at line 32 of file range_search_stat.hpp.

39.410.2.2 RangeSearchStat() [2/2]

```
RangeSearchStat (  
    TreeType & ) [inline]
```

Initialize the statistic given a tree node that this statistic belongs to.

In this case, we ignore the node.

Definition at line 39 of file range_search_stat.hpp.

39.410.3 Member Function Documentation

39.410.3.1 LastDistance() [1/2]

```
double LastDistance ( ) const [inline]
```

Get the last distance evaluation.

Definition at line 43 of file range_search_stat.hpp.

39.410.3.2 LastDistance() [2/2]

```
double& LastDistance ( ) [inline]
```

Modify the last distance evaluation.

Definition at line 45 of file range_search_stat.hpp.

39.410.3.3 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the statistic.

Definition at line 49 of file range_search_stat.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/ **range_search_stat.hpp**

39.411 ReferenceSetVisitor Class Reference

ReferenceSetVisitor (p. 1771) exposes the referenceSet of the given RSType.

Inheritance diagram for ReferenceSetVisitor:

Public Member Functions

- `template<typename RSType >`
`const arma::mat & operator() (RSType *rs) const`
Return the reference set.

39.411.1 Detailed Description

ReferenceSetVisitor (p. 1771) exposes the referenceSet of the given RSType.

Definition at line 166 of file `rs_model.hpp`.

39.411.2 Member Function Documentation

39.411.2.1 operator()()

```
const arma::mat& operator() (
    RSType * rs ) const
```

Return the reference set.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/ rs_model.hpp`

39.412 RSMModel Class Reference

Public Types

- enum **TreeTypes** {
KD_TREE,
COVER_TREE,
R_TREE,
R_STAR_TREE,
BALL_TREE,
X_TREE,
HILBERT_R_TREE,
R_PLUS_TREE,
R_PLUS_PLUS_TREE,

RP_TREE,
MAX_RP_TREE,
UB_TREE,
OCTREE }

Public Member Functions

- **RSMModel** (const **TreeTypes** treeType=TreeTypes::KD_TREE, const bool randomBasis=false)
*Initialize the **RSMModel** (p. 1772) with the given type and whether or not a random basis should be used.*
- **RSMModel** (const **RSMModel** &other)
*Copy the given **RSMModel** (p. 1772).*
- **RSMModel** (**RSMModel** &&other)
*Take ownership of the given **RSMModel** (p. 1772).*
- **~RSMModel** ()
Clean memory, if necessary.
- void **BuildModel** (arma::mat &&referenceSet, const size_t leafSize, const bool naive, const bool singleMode)
Build the reference tree on the given dataset with the given parameters.
- const arma::mat & **Dataset** () const
Expose the dataset.
- size_t **LeafSize** () const
Get the leaf size (applicable to everything but the cover tree).
- size_t & **LeafSize** ()
Modify the leaf size (applicable to everything but the cover tree).
- bool **Naive** () const
Get whether the model is in naive search mode.
- bool & **Naive** ()
Modify whether the model is in naive search mode.
- **RSMModel** & **operator=** (**RSMModel** other)
*Copy the given **RSMModel** (p. 1772).*
- bool **RandomBasis** () const
Get whether a random basis is used.
- bool & **RandomBasis** ()
Modify whether a random basis is used (don't do this after the model has been built).

- void **Search** (arma::mat &&querySet, const **math::Range** &range, std::vector< std::vector< size_t >> &neighbors, std::vector< std::vector< double >> &distances)
Perform range search.
- void **Search** (const **math::Range** &range, std::vector< std::vector< size_t >> &neighbors, std::vector< std::vector< double >> &distances)
Perform monochromatic range search, with the reference set as the query set.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the range search model.
- bool **SingleMode** () const
Get whether the model is in single-tree search mode.
- bool & **SingleMode** ()
Modify whether the model is in single-tree search mode.
- **TreeTypes TreeType** () const
Get the type of tree.
- **TreeTypes & TreeType** ()
Modify the type of tree (don't do this after the model has been built).

39.412.3 Constructor & Destructor Documentation

39.412.3.1 `RModel()` [1/3]

```
RModel (
    const TreeTypes treeType = TreeTypes::KD_TREE,
    const bool randomBasis = false )
```

Initialize the **RModel** (p. 1772) with the given type and whether or not a random basis should be used.

Parameters

<i>treeType</i>	Type of tree to use.
<i>randomBasis</i>	Whether or not to use a random basis.

39.412.3.2 `RModel()` [2/3]

```
RModel (
    const RModel & other )
```

Copy the given **RModel** (p. 1772).

Parameters

<i>other</i>	RModel (p. 1772) to copy.
--------------	----------------------------------

39.412.3.3 `RModel()` [3/3]

```
RModel (
    RModel && other )
```

Take ownership of the given **RModel** (p. 1772).

Parameters

<i>other</i>	RModel (p. 1772) to take ownership of.
--------------	---

39.412.3.4 ~RSModel()

`~ RSModel ()`

Clean memory, if necessary.

39.412.4 Member Function Documentation

39.412.4.1 BuildModel()

```
void BuildModel (
    arma::mat && referenceSet,
    const size_t leafSize,
    const bool naive,
    const bool singleMode )
```

Build the reference tree on the given dataset with the given parameters.

This takes possession of the reference set to avoid a copy.

Parameters

<i>referenceSet</i>	Set of reference points.
<i>leafSize</i>	Leaf size of tree (ignored for the cover tree).
<i>naive</i>	Whether naive search should be used.
<i>singleMode</i>	Whether single-tree search should be used.

39.412.4.2 Dataset()

```
const arma::mat& Dataset ( ) const
```

Expose the dataset.

39.412.4.3 LeafSize() [1/2]

```
size_t LeafSize ( ) const [inline]
```

Get the leaf size (applicable to everything but the cover tree).

Definition at line 319 of file rs_model.hpp.

39.412.4.4 LeafSize() [2/2]

```
size_t& LeafSize ( ) [inline]
```

Modify the leaf size (applicable to everything but the cover tree).

Definition at line 321 of file rs_model.hpp.

39.412.4.5 Naive() [1/2]

```
bool Naive ( ) const
```

Get whether the model is in naive search mode.

39.412.4.6 Naive() [2/2]

```
bool& Naive ( )
```

Modify whether the model is in naive search mode.

39.412.4.7 operator=()

```
RModel& operator= (
    RModel other )
```

Copy the given **RModel** (p. 1772).

Use `std::move` to pass in the model if the old copy is no longer needed.

Parameters

<i>other</i>	RSModel (p. 1772) to copy.
--------------	-----------------------------------

39.412.4.8 RandomBasis() [1/2]

```
bool RandomBasis ( ) const [inline]
```

Get whether a random basis is used.

Definition at line 329 of file `rs_model.hpp`.

39.412.4.9 RandomBasis() [2/2]

```
bool& RandomBasis ( ) [inline]
```

Modify whether a random basis is used (don't do this after the model has been built).

Definition at line 332 of file `rs_model.hpp`.

References `mlpack::bindings::tests::CleanMemory()`.

39.412.4.10 Search() [1/2]

```
void Search (
    arma::mat && querySet,
    const math::Range & range,
    std::vector< std::vector< size_t >> & neighbors,
    std::vector< std::vector< double >> & distances )
```

Perform range search.

This takes possession of the query set, so the query set will not be usable after the search. For more information on the output format, see **RangeSearch<>::Search()** (p. 1760).

Parameters

<i>querySet</i>	Set of query points.
<i>range</i>	Range to search for.
<i>neighbors</i>	Output: neighbors falling within the desired range.
<i>distances</i>	Output: distances of neighbors.

39.412.4.11 Search() [2/2]

```
void Search (
    const math::Range & range,
    std::vector< std::vector< size_t >> & neighbors,
    std::vector< std::vector< double >> & distances )
```

Perform monochromatic range search, with the reference set as the query set.

For more information on the output format, see **RangeSearch<>::Search()** (p. 1760).

Parameters

<i>range</i>	Range to search for.
<i>neighbors</i>	Output: neighbors falling within the desired range.
<i>distances</i>	Output: distances of neighbors.

39.412.4.12 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the range search model.

39.412.4.13 SingleMode() [1/2]

```
bool SingleMode ( ) const
```

Get whether the model is in single-tree search mode.

39.412.4.14 SingleMode() [2/2]

```
bool& SingleMode ( )
```

Modify whether the model is in single-tree search mode.

39.412.4.15 TreeType() [1/2]

```
TreeTypes TreeType ( ) const [inline]
```

Get the type of tree.

Definition at line 324 of file rs_model.hpp.

39.412.4.16 TreeType() [2/2]

```
TreeTypes& TreeType ( ) [inline]
```

Modify the type of tree (don't do this after the model has been built).

Definition at line 326 of file rs_model.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/ **rs_model.hpp**

39.413 SingleModeVisitor Class Reference

SingleModeVisitor (p. 1779) exposes the SingleMode() method of the given RSType.

Inheritance diagram for SingleModeVisitor:

Public Member Functions

- template<typename RSType >
bool & **operator()** (**RSType** *rs) const

Get a reference to the singleMode parameter of the given RangeSeach object.

39.413.1 Detailed Description

SingleModeVisitor (p. 1779) exposes the SingleMode() method of the given RSType.

Definition at line 188 of file rs_model.hpp.

39.413.2 Member Function Documentation

39.413.2.1 operator()()

```
bool& operator() (
    RSType * rs ) const
```

Get a reference to the singleMode parameter of the given RangeSeach object.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/ **rs_model.hpp**

39.414 TrainVisitor Class Reference

TrainVisitor (p. 1780) sets the reference set to a new reference set on the given RSType.

Inheritance diagram for TrainVisitor:

Public Types

- `template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType>`
`using RSTypeT = RSType< TreeType >`
Alias template necessary for visual c++ compiler.

Public Member Functions

- **TrainVisitor** (arma::mat &&referenceSet, const size_t leafSize)
Construct the **TrainVisitor** (p. 1780) object with the given reference set, leafSize.
- template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType>
void **operator()** (**RSTypeT**< TreeType > *rs) const
Default Train on the given RSType instance.
- void **operator()** (**RSTypeT**< **tree::KDTree** > *rs) const
Train on the given RSType specialized for KDTrees.
- void **operator()** (**RSTypeT**< **tree::BallTree** > *rs) const
Train on the given RSType specialized for BallTrees.
- void **operator()** (**RSTypeT**< **tree::Octree** > *rs) const
Train specialized for octrees.

39.414.1 Detailed Description

TrainVisitor (p. 1780) sets the reference set to a new reference set on the given RSType.

We use template specialization to differentiate those tree types that accept leafSize as a parameter. In these cases, a reference tree with proper leafSize is built from the referenceSet.

Definition at line 125 of file rs_model.hpp.

39.414.2 Member Typedef Documentation

39.414.2.1 RSTypeT

```
using RSTypeT = RSType<TreeType>
```

Alias template necessary for visual c++ compiler.

Definition at line 141 of file rs_model.hpp.

39.414.3 Constructor & Destructor Documentation

39.414.3.1 TrainVisitor()

```
TrainVisitor (  
    arma::mat && referenceSet,  
    const size_t leafSize )
```

Construct the **TrainVisitor** (p. 1780) object with the given reference set, leafSize.

39.414.4 Member Function Documentation

39.414.4.1 `operator()()` [1/4]

```
void operator() (
    RSTypeT< TreeType > * rs ) const
```

Default Train on the given RSType instance.

39.414.4.2 `operator()()` [2/4]

```
void operator() (
    RSTypeT< tree::KDTree > * rs ) const
```

Train on the given RSType specialized for KDTrees.

39.414.4.3 `operator()()` [3/4]

```
void operator() (
    RSTypeT< tree::BallTree > * rs ) const
```

Train on the given RSType specialized for BallTrees.

39.414.4.4 `operator()()` [4/4]

```
void operator() (
    RSTypeT< tree::Octree > * rs ) const
```

Train specialized for octrees.

*Run **LARS** (p. 1783).*

39.415.1 Detailed Description

An implementation of **LARS** (p. 1783), a stage-wise homotopy-based algorithm for l1-regularized linear regression (LASSO) and l1+l2 regularized linear regression (Elastic Net).

Let X be a matrix where each row is a point and each column is a dimension and let y be a vector of responses.

The Elastic Net problem is to solve

$$\min_{\beta} 0.5 \|X\beta - y\|_2^2 + \lambda_1 \|\beta\|_1 + 0.5\lambda_2 \|\beta\|_2^2$$

where β is the vector of regression coefficients.

If $\lambda_1 > 0$ and $\lambda_2 = 0$, the problem is the LASSO. If $\lambda_1 > 0$ and $\lambda_2 > 0$, the problem is the elastic net. If $\lambda_1 = 0$ and $\lambda_2 > 0$, the problem is ridge regression. If $\lambda_1 = 0$ and $\lambda_2 = 0$, the problem is unregularized linear regression.

Note: This algorithm is not recommended for use (in terms of efficiency) when $\lambda_1 = 0$.

For more details, see the following papers:

Definition at line 89 of file lars.hpp.

39.415.2 Constructor & Destructor Documentation

39.415.2.1 LARS() [1/4]

```
LARS (
    const bool useCholesky = false,
    const double lambda1 = 0.0,
    const double lambda2 = 0.0,
    const double tolerance = 1e-16 )
```

Set the parameters to **LARS** (p. 1783).

Both lambda1 and lambda2 default to 0.

Parameters

<i>useCholesky</i>	Whether or not to use Cholesky decomposition when solving linear system (as opposed to using the full Gram matrix).
<i>lambda1</i>	Regularization parameter for l1-norm penalty.
<i>lambda2</i>	Regularization parameter for l2-norm penalty.
<i>tolerance</i>	Run until the maximum correlation of elements in $(X^T y)$ is less than this.

39.415.2.2 LARS() [2/4]

```
LARS (
    const bool useCholesky,
    const arma::mat & gramMatrix,
    const double lambda1 = 0.0,
    const double lambda2 = 0.0,
    const double tolerance = 1e-16 )
```

Set the parameters to **LARS** (p. 1783), and pass in a precalculated Gram matrix.

Both lambda1 and lambda2 default to 0.

Parameters

<i>useCholesky</i>	Whether or not to use Cholesky decomposition when solving linear system (as opposed to using the full Gram matrix).
<i>gramMatrix</i>	Gram matrix.
<i>lambda1</i>	Regularization parameter for l1-norm penalty.
<i>lambda2</i>	Regularization parameter for l2-norm penalty.
<i>tolerance</i>	Run until the maximum correlation of elements in $(X^T y)$ is less than this.

39.415.2.3 LARS() [3/4]

```
LARS (
    const arma::mat & data,
    const arma::rowvec & responses,
    const bool transposeData = true,
    const bool useCholesky = false,
    const double lambda1 = 0.0,
    const double lambda2 = 0.0,
    const double tolerance = 1e-16 )
```

Set the parameters to **LARS** (p. 1783) and run training.

Both lambda1 and lambda2 are set by default to 0.

Parameters

<i>data</i>	Input data.
<i>responses</i>	A vector of targets.
<i>transposeData</i>	Should be true if the input data is column-major and false otherwise.
<i>useCholesky</i>	Whether or not to use Cholesky decomposition when solving linear system (as opposed to using the full Gram matrix).
<i>lambda1</i>	Regularization parameter for l1-norm penalty.
<i>lambda2</i>	Regularization parameter for l2-norm penalty.
<i>tolerance</i>	Run until the maximum correlation of elements in $(X^T y)$ is less than this.

39.415.2.4 LARS() [4/4]

```

LARS (
    const arma::mat & data,
    const arma::rowvec & responses,
    const bool transposeData,
    const bool useCholesky,
    const arma::mat & gramMatrix,
    const double lambda1 = 0.0,
    const double lambda2 = 0.0,
    const double tolerance = 1e-16 )

```

Set the parameters to **LARS** (p. 1783), pass in a precalculated Gram matrix, and run training.

Both lambda1 and lambda2 are set by default to 0.

Parameters

<i>data</i>	Input data.
<i>responses</i>	A vector of targets.
<i>transposeData</i>	Should be true if the input data is column-major and false otherwise.
<i>useCholesky</i>	Whether or not to use Cholesky decomposition when solving linear system (as opposed to using the full Gram matrix).
<i>gramMatrix</i>	Gram matrix.
<i>lambda1</i>	Regularization parameter for l1-norm penalty.
<i>lambda2</i>	Regularization parameter for l2-norm penalty.
<i>tolerance</i>	Run until the maximum correlation of elements in $(X^T y)$ is less than this.

39.415.3 Member Function Documentation

39.415.3.1 ActiveSet()

```
const std::vector<size_t>& ActiveSet ( ) const [inline]
```

Access the set of active dimensions.

Definition at line 225 of file lars.hpp.

39.415.3.2 Beta()

```
const arma::vec& Beta ( ) const [inline]
```

Access the solution coefficients.

Definition at line 232 of file lars.hpp.

39.415.3.3 BetaPath()

```
const std::vector<arma::vec>& BetaPath ( ) const [inline]
```

Access the set of coefficients after each iteration; the solution is the last element.

Definition at line 229 of file lars.hpp.

39.415.3.4 LambdaPath()

```
const std::vector<double>& LambdaPath ( ) const [inline]
```

Access the set of values for lambda1 after each iteration; the solution is the last element.

Definition at line 236 of file lars.hpp.

39.415.3.5 MatUtriCholFactor()

```
const arma::mat& MatUtriCholFactor ( ) const [inline]
```

Access the upper triangular cholesky factor.

Definition at line 239 of file lars.hpp.

References LARS::serialize().

39.415.3.6 Predict()

```
void Predict (
    const arma::mat & points,
    arma::rowvec & predictions,
    const bool rowMajor = false ) const
```

Predict y_i for each data point in the given data matrix using the currently-trained **LARS** (p. 1783) model.

Parameters

<i>points</i>	The data points to regress on.
<i>predictions</i>	y, which will contained calculated values on completion.
<i>rowMajor</i>	Should be true if the data points matrix is row-major and false otherwise.

39.415.3.7 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the **LARS** (p. 1783) model.

Referenced by `LARS::MatUtriCholFactor()`.

39.415.3.8 `Train()` [1/2]

```
double Train (
    const arma::mat & data,
    const arma::rowvec & responses,
    arma::vec & beta,
    const bool transposeData = true )
```

Run **LARS** (p. 1783).

The input matrix (like all mpack matrices) should be column-major – each column is an observation and each row is a dimension. However, because **LARS** (p. 1783) is more efficient on a row-major matrix, this method will (internally) transpose the matrix. If this transposition is not necessary (i.e., you want to pass in a row-major matrix), pass 'false' for the `transposeData` parameter.

Parameters

<i>data</i>	Column-major input data (or row-major input data if <code>rowMajor = true</code>).
<i>responses</i>	A vector of targets.
<i>beta</i>	Vector to store the solution (the coefficients) in.
<i>transposeData</i>	Set to false if the data is row-major.

Returns

The final absolute maximum correlation.

39.415.3.9 Train() [2/2]

```
double Train (
    const arma::mat & data,
    const arma::rowvec & responses,
    const bool transposeData = true )
```

Run **LARS** (p. 1783).

The input matrix (like all mlpack matrices) should be column-major – each column is an observation and each row is a dimension. However, because **LARS** (p. 1783) is more efficient on a row-major matrix, this method will (internally) transpose the matrix. If this transposition is not necessary (i.e., you want to pass in a row-major matrix), pass 'false' for the transposeData parameter.

Parameters

<i>data</i>	Input data.
<i>responses</i>	A vector of targets.
<i>transposeData</i>	Should be true if the input data is column-major and false otherwise.

Returns

The final absolute maximum correlation.

39.416.1 Detailed Description

A simple linear regression algorithm using ordinary least squares.

Optionally, this class can perform ridge regression, if the lambda parameter is set to a number greater than zero.

Definition at line 26 of file linear_regression.hpp.

39.416.2 Constructor & Destructor Documentation

39.416.2.1 LinearRegression() [1/3]

```
LinearRegression (
    const arma::mat & predictors,
    const arma::rowvec & responses,
    const double lambda = 0,
    const bool intercept = true )
```

Creates the model.

Parameters

<i>predictors</i>	X, matrix of data points.
<i>responses</i>	y, the measured data for each point in X.
<i>lambda</i>	Regularization constant for ridge regression.
<i>intercept</i>	Whether or not to include an intercept term.

39.416.2.2 LinearRegression() [2/3]

```

LinearRegression (
    const arma::mat & predictors,
    const arma::rowvec & responses,
    const arma::rowvec & weights,
    const double lambda = 0,
    const bool intercept = true )

```

Creates the model with weighted learning.

Parameters

<i>predictors</i>	X, matrix of data points.
<i>responses</i>	y, the measured data for each point in X.
<i>weights</i>	Observation weights (for boosting).
<i>lambda</i>	Regularization constant for ridge regression.
<i>intercept</i>	Whether or not to include an intercept term.

39.416.2.3 LinearRegression() [3/3]

```

LinearRegression ( ) [inline]

```

Empty constructor.

This gives a non-working model, so make sure **Train()** (p. 1794) is called (or make sure the model parameters are set) before calling **Predict()** (p. 1793)!

Definition at line 62 of file linear_regression.hpp.

References LinearRegression::ComputeError(), LinearRegression::Predict(), and LinearRegression::Train().

39.416.3 Member Function Documentation

39.416.3.1 ComputeError()

```
double ComputeError (
    const arma::mat & points,
    const arma::rowvec & responses ) const
```

Calculate the L2 squared error on the given predictors and responses using this linear regression model.

This calculation returns

$$(1/n) * \|y - XB\|_2^2$$

where y is the responses vector, X is the matrix of predictors, and B is the parameters of the trained linear regression model.

As this number decreases to 0, the linear regression fit is better.

Parameters

<i>points</i>	Matrix of predictors (X).
<i>responses</i>	Transposed vector of responses (y^T).

Referenced by `LinearRegression::LinearRegression()`, and `RegressionDistribution::RegressionDistribution()`.

39.416.3.2 Intercept()

```
bool Intercept ( ) const [inline]
```

Return whether or not an intercept term is used in the model.

Definition at line 137 of file `linear_regression.hpp`.

39.416.3.3 Lambda() [1/2]

```
double Lambda ( ) const [inline]
```

Return the Tikhonov regularization parameter for ridge regression.

Definition at line 132 of file `linear_regression.hpp`.

39.416.3.4 Lambda() [2/2]

```
double& Lambda ( ) [inline]
```

Modify the Tikhonov regularization parameter for ridge regression.

Definition at line 134 of file linear_regression.hpp.

39.416.3.5 Parameters() [1/2]

```
const arma::vec& Parameters ( ) const [inline]
```

Return the parameters (the b vector).

Definition at line 127 of file linear_regression.hpp.

Referenced by RegressionDistribution::Dimensionality(), and RegressionDistribution::Parameters().

39.416.3.6 Parameters() [2/2]

```
arma::vec& Parameters ( ) [inline]
```

Modify the parameters (the b vector).

Definition at line 129 of file linear_regression.hpp.

39.416.3.7 Predict()

```
void Predict (
    const arma::mat & points,
    arma::rowvec & predictions ) const
```

Calculate y_i for each data point in points.

Parameters

<i>points</i>	the data points to calculate with.
<i>predictions</i>	y, will contain calculated values on completion.

Referenced by LinearRegression::LinearRegression().

39.416.3.8 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the model.

Definition at line 143 of file `linear_regression.hpp`.

39.416.3.9 `Train()` [1/2]

```
double Train (
    const arma::mat & predictors,
    const arma::rowvec & responses,
    const bool intercept = true )
```

Train the **LinearRegression** (p. 1789) model on the given data.

Careful! This will completely ignore and overwrite the existing model. This particular implementation does not have an incremental training algorithm. To set the regularization parameter `lambda`, call **Lambda()** (p. 1792) or set a different value in the constructor.

Parameters

<i>predictors</i>	X, the matrix of data points to train the model on.
<i>responses</i>	y, the responses to the data points.
<i>intercept</i>	Whether or not to fit an intercept term.

Returns

The least squares error after training.

Referenced by `LinearRegression::LinearRegression()`, and `RegressionDistribution::RegressionDistribution()`.

39.416.3.10 `Train()` [2/2]

```
double Train (
    const arma::mat & predictors,
    const arma::rowvec & responses,
```

```
const arma::rowvec & weights,
const bool intercept = true )
```

Train the **LinearRegression** (p. 1789) model on the given data and weights.

Careful! This will completely ignore and overwrite the existing model. This particular implementation does not have an incremental training algorithm. To set the regularization parameter lambda, call **Lambda()** (p. 1792) or set a different value in the constructor.

Parameters

<i>predictors</i>	X, the matrix of data points to train the model on.
<i>responses</i>	y, the responses to the data points.
<i>weights</i>	Observation weights (for boosting).
<i>intercept</i>	Whether or not to fit an intercept term.

Returns

The least squares error after training.

*Train the **LogisticRegression** (p. 1795) model with the given instantiated optimizer.*

39.417.1 Detailed Description

```
template<typename MatType = arma::mat>
class mlpack::regression::LogisticRegression< MatType >
```

The **LogisticRegression** (p. 1795) class implements an L2-regularized logistic regression model, and supports training with multiple optimizers and classification.

The class supports different observation types via the MatType template parameter; for instance, logistic regression can be performed on sparse datasets by specifying arma::sp_mat as the MatType parameter.

LogisticRegression (p. 1795) can be used for general classification tasks, but the class is restricted to support only two classes. For multiclass logistic regression, see **mlpack::regression::SoftmaxRegression** (p. 1811).

Template Parameters

<i>MatType</i>	Type of data matrix.
----------------	----------------------

Definition at line 39 of file logistic_regression.hpp.

39.417.2 Constructor & Destructor Documentation

39.417.2.1 LogisticRegression() [1/4]

```
LogisticRegression (
    const MatType & predictors,
    const arma::Row< size_t > & responses,
    const double lambda = 0 )
```

Construct the **LogisticRegression** (p. 1795) class with the given labeled training data.

This will train the model. Optionally, specify *lambda*, which is the penalty parameter for L2-regularization. If not specified, it is set to 0, which results in standard (unregularized) logistic regression.

It is not possible to set a custom optimizer with this constructor. Either use a constructor that does not train and call **Train()** (p. 1802) with a custom optimizer type, or use the constructor that takes an instantiated optimizer. (This unfortunate situation is a language restriction of C++.)

Parameters

<i>predictors</i>	Input training variables.
<i>responses</i>	Outputs resulting from input training variables.
<i>lambda</i>	L2-regularization parameter.

39.417.2.2 LogisticRegression() [2/4]

```
LogisticRegression (
    const MatType & predictors,
    const arma::Row< size_t > & responses,
    const arma::rowvec & initialPoint,
    const double lambda = 0 )
```

Construct the **LogisticRegression** (p. 1795) class with the given labeled training data.

This will train the model. Optionally, specify *lambda*, which is the penalty parameter for L2-regularization. If not specified, it is set to 0, which results in standard (unregularized) logistic regression.

It is not possible to set a custom optimizer with this constructor. Either use a constructor that does not train and call **Train()** (p. 1802) with a custom optimizer type, or use the constructor that takes an instantiated optimizer. (This unfortunate situation is a language restriction of C++.)

Parameters

<i>predictors</i>	Input training variables.
<i>responses</i>	Outputs results from input training variables.
<i>initialPoint</i>	Initial model to train with.
<i>lambda</i>	L2-regularization parameter.

39.417.2.3 `LogisticRegression()` [3/4]

```
LogisticRegression (
    const size_t dimensionality = 0,
    const double lambda = 0 )
```

Construct the **LogisticRegression** (p. 1795) class without performing any training.

The dimensionality of the data (which will be used to set the size of the parameters vector) must be specified, and all of the parameters in the model will be set to 0. Note that the dimensionality may be changed later by directly modifying the parameters vector (using **Parameters()** (p. 1801)).

Parameters

<i>dimensionality</i>	Dimensionality of the data.
<i>lambda</i>	L2-regularization parameter.

39.417.2.4 `LogisticRegression()` [4/4]

```
LogisticRegression (
    const MatType & predictors,
    const arma::Row< size_t > & responses,
    OptimizerType & optimizer,
    const double lambda )
```

Construct the **LogisticRegression** (p. 1795) class with the given labeled training data.

This will train the model. This overload takes an already instantiated optimizer (which holds the **LogisticRegression**↔**Function** (p. 1803) error function, which must also be instantiated), so that the optimizer can be configured before the training is run by this constructor. The update policy of the optimizer can be set through the policy argument. The predictors and responses and initial point are all taken from the error function contained in the optimizer.

Parameters

<i>predictors</i>	Input training variables.
<i>responses</i>	Outputs results from input training variables.
<i>optimizer</i>	Instantiated optimizer with instantiated error function.
<i>lambda</i>	L2-regularization parameter.

39.417.3 Member Function Documentation

39.417.3.1 Classify() [1/3]

```
size_t Classify (
    const VecType & point,
    const double decisionBoundary = 0.5 ) const
```

Classify the given point.

The predicted label is returned. Optionally, specify the decision boundary; logistic regression returns a value between 0 and 1. If the value is greater than the decision boundary, the response is taken to be 1; otherwise, it is 0. By default the decision boundary is 0.5.

Parameters

<i>point</i>	Point to classify.
<i>decisionBoundary</i>	Decision boundary (default 0.5).

Returns

Predicted label of point.

Referenced by LogisticRegression< MatType >::Lambda().

39.417.3.2 Classify() [2/3]

```
void Classify (
    const MatType & dataset,
    arma::Row< size_t > & labels,
    const double decisionBoundary = 0.5 ) const
```

Classify the given points, returning the predicted labels for each point.

Optionally, specify the decision boundary; logistic regression returns a value between 0 and 1. If the value is greater than the decision boundary, the response is taken to be 1; otherwise, it is 0. By default the decision boundary is 0.5.

Parameters

<i>dataset</i>	Set of points to classify.
<i>labels</i>	Predicted labels for each point.
<i>decisionBoundary</i>	Decision boundary (default 0.5).

39.417.3.3 Classify() [3/3]

```
void Classify (
    const MatType & dataset,
    arma::mat & probabilities ) const
```

Classify the given points, returning class probabilities for each point.

Parameters

<i>dataset</i>	Set of points to classify.
<i>probabilities</i>	Class probabilities for each point (output).

39.417.3.4 ComputeAccuracy()

```
double ComputeAccuracy (
    const MatType & predictors,
    const arma::Row< size_t > & responses,
    const double decisionBoundary = 0.5 ) const
```

Compute the accuracy of the model on the given predictors and responses, optionally using the given decision boundary.

The responses should be either 0 or 1. Logistic regression returns a value between 0 and 1. If the value is greater than the decision boundary, the response is taken to be 1; otherwise, it is 0. By default, the decision boundary is 0.5.

The accuracy is returned as a percentage, between 0 and 100.

Parameters

<i>predictors</i>	Input predictors.
<i>responses</i>	Vector of responses.
<i>decisionBoundary</i>	Decision boundary (default 0.5).

Returns

Percentage of responses that are predicted correctly.

Referenced by LogisticRegression< MatType >::Lambda().

39.417.3.5 ComputeError()

```
double ComputeError (
    const MatType & predictors,
    const arma::Row< size_t > & responses ) const
```

Compute the error of the model.

This returns the negative objective function of the logistic regression log-likelihood function. For the model to be optimal, the negative log-likelihood function should be minimized.

Parameters

<i>predictors</i>	Input predictors.
<i>responses</i>	Vector of responses.

Referenced by LogisticRegression< MatType >::Lambda().

39.417.3.6 Lambda() [1/2]

```
const double& Lambda ( ) const [inline]
```

Return the lambda value for L2-regularization.

Definition at line 162 of file logistic_regression.hpp.

39.417.3.7 Lambda() [2/2]

```
double& Lambda ( ) [inline]
```

Modify the lambda value for L2-regularization.

Definition at line 164 of file logistic_regression.hpp.

References LogisticRegression< MatType >::Classify(), LogisticRegression< MatType >::ComputeAccuracy(), LogisticRegression< MatType >::ComputeError(), and LogisticRegression< MatType >::serialize().

39.417.3.8 Parameters() [1/2]

```
const arma::rowvec& Parameters ( ) const [inline]
```

Return the parameters (the b vector).

Definition at line 157 of file logistic_regression.hpp.

39.417.3.9 Parameters() [2/2]

```
arma::rowvec& Parameters ( ) [inline]
```

Modify the parameters (the **b** vector).

Definition at line 159 of file `logistic_regression.hpp`.

39.417.3.10 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the model.

Referenced by `LogisticRegression< MatType >::Lambda()`.

39.417.3.11 Train() [1/2]

```
double Train (
    const MatType & predictors,
    const arma::Row< size_t > & responses )
```

Train the **LogisticRegression** (p. 1795) model on the given input data.

By default, the L-BFGS optimization algorithm is used, but others can be specified (such as `ens::SGD`).

This will use the existing model parameters as a starting point for the optimization. If this is not what you want, then you should access the parameters vector directly with **Parameters()** (p. 1801) and modify it as desired.

Template Parameters

<i>OptimizerType</i>	Type of optimizer to use to train the model.
----------------------	--

Parameters

<i>predictors</i>	Input training variables.
<i>responses</i>	Outputs results from input training variables.

Returns

The final objective of the trained model (NaN or Inf on error)

39.417.3.12 Train() [2/2]

```
double Train (
    const MatType & predictors,
    const arma::Row< size_t > & responses,
    OptimizerType & optimizer )
```

Train the **LogisticRegression** (p. 1795) model with the given instantiated optimizer.

Using this overload allows configuring the instantiated optimizer before training is performed.

Note that the initial point of the optimizer (optimizer.Function().GetInitialPoint()) will be used as the initial point of the optimization, overwriting any existing trained model. If you don't want to overwrite the existing model, set optimizer.Function().GetInitialPoint() to the current parameters vector, accessible via **Parameters()** (p. 1801).

Parameters

<i>predictors</i>	Input training variables.
<i>responses</i>	Outputs results from input training variables.
<i>optimizer</i>	Instantiated optimizer with instantiated error function.

Returns

The final objective of the trained model (NaN or Inf on error)

The documentation for this class was generated from the following file:

39.418 LogisticRegressionFunction< MatType > Class Template Reference

The log-likelihood function for the logistic regression objective function.

Public Member Functions

- **LogisticRegressionFunction** (const MatType &predictors, const arma::Row< size_t > &responses, const double lambda=0)
Creates the **LogisticRegressionFunction** (p. 1803).

- **LogisticRegressionFunction** (const MatType &predictors, const arma::Row< size_t > &responses, const arma::vec &initialPoint, const double lambda=0)
*Creates the **LogisticRegressionFunction** (p. 1803) with initialPoint.*
- double **Evaluate** (const arma::mat ¶meters) const
Evaluate the logistic regression log-likelihood function with the given parameters.
- double **Evaluate** (const arma::mat ¶meters, const size_t begin, const size_t batchSize=1) const
Evaluate the logistic regression log-likelihood function with the given parameters using the given batch size from the given point index.
- template<typename GradType >
double **EvaluateWithGradient** (const arma::mat ¶meters, GradType &gradient) const
Evaluate the objective function and gradient of the logistic regression log-likelihood function simultaneously with the given parameters.
- template<typename GradType >
double **EvaluateWithGradient** (const arma::mat ¶meters, const size_t begin, GradType &gradient, const size_t batchSize=1) const
Evaluate the objective function and gradient of the logistic regression log-likelihood function simultaneously with the given parameters, for the given batch size from a given point in the dataset.
- const arma::mat & **GetInitialPoint** () const
Return the initial point for the optimization.
- void **Gradient** (const arma::mat ¶meters, arma::mat &gradient) const
Evaluate the gradient of the logistic regression log-likelihood function with the given parameters.
- template<typename GradType >
void **Gradient** (const arma::mat ¶meters, const size_t begin, GradType &gradient, const size_t batchSize=1) const
Evaluate the gradient of the logistic regression log-likelihood function with the given parameters, for the given batch size from a given point in the dataset.
- const arma::mat & **InitialPoint** () const
Return the initial point for the optimization.
- arma::mat & **InitialPoint** ()
Modify the initial point for the optimization.
- const double & **Lambda** () const
Return the regularization parameter (lambda).
- double & **Lambda** ()
Modify the regularization parameter (lambda).
- size_t **NumFeatures** () const
Return the number of features(add 1 for the intercept term).
- size_t **NumFunctions** () const
Return the number of separable functions (the number of predictor points).
- void **PartialGradient** (const arma::mat ¶meters, const size_t j, arma::sp_mat &gradient) const
Evaluate the gradient of the logistic regression log-likelihood function with the given parameters, and with respect to only one feature in the dataset.
- const MatType & **Predictors** () const
Return the matrix of predictors.
- const arma::Row< size_t > & **Responses** () const
Return the vector of responses.
- void **Shuffle** ()
Shuffle the order of function visitation.

39.418.1 Detailed Description

```
template<typename MatType = arma::mat>
class mlpack::regression::LogisticRegressionFunction< MatType >
```

The log-likelihood function for the logistic regression objective function.

This is used by various mlpack optimizers to train a logistic regression model.

Definition at line 28 of file logistic_regression_function.hpp.

39.418.2 Constructor & Destructor Documentation

39.418.2.1 LogisticRegressionFunction() [1/2]

```
LogisticRegressionFunction (
    const MatType & predictors,
    const arma::Row< size_t > & responses,
    const double lambda = 0 )
```

Creates the **LogisticRegressionFunction** (p. 1803).

Parameters

<i>predictors</i>	The matrix of data points.
<i>responses</i>	The measured data for each point in predictors.
<i>lambda</i>	Regularization constant for ridge regression.

39.418.2.2 LogisticRegressionFunction() [2/2]

```
LogisticRegressionFunction (
    const MatType & predictors,
    const arma::Row< size_t > & responses,
    const arma::vec & initialPoint,
    const double lambda = 0 )
```

Creates the **LogisticRegressionFunction** (p. 1803) with *initialPoint*.

Parameters

<i>predictors</i>	The matrix of data points.
-------------------	----------------------------

Parameters

<i>responses</i>	The measured data for each point in predictors.
<i>initialPoint</i>	Point from which to start the optimization.
<i>lambda</i>	Regularization constant for ridge regression.

39.418.3 Member Function Documentation

39.418.3.1 Evaluate() [1/2]

```
double Evaluate (
    const arma::mat & parameters ) const
```

Evaluate the logistic regression log-likelihood function with the given parameters.

Note that if a point has 0 probability of being classified directly with the given parameters, then **Evaluate()** (p. 1806) will return nan (this is kind of a corner case and should not happen for reasonable models).

The optimum (minimum) of this function is 0.0, and occurs when each point is classified correctly with very high probability.

Parameters

<i>parameters</i>	Vector of logistic regression parameters.
-------------------	---

Referenced by LogisticRegressionFunction< MatType >::Responses().

39.418.3.2 Evaluate() [2/2]

```
double Evaluate (
    const arma::mat & parameters,
    const size_t begin,
    const size_t batchSize = 1 ) const
```

Evaluate the logistic regression log-likelihood function with the given parameters using the given batch size from the given point index.

This is useful for optimizers such as SGD, which require a separable objective function. Note that if the points have 0 probability of being classified correctly with the given parameters, then **Evaluate()** (p. 1806) will return nan (this is kind of a corner case and should not happen for reasonable models).

The optimum (minimum) of this function is 0.0, and occurs when the points are classified correctly with very high probability.

Parameters

<i>parameters</i>	Vector of logistic regression parameters.
<i>begin</i>	Index of the starting point to use for objective function evaluation.
<i>batchSize</i>	Number of points to be passed at a time to use for objective function evaluation.

39.418.3.3 EvaluateWithGradient() [1/2]

```
double EvaluateWithGradient (
    const arma::mat & parameters,
    GradType & gradient ) const
```

Evaluate the objective function and gradient of the logistic regression log-likelihood function simultaneously with the given parameters.

Referenced by LogisticRegressionFunction< MatType >::Responses().

39.418.3.4 EvaluateWithGradient() [2/2]

```
double EvaluateWithGradient (
    const arma::mat & parameters,
    const size_t begin,
    GradType & gradient,
    const size_t batchSize = 1 ) const
```

Evaluate the objective function and gradient of the logistic regression log-likelihood function simultaneously with the given parameters, for the given batch size from a given point in the dataset.

39.418.3.5 GetInitialPoint()

```
const arma::mat& GetInitialPoint ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 172 of file logistic_regression_function.hpp.

39.418.3.6 Gradient() [1/2]

```
void Gradient (
    const arma::mat & parameters,
    arma::mat & gradient ) const
```

Evaluate the gradient of the logistic regression log-likelihood function with the given parameters.

Parameters

<i>parameters</i>	Vector of logistic regression parameters.
<i>gradient</i>	Vector to output gradient into.

Referenced by `LogisticRegressionFunction< MatType >::Responses()`.

39.418.3.7 Gradient() [2/2]

```
void Gradient (
    const arma::mat & parameters,
    const size_t begin,
    GradType & gradient,
    const size_t batchSize = 1 ) const
```

Evaluate the gradient of the logistic regression log-likelihood function with the given parameters, for the given batch size from a given point in the dataset.

This is useful for optimizers such as SGD, which require a separable objective function.

Parameters

<i>parameters</i>	Vector of logistic regression parameters.
<i>begin</i>	Index of the starting point to use for objective function gradient evaluation.
<i>gradient</i>	Vector to output gradient into.
<i>batchSize</i>	Number of points to be processed as a batch for objective function gradient evaluation.

39.418.3.8 InitialPoint() [1/2]

```
const arma::mat& InitialPoint ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 56 of file `logistic_regression_function.hpp`.

39.418.3.9 InitialPoint() [2/2]

```
arma::mat& InitialPoint ( ) [inline]
```

Modify the initial point for the optimization.

Definition at line 58 of file `logistic_regression_function.hpp`.

39.418.3.10 Lambda() [1/2]

```
const double& Lambda ( ) const [inline]
```

Return the regularization parameter (lambda).

Definition at line 61 of file logistic_regression_function.hpp.

39.418.3.11 Lambda() [2/2]

```
double& Lambda ( ) [inline]
```

Modify the regularization parameter (lambda).

Definition at line 63 of file logistic_regression_function.hpp.

39.418.3.12 NumFeatures()

```
size_t NumFeatures ( ) const [inline]
```

Return the number of features(add 1 for the intercept term).

Definition at line 178 of file logistic_regression_function.hpp.

39.418.3.13 NumFunctions()

```
size_t NumFunctions ( ) const [inline]
```

Return the number of separable functions (the number of predictor points).

Definition at line 175 of file logistic_regression_function.hpp.

39.418.3.14 PartialGradient()

```
void PartialGradient (
    const arma::mat & parameters,
    const size_t j,
    arma::sp_mat & gradient ) const
```

Evaluate the gradient of the logistic regression log-likelihood function with the given parameters, and with respect to only one feature in the dataset.

This is useful for optimizers such as SCD, which require partial gradients.

Parameters

<i>parameters</i>	Vector of logistic regression parameters.
<i>j</i>	Index of the feature with respect to which the gradient is to be computed.
<i>gradient</i>	Sparse matrix to output gradient into.

Referenced by `LogisticRegressionFunction< MatType >::Responses()`.

39.418.3.15 Predictors()

```
const MatType& Predictors ( ) const [inline]
```

Return the matrix of predictors.

Definition at line 66 of file `logistic_regression_function.hpp`.

39.418.3.16 Responses()

```
const arma::Row<size_t>& Responses ( ) const [inline]
```

Return the vector of responses.

Definition at line 68 of file `logistic_regression_function.hpp`.

References `LogisticRegressionFunction< MatType >::Evaluate()`, `LogisticRegressionFunction< MatType >::EvaluateWithGradient()`, `LogisticRegressionFunction< MatType >::Gradient()`, `LogisticRegressionFunction< MatType >::PartialGradient()`, and `LogisticRegressionFunction< MatType >::Shuffle()`.

39.418.3.17 Shuffle()

```
void Shuffle ( )
```

Shuffle the order of function visitation.

This may be called by the optimizer.

Referenced by `LogisticRegressionFunction< MatType >::Responses()`.

39.419 SoftmaxRegression Class Reference

Softmax Regression is a classifier which can be used for classification when the data available can take two or more class values.

Public Member Functions

- **SoftmaxRegression** (const size_t inputSize=0, const size_t numClasses=0, const bool fitIntercept=false)
*Initialize the **SoftmaxRegression** (p. 1811) without performing training.*
- template<typename OptimizerType = ens::L_BFGS>
SoftmaxRegression (const arma::mat &data, const arma::Row< size_t > &labels, const size_t numClasses, const double lambda=0.0001, const bool fitIntercept=false, OptimizerType optimizer=OptimizerType())
*Construct the **SoftmaxRegression** (p. 1811) class with the provided data and labels.*
- void **Classify** (const arma::mat &dataset, arma::Row< size_t > &labels) const
Classify the given points, returning the predicted labels for each point.
- template<typename VecType >
size_t **Classify** (const VecType &point) const
Classify the given point.
- void **Classify** (const arma::mat &dataset, arma::Row< size_t > &labels, arma::mat &probabilites) const
Classify the given points, returning class probabilities and predicted class label for each point.
- void **Classify** (const arma::mat &dataset, arma::mat &probabilities) const
Classify the given points, returning class probabilities for each point.
- double **ComputeAccuracy** (const arma::mat &testData, const arma::Row< size_t > &labels) const
Computes accuracy of the learned model given the feature data and the labels associated with each data point.
- size_t **FeatureSize** () const
Gets the features size of the training data.
- bool **FitIntercept** () const
Gets the intercept term flag. We can't change this after training.
- double & **Lambda** ()
Sets the regularization parameter.
- double **Lambda** () const
Gets the regularization parameter.
- size_t & **NumClasses** ()
Sets the number of classes.
- size_t **NumClasses** () const
Gets the number of classes.
- arma::mat & **Parameters** ()
Get the model parameters.
- const arma::mat & **Parameters** () const
Get the model parameters.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
*Serialize the **SoftmaxRegression** (p. 1811) model.*
- template<typename OptimizerType = ens::L_BFGS>
double **Train** (const arma::mat &data, const arma::Row< size_t > &labels, const size_t numClasses, OptimizerType optimizer=OptimizerType())
Train the softmax regression with the given training data.

39.419.1 Detailed Description

Softmax Regression is a classifier which can be used for classification when the data available can take two or more class values.

It is a generalization of Logistic Regression (which is used only for binary classification). The model has a different set of parameters for each class, but can be easily converted into a vectorized implementation as has been done in this module. The model can be used for direct classification of feature data or in conjunction with unsupervised learning methods. More technical details about the model can be found on the following webpage:

http://ufldl.stanford.edu/wiki/index.php/Softmax_Regression

An example on how to use the interface is shown below:

```
arma::mat trainData; // Training data matrix.
arma::Row<size_t> labels; // Labels associated with the data.
const size_t inputSize = 1000; // Size of input feature vector.
const size_t numClasses = 10; // Number of classes.
const double lambda = 0.0001; // L2-Regularization parameter.

const size_t numBasis = 5; // Parameter required for L-BFGS algorithm.
const size_t numIterations = 100; // Maximum number of iterations.

// Train the model using an instantiated optimizer for the training.
SoftmaxRegression regressor(trainData.n_rows, numClasses);
ens::L_BFGS optimizer(numBasis, numIterations);
regressor.Train(trainData, labels, numClasses, std::move(optimizer));

arma::mat testData; // Test data matrix.
arma::Row<size_t> predictions; // Vectors to store predictions in.

// Obtain predictions from both the learned models.
regressor.Classify(testData, predictions);
```

Definition at line 59 of file softmax_regression.hpp.

39.419.2 Constructor & Destructor Documentation

39.419.2.1 SoftmaxRegression() [1/2]

```
SoftmaxRegression (
    const size_t inputSize = 0,
    const size_t numClasses = 0,
    const bool fitIntercept = false )
```

Initialize the **SoftmaxRegression** (p. 1811) without performing training.

Default value of lambda is 0.0001. Be sure to use **Train()** (p. 1817) before calling **Classify()** (p. 1813) or **ComputeAccuracy()** (p. 1815), otherwise the results may be meaningless.

Parameters

<i>inputSize</i>	Size of the input feature vector.
<i>numClasses</i>	Number of classes for classification.
<i>fitIntercept</i>	add intercept term or not.

39.419.2.2 SoftmaxRegression() [2/2]

```

SoftmaxRegression (
    const arma::mat & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const double lambda = 0.0001,
    const bool fitIntercept = false,
    OptimizerType optimizer = OptimizerType() )

```

Construct the **SoftmaxRegression** (p. 1811) class with the provided data and labels.

This will train the model. Optionally, the parameter 'lambda' can be passed, which controls the amount of L2-regularization in the objective function. By default, the model takes a small value.

Template Parameters

<i>OptimizerType</i>	Desired optimizer type.
----------------------	-------------------------

Parameters

<i>data</i>	Input training features. Each column associate with one sample
<i>labels</i>	Labels associated with the feature data.
<i>inputSize</i>	Size of the input feature vector.
<i>numClasses</i>	Number of classes for classification.
<i>optimizer</i>	Desired optimizer.
<i>lambda</i>	L2-regularization constant.
<i>fitIntercept</i>	add intercept term or not.

39.419.3 Member Function Documentation

39.419.3.1 Classify() [1/4]

```

void Classify (
    const arma::mat & dataset,

```

```
arma::Row< size_t > & labels ) const
```

Classify the given points, returning the predicted labels for each point.

The function calculates the probabilities for every class, given a data point. It then chooses the class which has the highest probability among all.

Parameters

<i>dataset</i>	Set of points to classify.
<i>labels</i>	Predicted labels for each point.

39.419.3.2 Classify() [2/4]

```
size_t Classify (
    const VecType & point ) const
```

Classify the given point.

The predicted class label is returned. The function calculates the probabilities for every class, given the point. It then chooses the class which has the highest probability among all.

Parameters

<i>point</i>	Point to be classified.
--------------	-------------------------

Returns

Predicted class label of the point.

39.419.3.3 Classify() [3/4]

```
void Classify (
    const arma::mat & dataset,
    arma::Row< size_t > & labels,
    arma::mat & probabilites ) const
```

Classify the given points, returning class probabilities and predicted class label for each point.

The function calculates the probabilities for every class, given a data point. It then chooses the class which has the highest probability among all.

Parameters

<i>dataset</i>	Matrix of data points to be classified.
<i>labels</i>	Predicted labels for each point.
<i>probabilities</i>	Class probabilities for each point.

39.419.3.4 Classify() [4/4]

```
void Classify (
    const arma::mat & dataset,
    arma::mat & probabilities ) const
```

Classify the given points, returning class probabilities for each point.

Parameters

<i>dataset</i>	Matrix of data points to be classified.
<i>probabilities</i>	Class probabilities for each point.

39.419.3.5 ComputeAccuracy()

```
double ComputeAccuracy (
    const arma::mat & testData,
    const arma::Row< size_t > & labels ) const
```

Computes accuracy of the learned model given the feature data and the labels associated with each data point.

Predictions are made using the provided data and are compared with the actual labels.

Parameters

<i>testData</i>	Matrix of data points using which predictions are made.
<i>labels</i>	Vector of labels associated with the data.

39.419.3.6 FeatureSize()

```
size_t FeatureSize ( ) const [inline]
```

Gets the features size of the training data.

Definition at line 190 of file softmax_regression.hpp.

39.419.3.7 FitIntercept()

```
bool FitIntercept ( ) const [inline]
```

Gets the intercept term flag. We can't change this after training.

Definition at line 182 of file softmax_regression.hpp.

39.419.3.8 Lambda() [1/2]

```
double& Lambda ( ) [inline]
```

Sets the regularization parameter.

Definition at line 177 of file softmax_regression.hpp.

39.419.3.9 Lambda() [2/2]

```
double Lambda ( ) const [inline]
```

Gets the regularization parameter.

Definition at line 179 of file softmax_regression.hpp.

39.419.3.10 NumClasses() [1/2]

```
size_t& NumClasses ( ) [inline]
```

Sets the number of classes.

Definition at line 172 of file softmax_regression.hpp.

39.419.3.11 NumClasses() [2/2]

```
size_t NumClasses ( ) const [inline]
```

Gets the number of classes.

Definition at line 174 of file softmax_regression.hpp.

39.419.3.12 Parameters() [1/2]

```
arma::mat& Parameters ( ) [inline]
```

Get the model parameters.

Definition at line 185 of file softmax_regression.hpp.

39.419.3.13 Parameters() [2/2]

```
const arma::mat& Parameters ( ) const [inline]
```

Get the model parameters.

Definition at line 187 of file softmax_regression.hpp.

39.419.3.14 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the **SoftmaxRegression** (p. 1811) model.

Definition at line 198 of file softmax_regression.hpp.

39.419.3.15 Train()

```
double Train (
    const arma::mat & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    OptimizerType optimizer = OptimizerType() )
```

Train the softmax regression with the given training data.

Template Parameters

<i>OptimizerType</i>	Desired optimizer type.
----------------------	-------------------------

Parameters

<i>data</i>	Input data with each column as one example.
<i>labels</i>	Labels associated with the feature data.
<i>numClasses</i>	Number of classes for classification.
<i>optimizer</i>	Desired optimizer.

Returns

Objective value of the final point.

The documentation for this class was generated from the following file:

39.420 SoftmaxRegressionFunction Class Reference

Public Member Functions

- **SoftmaxRegressionFunction** (const arma::mat &data, const arma::Row< size_t > &labels, const size_t numClasses, const double lambda=0.0001, const bool fitIntercept=false)
Construct the Softmax Regression objective function with the given parameters.
- double **Evaluate** (const arma::mat ¶meters) const
Evaluates the objective function of the softmax regression model using the given parameters.
- double **Evaluate** (const arma::mat ¶meters, const size_t start, const size_t batchSize=1) const
Evaluate the objective function of the softmax regression model for a subset of the data points using the given parameters.
- bool **FitIntercept** () const
Gets the intercept flag.
- void **GetGroundTruthMatrix** (const arma::Row< size_t > &labels, arma::sp_mat &groundTruth)
Constructs the ground truth label matrix with the passed labels.
- const arma::mat & **GetInitialPoint** () const
Return the initial point for the optimization.
- void **GetProbabilitiesMatrix** (const arma::mat ¶meters, arma::mat &probabilities, const size_t start, const size_t batchSize) const
Evaluate the probabilities matrix with the passed parameters.
- void **Gradient** (const arma::mat ¶meters, arma::mat &gradient) const
Evaluates the gradient values of the objective function given the current set of parameters.
- void **Gradient** (const arma::mat ¶meters, const size_t start, arma::mat &gradient, const size_t batchSize=1) const
Evaluate the gradient of the objective function given the current set of parameters, on a subset of the data.

- `const arma::mat InitializeWeights ()`
Initializes the parameters of the model to suitable values.
- `double & Lambda ()`
Sets the regularization parameter.
- `double Lambda () const`
Gets the regularization parameter.
- `size_t NumClasses () const`
Gets the number of classes.
- `size_t NumFeatures () const`
Gets the features size of the training data.
- `void PartialGradient (const arma::mat ¶meters, size_t j, arma::sp_mat &gradient) const`
Evaluates the gradient values of the objective function given the current set of parameters for a single feature indexed by j.
- `void Shuffle ()`
Shuffle the dataset.

Static Public Member Functions

- `static const arma::mat InitializeWeights (const size_t featureSize, const size_t numClasses, const bool fit↵ Intercept=false)`
Initialize Softmax Regression weights (trainable parameters) with the given parameters.
- `static void InitializeWeights (arma::mat &weights, const size_t featureSize, const size_t numClasses, const bool fitIntercept=false)`
Initialize Softmax Regression weights (trainable parameters) with the given parameters.

39.420.1 Detailed Description

Definition at line 21 of file softmax_regression_function.hpp.

39.420.2 Constructor & Destructor Documentation

39.420.2.1 SoftmaxRegressionFunction()

```
SoftmaxRegressionFunction (
    const arma::mat & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const double lambda = 0.0001,
    const bool fitIntercept = false )
```

Construct the Softmax Regression objective function with the given parameters.

Parameters

<i>data</i>	Input training data, each column associate with one sample
<i>labels</i>	Labels associated with the feature data.
<i>inputSize</i>	Size of the input feature vector.
<i>numClasses</i>	Number of classes for classification.
<i>lambda</i>	L2-regularization constant.
<i>fitIntercept</i>	Intercept term flag.

39.420.3 Member Function Documentation

39.420.3.1 Evaluate() [1/2]

```
double Evaluate (
    const arma::mat & parameters ) const
```

Evaluates the objective function of the softmax regression model using the given parameters.

The cost function has terms for the log likelihood error and the regularization cost. The objective function takes a low value when the model generalizes well for the given training data, while having small parameter values.

Parameters

<i>parameters</i>	Current values of the model parameters.
-------------------	---

39.420.3.2 Evaluate() [2/2]

```
double Evaluate (
    const arma::mat & parameters,
    const size_t start,
    const size_t batchSize = 1 ) const
```

Evaluate the objective function of the softmax regression model for a subset of the data points using the given parameters.

The cost function has terms for the log likelihood error and the regularization cost. The objective function takes a low value when the model generalizes well for the given training data, while having small parameter values.

Parameters

<i>parameters</i>	Current values of the model parameters.
<i>start</i>	First index of the data points to use.
<i>batchSize</i>	Number of data points to evaluate objective for.

39.420.3.3 FitIntercept()

```
bool FitIntercept ( ) const [inline]
```

Gets the intercept flag.

Definition at line 185 of file softmax_regression_function.hpp.

39.420.3.4 GetGroundTruthMatrix()

```
void GetGroundTruthMatrix (
    const arma::Row< size_t > & labels,
    arma::sp_mat & groundTruth )
```

Constructs the ground truth label matrix with the passed labels.

Parameters

<i>labels</i>	Labels associated with the training data.
<i>groundTruth</i>	Pointer to arma::mat which stores the computed matrix.

39.420.3.5 GetInitialPoint()

```
const arma::mat& GetInitialPoint ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 168 of file softmax_regression_function.hpp.

39.420.3.6 GetProbabilitiesMatrix()

```
void GetProbabilitiesMatrix (
    const arma::mat & parameters,
    arma::mat & probabilities,
    const size_t start,
    const size_t batchSize ) const
```

Evaluate the probabilities matrix with the passed parameters.

$\text{probabilities}(i, j) = \exp(*\text{data}_j) / \sum_k(\exp(*\text{data}_j))$. It represents the probability of data_j belongs to class i .

Parameters

<i>parameters</i>	Current values of the model parameters.
<i>probabilities</i>	Pointer to arma::mat which stores the probabilities.
<i>start</i>	Index of point to start at.
<i>batchSize</i>	Number of points to calculate probabilities for.

39.420.3.7 Gradient() [1/2]

```
void Gradient (
    const arma::mat & parameters,
    arma::mat & gradient ) const
```

Evaluates the gradient values of the objective function given the current set of parameters.

The function calculates the probabilities for each class given the parameters, and computes the gradients based on the difference from the ground truth.

Parameters

<i>parameters</i>	Current values of the model parameters.
<i>gradient</i>	Matrix where gradient values will be stored.

39.420.3.8 Gradient() [2/2]

```
void Gradient (
    const arma::mat & parameters,
    const size_t start,
    arma::mat & gradient,
    const size_t batchSize = 1 ) const
```

Evaluate the gradient of the objective function given the current set of parameters, on a subset of the data.

The function calculates the probabilities for each class given the parameters, and computes the gradients based on the difference from the ground truth.

Parameters

<i>parameters</i>	Current values of the model parameters.
<i>start</i>	First index of the data points to use.
<i>gradient</i>	Matrix to store gradient into.
<i>batchSize</i>	Number of data points to evaluate gradient for.

39.420.3.9 InitializeWeights() [1/3]

```
const arma::mat InitializeWeights ( )
```

Initializes the parameters of the model to suitable values.

39.420.3.10 InitializeWeights() [2/3]

```
static const arma::mat InitializeWeights (
    const size_t featureSize,
    const size_t numClasses,
    const bool fitIntercept = false ) [static]
```

Initialize Softmax Regression weights (trainable parameters) with the given parameters.

Parameters

<i>featureSize</i>	The number of features in the training set.
<i>numClasses</i>	Number of classes for classification.
<i>fitIntercept</i>	If true, an intercept is fitted.

Returns

Initialized model weights.

39.420.3.11 InitializeWeights() [3/3]

```
static void InitializeWeights (
    arma::mat & weights,
    const size_t featureSize,
    const size_t numClasses,
    const bool fitIntercept = false ) [static]
```

Initialize Softmax Regression weights (trainable parameters) with the given parameters.

Parameters

<i>weights</i>	This will be filled with the initialized model weights.
<i>featureSize</i>	The number of features in the training set.
<i>numClasses</i>	Number of classes for classification.
<i>fitIntercept</i>	Intercept term flag.

39.420.3.12 Lambda() [1/2]

```
double& Lambda ( ) [inline]
```

Sets the regularization parameter.

Definition at line 180 of file softmax_regression_function.hpp.

39.420.3.13 Lambda() [2/2]

```
double Lambda ( ) const [inline]
```

Gets the regularization parameter.

Definition at line 182 of file softmax_regression_function.hpp.

39.420.3.14 NumClasses()

```
size_t NumClasses ( ) const [inline]
```

Gets the number of classes.

Definition at line 171 of file softmax_regression_function.hpp.

39.420.3.15 NumFeatures()

```
size_t NumFeatures ( ) const [inline]
```

Gets the features size of the training data.

Definition at line 174 of file softmax_regression_function.hpp.

39.420.3.16 PartialGradient()

```
void PartialGradient (
    const arma::mat & parameters,
    size_t j,
    arma::sp_mat & gradient ) const
```

Evaluates the gradient values of the objective function given the current set of parameters for a single feature indexed by j.

Parameters

<i>parameters</i>	Current values of the model parameters.
<i>j</i>	The index of the feature with respect to which the partial gradient is to be computed.
<i>gradient</i>	Out param for the gradient value.

39.420.3.17 Shuffle()

```
void Shuffle ( )
```

Shuffle the dataset.

- double **Sample** (const **State** &state, const **Action** &action) const
*Dynamics of the **Acrobot** (p. 1825) System.*
- double **Torque** (const **Action** &action) const
This function calculates the torque for a particular action.
- double **Wrap** (double value, const double minimum, const double maximum) const
Wrap funtion is required to truncate the angle value from -180 to 180.

39.421.1 Detailed Description

Implementation of **Acrobot** (p. 1825) game.

Acrobot (p. 1825) is a 2-link pendulum with only the second joint actuated. Initially, both links point downwards. The goal is to swing the end-effector at a height at least the length of one link above the base. Both links can swing freely and can pass by each other, i.e., they don't collide when they have the same angle.

Definition at line 28 of file acrobot.hpp.

39.421.2 Member Enumeration Documentation

39.421.2.1 Action

enum **Action**

Enumerator

negativeTorque	
zeroTorque	
positiveTorque	
size	

Definition at line 88 of file `acrobot.hpp`.

39.421.3 Constructor & Destructor Documentation

39.421.3.1 Acrobat()

```
Acrobot (
    const double gravity = 9.81,
    const double linkLength1 = 1.0,
    const double linkLength2 = 1.0,
    const double linkMass1 = 1.0,
    const double linkMass2 = 1.0,
    const double linkCom1 = 0.5,
    const double linkCom2 = 0.5,
    const double linkMoi = 1.0,
    const double maxVel1 = 4 * M_PI,
    const double maxVel2 = 9 * M_PI,
    const double dt = 0.2,
    const double doneReward = 0 ) [inline]
```

Construct a **Acrobot** (p. 1825) instance using the given constants.

Parameters

<i>gravity</i>	The gravity parameter.
<i>linkLength1</i>	The length of link 1.
<i>linkLength2</i>	The length of link 2.
<i>linkMass1</i>	The mass of link 1.
<i>linkMass2</i>	The mass of link 2.
<i>linkCom1</i>	The position of the center of mass of link 1.
<i>linkCom2</i>	The position of the center of mass of link 2.
<i>linkMoi</i>	The moments of inertia for both link.
<i>maxVel1</i>	The max angular velocity of link1.
<i>maxVel2</i>	The max angular velocity of link2.
<i>dt</i>	The differential value.

Definition at line 113 of file `acrobot.hpp`.

39.421.4 Member Function Documentation

39.421.4.1 Dsdt()

```
arma::colvec Dsdt (
    arma::colvec state,
    const double torque ) const [inline]
```

This is the ordinary differential equations required for estimation of nextState through RK4 method.

Parameters

<i>state</i>	Current State (p. 1831).
<i>torque</i>	The torque Applied.

Definition at line 218 of file acrobot.hpp.

References M_PI.

Referenced by Acrobot::Rk4().

39.421.4.2 InitialSample()

```
State InitialSample ( ) const [inline]
```

This function does random initialization of state space.

Definition at line 195 of file acrobot.hpp.

References Acrobot::State::State().

39.421.4.3 IsTerminal()

```
bool IsTerminal (
    const State & state ) const [inline]
```

This function checks if the acrobot has reached the terminal state.

Parameters

<i>state</i>	The current State (p. 1831).
--------------	-------------------------------------

Definition at line 205 of file acrobot.hpp.

References Acrobot::State::Theta1(), and Acrobot::State::Theta2().

Referenced by Acrobot::Sample().

39.421.4.4 Rk4()

```
arma::colvec Rk4 (
    const arma::colvec state,
    const double torque ) const [inline]
```

This function calls the RK4 iterative method to estimate the next state based on given ordinary differential equation.

Parameters

<i>state</i>	The current State (p. 1831).
<i>torque</i>	The torque applied.

Definition at line 305 of file acrobot.hpp.

References Acrobot::Dsdt().

Referenced by Acrobot::Sample().

39.421.4.5 Sample() [1/2]

```
double Sample (
    const State & state,
    const Action & action,
    State & nextState ) const [inline]
```

Dynamics of the **Acrobot** (p. 1825) System.

To get reward and next state based on current state and current action. Always return -1 reward.

Parameters

<i>state</i>	The current State (p. 1831).
<i>action</i>	The action taken.
<i>nextState</i>	The next state.

Returns

reward, it's always -1.0.

The value of angular velocity is bounded in min and max value.

If the acrobot reaches a terminal state, it should be given a positive reward. This will ensure that the agent learns the goal of the game.

Definition at line 148 of file acrobot.hpp.

References `Acrobot::State::AngularVelocity1()`, `Acrobot::State::AngularVelocity2()`, `Acrobot::IsTerminal()`, `M_PI`, `Acrobot::Rk4()`, `Acrobot::State::Theta1()`, `Acrobot::State::Theta2()`, `Acrobot::Torque()`, and `Acrobot::Wrap()`.

Referenced by `Acrobot::Sample()`.

39.421.4.6 `Sample()` [2/2]

```
double Sample (
    const State & state,
    const Action & action ) const [inline]
```

Dynamics of the **Acrobot** (p. 1825) System.

To get reward and next state based on current state and current action. This function calls the `Sample` function to estimate the next state return reward for taking a particular action.

Parameters

<i>state</i>	The current State (p. 1831).
<i>action</i>	The action taken.
<i>nextState</i>	The next state.

Definition at line 186 of file acrobot.hpp.

References `Acrobot::Sample()`.

39.421.4.7 `Torque()`

```
double Torque (
    const Action & action ) const [inline]
```

This function calculates the torque for a particular action.

0 : negative torque, 1 : zero torque, 2 : positive torque.

Parameters

<i>Action</i>	action taken.
---------------	---------------

Definition at line 291 of file acrobot.hpp.

References `mlpack::math::Random()`.

Referenced by `Acrobot::Sample()`.

39.421.4.8 Wrap()

```
double Wrap (
    double value,
    const double minimum,
    const double maximum ) const [inline]
```

Wrap function is required to truncate the angle value from -180 to 180.

This function will make sure that value will always be between minimum to maximum.

Parameters

<i>value</i>	Scalar value to wrap.
<i>minimum</i>	Minimum range of wrap.
<i>maximum</i>	Maximum range of wrap.

Definition at line 267 of file acrobot.hpp.

Referenced by `Acrobot::Sample()`.

39.423 AggregatedPolicy< PolicyType > Class Template Reference**Public Types**

- using **ActionType** = typename PolicyType::ActionType
Convenient typedef for action.

Public Member Functions

- **AggregatedPolicy** (std::vector< PolicyType > policies, const arma::colvec &distribution)
- void **Anneal** ()
Exploration probability will anneal at each step.
- **ActionType Sample** (const arma::colvec &actionValue, bool deterministic=false)
Sample an action based on given action values.

39.423.1 Detailed Description

```
template<typename PolicyType>
class mlpack::rl::AggregatedPolicy< PolicyType >
```

Template Parameters

<i>PolicyType</i>	The type of the child policy.
-------------------	-------------------------------

Definition at line 27 of file aggregated_policy.hpp.

39.423.2 Member Typedef Documentation

39.423.2.1 ActionType

```
using ActionType = typename PolicyType::ActionType
```

Convenient typedef for action.

Definition at line 31 of file aggregated_policy.hpp.

39.423.3 Constructor & Destructor Documentation

39.423.3.1 AggregatedPolicy()

```
AggregatedPolicy (  
    std::vector< PolicyType > policies,  
    const arma::colvec & distribution ) [inline]
```

Parameters

<i>policies</i>	Child policies.
<i>distribution</i>	Probability distribution for each child policy. User should make sure its size is same as the number of policies and the sum of its element is equal to 1.

Definition at line 39 of file aggregated_policy.hpp.

39.423.4 Member Function Documentation

39.423.4.1 Anneal()

```
void Anneal ( ) [inline]
```

Exploration probability will anneal at each step.

Definition at line 63 of file aggregated_policy.hpp.

39.423.4.2 Sample()

```
ActionType Sample (
    const arma::colvec & actionValue,
    bool deterministic = false ) [inline]
```

Sample an action based on given action values.

Parameters

<i>actionValue</i>	Values for each action.
<i>deterministic</i>	Always select the action greedily.

Returns

Sampled action.

Definition at line 52 of file aggregated_policy.hpp.

References `DiscreteDistribution::Random()`.

39.424 AsyncLearning< WorkerType, EnvironmentType, NetworkType, UpdaterType, PolicyType > Class Template Reference

Wrapper of various asynchronous learning algorithms, e.g.

Public Member Functions

- **AsyncLearning** (**TrainingConfig** config, NetworkType network, PolicyType policy, UpdaterType updater=UpdaterType(), EnvironmentType environment=EnvironmentType())
Construct an instance of the given async learning algorithm.
- **TrainingConfig** & **Config** ()
Get training config.
- const **TrainingConfig** & **Config** () const
Modify training config.
- EnvironmentType & **Environment** ()
Get the environment.
- const EnvironmentType & **Environment** () const
Modify the environment.
- NetworkType & **Network** ()
Get learning network.
- const NetworkType & **Network** () const
Modify learning network.
- PolicyType & **Policy** ()
Get behavior policy.
- const PolicyType & **Policy** () const
Modify behavior policy.
- template<typename Measure >
void **Train** (Measure &measure)
Starting async training.
- UpdaterType & **Updater** ()
Get optimizer.
- const UpdaterType & **Updater** () const
Modify optimizer.

39.424.1 Detailed Description

```
template<typename WorkerType, typename EnvironmentType, typename NetworkType, typename UpdaterType, typename PolicyType>
class mlpack::rl::AsyncLearning< WorkerType, EnvironmentType, NetworkType, UpdaterType, PolicyType >
```

Wrapper of various asynchronous learning algorithms, e.g.

async one-step Q-learning, async one-step Sarsa, async n-step Q-learning and async advantage actor-critic.

For more details, see the following:

```
@inproceedings{mnih2016asynchronous,
  title   = {Asynchronous methods for deep reinforcement learning},
  author  = {Mnih, Volodymyr and Badia, Adria Puigdomenech and Mirza,
            Mehdi and Graves, Alex and Lillicrap, Timothy and Harley,
            Tim and Silver, David and Kavukcuoglu, Koray},
  booktitle = {International Conference on Machine Learning},
  pages   = {1928--1937},
  year    = {2016}
}
```

Template Parameters

<i>WorkerType</i>	The type of the worker.
<i>EnvironmentType</i>	The type of reinforcement learning task.
<i>NetworkType</i>	The type of the network model.
<i>UpdaterType</i>	The type of the optimizer.
<i>PolicyType</i>	The type of the behavior policy.

Definition at line 57 of file `async_learning.hpp`.

39.424.2 Constructor & Destructor Documentation

39.424.2.1 AsyncLearning()

```
AsyncLearning (
    TrainingConfig config,
    NetworkType network,
    PolicyType policy,
    UpdaterType updater = UpdaterType(),
    EnvironmentType environment = EnvironmentType() )
```

Construct an instance of the given async learning algorithm.

Parameters

<i>config</i>	Hyper-parameters for training.
<i>network</i>	The network model.
<i>policy</i>	The behavior policy.
<i>updater</i>	The optimizer.
<i>environment</i>	The reinforcement learning task.

39.424.3 Member Function Documentation

39.424.3.1 Config() [1/2]

```
TrainingConfig& Config ( ) [inline]
```

Get training config.

Definition at line 92 of file `async_learning.hpp`.

39.424.3.2 Config() [2/2]

```
const TrainingConfig& Config ( ) const [inline]
```

Modify training config.

Definition at line 94 of file `async_learning.hpp`.

39.424.3.3 Environment() [1/2]

```
EnvironmentType& Environment ( ) [inline]
```

Get the environment.

Definition at line 112 of file `async_learning.hpp`.

39.424.3.4 Environment() [2/2]

```
const EnvironmentType& Environment ( ) const [inline]
```

Modify the environment.

Definition at line 114 of file `async_learning.hpp`.

39.424.3.5 Network() [1/2]

```
NetworkType& Network ( ) [inline]
```

Get learning network.

Definition at line 97 of file `async_learning.hpp`.

39.424.3.6 Network() [2/2]

```
const NetworkType& Network ( ) const [inline]
```

Modify learning network.

Definition at line 99 of file `async_learning.hpp`.

39.424.3.7 Policy() [1/2]

```
PolicyType& Policy ( ) [inline]
```

Get behavior policy.

Definition at line 102 of file async_learning.hpp.

39.424.3.8 Policy() [2/2]

```
const PolicyType& Policy ( ) const [inline]
```

Modify behavior policy.

Definition at line 104 of file async_learning.hpp.

39.424.3.9 Train()

```
void Train (
    Measure & measure )
```

Starting async training.

Template Parameters

<i>Measure</i>	<p>The type of the measurement. It should be a callable object like</p> <pre>bool foo(double reward);</pre> <p>where reward is the total reward of a deterministic test episode, and the return value should indicate whether the training process is completed.</p>
----------------	--

Parameters

<i>measure</i>	The measurement instance.
----------------	---------------------------

39.424.3.10 Updater() [1/2]

```
UpdaterType& Updater ( ) [inline]
```

Get optimizer.

Definition at line 107 of file `async_learning.hpp`.

39.424.3.11 Updater() [2/2]

```
const UpdaterType& Updater ( ) const [inline]
```

Modify optimizer.

Definition at line 109 of file `async_learning.hpp`.

39.425 CartPole Class Reference

Implementation of Cart Pole task.

Classes

- class **State**
Implementation of the state of Cart Pole.

Public Types

- enum **Action** {
 backward,
 forward,
 size }
Implementation of action of Cart Pole.

Public Member Functions

- **CartPole** (const double gravity=9.8, const double massCart=1.0, const double massPole=0.1, const double length=0.5, const double forceMag=10.0, const double tau=0.02, const double thetaThresholdRadians=12 *2 *3.1416/360, const double xThreshold=2.4, const double doneReward=0.0)
Construct a Cart Pole instance using the given constants.
- **State InitialSample** () const
Initial state representation is randomly generated within [-0.05, 0.05].
- bool **IsTerminal** (const **State** &state) const
Whether given state is a terminal state.
- double **Sample** (const **State** &state, const **Action** &action, **State** &nextState) const
Dynamics of Cart Pole instance.
- double **Sample** (const **State** &state, const **Action** &action) const
Dynamics of Cart Pole.

39.425.1 Detailed Description

Implementation of Cart Pole task.

Definition at line 26 of file cart_pole.hpp.

39.425.2 Member Enumeration Documentation

39.425.2.1 Action

enum **Action**

Implementation of action of Cart Pole.

Enumerator

backward	
forward	
size	

Definition at line 87 of file cart_pole.hpp.

39.425.3 Constructor & Destructor Documentation

39.425.3.1 CartPole()

```
CartPole (  
    const double gravity = 9.8,  
    const double massCart = 1.0,  
    const double massPole = 0.1,  
    const double length = 0.5,  
    const double forceMag = 10.0,  
    const double tau = 0.02,  
    const double thetaThresholdRadians = 12 * 2 * 3.1416 / 360,  
    const double xThreshold = 2.4,  
    const double doneReward = 0.0 ) [inline]
```

Construct a Cart Pole instance using the given constants.

Parameters

<i>gravity</i>	The gravity constant.
<i>massCart</i>	The mass of the cart.
<i>massPole</i>	The mass of the pole.
<i>length</i>	The length of the pole.
<i>forceMag</i>	The magnitude of the applied force.
<i>tau</i>	The time interval.
<i>thetaThresholdRadians</i>	The maximum angle.
<i>xThreshold</i>	The maximum position.

Definition at line 108 of file cart_pole.hpp.

39.425.4 Member Function Documentation

39.425.4.1 InitialSample()

```
State InitialSample ( ) const [inline]
```

Initial state representation is randomly generated within [-0.05, 0.05].

Returns

Initial state for each episode.

Definition at line 192 of file cart_pole.hpp.

References `CartPole::State::State()`.

39.425.4.2 IsTerminal()

```
bool IsTerminal (
    const State & state ) const [inline]
```

Whether given state is a terminal state.

Parameters

<i>state</i>	The desired state.
--------------	--------------------

Returns

true if state is a terminal state, otherwise false.

Definition at line 203 of file cart_pole.hpp.

References `CartPole::State::Angle()`, and `CartPole::State::Position()`.

Referenced by `CartPole::Sample()`.

39.425.4.3 Sample() [1/2]

```
double Sample (
    const State & state,
    const Action & action,
    State & nextState ) const [inline]
```

Dynamics of Cart Pole instance.

Get reward and next state based on current state and current action.

Parameters

<i>state</i>	The current state.
<i>action</i>	The current action.
<i>nextState</i>	The next state.

Returns

reward, it's always 1.0.

It is important to note that if the cartpole is falling down, it should be penalized.

When done is false, it means that the cartpole has fallen down. For this case the reward is 1.0.

Definition at line 139 of file cart_pole.hpp.

References `CartPole::State::Angle()`, `CartPole::State::AngularVelocity()`, `CartPole::IsTerminal()`, `CartPole::State::Position()`, and `CartPole::State::Velocity()`.

Referenced by `CartPole::Sample()`.

39.425.4.4 Sample() [2/2]

```
double Sample (
    const State & state,
    const Action & action ) const [inline]
```

Dynamics of Cart Pole.

Get reward based on current state and current action.

Parameters

<i>state</i>	The current state.
<i>action</i>	The current action.

Returns

reward, it's always 1.0.

Definition at line 181 of file cart_pole.hpp.

References `CartPole::Sample()`.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/reinforcement_learning/environment/ **cart_pole.hpp**

39.426 CartPole::State Class Reference

Implementation of the state of Cart Pole.

Public Member Functions

- **State** ()
Construct a state instance.
- **State** (const arma::colvec &data)
Construct a state instance from given data.
- double **Angle** () const
Get the angle.
- double & **Angle** ()
Modify the angle.
- double **AngularVelocity** () const
Get the angular velocity.
- double & **AngularVelocity** ()
Modify the angular velocity.
- arma::colvec & **Data** ()
Modify the internal representation of the state.
- const arma::colvec & **Encode** () const
Encode the state to a column vector.
- double **Position** () const
Get the position.
- double & **Position** ()
Modify the position.
- double **Velocity** () const
Get the velocity.
- double & **Velocity** ()
Modify the velocity.

Static Public Attributes

- static constexpr size_t **dimension** = 4
Dimension of the encoded state.

39.426.1 Detailed Description

Implementation of the state of Cart Pole.

Each state is a tuple vector (position, velocity, angle, angular velocity).

Definition at line 33 of file cart_pole.hpp.

39.426.2 Constructor & Destructor Documentation

39.426.2.1 State() [1/2]

```
State ( ) [inline]
```

Construct a state instance.

Definition at line 39 of file cart_pole.hpp.

Referenced by CartPole::InitialSample().

39.426.2.2 State() [2/2]

```
State (
    const arma::colvec & data ) [inline]
```

Construct a state instance from given data.

Parameters

<i>data</i>	Data for the position, velocity, angle and angular velocity.
-------------	--

Definition at line 47 of file cart_pole.hpp.

39.426.3 Member Function Documentation

39.426.3.1 Angle() [1/2]

```
double Angle ( ) const [inline]
```

Get the angle.

Definition at line 64 of file cart_pole.hpp.

Referenced by CartPole::IsTerminal(), and CartPole::Sample().

39.426.3.2 Angle() [2/2]

```
double& Angle ( ) [inline]
```

Modify the angle.

Definition at line 66 of file cart_pole.hpp.

39.426.3.3 AngularVelocity() [1/2]

```
double AngularVelocity ( ) const [inline]
```

Get the angular velocity.

Definition at line 69 of file cart_pole.hpp.

Referenced by CartPole::Sample().

39.426.3.4 AngularVelocity() [2/2]

```
double& AngularVelocity ( ) [inline]
```

Modify the angular velocity.

Definition at line 71 of file cart_pole.hpp.

39.426.3.5 Data()

```
arma::colvec& Data ( ) [inline]
```

Modify the internal representation of the state.

Definition at line 51 of file cart_pole.hpp.

39.426.3.6 Encode()

```
const arma::colvec& Encode ( ) const [inline]
```

Encode the state to a column vector.

Definition at line 74 of file cart_pole.hpp.

39.426.3.7 Position() [1/2]

```
double Position ( ) const [inline]
```

Get the position.

Definition at line 54 of file cart_pole.hpp.

Referenced by CartPole::IsTerminal(), and CartPole::Sample().

39.426.3.8 Position() [2/2]

```
double& Position ( ) [inline]
```

Modify the position.

Definition at line 56 of file cart_pole.hpp.

39.426.3.9 Velocity() [1/2]

```
double Velocity ( ) const [inline]
```

Get the velocity.

Definition at line 59 of file cart_pole.hpp.

Referenced by CartPole::Sample().

39.426.3.10 Velocity() [2/2]

```
double& Velocity ( ) [inline]
```

Modify the velocity.

Definition at line 61 of file cart_pole.hpp.

39.426.4 Member Data Documentation**39.426.4.1 dimension**

```
constexpr size_t dimension = 4 [static]
```

Dimension of the encoded state.

Definition at line 77 of file cart_pole.hpp.

39.427 ContinuousMountainCar Class Reference

Implementation of Continuous Mountain Car task.

Classes

- struct **Action**
Implementation of action of Continuous Mountain Car.
- class **State**
Implementation of state of Continuous Mountain Car.

Public Member Functions

- **ContinuousMountainCar** (const double positionMin=-1.2, const double positionMax=0.6, const double positionGoal=0.45, const double velocityMin=-0.07, const double velocityMax=0.07, const double power=0.0015)
Construct a Continuous Mountain Car instance using the given constant.
- **State InitialSample** () const
Initial position is randomly generated within [-0.6, -0.4].
- bool **IsTerminal** (const **State** &state) const
Whether given state is a terminal state.
- double **Sample** (const **State** &state, const **Action** &action, **State** &nextState) const
Dynamics of Continuous Mountain Car.
- double **Sample** (const **State** &state, const **Action** &action) const
Dynamics of Continuous Mountain Car.

39.427.1 Detailed Description

Implementation of Continuous Mountain Car task.

Definition at line 28 of file continuous_mountain_car.hpp.

39.427.2 Constructor & Destructor Documentation

39.427.2.1 ContinuousMountainCar()

```
ContinuousMountainCar (  
    const double positionMin = -1.2,  
    const double positionMax = 0.6,  
    const double positionGoal = 0.45,  
    const double velocityMin = -0.07,  
    const double velocityMax = 0.07,  
    const double power = 0.0015 ) [inline]
```

Construct a Continuous Mountain Car instance using the given constant.

Parameters

<i>positionMin</i>	Minimum legal position.
<i>positionMax</i>	Maximum legal position.
<i>positionGoal</i>	Final target position.
<i>velocityMin</i>	Minimum legal velocity.
<i>velocityMax</i>	Maximum legal velocity.
<i>power</i>	Power generated by car.

Definition at line 101 of file continuous_mountain_car.hpp.

39.427.3 Member Function Documentation

39.427.3.1 InitialSample()

```
State InitialSample ( ) const [inline]
```

Initial position is randomly generated within [-0.6, -0.4].

Initial velocity is 0.

Returns

Initial state for each episode.

Definition at line 171 of file continuous_mountain_car.hpp.

References ContinuousMountainCar::State::Position(), mpack::math::Random(), and ContinuousMountainCar::State::Velocity().

39.427.3.2 IsTerminal()

```
bool IsTerminal (
    const State & state ) const [inline]
```

Whether given state is a terminal state.

Parameters

<i>state</i>	desired state.
--------------	----------------

Returns

true if state is a terminal state, otherwise false.

Definition at line 185 of file continuous_mountain_car.hpp.

References ContinuousMountainCar::State::Position().

Referenced by ContinuousMountainCar::Sample().

39.427.3.3 Sample() [1/2]

```
double Sample (
    const State & state,
    const Action & action,
    State & nextState ) const [inline]
```

Dynamics of Continuous Mountain Car.

Get reward and next state based on current state and current action.

Parameters

<i>state</i>	The current state.
<i>action</i>	The current action.
<i>nextState</i>	The next state.

Returns

reward, it's always -1.0.

Definition at line 124 of file continuous_mountain_car.hpp.

References ContinuousMountainCar::Action::action, ContinuousMountainCar::IsTerminal(), ContinuousMountainCar::State::Position(), and ContinuousMountainCar::State::Velocity().

Referenced by ContinuousMountainCar::Sample().

39.427.3.4 Sample() [2/2]

```
double Sample (
    const State & state,
    const Action & action ) const [inline]
```

Dynamics of Continuous Mountain Car.

Get reward based on current state and current action.

Parameters

<i>state</i>	The current state.
<i>action</i>	The current action.

Returns

reward, it's always -1.0.

Definition at line 159 of file continuous_mountain_car.hpp.

References ContinuousMountainCar::Sample().

The documentation for this class was generated from the following file:

_mountain_car.hpp

39.428 ContinuousMountainCar::Action Struct Reference

Implementation of action of Continuous Mountain Car.

Public Attributes

- double **action** [1]
- const int **size** = 1

39.428.1 Detailed Description

Implementation of action of Continuous Mountain Car.

In Continuous mountain car gain, the action represents the force to be applied. This value is bounded in range -1.0 to 1.0. Unlike the simple mountain car environment, where action space has a discrete value, continuous mountain car has continuous action space value.

Definition at line 84 of file continuous_mountain_car.hpp.

39.428.2 Member Data Documentation

39.428.2.1 action

```
double action[1]
```

Definition at line 86 of file continuous_mountain_car.hpp.

Referenced by ContinuousMountainCar::Sample().

39.428.2.2 size

```
const int size = 1
```

Definition at line 88 of file continuous_mountain_car.hpp.

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/reinforcement_learning/environment/ **continuous_↵**
_mountain_car.hpp

39.429 ContinuousMountainCar::State Class Reference

Implementation of state of Continuous Mountain Car.

Public Member Functions

- **State** ()
Construct a state instance.
- **State** (const arma::colvec &data)
Construct a state based on the given data.
- arma::colvec & **Data** ()
Modify the internal representation of the state.
- const arma::colvec & **Encode** () const
Encode the state to a column vector.
- double **Position** () const
Get the position.
- double & **Position** ()
Modify the position.
- double **Velocity** () const
Get the velocity.
- double & **Velocity** ()
Modify the velocity.

Static Public Attributes

- static constexpr size_t **dimension** = 2
Dimension of the encoded state.

39.429.1 Detailed Description

Implementation of state of Continuous Mountain Car.

Each state is a (velocity, position) vector.

Definition at line 35 of file continuous_mountain_car.hpp.

39.429.2 Constructor & Destructor Documentation

39.429.2.1 State() [1/2]

```
State ( ) [inline]
```

Construct a state instance.

Definition at line 41 of file continuous_mountain_car.hpp.

39.429.2.2 State() [2/2]

```
State (
    const arma::colvec & data ) [inline]
```

Construct a state based on the given data.

Parameters

<i>data</i>	Data for the velocity and position.
-------------	-------------------------------------

Definition at line 49 of file continuous_mountain_car.hpp.

39.429.3 Member Function Documentation

39.429.3.1 Data()

```
arma::colvec& Data ( ) [inline]
```

Modify the internal representation of the state.

Definition at line 53 of file continuous_mountain_car.hpp.

39.429.3.2 Encode()

```
const arma::colvec& Encode ( ) const [inline]
```

Encode the state to a column vector.

Definition at line 66 of file continuous_mountain_car.hpp.

39.429.3.3 Position() [1/2]

```
double Position ( ) const [inline]
```

Get the position.

Definition at line 61 of file continuous_mountain_car.hpp.

Referenced by ContinuousMountainCar::InitialSample(), ContinuousMountainCar::IsTerminal(), and ContinuousMountainCar::Sample().

39.429.3.4 Position() [2/2]

```
double& Position ( ) [inline]
```

Modify the position.

Definition at line 63 of file continuous_mountain_car.hpp.

39.429.3.5 Velocity() [1/2]

```
double Velocity ( ) const [inline]
```

Get the velocity.

Definition at line 56 of file continuous_mountain_car.hpp.

Referenced by ContinuousMountainCar::InitialSample(), and ContinuousMountainCar::Sample().

39.429.3.6 Velocity() [2/2]

```
double& Velocity ( ) [inline]
```

Modify the velocity.

Definition at line 58 of file continuous_mountain_car.hpp.

39.429.4 Member Data Documentation**39.429.4.1 dimension**

```
constexpr size_t dimension = 2 [static]
```

Dimension of the encoded state.

39.430 GreedyPolicy< EnvironmentType > Class Template Reference

Implementation for epsilon greedy policy.

Public Types

- using **ActionType** = typename EnvironmentType::Action
Convenient typedef for action.

Public Member Functions

- **GreedyPolicy** (const double initialEpsilon, const size_t annealInterval, const double minEpsilon, const double decayRate=1.0)
Constructor for epsilon greedy policy class.
- void **Anneal** ()
Exploration probability will anneal at each step.
- const double & **Epsilon** () const
- **ActionType Sample** (const arma::colvec &actionValue, bool deterministic=false)
Sample an action based on given action values.

39.430.1 Detailed Description

```
template<typename EnvironmentType>
class mlpack::rl::GreedyPolicy< EnvironmentType >
```

Implementation for epsilon greedy policy.

In general we will select an action greedily based on the action value, however sometimes we will also randomly select an action to encourage exploration.

Template Parameters

<i>EnvironmentType</i>	The reinforcement learning task.
------------------------	----------------------------------

Definition at line 31 of file greedy_policy.hpp.

39.430.2 Member Typedef Documentation

39.430.2.1 ActionType

```
using ActionType = typename EnvironmentType::Action
```

Convenient typedef for action.

Definition at line 35 of file greedy_policy.hpp.

39.430.3 Constructor & Destructor Documentation

39.430.3.1 GreedyPolicy()

```
GreedyPolicy (  
    const double initialEpsilon,  
    const size_t annealInterval,  
    const double minEpsilon,  
    const double decayRate = 1.0 ) [inline]
```

Constructor for epsilon greedy policy class.

Parameters

<i>initialEpsilon</i>	The initial probability to explore (select a random action).
<i>annealInterval</i>	The steps during which the probability to explore will anneal.
<i>minEpsilon</i>	Epsilon will never be less than this value.
<i>decayRate</i>	How much to change the model in response to the estimated error each time the model weights are updated.

Definition at line 48 of file greedy_policy.hpp.

39.430.4 Member Function Documentation

39.430.4.1 Anneal()

```
void Anneal ( ) [inline]
```

Exploration probability will anneal at each step.

Definition at line 80 of file greedy_policy.hpp.

39.430.4.2 Epsilon()

```
const double& Epsilon ( ) const [inline]
```

Returns

Current possibility to explore.

Definition at line 89 of file greedy_policy.hpp.

39.430.4.3 Sample()

```
ActionType Sample (  
    const arma::colvec & actionValue,  
    bool deterministic = false ) [inline]
```

Sample an action based on given action values.

Parameters

<i>actionValue</i>	Values for each action.
<i>deterministic</i>	Always select the action greedily.

Returns

Sampled action.

Definition at line 64 of file greedy_policy.hpp.

References `mlpack::math::RandInt()`, and `mlpack::math::Random()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/reinforcement_learning/policy/greedy_policy.hpp`

39.431 MountainCar Class Reference

Implementation of Mountain Car task.

Classes

- class **State**
Implementation of state of Mountain Car.

Public Types

- enum **Action** {
 backward,
 stop,
 forward,
 size }
Implementation of action of Mountain Car.

Public Member Functions

- **MountainCar** (const double positionMin=-1.2, const double positionMax=0.6, const double positionGoal=0.5, const double velocityMin=-0.07, const double velocityMax=0.07, const double doneReward=0)
Construct a Mountain Car instance using the given constant.
- **State InitialSample** () const
Initial position is randomly generated within [-0.6, -0.4].
- bool **IsTerminal** (const **State** &state) const
Whether given state is a terminal state.
- double **Sample** (const **State** &state, const **Action** &action, **State** &nextState) const
Dynamics of Mountain Car.
- double **Sample** (const **State** &state, const **Action** &action) const
Dynamics of Mountain Car.

39.431.1 Detailed Description

Implementation of Mountain Car task.

Definition at line 27 of file mountain_car.hpp.

39.431.2 Member Enumeration Documentation

39.431.2.1 Action

enum **Action**

Implementation of action of Mountain Car.

Enumerator

backward	
stop	
forward	
size	Track the size of the action space.

Definition at line 78 of file mountain_car.hpp.

39.431.3 Constructor & Destructor Documentation

39.431.3.1 MountainCar()

```
MountainCar (  
    const double positionMin = -1.2,  
    const double positionMax = 0.6,  
    const double positionGoal = 0.5,  
    const double velocityMin = -0.07,  
    const double velocityMax = 0.07,  
    const double doneReward = 0 ) [inline]
```

Construct a Mountain Car instance using the given constant.

Parameters

<i>positionMin</i>	Minimum legal position.
--------------------	-------------------------

Parameters

<i>positionMax</i>	Maximum legal position.
<i>positionGoal</i>	Final target position.
<i>velocityMin</i>	Minimum legal velocity.
<i>velocityMax</i>	Maximum legal velocity.

Definition at line 97 of file mountain_car.hpp.

39.431.4 Member Function Documentation

39.431.4.1 InitialSample()

```
State InitialSample ( ) const [inline]
```

Initial position is randomly generated within [-0.6, -0.4].

Initial velocity is 0.

Returns

Initial state for each episode.

Definition at line 172 of file mountain_car.hpp.

References MountainCar::State::Position(), and MountainCar::State::Velocity().

39.431.4.2 IsTerminal()

```
bool IsTerminal (
    const State & state ) const [inline]
```

Whether given state is a terminal state.

Parameters

<i>state</i>	desired state.
--------------	----------------

Returns

true if state is a terminal state, otherwise false.

Definition at line 186 of file mountain_car.hpp.

References MountainCar::State::Position().

Referenced by MountainCar::Sample().

39.431.4.3 Sample() [1/2]

```
double Sample (
    const State & state,
    const Action & action,
    State & nextState ) const [inline]
```

Dynamics of Mountain Car.

Get reward and next state based on current state and current action.

Parameters

<i>state</i>	The current state.
<i>action</i>	The current action.
<i>nextState</i>	The next state.

Returns

reward, it's always -1.0.

If done is true , it means that car has reached its goal. To make sure that the agent learns this, we will give some positive reward to the agent. If the agent doesn't reach the terminal state, then we will give a -1.0 reward to penalize the agent to take that step.

Definition at line 120 of file mountain_car.hpp.

References MountainCar::IsTerminal(), MountainCar::State::Position(), and MountainCar::State::Velocity().

Referenced by MountainCar::Sample().

39.431.4.4 Sample() [2/2]

```
double Sample (
    const State & state,
    const Action & action ) const [inline]
```

Dynamics of Mountain Car.

Get reward based on current state and current action.

Parameters

<i>state</i>	The current state.
<i>action</i>	The current action.

Returns

reward, it's always -1.0.

Definition at line 160 of file mountain_car.hpp.

References MountainCar::Sample().

The documentation for this class was generated from the following file:

39.432 MountainCar::State Class Reference

Implementation of state of Mountain Car.

Public Member Functions

- **State** ()
Construct a state instance.
- **State** (const arma::colvec &data)
Construct a state based on the given data.
- arma::colvec & **Data** ()
Modify the internal representation of the state.
- const arma::colvec & **Encode** () const
Encode the state to a column vector.
- double **Position** () const
Get the position.
- double & **Position** ()
Modify the position.
- double **Velocity** () const
Get the velocity.
- double & **Velocity** ()
Modify the velocity.

Static Public Attributes

- static constexpr size_t **dimension** = 2
Dimension of the encoded state.

39.432.1 Detailed Description

Implementation of state of Mountain Car.

Each state is a (velocity, position) vector.

Definition at line 34 of file mountain_car.hpp.

39.432.2 Constructor & Destructor Documentation

39.432.2.1 State() [1/2]

```
State ( ) [inline]
```

Construct a state instance.

Definition at line 40 of file mountain_car.hpp.

39.432.2.2 State() [2/2]

```
State (
    const arma::colvec & data ) [inline]
```

Construct a state based on the given data.

Parameters

<i>data</i>	Data for the velocity and position.
-------------	-------------------------------------

Definition at line 48 of file mountain_car.hpp.

39.432.3 Member Function Documentation

39.432.3.1 Data()

```
arma::colvec& Data ( ) [inline]
```

Modify the internal representation of the state.

Definition at line 52 of file mountain_car.hpp.

39.432.3.2 Encode()

```
const arma::colvec& Encode ( ) const [inline]
```

Encode the state to a column vector.

Definition at line 65 of file mountain_car.hpp.

39.432.3.3 Position() [1/2]

```
double Position ( ) const [inline]
```

Get the position.

Definition at line 60 of file mountain_car.hpp.

Referenced by MountainCar::InitialSample(), MountainCar::IsTerminal(), and MountainCar::Sample().

39.432.3.4 Position() [2/2]

```
double& Position ( ) [inline]
```

Modify the position.

Definition at line 62 of file mountain_car.hpp.

39.432.3.5 Velocity() [1/2]

```
double Velocity ( ) const [inline]
```

Get the velocity.

Definition at line 55 of file mountain_car.hpp.

Referenced by MountainCar::InitialSample(), and MountainCar::Sample().

39.432.3.6 Velocity() [2/2]

```
double& Velocity ( ) [inline]
```

Modify the velocity.

Definition at line 57 of file mountain_car.hpp.

39.432.4 Member Data Documentation**39.432.4.1 dimension**

```
constexpr size_t dimension = 2 [static]
```

Dimension of the encoded state.

Definition at line 68 of file mountain_car.hpp.

The documentation for this class was generated from the following file:

39.433 NStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType > Class Template Reference

Forward declaration of **NStepQLearningWorker** (p. 1868).

Public Types

- using **ActionType** = typename EnvironmentType::Action
- using **StateType** = typename EnvironmentType::State
- using **TransitionType** = std::tuple< **StateType**, **ActionType**, double, **StateType** >

Public Member Functions

- **NStepQLearningWorker** (const UpdaterType &updater, const EnvironmentType &environment, const **TrainingConfig** &config, bool deterministic)
Construct N-step Q-Learning worker with the given parameters and environment.
- void **Initialize** (NetworkType &learningNetwork)
Initialize the worker.
- bool **Step** (NetworkType &learningNetwork, NetworkType &targetNetwork, size_t &totalSteps, PolicyType &policy, double &totalReward)
The agent will execute one step.

39.433.1 Detailed Description

```
template<typename EnvironmentType, typename NetworkType, typename UpdaterType, typename PolicyType>
class mlpack::rl::NStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >
```

Forward declaration of **NStepQLearningWorker** (p. 1868).

N-step Q-Learning worker.

Template Parameters

<i>EnvironmentType</i>	The type of the reinforcement learning task.
<i>NetworkType</i>	The type of the network model.
<i>UpdaterType</i>	The type of the optimizer.
<i>PolicyType</i>	The type of the behavior policy.

Definition at line 179 of file `async_learning.hpp`.

39.433.2 Member Typedef Documentation

39.433.2.1 ActionType

```
using ActionType = typename EnvironmentType::Action
```

Definition at line 39 of file `n_step_q_learning_worker.hpp`.

39.433.2.2 StateType

```
using StateType = typename EnvironmentType::State
```

Definition at line 38 of file `n_step_q_learning_worker.hpp`.

39.433.2.3 TransitionType

```
using TransitionType = std::tuple< StateType, ActionType, double, StateType>
```

Definition at line 40 of file `n_step_q_learning_worker.hpp`.

39.433.3 Constructor & Destructor Documentation

39.433.3.1 NStepQLearningWorker()

```
NStepQLearningWorker (  
    const UpdaterType & updater,  
    const EnvironmentType & environment,  
    const TrainingConfig & config,  
    bool deterministic ) [inline]
```

Construct N-step Q-Learning worker with the given parameters and environment.

Parameters

<i>updater</i>	The optimizer.
<i>environment</i>	The reinforcement learning task.
<i>config</i>	Hyper-parameters.
<i>deterministic</i>	Whether it should be deterministic.

Definition at line 51 of file `n_step_q_learning_worker.hpp`.

39.433.4 Member Function Documentation

39.433.4.1 Initialize()

```
void Initialize (  
    NetworkType & learningNetwork ) [inline]
```

Initialize the worker.

Parameters

<i>learningNetwork</i>	The shared network.
------------------------	---------------------

Definition at line 67 of file `n_step_q_learning_worker.hpp`.

39.433.4.2 Step()

```
bool Step (
    NetworkType & learningNetwork,
    NetworkType & targetNetwork,
    size_t & totalSteps,
    PolicyType & policy,
    double & totalReward ) [inline]
```

The agent will execute one step.

Parameters

<i>learningNetwork</i>	The shared learning network.
<i>targetNetwork</i>	The shared target network.
<i>totalSteps</i>	The shared counter for total steps.
<i>policy</i>	The shared behavior policy.
<i>totalReward</i>	This will be the episode return if the episode ends after this step. Otherwise this is invalid.

Returns

Indicate whether current episode ends after this step.

Definition at line 86 of file `n_step_q_learning_worker.hpp`.

39.434 OneStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, Policy↵Type > Class Template Reference

Forward declaration of **OneStepQLearningWorker** (p. 1871).

Public Types

- using **ActionType** = typename EnvironmentType::Action
- using **StateType** = typename EnvironmentType::State
- using **TransitionType** = std::tuple< **StateType**, **ActionType**, double, **StateType** >

Public Member Functions

- **OneStepQLearningWorker** (const UpdaterType &updater, const EnvironmentType &environment, const TrainingConfig &config, bool deterministic)
Construct one step Q-Learning worker with the given parameters and environment.
- void **Initialize** (NetworkType &learningNetwork)
Initialize the worker.
- bool **Step** (NetworkType &learningNetwork, NetworkType &targetNetwork, size_t &totalSteps, PolicyType &policy, double &totalReward)
The agent will execute one step.

39.434.1 Detailed Description

```
template<typename EnvironmentType, typename NetworkType, typename UpdaterType, typename PolicyType>
class mlpack::rl::OneStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >
```

Forward declaration of **OneStepQLearningWorker** (p. 1871).

One step Q-Learning worker.

Template Parameters

<i>EnvironmentType</i>	The type of the reinforcement learning task.
<i>NetworkType</i>	The type of the network model.
<i>UpdaterType</i>	The type of the optimizer.
<i>PolicyType</i>	The type of the behavior policy.
<i>EnvironmentType</i>	The type of the reinforcement learning task.
<i>NetworkType</i>	The type of the network model.
<i>UpdaterType</i>	The type of the optimizer.
<i>PolicyType</i>	The type of the behavior policy. *

Definition at line 147 of file `async_learning.hpp`.

Definition at line 40 of file one_step_q_learning_worker.hpp.

39.434.3 Constructor & Destructor Documentation

39.434.3.1 OneStepQLearningWorker()

```
OneStepQLearningWorker (  
    const UpdaterType & updater,  
    const EnvironmentType & environment,  
    const TrainingConfig & config,  
    bool deterministic ) [inline]
```

Construct one step Q-Learning worker with the given parameters and environment.

Parameters

<i>updater</i>	The optimizer.
<i>environment</i>	The reinforcement learning task.
<i>config</i>	Hyper-parameters.
<i>deterministic</i>	Whether it should be deterministic.

Definition at line 51 of file one_step_q_learning_worker.hpp.

39.434.4 Member Function Documentation

39.434.4.1 Initialize()

```
void Initialize (
    NetworkType & learningNetwork ) [inline]
```

Initialize the worker.

Parameters

<i>learningNetwork</i>	The shared network.
------------------------	---------------------

Definition at line 67 of file one_step_q_learning_worker.hpp.

39.434.4.2 Step()

```
bool Step (
    NetworkType & learningNetwork,
    NetworkType & targetNetwork,
    size_t & totalSteps,
    PolicyType & policy,
    double & totalReward ) [inline]
```

The agent will execute one step.

Parameters

<i>learningNetwork</i>	The shared learning network.
<i>targetNetwork</i>	The shared target network.
<i>totalSteps</i>	The shared counter for total steps.
<i>policy</i>	The shared behavior policy.
<i>totalReward</i>	This will be the episode return if the episode ends after this step. Otherwise this is invalid.

Returns

Indicate whether current episode ends after this step.

39.435 OneStepSarsaWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType > Class Template Reference

Forward declaration of **OneStepSarsaWorker** (p. 1875).

Public Types

- using **ActionType** = typename EnvironmentType::Action
- using **StateType** = typename EnvironmentType::State
- using **TransitionType** = std::tuple< **StateType**, **ActionType**, double, **StateType**, **ActionType** >

Public Member Functions

- **OneStepSarsaWorker** (const UpdaterType &updater, const EnvironmentType &environment, const **TrainingConfig** &config, bool deterministic)
Construct one step sarsa worker with the given parameters and environment.
- void **Initialize** (NetworkType &learningNetwork)
Initialize the worker.
- bool **Step** (NetworkType &learningNetwork, NetworkType &targetNetwork, size_t &totalSteps, PolicyType &policy, double &totalReward)
The agent will execute one step.

39.435.1 Detailed Description

```
template<typename EnvironmentType, typename NetworkType, typename UpdaterType, typename PolicyType>
class mlpack::rl::OneStepSarsaWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >
```

Forward declaration of **OneStepSarsaWorker** (p. 1875).

One step Sarsa worker.

Template Parameters

<i>EnvironmentType</i>	The type of the reinforcement learning task.
<i>NetworkType</i>	The type of the network model.
<i>UpdaterType</i>	The type of the optimizer.
<i>PolicyType</i>	The type of the behavior policy.

Definition at line 163 of file `async_learning.hpp`.

```
OneStepSarsaWorker (
    const UpdaterType & updater,
    const EnvironmentType & environment,
    const TrainingConfig & config,
    bool deterministic ) [inline]
```

Construct one step sarsa worker with the given parameters and environment.

Parameters

<i>updater</i>	The optimizer.
<i>environment</i>	The reinforcement learning task.
<i>config</i>	Hyper-parameters.
<i>deterministic</i>	Whether it should be deterministic.

Definition at line 52 of file one_step_sarsa_worker.hpp.

39.435.4 Member Function Documentation

39.435.4.1 Initialize()

```
void Initialize (
    NetworkType & learningNetwork ) [inline]
```

Initialize the worker.

Parameters

<i>learningNetwork</i>	The shared network.
------------------------	---------------------

Definition at line 68 of file one_step_sarsa_worker.hpp.

39.435.4.2 Step()

```
bool Step (
    NetworkType & learningNetwork,
    NetworkType & targetNetwork,
    size_t & totalSteps,
    PolicyType & policy,
    double & totalReward ) [inline]
```

The agent will execute one step.

Parameters

<i>learningNetwork</i>	The shared learning network.
<i>targetNetwork</i>	The shared target network.
<i>totalSteps</i>	The shared counter for total steps.
<i>policy</i>	The shared behavior policy.
<i>totalReward</i>	This will be the episode return if the episode ends after this step. Otherwise this is invalid.

Returns

Indicate whether current episode ends after this step.

39.436 Pendulum Class Reference

Implementation of **Pendulum** (p. 1878) task.

Classes

- struct **Action**
*Implementation of action of **Pendulum** (p. 1878).*
- class **State**
*Implementation of state of **Pendulum** (p. 1878).*

Public Member Functions

- **Pendulum** (const double maxAngularVelocity=8, const double maxTorque=2.0, const double dt=0.05)
*Construct a **Pendulum** (p. 1878) instance using the given values.*
- double **AngleNormalize** (double theta) const
This function calculates the normalized angle for a particular theta.
- **State InitialSample** () const
Initial theta is randomly generated within $[-\pi, \pi]$.
- double **Sample** (const **State** &state, const **Action** &action, **State** &nextState) const
*Dynamics of **Pendulum** (p. 1878).*
- double **Sample** (const **State** &state, const **Action** &action) const
*Dynamics of **Pendulum** (p. 1878).*

39.436.1 Detailed Description

Implementation of **Pendulum** (p. 1878) task.

The inverted pendulum swingup problem is a classic problem in the control literature. In this version of the problem, the pendulum starts in a random position, and the goal is to swing it up so it stays upright

Definition at line 30 of file pendulum.hpp.

39.436.2 Constructor & Destructor Documentation

39.436.2.1 Pendulum()

```
Pendulum (
    const double maxAngularVelocity = 8,
    const double maxTorque = 2.0,
    const double dt = 0.05 ) [inline]
```

Construct a **Pendulum** (p. 1878) instance using the given values.

Parameters

<i>maxAngularVelocity</i>	Maximum angular velocity.
<i>maxTorque</i>	Maximum torque.
<i>dt</i>	The differential value.

Definition at line 97 of file pendulum.hpp.

39.436.3 Member Function Documentation

39.436.3.1 AngleNormalize()

```
double AngleNormalize (  
    double theta ) const [inline]
```

This function calculates the normalized anlge for a particular theta.

Parameters

<i>theta</i>	The un-normalized angle.
--------------	--------------------------

Definition at line 180 of file pendulum.hpp.

References `M_PI`.

Referenced by `Pendulum::Sample()`.

39.436.3.2 InitialSample()

```
State InitialSample ( ) const [inline]
```

Initial theta is randomly generated within $[-\pi, \pi]$.

Initial angular velocity is randomly generated within $[-1, 1]$.

Returns

Initial state for each episode.

Definition at line 167 of file pendulum.hpp.

References `Pendulum::State::AngularVelocity()`, `M_PI`, `mlpack::math::Random()`, and `Pendulum::State::Theta()`.

39.436.3.3 Sample() [1/2]

```
double Sample (
    const State & state,
    const Action & action,
    State & nextState ) const [inline]
```

Dynamics of **Pendulum** (p. 1878).

Get reward and next state based on current state and current action.

Parameters

<i>state</i>	The current state.
<i>action</i>	The current action.
<i>nextState</i>	The next state.

Returns

reward, The reward for taking the action taken for current state.

Definition at line 114 of file pendulum.hpp.

References `Pendulum::Action::action`, `Pendulum::AngleNormalize()`, `Pendulum::State::AngularVelocity()`, `M_PI`, and `Pendulum::State::Theta()`.

Referenced by `Pendulum::Sample()`.

39.436.3.4 Sample() [2/2]

```
double Sample (
    const State & state,
    const Action & action ) const [inline]
```

Dynamics of **Pendulum** (p. 1878).

Get reward based on current state and current action

Parameters

<i>state</i>	The current state.
<i>action</i>	The current action.

Returns

reward, The reward.

Definition at line 155 of file pendulum.hpp.

References Pendulum::Sample().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/reinforcement_learning/environment/ **pendulum.hpp**

39.437 Pendulum::Action Struct Reference

Implementation of action of **Pendulum** (p. 1878).

Public Attributes

- double **action** [1]
- const int **size** = 1

39.437.1 Detailed Description

Implementation of action of **Pendulum** (p. 1878).

In **Pendulum** (p. 1878), the action represents the torque to be applied. This value is bounded in range -2.0 to 2.0 by default.

Definition at line 83 of file pendulum.hpp.

39.437.2 Member Data Documentation

39.437.2.1 action

```
double action[1]
```

Definition at line 85 of file pendulum.hpp.

Referenced by Pendulum::Sample().

39.437.2.2 size

```
const int size = 1
```

Definition at line 87 of file pendulum.hpp.

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/reinforcement_learning/environment/ **pendulum.hpp**

39.438 Pendulum::State Class Reference

Implementation of state of **Pendulum** (p. 1878).

Public Member Functions

- **State** ()
Construct a state instance.
- **State** (const arma::colvec &data)
Construct a state based on the given data.
- double **AngularVelocity** () const
Get the angular velocity.
- double & **AngularVelocity** ()
Modify the value of angular velocity.
- arma::colvec & **Data** ()
Modify the internal representation of the state.
- const arma::colvec & **Encode** () const
Encode the state to a column vector.
- double **Theta** () const
Get the theta.
- double & **Theta** ()
Modify the value of theta.

Static Public Attributes

- static constexpr size_t **dimension** = 2
Dimension of the encoded state.

39.438.1 Detailed Description

Implementation of state of **Pendulum** (p. 1878).

Each state is a (theta, angular velocity) vector.

Definition at line 37 of file pendulum.hpp.

39.438.2 Constructor & Destructor Documentation

39.438.2.1 State() [1/2]

```
State ( ) [inline]
```

Construct a state instance.

Definition at line 43 of file pendulum.hpp.

39.438.2.2 State() [2/2]

```
State (
    const arma::colvec & data ) [inline]
```

Construct a state based on the given data.

Parameters

<i>data</i>	Data for the theta and angular velocity.
-------------	--

Definition at line 51 of file pendulum.hpp.

39.438.3 Member Function Documentation

39.438.3.1 AngularVelocity() [1/2]

```
double AngularVelocity ( ) const [inline]
```

Get the angular velocity.

Definition at line 63 of file pendulum.hpp.

Referenced by Pendulum::InitialSample(), and Pendulum::Sample().

39.438.3.2 AngularVelocity() [2/2]

```
double& AngularVelocity ( ) [inline]
```

Modify the value of angular velocity.

Definition at line 65 of file pendulum.hpp.

39.438.3.3 Data()

```
arma::colvec& Data ( ) [inline]
```

Modify the internal representation of the state.

Definition at line 55 of file pendulum.hpp.

39.438.3.4 Encode()

```
const arma::colvec& Encode ( ) const [inline]
```

Encode the state to a column vector.

Definition at line 68 of file pendulum.hpp.

39.438.3.5 Theta() [1/2]

```
double Theta ( ) const [inline]
```

Get the theta.

Definition at line 58 of file pendulum.hpp.

Referenced by Pendulum::InitialSample(), and Pendulum::Sample().

39.438.3.6 Theta() [2/2]

```
double& Theta ( ) [inline]
```

Modify the value of theta.

Definition at line 60 of file pendulum.hpp.

39.438.4 Member Data Documentation

39.438.4.1 dimension

```
constexpr size_t dimension = 2 [static]
```

Dimension of the encoded state.

Definition at line 71 of file pendulum.hpp.

39.439 QLearning< EnvironmentType, NetworkType, UpdaterType, PolicyType, ReplayType > Class Template Reference

Implementation of various Q-Learning algorithms, such as DQN, double DQN.

Public Types

- using **ActionType** = typename EnvironmentType::Action
Convenient typedef for action.
- using **StateType** = typename EnvironmentType::State
Convenient typedef for state.

Public Member Functions

- **QLearning** (**TrainingConfig** config, NetworkType network, PolicyType policy, ReplayType replayMethod, UpdaterType updater=UpdaterType(), EnvironmentType environment=EnvironmentType())
*Create the **QLearning** (p. 1885) object with given settings.*
- bool & **Deterministic** ()
Modify the training mode / test mode indicator.
- const bool & **Deterministic** () const
Get the indicator of training mode / test mode.
- EnvironmentType & **Environment** ()
Modify the environment in which the agent is.
- const EnvironmentType & **Environment** () const
Get the environment in which the agent is.
- double **Episode** ()
Execute an episode.

- `const NetworkType & Network () const`
Return the learning network.
- `NetworkType & Network ()`
Modify the learning network.
- `StateType & State ()`
Modify the state of the agent.
- `const StateType & State () const`
Get the state of the agent.
- `double Step ()`
Execute a step in an episode.
- `const size_t & TotalSteps () const`

39.439.1 Detailed Description

```
template<typename EnvironmentType, typename NetworkType, typename UpdaterType, typename PolicyType, typename ReplayType
= RandomReplay<EnvironmentType>>
class mlpack::rl::QLearning< EnvironmentType, NetworkType, UpdaterType, PolicyType, ReplayType >
```

Implementation of various Q-Learning algorithms, such as DQN, double DQN.

For more details, see the following:

```
@article{Mnih2013,
  author    = {Volodymyr Mnih and
              Koray Kavukcuoglu and

  journal   = {CoRR},
  year      = {2013},
  url       = {http://arxiv.org/abs/1312.5602}
}
```

Template Parameters

<i>EnvironmentType</i>	The environment of the reinforcement learning task.
<i>NetworkType</i>	The network to compute action value.
<i>UpdaterType</i>	How to apply gradients when training.
<i>PolicyType</i>	Behavior policy of the agent.
<i>ReplayType</i>	Experience replay method.

Definition at line 57 of file `q_learning.hpp`.

39.439.2 Member Typedef Documentation

39.439.2.1 ActionType

```
using ActionType = typename EnvironmentType::Action
```

Convenient typedef for action.

Definition at line 64 of file q_learning.hpp.

39.439.2.2 StateType

```
using StateType = typename EnvironmentType::State
```

Convenient typedef for state.

Definition at line 61 of file q_learning.hpp.

39.439.3 Constructor & Destructor Documentation

39.439.3.1 QLearning()

```
QLearning (
    TrainingConfig config,
    NetworkType network,
    PolicyType policy,
    ReplayType replayMethod,
    UpdaterType updater = UpdaterType(),
    EnvironmentType environment = EnvironmentType() )
```

Create the **QLearning** (p. 1885) object with given settings.

If you want to pass in a parameter and discard the original parameter object, be sure to use `std::move` to avoid unnecessary copy.

Parameters

<i>config</i>	Hyper-parameters for training.
<i>network</i>	The network to compute action value.
<i>policy</i>	Behavior policy of the agent.
<i>replayMethod</i>	Experience replay method.
<i>updater</i>	How to apply gradients when training.
<i>environment</i>	Reinforcement learning task.

39.439.4 Member Function Documentation

39.439.4.1 Deterministic() [1/2]

```
bool& Deterministic ( ) [inline]
```

Modify the training mode / test mode indicator.

Definition at line 114 of file q_learning.hpp.

39.439.4.2 Deterministic() [2/2]

```
const bool& Deterministic ( ) const [inline]
```

Get the indicator of training mode / test mode.

Definition at line 116 of file q_learning.hpp.

39.439.4.3 Environment() [1/2]

```
EnvironmentType& Environment ( ) [inline]
```

Modify the environment in which the agent is.

Definition at line 109 of file q_learning.hpp.

39.439.4.4 Environment() [2/2]

```
const EnvironmentType& Environment ( ) const [inline]
```

Get the environment in which the agent is.

Definition at line 111 of file q_learning.hpp.

39.439.4.5 Episode()

```
double Episode ( )
```

Execute an episode.

Returns

Return of the episode.

39.439.4.6 Network() [1/2]

```
const NetworkType& Network ( ) const [inline]
```

Return the learning network.

Definition at line 119 of file q_learning.hpp.

39.439.4.7 Network() [2/2]

```
NetworkType& Network ( ) [inline]
```

Modify the learning network.

Definition at line 121 of file q_learning.hpp.

39.439.4.8 State() [1/2]

```
StateType& State ( ) [inline]
```

Modify the state of the agent.

Definition at line 104 of file q_learning.hpp.

39.439.4.9 State() [2/2]

```
const StateType& State ( ) const [inline]
```

Get the state of the agent.

Definition at line 106 of file `q_learning.hpp`.

39.439.4.10 Step()

```
double Step ( )
```

Execute a step in an episode.

Returns

Reward for the step.

39.439.4.11 TotalSteps()

```
const size_t& TotalSteps ( ) const [inline]
```

Returns

Total steps from beginning.

Definition at line 101 of file `q_learning.hpp`.

The documentation for this class was generated from the following file:

39.440 RandomReplay< EnvironmentType > Class Template Reference

Implementation of random experience replay.

Public Types

- using **ActionType** = typename EnvironmentType::Action
Convenient typedef for action.
- using **StateType** = typename EnvironmentType::State
Convenient typedef for state.

Public Member Functions

- **RandomReplay** (const size_t batchSize, const size_t capacity, const size_t dimension=StateType::dimension)
Construct an instance of random experience replay class.
- void **Sample** (arma::mat &sampledStates, arma::icolvec &sampledActions, arma::colvec &sampledRewards, arma::mat &sampledNextStates, arma::icolvec &isTerminal)
Sample some experiences.
- const size_t & **Size** ()
Get the number of transitions in the memory.
- void **Store** (const **StateType** &state, **ActionType** action, double reward, const **StateType** &nextState, bool isEnd)
Store the given experience.

39.440.1 Detailed Description

```
template<typename EnvironmentType>
class mlpack::rl::RandomReplay< EnvironmentType >
```

Implementation of random experience replay.

At each time step, interactions between the agent and the environment will be saved to a memory buffer. When necessary, we can simply sample previous experiences from the buffer to train the agent. Typically this would be a random sample and the memory will be a First-In-First-Out buffer.

For more information, see the following.

```
@phdthesis{lin1993reinforcement,
  title = {Reinforcement learning for robots using neural networks},
  author = {Lin, Long-Ji},
  year = {1993},
  school = {Fujitsu Laboratories Ltd}
}
```

Template Parameters

<i>EnvironmentType</i>	Desired task.
------------------------	---------------

Definition at line 43 of file random_replay.hpp.

39.440.2 Member Typedef Documentation

39.440.2.1 ActionType

```
using ActionType = typename EnvironmentType::Action
```

Convenient typedef for action.

Definition at line 47 of file random_replay.hpp.

39.440.2.2 StateType

```
using StateType = typename EnvironmentType::State
```

Convenient typedef for state.

Definition at line 50 of file random_replay.hpp.

39.440.3 Constructor & Destructor Documentation

39.440.3.1 RandomReplay()

```
RandomReplay (
    const size_t batchSize,
    const size_t capacity,
    const size_t dimension = StateType::dimension ) [inline]
```

Construct an instance of random experience replay class.

Parameters

<i>batchSize</i>	Number of examples returned at each sample.
<i>capacity</i>	Total memory size in terms of number of examples.
<i>dimension</i>	The dimension of an encoded state.

Definition at line 59 of file random_replay.hpp.

39.440.4 Member Function Documentation

39.440.4.1 Sample()

```
void Sample (
    arma::mat & sampledStates,
```

```

        arma::icolvec & sampledActions,
        arma::colvec & sampledRewards,
        arma::mat & sampledNextStates,
        arma::icolvec & isTerminal ) [inline]

```

Sample some experiences.

Parameters

<i>sampledStates</i>	Sampled encoded states.
<i>sampledActions</i>	Sampled actions.
<i>sampledRewards</i>	Sampled rewards.
<i>sampledNextStates</i>	Sampled encoded next states.
<i>isTerminal</i>	Indicate whether corresponding next state is terminal state.

Definition at line 111 of file random_replay.hpp.

39.440.4.2 Size()

```
const size_t& Size ( ) [inline]
```

Get the number of transitions in the memory.

Returns

Actual used memory size

Definition at line 133 of file random_replay.hpp.

39.440.4.3 Store()

```

void Store (
    const StateType & state,
    ActionType action,
    double reward,
    const StateType & nextState,
    bool isEnd ) [inline]

```

Store the given experience.

Parameters

<i>state</i>	Given state.
<i>action</i>	Given action.
<i>reward</i>	Given reward.
<i>nextState</i>	Given next state.
<i>isEnd</i>	Whether next state is terminal state.

Definition at line 82 of file random_replay.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/reinforcement_learning/replay/ **random_replay.hpp**

39.441 **RewardClipping**< **EnvironmentType** > Class Template Reference

Interface for clipping the reward to some value between the specified maximum and minimum value (Clipping here is implemented as $g_{\text{clipped}} = \max(g_{\text{min}}, \min(g_{\text{min}}, g))$.)

Public Types

- using **Action** = typename **EnvironmentType**::Action
Convenient typedef for action.
- using **State** = typename **EnvironmentType**::State
Convenient typedef for state.

Public Member Functions

- **RewardClipping** (**EnvironmentType** &environment, const double minReward=-1.0, const double maxReward=1.0)
*Constructor for creating a **RewardClipping** (p. 1894) instance.*
- **EnvironmentType** & **Environment** () const
Get the environment.
- **EnvironmentType** & **Environment** ()
Modify the environment.
- **State** **InitialSample** ()
The InitialSample method is called by the environment to initialize the starting state.
- bool **IsTerminal** (const **State** &state) const
Checks whether given state is a terminal state.
- double **MaxReward** () const
Get the maximum reward value.
- double & **MaxReward** ()
Modify the maximum reward value.
- double **MinReward** () const
Get the minimum reward value.
- double & **MinReward** ()
Modify the minimum reward value.
- double **Sample** (const **State** &state, const **Action** &action, **State** &nextState) const
Dynamics of Environment.
- double **Sample** (const **State** &state, const **Action** &action) const
Dynamics of Environment.

39.441.1 Detailed Description

```
template<typename EnvironmentType>  
class mlpack::rl::RewardClipping< EnvironmentType >
```

Interface for clipping the reward to some value between the specified maximum and minimum value (Clipping here is implemented as $g_{\text{clipped}} = \max(g_{\text{min}}, \min(g_{\text{min}}, g))$.)

Template Parameters

<i>EnvironmentType</i>	A type of Environment that is being wrapped.
------------------------	--

Definition at line 29 of file reward_clipping.hpp.

39.441.2 Member Typedef Documentation

39.441.2.1 Action

```
using Action = typename EnvironmentType::Action
```

Convenient typedef for action.

Definition at line 36 of file reward_clipping.hpp.

39.441.2.2 State

```
using State = typename EnvironmentType::State
```

Convenient typedef for state.

Definition at line 33 of file reward_clipping.hpp.

39.441.3 Constructor & Destructor Documentation

39.441.3.1 RewardClipping()

```
RewardClipping (  
    EnvironmentType & environment,  
    const double minReward = -1.0,  
    const double maxReward = 1.0 ) [inline]
```

Constructor for creating a **RewardClipping** (p. 1894) instance.

Parameters

<i>minReward</i>	Minimum possible value of clipped reward.
<i>maxReward</i>	Maximum possible value of clipped reward.
<i>environment</i>	An instance of the environment used for actual simulations.

Definition at line 46 of file reward_clipping.hpp.

39.441.4 Member Function Documentation

39.441.4.1 Environment() [1/2]

```
EnvironmentType& Environment ( ) const [inline]
```

Get the environment.

Definition at line 112 of file reward_clipping.hpp.

39.441.4.2 Environment() [2/2]

```
EnvironmentType& Environment ( ) [inline]
```

Modify the environment.

Definition at line 114 of file reward_clipping.hpp.

39.441.4.3 InitialSample()

```
State InitialSample ( ) [inline]
```

The InitialSample method is called by the environment to initialize the starting state.

Returns whatever Initial Sample is returned by the environment.

Definition at line 61 of file reward_clipping.hpp.

39.441.4.4 IsTerminal()

```
bool IsTerminal (
    const State & state ) const [inline]
```

Checks whether given state is a terminal state.

Returns the value by calling the environment method.

Parameters

<i>state</i>	desired state.
--------------	----------------

Returns

true if state is a terminal state, otherwise false.

Definition at line 73 of file reward_clipping.hpp.

39.441.4.5 MaxReward() [1/2]

```
double MaxReward ( ) const [inline]
```

Get the maximum reward value.

Definition at line 122 of file reward_clipping.hpp.

39.441.4.6 MaxReward() [2/2]

```
double& MaxReward ( ) [inline]
```

Modify the maximum reward value.

Definition at line 124 of file reward_clipping.hpp.

39.441.4.7 MinReward() [1/2]

```
double MinReward ( ) const [inline]
```

Get the minimum reward value.

Definition at line 117 of file reward_clipping.hpp.

39.441.4.8 MinReward() [2/2]

```
double& MinReward ( ) [inline]
```

Modify the minimum reward value.

Definition at line 119 of file reward_clipping.hpp.

39.441.4.9 Sample() [1/2]

```
double Sample (
    const State & state,
    const Action & action,
    State & nextState ) const [inline]
```

Dynamics of Environment.

The rewards returned from the base environment are clipped according the maximum and minimum values specified.

Parameters

<i>state</i>	The current state.
<i>action</i>	The current action.
<i>nextState</i>	The next state.

Returns

clippedReward, Reward clipped between [minReward, maxReward].

Definition at line 87 of file reward_clipping.hpp.

Referenced by RewardClipping< EnvironmentType >::Sample().

39.441.4.10 Sample() [2/2]

```
double Sample (
    const State & state,
    const Action & action ) const [inline]
```

Dynamics of Environment.

The rewards returned from the base environment are clipped according the maximum and minimum values specified.

Parameters

<i>state</i>	The current state.
<i>action</i>	The current action.

Returns

clippedReward, Reward clipped between [minReward, maxReward].

Definition at line 105 of file reward_clipping.hpp.

References RewardClipping< EnvironmentType >::Sample().

39.442 TrainingConfig Class Reference

Public Member Functions

- **TrainingConfig** ()
- **TrainingConfig** (size_t numWorkers, size_t updateInterval, size_t targetNetworkSyncInterval, size_t stepLimit, size_t explorationSteps, double stepSize, double discount, double gradientLimit, bool doubleQLearning)
- double **Discount** () const
Get the discount rate for future reward.
- double & **Discount** ()
Modify the discount rate for future reward.
- bool **DoubleQLearning** () const
Get the indicator of double q-learning.
- bool & **DoubleQLearning** ()
Modify the indicator of double q-learning.
- size_t **ExplorationSteps** () const
Get the exploration steps.
- size_t & **ExplorationSteps** ()
Modify the exploration steps.
- double **GradientLimit** () const
Get the limit of update gradient.
- double & **GradientLimit** ()
Modify the limit of update gradient.
- size_t **NumWorkers** () const
Get the amount of workers.
- size_t & **NumWorkers** ()
Modify the amount of workers.
- size_t **StepLimit** () const
Get the maximum steps of each episode.
- size_t & **StepLimit** ()
Modify the maximum steps of each episode.
- double **StepSize** () const
Get the step size of the optimizer.
- double & **StepSize** ()
Modify the step size of the optimizer.
- size_t **TargetNetworkSyncInterval** () const
Get the interval for syncing target network.
- size_t & **TargetNetworkSyncInterval** ()
Modify the interval for syncing target network.
- size_t **UpdateInterval** () const
Get the update interval.
- size_t & **UpdateInterval** ()
Modify the update interval.

39.442.1 Detailed Description

Definition at line 19 of file training_config.hpp.

39.442.2 Constructor & Destructor Documentation

39.442.2.1 TrainingConfig() [1/2]

```
TrainingConfig ( ) [inline]
```

Definition at line 22 of file training_config.hpp.

39.442.2.2 TrainingConfig() [2/2]

```
TrainingConfig (
    size_t numWorkers,
    size_t updateInterval,
    size_t targetNetworkSyncInterval,
    size_t stepLimit,
    size_t explorationSteps,
    double stepSize,
    double discount,
    double gradientLimit,
    bool doubleQLearning ) [inline]
```

Definition at line 31 of file training_config.hpp.

39.442.3 Member Function Documentation

39.442.3.1 Discount() [1/2]

```
double Discount ( ) const [inline]
```

Get the discount rate for future reward.

Definition at line 87 of file training_config.hpp.

Referenced by NStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step(), OneStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step(), and OneStepSarsaWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step().

39.442.3.2 Discount() [2/2]

```
double& Discount ( ) [inline]
```

Modify the discount rate for future reward.

Definition at line 89 of file training_config.hpp.

39.442.3.3 DoubleQLearning() [1/2]

```
bool DoubleQLearning ( ) const [inline]
```

Get the indicator of double q-learning.

Definition at line 97 of file training_config.hpp.

39.442.3.4 DoubleQLearning() [2/2]

```
bool& DoubleQLearning ( ) [inline]
```

Modify the indicator of double q-learning.

Definition at line 99 of file training_config.hpp.

39.442.3.5 ExplorationSteps() [1/2]

```
size_t ExplorationSteps ( ) const [inline]
```

Get the exploration steps.

Definition at line 77 of file training_config.hpp.

39.442.3.6 ExplorationSteps() [2/2]

```
size_t& ExplorationSteps ( ) [inline]
```

Modify the exploration steps.

Definition at line 79 of file training_config.hpp.

39.442.3.7 GradientLimit() [1/2]

```
double GradientLimit ( ) const [inline]
```

Get the limit of update gradient.

Definition at line 92 of file training_config.hpp.

Referenced by `NStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step()`, `OneStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step()`, and `OneStepSarsaWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step()`.

39.442.3.8 GradientLimit() [2/2]

```
double& GradientLimit ( ) [inline]
```

Modify the limit of update gradient.

Definition at line 94 of file training_config.hpp.

39.442.3.9 NumWorkers() [1/2]

```
size_t NumWorkers ( ) const [inline]
```

Get the amount of workers.

Definition at line 53 of file training_config.hpp.

39.442.3.10 NumWorkers() [2/2]

```
size_t& NumWorkers ( ) [inline]
```

Modify the amount of workers.

Definition at line 55 of file training_config.hpp.

39.442.3.11 StepLimit() [1/2]

```
size_t StepLimit ( ) const [inline]
```

Get the maximum steps of each episode.

Definition at line 69 of file training_config.hpp.

Referenced by NStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step(), OneStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step(), and OneStepSarsaWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step().

39.442.3.12 StepLimit() [2/2]

```
size_t& StepLimit ( ) [inline]
```

Modify the maximum steps of each episode.

Setting it to 0 means no limit.

Definition at line 74 of file training_config.hpp.

39.442.3.13 StepSize() [1/2]

```
double StepSize ( ) const [inline]
```

Get the step size of the optimizer.

Definition at line 82 of file training_config.hpp.

Referenced by NStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step(), OneStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step(), and OneStepSarsaWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step().

39.442.3.14 StepSize() [2/2]

```
double& StepSize ( ) [inline]
```

Modify the step size of the optimizer.

Definition at line 84 of file training_config.hpp.

39.442.3.15 TargetNetworkSyncInterval() [1/2]

```
size_t TargetNetworkSyncInterval ( ) const [inline]
```

Get the interval for syncing target network.

Definition at line 63 of file training_config.hpp.

Referenced by NStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step(), OneStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step(), and OneStepSarsaWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step().

39.442.3.16 TargetNetworkSyncInterval() [2/2]

```
size_t& TargetNetworkSyncInterval ( ) [inline]
```

Modify the interval for syncing target network.

Definition at line 66 of file training_config.hpp.

39.442.3.17 UpdateInterval() [1/2]

```
size_t UpdateInterval ( ) const [inline]
```

Get the update interval.

Definition at line 58 of file training_config.hpp.

Referenced by NStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step(), OneStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step(), and OneStepSarsaWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >::Step().

39.442.3.18 UpdateInterval() [2/2]

```
size_t& UpdateInterval ( ) [inline]
```

Modify the update interval.

Definition at line 60 of file training_config.hpp.

39.453 DataDependentRandomInitializer Class Reference

A data-dependent random dictionary initializer for **SparseCoding** (p. 1916).

Static Public Member Functions

- static void **Initialize** (const arma::mat &data, const size_t atoms, arma::mat &dictionary)
Initialize the dictionary by adding together three random observations from the data, and then normalizing the atom.

39.453.1 Detailed Description

A data-dependent random dictionary initializer for **SparseCoding** (p. 1916).

This creates random dictionary atoms by adding three random observations from the data together, and then normalizing the atom.

Definition at line 26 of file data_dependent_random_initializer.hpp.

39.453.2 Member Function Documentation

39.453.2.1 Initialize()

```
static void Initialize (
    const arma::mat & data,
    const size_t atoms,
    arma::mat & dictionary ) [inline], [static]
```

Initialize the dictionary by adding together three random observations from the data, and then normalizing the atom.

This implementation is simple enough to be included with the definition.

Parameters

<i>data</i>	Dataset to initialize the dictionary with.
<i>atoms</i>	Number of atoms in dictionary.
<i>dictionary</i>	Dictionary to initialize.

Definition at line 38 of file `data_dependent_random_initializer.hpp`.

References `mlpack::math::RandInt()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/sparse_coding/data_dependent_random_initializer.hpp` 

39.454 NothingInitializer Class Reference

A DictionaryInitializer for **SparseCoding** (p. 1916) which does not initialize anything; it is useful for when the dictionary is already known and will be set with **SparseCoding::Dictionary()** (p. 1920).

Static Public Member Functions

- static void **Initialize** (const arma::mat &, const size_t, arma::mat &)
This function does not initialize the dictionary.

39.454.1 Detailed Description

A DictionaryInitializer for **SparseCoding** (p. 1916) which does not initialize anything; it is useful for when the dictionary is already known and will be set with **SparseCoding::Dictionary()** (p. 1920).

Definition at line 27 of file `nothing_initializer.hpp`.

39.454.2 Member Function Documentation

39.454.2.1 Initialize()

```
static void Initialize (
    const arma::mat & ,
    const size_t ,
    arma::mat & ) [inline], [static]
```

This function does not initialize the dictionary.

This will cause problems for **SparseCoding** (p. 1916) if the dictionary is not set manually before running the method.

Definition at line 35 of file `nothing_initializer.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/sparse_coding/ nothing_initializer.hpp`

39.455 RandomInitializer Class Reference

A DictionaryInitializer for use with the **SparseCoding** (p. 1916) class.

Static Public Member Functions

- static void **Initialize** (const arma::mat &data, const size_t atoms, arma::mat &dictionary)
Initialize the dictionary randomly from a normal distribution, such that each atom has a norm of 1.

39.455.1 Detailed Description

A DictionaryInitializer for use with the **SparseCoding** (p. 1916) class.

This provides a random, normally distributed dictionary, such that each atom has a norm of 1.

Definition at line 25 of file `random_initializer.hpp`.

39.455.2 Member Function Documentation

39.455.2.1 Initialize()

```
static void Initialize (
    const arma::mat & data,
    const size_t atoms,
    arma::mat & dictionary ) [inline], [static]
```

Initialize the dictionary randomly from a normal distribution, such that each atom has a norm of 1.

This is simple enough to be included with the definition.

Parameters

<i>data</i>	Dataset to use for initialization.
<i>atoms</i>	Number of atoms (columns) in the dictionary.
<i>dictionary</i>	Dictionary to initialize.

Definition at line 37 of file random_initializer.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/sparse_coding/ **random_initializer.hpp**

39.456 SparseCoding Class Reference

An implementation of Sparse Coding with Dictionary Learning that achieves sparsity via an l_1 -norm regularizer on the codes (LASSO) or an (l_1+l_2) -norm regularizer on the codes (the Elastic Net).

Public Member Functions

- `template<typename DictionaryInitializer = DataDependentRandomInitializer>`
SparseCoding (const arma::mat &data, const size_t atoms, const double lambda1, const double lambda2=0, const size_t maxIterations=0, const double objTolerance=0.01, const double newtonTolerance=1e-6, const DictionaryInitializer &initializer=DictionaryInitializer())
*Set the parameters to **SparseCoding** (p. 1916).*
- **SparseCoding** (const size_t atoms=0, const double lambda1=0, const double lambda2=0, const size_t maxIterations=0, const double objTolerance=0.01, const double newtonTolerance=1e-6)
*Set the parameters to **SparseCoding** (p. 1916).*
- size_t **Atoms** () const
Access the number of atoms.
- size_t & **Atoms** ()
Modify the number of atoms.
- const arma::mat & **Dictionary** () const
Access the dictionary.
- arma::mat & **Dictionary** ()
Modify the dictionary.
- void **Encode** (const arma::mat &data, arma::mat &codes)
Sparse code each point in the given dataset via LARS, using the current dictionary and store the encoded data in the codes matrix.
- double **Lambda1** () const
Access the L_1 regularization term.
- double & **Lambda1** ()
Modify the L_1 regularization term.
- double **Lambda2** () const
Access the L_2 regularization term.
- double & **Lambda2** ()

- Modify the L2 regularization term.
 - `size_t MaxIterations () const`
 Get the maximum number of iterations.
 - `size_t & MaxIterations ()`
 Modify the maximum number of iterations.
 - `double NewtonTolerance () const`
 Get the tolerance for Newton's method (dictionary optimization step).
 - `double & NewtonTolerance ()`
 Modify the tolerance for Newton's method (dictionary optimization step).
 - `double Objective (const arma::mat &data, const arma::mat &codes) const`
 Compute the objective function.
 - `double ObjTolerance () const`
 Get the objective tolerance.
 - `double & ObjTolerance ()`
 Modify the objective tolerance.
 - `double OptimizeDictionary (const arma::mat &data, const arma::mat &codes, const arma::uvec &adjacencies)`
 Learn dictionary via Newton method based on Lagrange dual.
 - `void ProjectDictionary ()`
 Project each atom of the dictionary back onto the unit ball, if necessary.
 - `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
 Serialize the sparse coding model.
 - `template<typename DictionaryInitializer = DataDependentRandomInitializer>`
`double Train (const arma::mat &data, const DictionaryInitializer &initializer=DictionaryInitializer())`
 Train the sparse coding model on the given dataset.

39.456.1 Detailed Description

An implementation of Sparse Coding with Dictionary Learning that achieves sparsity via an l1-norm regularizer on the codes (LASSO) or an (l1+l2)-norm regularizer on the codes (the Elastic Net).

Let d be the number of dimensions in the original space, m the number of training points, and k the number of atoms in the dictionary (the dimension of the learned feature space). The training data X is a d -by- m matrix where each column is a point and each row is a dimension. The dictionary D is a d -by- k matrix, and the sparse codes matrix Z is a k -by- m matrix. This program seeks to minimize the objective:

$$\min_{D,Z} 0.5 \|X - DZ\|_F^2 + \lambda_1 \sum_{i=1}^m \|Z_i\|_1 + 0.5 \lambda_2 \sum_{i=1}^m \|Z_i\|_2^2$$

subject to $\|D_j\|_2 \leq 1$ for $1 \leq j \leq k$ where typically $\lambda_1 > 0$ and $\lambda_2 = 0$.

This problem is solved by an algorithm that alternates between a dictionary learning step and a sparse coding step. The dictionary learning step updates the dictionary D using a Newton method based on the Lagrange dual (see the paper below for details). The sparse coding step involves solving a large number of sparse linear regression problems; this can be done efficiently using LARS, an algorithm that can solve the LASSO or the Elastic Net (papers below).

Here are those papers:

```

@incollection{lee2007efficient,
  title = {Efficient sparse coding algorithms},
  author = {Honglak Lee and Alexis Battle and Rajat Raina and Andrew Y. Ng},
  booktitle = {Advances in Neural Information Processing Systems 19},
  editor = {B. Schölkopf and J. Platt and T. Hoffman},
  publisher = {MIT Press},
  address = {Cambridge, MA},
  pages = {801--808},
  year = {2007}
}

@article{efron2004least,
  title={Least angle regression},
  author={Efron, B. and Hastie, T. and Johnstone, I. and Tibshirani, R.},
  journal={The Annals of Statistics},
  volume={32},
  number={2},
  pages={407--499},
  year={2004},
  publisher={Institute of Mathematical Statistics}
}

@article{zou2005regularization,
  title={Regularization and variable selection via the elastic net},
  author={Zou, H. and Hastie, T.},
  journal={Journal of the Royal Statistical Society Series B},
  volume={67},
  number={2},
  pages={301--320},
  year={2005},
  publisher={Royal Statistical Society}
}

```

Note that the implementation here does not use the feature-sign search algorithm from Honglak Lee's paper, but instead the LARS algorithm suggested in that paper.

When **Train()** (p. 1924) is called, the dictionary is initialized using the `DictionaryInitializationPolicy` class. Possible choices include the **RandomInitializer** (p. 1915), which provides an entirely random dictionary, the **DataDependentRandomInitializer** (p. 1913), which provides a random dictionary based loosely on characteristics of the dataset, and the **NothingInitializer** (p. 1914), which does not initialize the dictionary – instead, the user should set the dictionary using the **Dictionary()** (p. 1920) mutator method.

Once a dictionary is trained with **Train()** (p. 1924), another matrix may be encoded with the **Encode()** (p. 1921) function.

Template Parameters

<i>DictionaryInitializationPolicy</i>	The class to use to initialize the dictionary; must have 'void Initialize(const arma::mat& data, arma::mat& dictionary)' function.
---------------------------------------	--

Definition at line 115 of file `sparse_coding.hpp`.

39.456.2 Constructor & Destructor Documentation

39.456.2.1 SparseCoding() [1/2]

```

SparseCoding (
    const arma::mat & data,
    const size_t atoms,
    const double lambda1,
    const double lambda2 = 0,
    const size_t maxIterations = 0,
    const double objTolerance = 0.01,
    const double newtonTolerance = 1e-6,
    const DictionaryInitializer & initializer = DictionaryInitializer() )

```

Set the parameters to **SparseCoding** (p. 1916).

lambda2 defaults to 0. This constructor will train the model. If that is not desired, call the other constructor that does not take a data matrix. This constructor will also initialize the dictionary using the given DictionaryInitializer before training.

If you want to initialize the dictionary to a custom matrix, consider either writing your own DictionaryInitializer class (with void Initialize(const arma::mat& data, arma::mat& dictionary) function), or call the constructor that does not take a data matrix, then call **Dictionary()** (p. 1920) to set the dictionary matrix to a matrix of your choosing, and then call **Train()** (p. 1924) with **NothingInitializer** (p. 1914) (i.e. Train<NothingInitializer>(data)).

Parameters

<i>data</i>	Data matrix.
<i>atoms</i>	Number of atoms in dictionary.
<i>lambda1</i>	Regularization parameter for l1-norm penalty.
<i>lambda2</i>	Regularization parameter for l2-norm penalty.
<i>maxIterations</i>	Maximum number of iterations to run algorithm. If 0, the algorithm will run until convergence (or forever).
<i>objTolerance</i>	Tolerance for objective function. When an iteration of the algorithm produces an improvement smaller than this, the algorithm will terminate.
<i>newtonTolerance</i>	Tolerance for the Newton's method dictionary optimization step.

39.456.2.2 SparseCoding() [2/2]

```

SparseCoding (
    const size_t atoms = 0,
    const double lambda1 = 0,
    const double lambda2 = 0,
    const size_t maxIterations = 0,
    const double objTolerance = 0.01,
    const double newtonTolerance = 1e-6 )

```

Set the parameters to **SparseCoding** (p. 1916).

lambda2 defaults to 0. This constructor will not train the model, and a subsequent call to **Train()** (p. 1924) will be required before the model can encode points with **Encode()** (p. 1921).

Parameters

<i>atoms</i>	Number of atoms in dictionary.
<i>lambda1</i>	Regularization parameter for l1-norm penalty.
<i>lambda2</i>	Regularization parameter for l2-norm penalty.
<i>maxIterations</i>	Maximum number of iterations to run algorithm. If 0, the algorithm will run until convergence (or forever).
<i>objTolerance</i>	Tolerance for objective function. When an iteration of the algorithm produces an improvement smaller than this, the algorithm will terminate.
<i>newtonTolerance</i>	Tolerance for the Newton's method dictionary optimization step.

39.456.3 Member Function Documentation

39.456.3.1 Atoms() [1/2]

```
size_t Atoms ( ) const [inline]
```

Access the number of atoms.

Definition at line 227 of file sparse_coding.hpp.

39.456.3.2 Atoms() [2/2]

```
size_t& Atoms ( ) [inline]
```

Modify the number of atoms.

Definition at line 229 of file sparse_coding.hpp.

39.456.3.3 Dictionary() [1/2]

```
const arma::mat& Dictionary ( ) const [inline]
```

Access the dictionary.

Definition at line 222 of file sparse_coding.hpp.

39.456.3.4 Dictionary() [2/2]

```
arma::mat& Dictionary ( ) [inline]
```

Modify the dictionary.

Definition at line 224 of file `sparse_coding.hpp`.

39.456.3.5 Encode()

```
void Encode (
    const arma::mat & data,
    arma::mat & codes )
```

Sparse code each point in the given dataset via LARS, using the current dictionary and store the encoded data in the codes matrix.

Parameters

<i>data</i>	Input data matrix to be encoded.
<i>codes</i>	Output codes matrix.

39.456.3.6 Lambda1() [1/2]

```
double Lambda1 ( ) const [inline]
```

Access the L1 regularization term.

Definition at line 232 of file `sparse_coding.hpp`.

39.456.3.7 Lambda1() [2/2]

```
double& Lambda1 ( ) [inline]
```

Modify the L1 regularization term.

Definition at line 234 of file `sparse_coding.hpp`.

39.456.3.8 Lambda2() [1/2]

```
double Lambda2 ( ) const [inline]
```

Access the L2 regularization term.

Definition at line 237 of file sparse_coding.hpp.

39.456.3.9 Lambda2() [2/2]

```
double& Lambda2 ( ) [inline]
```

Modify the L2 regularization term.

Definition at line 239 of file sparse_coding.hpp.

39.456.3.10 MaxIterations() [1/2]

```
size_t MaxIterations ( ) const [inline]
```

Get the maximum number of iterations.

Definition at line 242 of file sparse_coding.hpp.

39.456.3.11 MaxIterations() [2/2]

```
size_t& MaxIterations ( ) [inline]
```

Modify the maximum number of iterations.

Definition at line 244 of file sparse_coding.hpp.

39.456.3.12 NewtonTolerance() [1/2]

```
double NewtonTolerance ( ) const [inline]
```

Get the tolerance for Newton's method (dictionary optimization step).

Definition at line 252 of file sparse_coding.hpp.

39.456.3.13 NewtonTolerance() [2/2]

```
double& NewtonTolerance ( ) [inline]
```

Modify the tolerance for Newton's method (dictionary optimization step).

Definition at line 254 of file `sparse_coding.hpp`.

References `SparseCoding::serialize()`.

39.456.3.14 Objective()

```
double Objective (
    const arma::mat & data,
    const arma::mat & codes ) const
```

Compute the objective function.

39.456.3.15 ObjTolerance() [1/2]

```
double ObjTolerance ( ) const [inline]
```

Get the objective tolerance.

Definition at line 247 of file `sparse_coding.hpp`.

39.456.3.16 ObjTolerance() [2/2]

```
double& ObjTolerance ( ) [inline]
```

Modify the objective tolerance.

Definition at line 249 of file `sparse_coding.hpp`.

39.456.3.17 OptimizeDictionary()

```
double OptimizeDictionary (
    const arma::mat & data,
    const arma::mat & codes,
    const arma::uvec & adjacencies )
```

Learn dictionary via Newton method based on Lagrange dual.

Parameters

<i>data</i>	Data matrix.
<i>codes</i>	Matrix of codes.
<i>adjacencies</i>	Indices of entries (unrolled column by column) of the coding matrix Z that are non-zero (the adjacency matrix for the bipartite graph of points and atoms).

Returns

the norm of the gradient of the Lagrange dual with respect to the dual variables

39.456.3.18 ProjectDictionary()

```
void ProjectDictionary ( )
```

Project each atom of the dictionary back onto the unit ball, if necessary.

39.456.3.19 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the sparse coding model.

Referenced by SparseCoding::NewtonTolerance().

39.456.3.20 Train()

```
double Train (
    const arma::mat & data,
    const DictionaryInitializer & initializer = DictionaryInitializer() )
```

Train the sparse coding model on the given dataset.

Returns

The final objective value.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/sparse_coding/ **sparse_coding.hpp**

39.457 BiasSVD< OptimizerType > Class Template Reference

Bias SVD is an improvement on Regularized SVD which is a matrix factorization techniques.

Public Member Functions

- **BiasSVD** (const size_t iterations=10, const double alpha=0.02, const double lambda=0.05)
Constructor of Bias SVD.
- void **Apply** (const arma::mat &data, const size_t rank, arma::mat &u, arma::mat &v, arma::vec &p, arma::vec &q)
Trains the model and obtains user/item matrices and user/item bias.

39.457.1 Detailed Description

```
template<typename OptimizerType = ens::StandardSGD>
class mlpack::svd::BiasSVD< OptimizerType >
```

Bias SVD is an improvement on Regularized SVD which is a matrix factorization techniques.

Bias SVD outputs user/item latent vectors and user/item bias, so that $r_{iu} = b_i + b_u + p_i * q_u$, where b, p, q are bias, item latent, user latent respectively. Parameters are optimized by Stochastic Gradient Descent (SGD). The updates also penalize the learning of large feature values by means of regularization.

An example of how to use the interface is shown below:

```
arma::mat data; // Rating data in the form of coordinate list.

const size_t rank = 10; // Rank used for the decomposition.
const size_t iterations = 10; // Number of iterations used for optimization.

const double alpha = 0.005 // Learning rate for the SGD optimizer.
const double lambda = 0.02 // Regularization parameter for the optimization.

// Make a BiasSVD object.
BiasSVD<> biasSVD(iterations, alpha, lambda);

arma::mat u, v; // Item and User matrices.
arma::vec p, q; // Item and User bias.

// Use the Apply() method to get a factorization.
rSVD.Apply(data, rank, u, v, p, q);
```

Definition at line 57 of file bias_svd.hpp.

39.457.2 Constructor & Destructor Documentation

39.457.2.1 BiasSVD()

```
BiasSVD (
    const size_t iterations = 10,
    const double alpha = 0.02,
    const double lambda = 0.05 )
```

Constructor of Bias SVD.

By default SGD optimizer is used in **BiasSVD** (p. 1925). The optimizer uses a template specialization of Optimize().

Parameters

<i>iterations</i>	Number of optimization iterations.
<i>alpha</i>	Learning rate for the SGD optimizer.
<i>lambda</i>	Regularization parameter for the optimization.

39.457.3 Member Function Documentation

39.457.3.1 Apply()

```
void Apply (
    const arma::mat & data,
    const size_t rank,
    arma::mat & u,
    arma::mat & v,
    arma::vec & p,
    arma::vec & q )
```

Trains the model and obtains user/item matrices and user/item bias.

Parameters

<i>data</i>	Rating data matrix.
<i>rank</i>	Rank parameter to be used for optimization.
<i>u</i>	Item matrix obtained on decomposition.
<i>v</i>	User matrix obtained on decomposition.
<i>p</i>	Item bias.
<i>q</i>	User bias.

Referenced by BiasSVDPolicy::Apply().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/bias_svd/ **bias_svd.hpp**

39.458 BiasSVDFunction< MatType > Class Template Reference

This class contains methods which are used to calculate the cost of **BiasSVD** (p. 1925)'s objective function, to calculate gradient of parameters with respect to the objective function, etc.

Public Member Functions

- **BiasSVDFunction** (const MatType &data, const size_t rank, const double lambda)
*Constructor for **BiasSVDFunction** (p. 1926) class.*
- const arma::mat & **Dataset** () const
Return the dataset passed into the constructor.
- double **Evaluate** (const arma::mat ¶meters) const
Evaluates the cost function over all examples in the data.
- double **Evaluate** (const arma::mat ¶meters, const size_t start, const size_t batchSize=1) const
Evaluates the cost function for one training example.
- const arma::mat & **GetInitialPoint** () const
Return the initial point for the optimization.
- void **Gradient** (const arma::mat ¶meters, arma::mat &gradient) const
Evaluates the full gradient of the cost function over all the training examples.
- template<typename GradType >
void **Gradient** (const arma::mat ¶meters, const size_t start, GradType &gradient, const size_t batchSize=1) const
Evaluates the gradient of the cost function over one training example.
- double **Lambda** () const
Return the regularization parameters.
- size_t **NumFunctions** () const
Return the number of training examples. Useful for SGD optimizer.
- size_t **NumItems** () const
Return the number of items in the data.
- size_t **NumUsers** () const
Return the number of users in the data.
- size_t **Rank** () const
Return the rank used for the factorization.
- void **Shuffle** ()
Shuffle the points in the dataset.

39.458.1 Detailed Description

```
template<typename MatType = arma::mat>
class mlpack::svd::BiasSVDFunction< MatType >
```

This class contains methods which are used to calculate the cost of **BiasSVD** (p. 1925)'s objective function, to calculate gradient of parameters with respect to the objective function, etc.

Template Parameters

<i>MatType</i>	The matrix type of the dataset.
----------------	---------------------------------

Definition at line 31 of file bias_svd_function.hpp.

39.458.2 Constructor & Destructor Documentation

39.458.2.1 BiasSVDFunction()

```
BiasSVDFunction (
    const MatType & data,
    const size_t rank,
    const double lambda )
```

Constructor for **BiasSVDFunction** (p. 1926) class.

The constructor calculates the number of users and items in the passed data. It also randomly initializes the parameter values.

Parameters

<i>data</i>	Dataset for which SVD is calculated.
<i>rank</i>	Rank used for matrix factorization.
<i>lambda</i>	Regularization parameter used for optimization.

39.458.3 Member Function Documentation

39.458.3.1 Dataset()

```
const arma::mat& Dataset ( ) const [inline]
```

Return the dataset passed into the constructor.

Definition at line 107 of file `bias_svd_function.hpp`.

39.458.3.2 Evaluate() [1/2]

```
double Evaluate (
    const arma::mat & parameters ) const
```

Evaluates the cost function over all examples in the data.

Parameters

<i>parameters</i>	Parameters(user/item matrices/bias) of the decomposition.
-------------------	---

39.458.3.3 Evaluate() [2/2]

```
double Evaluate (
    const arma::mat & parameters,
    const size_t start,
    const size_t batchSize = 1 ) const
```

Evaluates the cost function for one training example.

Useful for the SGD optimizer abstraction which uses one training example at a time.

Parameters

<i>parameters</i>	Parameters(user/item matrices/bias) of the decomposition.
<i>start</i>	First index of the training examples to be used.
<i>batchSize</i>	Size of batch to evaluate.

39.458.3.4 GetInitialPoint()

```
const arma::mat& GetInitialPoint ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 104 of file bias_svd_function.hpp.

39.458.3.5 Gradient() [1/2]

```
void Gradient (
    const arma::mat & parameters,
    arma::mat & gradient ) const
```

Evaluates the full gradient of the cost function over all the training examples.

Parameters

<i>parameters</i>	Parameters(user/item matrices/bias) of the decomposition.
<i>gradient</i>	Calculated gradient for the parameters.

39.458.3.6 Gradient() [2/2]

```
void Gradient (
    const arma::mat & parameters,
    const size_t start,
    GradType & gradient,
    const size_t batchSize = 1 ) const
```

Evaluates the gradient of the cost function over one training example.

This function is useful for optimizers like SGD. The type of the gradient parameter is a template argument to allow the computation of a sparse gradient.

Template Parameters

<i>GradType</i>	The type of the gradient out-param.
-----------------	-------------------------------------

Parameters

<i>parameters</i>	Parameters(user/item matrices/bias) of the decomposition.
<i>start</i>	The first index of the training examples to use.
<i>gradient</i>	Calculated gradient for the parameters.
<i>batchSize</i>	Size of batch to calculate gradient for.

39.458.3.7 Lambda()

```
double Lambda ( ) const [inline]
```

Return the regularization parameters.

Definition at line 119 of file bias_svd_function.hpp.

39.458.3.8 NumFunctions()

```
size_t NumFunctions ( ) const [inline]
```

Return the number of training examples. Useful for SGD optimizer.

Definition at line 110 of file `bias_svd_function.hpp`.

39.458.3.9 NumItems()

```
size_t NumItems ( ) const [inline]
```

Return the number of items in the data.

Definition at line 116 of file `bias_svd_function.hpp`.

39.458.3.10 NumUsers()

```
size_t NumUsers ( ) const [inline]
```

Return the number of users in the data.

Definition at line 113 of file `bias_svd_function.hpp`.

39.458.3.11 Rank()

```
size_t Rank ( ) const [inline]
```

Return the rank used for the factorization.

Definition at line 122 of file `bias_svd_function.hpp`.

39.458.3.12 Shuffle()

```
void Shuffle ( )
```

Shuffle the points in the dataset.

This may be used by optimizers.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/bias_svd/ bias_svd_function.hpp`

39.459 QUIC_SVD Class Reference

QUIC-SVD is a matrix factorization technique, which operates in a subspace such that A's approximation in that subspace has minimum error(A being the data matrix).

Public Member Functions

- **QUIC_SVD** (const arma::mat &dataset, arma::mat &u, arma::mat &v, arma::mat &sigma, const double epsilon=0.03, const double delta=0.1)

Constructor which implements the QUIC-SVD algorithm.

- void **ExtractSVD** (arma::mat &u, arma::mat &v, arma::mat &sigma)

This function uses the vector subspace created using a cosine tree to calculate an approximate SVD of the original matrix.

39.459.1 Detailed Description

QUIC-SVD is a matrix factorization technique, which operates in a subspace such that A's approximation in that subspace has minimum error(A being the data matrix).

The subspace is constructed using a cosine tree, which ensures minimum representative rank(and thus a fast running time). It follows a splitting policy based on Length-squared(LS) sampling and constructs the child nodes based on the absolute cosines of the remaining points relative to the pivot. The centroids of the points in the child nodes are added to the subspace span in each step. Each node is then placed into a queue prioritized by its residual error. The subspace approximation error of A after each step is calculated using a Monte Carlo estimate. If the error is below a certain threshold, the method proceeds to calculate the Singular Value Decomposition in the obtained subspace. Otherwise, the same procedure is repeated until we obtain a subspace of sufficiently low error. Technical details can be found in the following paper:

<http://www.cc.gatech.edu/~isbell/papers/isbell-quicsvd-nips-2008.pdf>

An example of how to use the interface is shown below:

```
arma::mat data; // Data matrix.

const double epsilon = 0.01; // Relative error limit of data in subspace.
const double delta = 0.1 // Lower error bound for Monte Carlo estimate.

arma::mat u, v, sigma; // Matrices for the factors. data = u * sigma * v.t()

// Get the factorization in the constructor.
QUIC_SVD(data, u, v, sigma, epsilon, delta);
```

Definition at line 53 of file quic_svd.hpp.

39.459.2 Constructor & Destructor Documentation

39.459.2.1 QUIC_SVD()

```

QUIC_SVD (
    const arma::mat & dataset,
    arma::mat & u,
    arma::mat & v,
    arma::mat & sigma,
    const double epsilon = 0.03,
    const double delta = 0.1 )

```

Constructor which implements the QUIC-SVD algorithm.

The function calls the CosineTree constructor to create a subspace basis, where the original matrix's projection has minimum reconstruction error. The constructor then uses the **ExtractSVD()** (p. 1933) function to calculate the SVD of the original dataset in that subspace.

Parameters

<i>dataset</i>	Matrix for which SVD is calculated.
<i>u</i>	First unitary matrix.
<i>v</i>	Second unitary matrix.
<i>sigma</i>	Diagonal matrix of singular values.
<i>epsilon</i>	Error tolerance fraction for calculated subspace.
<i>delta</i>	Cumulative probability for Monte Carlo error lower bound.

39.459.3 Member Function Documentation

39.459.3.1 ExtractSVD()

```

void ExtractSVD (
    arma::mat & u,
    arma::mat & v,
    arma::mat & sigma )

```

This function uses the vector subspace created using a cosine tree to calculate an approximate SVD of the original matrix.

Parameters

<i>u</i>	First unitary matrix.
<i>v</i>	Second unitary matrix.
<i>sigma</i>	Diagonal matrix of singular values.

  pages     = {1396--1404},
  year      = {2015},
}
```

An example of how to use the interface is shown below:

```
arma::mat data; // Rating data in the form of coordinate list.

const size_t rank = 20; // Rank used for the decomposition.

// Make a RandomizedBlockKrylovSVD object.
RandomizedBlockKrylovSVD bSVD();

arma::mat u, s, v;

// Use the Apply() method to get a factorization.
bSVD.Apply(data, u, s, v, rank);
```

Definition at line 58 of file randomized_block_krylov_svd.hpp.

39.460.2 Constructor & Destructor Documentation

39.460.2.1 RandomizedBlockKrylovSVD() [1/2]

```
RandomizedBlockKrylovSVD (
    const arma::mat & data,
    arma::mat & u,
    arma::vec & s,
    arma::mat & v,
    const size_t maxIterations = 2,
    const size_t rank = 0,
    const size_t blockSize = 0 )
```

Create object for the randomized block krylov SVD method.

Parameters

<i>data</i>	Data matrix.
<i>u</i>	First unitary matrix.
<i>v</i>	Second unitary matrix.
<i>s</i>	Diagonal matrix of singular values.
<i>maxIterations</i>	Number of iterations for the power method (Default: 2).
<i>rank</i>	Rank of the approximation (Default: number of rows.)
<i>blockSize</i>	The block size, must be \geq rank (Default: rank + 10).

39.460.2.2 RandomizedBlockKrylovSVD() [2/2]

```
RandomizedBlockKrylovSVD (
    const size_t maxIterations = 2,
    const size_t blockSize = 0 )
```

Create object for the randomized block krylov SVD method.

Parameters

<i>maxIterations</i>	Number of iterations for the power method (Default: 2).
<i>blockSize</i>	The block size, must be \geq rank (Default: rank + 10).

39.460.3 Member Function Documentation

39.460.3.1 Apply()

```
void Apply (
    const arma::mat & data,
    arma::mat & u,
    arma::vec & s,
    arma::mat & v,
    const size_t rank )
```

Apply Principal Component Analysis to the provided data set using the randomized block krylov SVD.

Parameters

<i>data</i>	Data matrix.
<i>u</i>	First unitary matrix.
<i>v</i>	Second unitary matrix.
<i>s</i>	Diagonal matrix of singular values.
<i>rank</i>	Rank of the approximation.

Referenced by RandomizedBlockKrylovSVDPolicy::Apply().

  year = {2014},
}
```

An example of how to use the interface is shown below:

```
arma::mat data; // Rating data in the form of coordinate list.

const size_t rank = 20; // Rank used for the decomposition.

// Make a RandomizedSVD object.
RandomizedSVD rSVD();

arma::mat u, s, v;

// Use the Apply() method to get a factorization.
rSVD.Apply(data, u, s, v, rank);
```

Definition at line 66 of file randomized_svd.hpp.

39.461.2 Constructor & Destructor Documentation

39.461.2.1 RandomizedSVD() [1/2]

```
RandomizedSVD (
    const arma::mat & data,
    arma::mat & u,
    arma::vec & s,
    arma::mat & v,
    const size_t iteratedPower = 0,
    const size_t maxIterations = 2,
    const size_t rank = 0,
    const double eps = 1e-7 )
```

Create object for the randomized SVD method.

Parameters

<i>data</i>	Data matrix.
<i>u</i>	First unitary matrix.
<i>v</i>	Second unitary matrix.
<i>sigma</i>	Diagonal matrix of singular values.
<i>iteratedPower</i>	Size of the normalized power iterations (Default: rank + 2).
<i>maxIterations</i>	Number of iterations for the power method (Default: 2).
<i>rank</i>	Rank of the approximation (Default: number of rows.)
<i>eps</i>	The eps coefficient to avoid division by zero (numerical stability).

39.461.2.2 RandomizedSVD() [2/2]

```

RandomizedSVD (
    const size_t iteratedPower = 0,
    const size_t maxIterations = 2,
    const double eps = 1e-7 )

```

Create object for the randomized SVD method.

Parameters

<i>iteratedPower</i>	Size of the normalized power iterations (Default: rank + 2).
<i>maxIterations</i>	Number of iterations for the power method (Default: 2).
<i>eps</i>	The eps coefficient to avoid division by zero (numerical stability).

39.461.3 Member Function Documentation**39.461.3.1 Apply()** [1/3]

```

void Apply (
    const arma::sp_mat & data,
    arma::mat & u,
    arma::vec & s,
    arma::mat & v,
    const size_t rank )

```

Center the data to apply Principal Component Analysis on given sparse matrix dataset using randomized SVD.

Parameters

<i>data</i>	Sparse data matrix.
<i>u</i>	First unitary matrix.
<i>v</i>	Second unitary matrix.
<i>sigma</i>	Diagonal matrix of singular values.
<i>rank</i>	Rank of the approximation.

Referenced by RandomizedSVDPolicy::Apply().

39.461.3.2 Apply() [2/3]

```

void Apply (
    const arma::mat & data,

```

```

    arma::mat & u,
    arma::vec & s,
    arma::mat & v,
    const size_t rank )

```

Center the data to apply Principal Component Analysis on given matrix dataset using randomized SVD.

Parameters

<i>data</i>	Data matrix.
<i>u</i>	First unitary matrix.
<i>v</i>	Second unitary matrix.
<i>sigma</i>	Diagonal matrix of singular values.
<i>rank</i>	Rank of the approximation.

39.461.3.3 Apply() [3/3]

```

void Apply (
    const MatType & data,
    arma::mat & u,
    arma::vec & s,
    arma::mat & v,
    const size_t rank,
    MatType rowMean ) [inline]

```

Apply Principal Component Analysis to the provided matrix data set using the randomized SVD.

Parameters

<i>data</i>	Data matrix.
<i>u</i>	First unitary matrix.
<i>v</i>	Second unitary matrix.
<i>sigma</i>	Diagonal matrix of singular values.
<i>rank</i>	Rank of the approximation.
<i>rowMean</i>	Centered mean value matrix.

Definition at line 151 of file randomized_svd.hpp.

39.461.3.4 Epsilon() [1/2]

```

double Epsilon ( ) const [inline]

```

Get the value used for decomposition stability.

Definition at line 245 of file randomized_svd.hpp.

39.461.3.5 Epsilon() [2/2]

```
double& Epsilon ( ) [inline]
```

Modify the value used for decomposition stability.

Definition at line 247 of file randomized_svd.hpp.

39.461.3.6 IteratedPower() [1/2]

```
size_t IteratedPower ( ) const [inline]
```

Get the size of the normalized power iterations.

Definition at line 235 of file randomized_svd.hpp.

39.461.3.7 IteratedPower() [2/2]

```
size_t& IteratedPower ( ) [inline]
```

Modify the size of the normalized power iterations.

Definition at line 237 of file randomized_svd.hpp.

39.461.3.8 MaxIterations() [1/2]

```
size_t MaxIterations ( ) const [inline]
```

Get the number of iterations for the power method.

Definition at line 240 of file randomized_svd.hpp.

39.461.3.9 MaxIterations() [2/2]

```
size_t& MaxIterations ( ) [inline]
```

Modify the number of iterations for the power method.

Definition at line 242 of file randomized_svd.hpp.

39.462 RegularizedSVD< OptimizerType > Class Template Reference

Regularized SVD is a matrix factorization technique that seeks to reduce the error on the training set, that is on the examples for which the ratings have been provided by the users.

Public Member Functions

- **RegularizedSVD** (const size_t iterations=10, const double alpha=0.01, const double lambda=0.02)
Constructor for Regularized SVD.
- void **Apply** (const arma::mat &data, const size_t rank, arma::mat &u, arma::mat &v)
Obtains the user and item matrices using the provided data and rank.

39.462.1 Detailed Description

```
template<typename OptimizerType = ens::StandardSGD>
class mlpack::svd::RegularizedSVD< OptimizerType >
```

Regularized SVD is a matrix factorization technique that seeks to reduce the error on the training set, that is on the examples for which the ratings have been provided by the users.

It is a fairly straightforward technique where the user and item matrices are updated with the help of Stochastic Gradient Descent(SGD) updates. The updates also penalize the learning of large feature values by means of regularization. More details can be found in the following links:

<http://sifter.org/~simon/journal/20061211.html> <http://www.cs.uic.edu/~liub/KDD-cup-2007/proceedings/Regular-Paterek.pdf>

An example of how to use the interface is shown below:

```
arma::mat data; // Rating data in the form of coordinate list.

const size_t rank = 20; // Rank used for the decomposition.
const size_t iterations = 10; // Number of iterations used for optimization.

const double alpha = 0.01 // Learning rate for the SGD optimizer.
const double lambda = 0.1 // Regularization parameter for the optimization.

// Make a RegularizedSVD object.
RegularizedSVD<> rSVD(iterations, alpha, lambda);

arma::mat u, v; // User and item matrices.

// Use the Apply() method to get a factorization.
rSVD.Apply(data, rank, u, v);
```

Definition at line 58 of file regularized_svd.hpp.

39.462.2 Constructor & Destructor Documentation

39.462.2.1 RegularizedSVD()

```
RegularizedSVD (
    const size_t iterations = 10,
    const double alpha = 0.01,
    const double lambda = 0.02 )
```

Constructor for Regularized SVD.

Obtains the user and item matrices after training on the passed data. The constructor initiates an object of class **RegularizedSVDFunction** (p. 1945) for optimization. It uses the SGD optimizer by default. The optimizer uses a template specialization of `Optimize()`.

Parameters

<i>iterations</i>	Number of optimization iterations.
<i>alpha</i>	Learning rate for the SGD optimizer.
<i>lambda</i>	Regularization parameter for the optimization.

39.462.3 Member Function Documentation

39.462.3.1 Apply()

```
void Apply (
    const arma::mat & data,
    const size_t rank,
    arma::mat & u,
    arma::mat & v )
```

Obtains the user and item matrices using the provided data and rank.

Parameters

<i>data</i>	Rating data matrix.
<i>rank</i>	Rank parameter to be used for optimization.
<i>u</i>	Item matrix obtained on decomposition.
<i>v</i>	User matrix obtained on decomposition.

Referenced by RegSVDPolicy::Apply().

39.463 RegularizedSVDFunction< MatType > Class Template Reference

The data is stored in a matrix of type MatType, so that this class can be used with both dense and sparse matrix types.

Public Member Functions

- **RegularizedSVDFunction** (const MatType &data, const size_t rank, const double lambda)
*Constructor for **RegularizedSVDFunction** (p. 1945) class.*
- const arma::mat & **Dataset** () const
Return the dataset passed into the constructor.
- double **Evaluate** (const arma::mat ¶meters) const
Evaluates the cost function over all examples in the data.
- double **Evaluate** (const arma::mat ¶meters, const size_t start, const size_t batchSize=1) const
Evaluates the cost function for one training example.
- const arma::mat & **GetInitialPoint** () const
Return the initial point for the optimization.
- void **Gradient** (const arma::mat ¶meters, arma::mat &gradient) const
Evaluates the full gradient of the cost function over all the training examples.
- template<typename GradType >
void **Gradient** (const arma::mat ¶meters, const size_t start, GradType &gradient, const size_t batchSize=1) const
Evaluates the gradient of the cost function over one training example.
- double **Lambda** () const
Return the regularization parameters.
- size_t **NumFunctions** () const
Return the number of training examples. Useful for SGD optimizer.
- size_t **NumItems** () const
Return the number of items in the data.
- size_t **NumUsers** () const
Return the number of users in the data.
- size_t **Rank** () const
Return the rank used for the factorization.
- void **Shuffle** ()
Shuffle the points in the dataset.

39.463.1 Detailed Description

```
template<typename MatType = arma::mat>
class mlpack::svd::RegularizedSVDFunction< MatType >
```

The data is stored in a matrix of type MatType, so that this class can be used with both dense and sparse matrix types.

Template Parameters

<i>MatType</i>	The matrix type of the dataset.
----------------	---------------------------------

Definition at line 29 of file regularized_svd_function.hpp.

39.463.2 Constructor & Destructor Documentation

39.463.2.1 RegularizedSVDFunction()

```
RegularizedSVDFunction (
    const MatType & data,
    const size_t rank,
    const double lambda )
```

Constructor for **RegularizedSVDFunction** (p. 1945) class.

The constructor calculates the number of users and items in the passed data. It also randomly initializes the parameter values.

Parameters

<i>data</i>	Dataset for which SVD is calculated.
<i>rank</i>	Rank used for matrix factorization.
<i>lambda</i>	Regularization parameter used for optimization.

39.463.3 Member Function Documentation

39.463.3.1 Dataset()

```
const arma::mat& Dataset ( ) const [inline]
```

Return the dataset passed into the constructor.

Definition at line 101 of file regularized_svd_function.hpp.

39.463.3.2 Evaluate() [1/2]

```
double Evaluate (
    const arma::mat & parameters ) const
```

Evaluates the cost function over all examples in the data.

Parameters

<i>parameters</i>	Parameters(user/item matrices) of the decomposition.
-------------------	--

39.463.3.3 Evaluate() [2/2]

```
double Evaluate (
    const arma::mat & parameters,
    const size_t start,
    const size_t batchSize = 1 ) const
```

Evaluates the cost function for one training example.

Useful for the SGD optimizer abstraction which uses one training example at a time.

Parameters

<i>parameters</i>	Parameters(user/item matrices) of the decomposition.
<i>start</i>	First index of the training examples to be used.
<i>batchSize</i>	Size of batch to evaluate.

39.463.3.4 GetInitialPoint()

```
const arma::mat& GetInitialPoint ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 98 of file regularized_svd_function.hpp.

39.463.3.5 Gradient() [1/2]

```
void Gradient (
    const arma::mat & parameters,
    arma::mat & gradient ) const
```

Evaluates the full gradient of the cost function over all the training examples.

Parameters

<i>parameters</i>	Parameters(user/item matrices) of the decomposition.
<i>gradient</i>	Calculated gradient for the parameters.

39.463.3.6 Gradient() [2/2]

```
void Gradient (
    const arma::mat & parameters,
    const size_t start,
    GradType & gradient,
    const size_t batchSize = 1 ) const
```

Evaluates the gradient of the cost function over one training example.

This function is useful for optimizers like SGD. The type of the gradient parameter is a template argument to allow the computation of a sparse gradient.

Template Parameters

<i>GradType</i>	The type of the gradient out-param.
-----------------	-------------------------------------

Parameters

<i>parameters</i>	Parameters(user/item matrices) of the decomposition.
<i>start</i>	The first index of the training examples to use.
<i>gradient</i>	Calculated gradient for the parameters.
<i>batchSize</i>	Size of batch to calculate gradient for.

39.463.3.7 Lambda()

```
double Lambda ( ) const [inline]
```

Return the regularization parameters.

Definition at line 113 of file regularized_svd_function.hpp.

39.463.3.8 NumFunctions()

```
size_t NumFunctions ( ) const [inline]
```

Return the number of training examples. Useful for SGD optimizer.

Definition at line 104 of file `regularized_svd_function.hpp`.

39.463.3.9 NumItems()

```
size_t NumItems ( ) const [inline]
```

Return the number of items in the data.

Definition at line 110 of file `regularized_svd_function.hpp`.

39.463.3.10 NumUsers()

```
size_t NumUsers ( ) const [inline]
```

Return the number of users in the data.

Definition at line 107 of file `regularized_svd_function.hpp`.

39.463.3.11 Rank()

```
size_t Rank ( ) const [inline]
```

Return the rank used for the factorization.

Definition at line 116 of file `regularized_svd_function.hpp`.

39.463.3.12 Shuffle()

```
void Shuffle ( )
```

Shuffle the points in the dataset.

This may be used by optimizers.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/regularized_svd/regularized_svd_function.hpp`

39.464 SVDPlusPlus< OptimizerType > Class Template Reference

SVD++ is a matrix decomposition technique used in collaborative filtering.

Public Member Functions

- **SVDPlusPlus** (const size_t iterations=10, const double alpha=0.001, const double lambda=0.1)
*Constructor of **SVDPlusPlus** (p. 1951).*
- void **Apply** (const arma::mat &data, const arma::mat &implicitData, const size_t rank, arma::mat &u, arma::mat &v, arma::vec &p, arma::vec &q, arma::mat &y)
Trains the model and obtains user/item matrices, user/item bias, and item implicit matrix.
- void **Apply** (const arma::mat &data, const size_t rank, arma::mat &u, arma::mat &v, arma::vec &p, arma::vec &q, arma::mat &y)
Trains the model and obtains user/item matrices, user/item bias, and item implicit matrix.

Static Public Member Functions

- static void **CleanData** (const arma::mat &implicitData, arma::sp_mat &cleanedData, const arma::mat &data)
Converts the User, Item matrix of implicit data to Item-User Table.

39.464.1 Detailed Description

```
template<typename OptimizerType = ens::StandardSGD>
class mlpack::svd::SVDPlusPlus< OptimizerType >
```

SVD++ is a matrix decomposition technique used in collaborative filtering.

SVD++ is similar to **BiasSVD** (p. 1925), but it is a more expressive model because SVD++ also models implicit feedback. SVD++ outputs user/item latent vectors, user/item bias, and item vectors with regard to implicit feedback. Parameters are optimized by Stochastic Gradient Descent (SGD). The updates also penalize the learning of large feature values by means of regularization.

For more information, see the following paper:

{koren2008factorization, title={Factorization meets the neighborhood: a multifaceted collaborative filtering model}, author={Koren, Yehuda}, booktitle={Proceedings of the 14th ACM SIGKDD international conference on Knowledge discovery and data mining}, pages={426–434}, year={2008}, organization={ACM} }

An example of how to use the interface is shown below:

```
arma::mat data; // Rating data in the form of coordinate list.

// Implicit feedback data in the form of coordinate list.
arma::mat implicitData;

const size_t rank = 10; // Rank used for the decomposition.
const size_t iterations = 10; // Number of iterations used for optimization.

const double alpha = 0.001 // Learning rate for the SGD optimizer.
const double lambda = 0.1 // Regularization parameter for the optimization.

// Make a SVD++ object.
SVDPlusPlus<> svdPP(iterations, alpha, lambda);

arma::mat u, v; // Item and User matrices.
arma::vec p, q; // Item and User bias.
arma::mat y;    // Item matrix with respect to implicit feedback.

// Use the Apply() method to get a factorization.
svdPP.Apply(data, implicitData, rank, u, v, p, q, y);
```

Definition at line 74 of file svdplusplus.hpp.

39.464.2 Constructor & Destructor Documentation

39.464.2.1 SVDPlusPlus()

```
SVDPlusPlus (
    const size_t iterations = 10,
    const double alpha = 0.001,
    const double lambda = 0.1 )
```

Constructor of **SVDPlusPlus** (p. 1951).

By default SGD optimizer is used in **SVDPlusPlus** (p. 1951). The optimizer uses a template specialization of `Optimize()`.

Parameters

<i>iterations</i>	Number of optimization iterations.
<i>alpha</i>	Learning rate for the SGD optimizer.
<i>lambda</i>	Regularization parameter for the optimization.

39.464.3 Member Function Documentation

39.464.3.1 Apply() [1/2]

```
void Apply (
    const arma::mat & data,
    const arma::mat & implicitData,
    const size_t rank,
    arma::mat & u,
    arma::mat & v,
    arma::vec & p,
    arma::vec & q,
    arma::mat & y )
```

Trains the model and obtains user/item matrices, user/item bias, and item implicit matrix.

Parameters

<i>data</i>	Rating data matrix.
<i>implicitData</i>	Implicit feedback.
<i>rank</i>	Rank parameter to be used for optimization.
<i>u</i>	Item matrix obtained on decomposition.

Parameters

<i>v</i>	User matrix obtained on decomposition.
<i>p</i>	Item bias.
<i>q</i>	User bias.
<i>y</i>	Item matrix with respect to implicit feedback.

Referenced by SVDPlusPlusPolicy::Apply().

39.464.3.2 Apply() [2/2]

```
void Apply (
    const arma::mat & data,
    const size_t rank,
    arma::mat & u,
    arma::mat & v,
    arma::vec & p,
    arma::vec & q,
    arma::mat & y )
```

Trains the model and obtains user/item matrices, user/item bias, and item implicit matrix.

Whether a user rates an item is used as implicit feedback.

Parameters

<i>data</i>	Rating data matrix.
<i>rank</i>	Rank parameter to be used for optimization.
<i>u</i>	Item matrix obtained on decomposition.
<i>v</i>	User matrix obtained on decomposition.
<i>p</i>	Item bias.
<i>q</i>	User bias.
<i>y</i>	Item matrix with respect to implicit feedback. Each column is a latent vector of an item with respect to implicit feedback.

39.464.3.3 CleanData()

```
static void CleanData (
    const arma::mat & implicitData,
    arma::sp_mat & cleanedData,
    const arma::mat & data ) [static]
```

Converts the User, Item matrix of implicit data to Item-User Table.

Referenced by `SVDPlusPlusPolicy::Apply()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/svdplusplus/ svdplusplus.hpp`

39.465 SVDPlusPlusFunction< MatType > Class Template Reference

This class contains methods which are used to calculate the cost of SVD++'s objective function, to calculate gradient of parameters with respect to the objective function, etc.

Public Member Functions

- **SVDPlusPlusFunction** (const MatType &data, const arma::sp_mat &implicitData, const size_t rank, const double lambda)
*Constructor for **SVDPlusPlusFunction** (p. 1954) class.*
- const arma::mat & **Dataset** () const
Return the dataset passed into the constructor.
- double **Evaluate** (const arma::mat ¶meters) const
Evaluates the cost function over all examples in the data.
- double **Evaluate** (const arma::mat ¶meters, const size_t start, const size_t batchSize=1) const
Evaluates the cost function for one training example.
- const arma::mat & **GetInitialPoint** () const
Return the initial point for the optimization.
- void **Gradient** (const arma::mat ¶meters, arma::mat &gradient) const
Evaluates the full gradient of the cost function over all the training examples.
- template<typename GradType >
void **Gradient** (const arma::mat ¶meters, const size_t start, GradType &gradient, const size_t batchSize=1) const
Evaluates the gradient of the cost function over one training example.
- const arma::sp_mat & **ImplicitDataset** () const
Return the implicit data passed into the constructor.
- double **Lambda** () const
Return the regularization parameters.
- size_t **NumFunctions** () const
Return the number of training examples. Useful for SGD optimizer.
- size_t **NumItems** () const
Return the number of items in the data.
- size_t **NumUsers** () const
Return the number of users in the data.
- size_t **Rank** () const
Return the rank used for the factorization.
- void **Shuffle** ()
Shuffle the points in the dataset.

39.465.1 Detailed Description

```
template<typename MatType = arma::mat>
class mlpack::svd::SVDPlusPlusFunction< MatType >
```

This class contains methods which are used to calculate the cost of SVD++'s objective function, to calculate gradient of parameters with respect to the objective function, etc.

Template Parameters

<i>MatType</i>	The matrix type of the dataset.
----------------	---------------------------------

Definition at line 31 of file `svdplusplus_function.hpp`.

39.465.2 Constructor & Destructor Documentation

39.465.2.1 SVDPlusPlusFunction()

```
SVDPlusPlusFunction (
    const MatType & data,
    const arma::sp_mat & implicitData,
    const size_t rank,
    const double lambda )
```

Constructor for **SVDPlusPlusFunction** (p. 1954) class.

The constructor calculates the number of users and items in the passed data. It also randomly initializes the parameter values.

Parameters

<i>data</i>	Dataset for which SVD is calculated.
<i>implicitData</i>	Implicit feedback matrix where a non-zero entry means interaction between a user and an item is observed.
<i>rank</i>	Rank used for matrix factorization.
<i>lambda</i>	Regularization parameter used for optimization.

39.465.3 Member Function Documentation

39.465.3.1 Dataset()

```
const arma::mat& Dataset ( ) const [inline]
```

Return the dataset passed into the constructor.

Definition at line 110 of file svdplusplus_function.hpp.

39.465.3.2 Evaluate() [1/2]

```
double Evaluate (
    const arma::mat & parameters ) const
```

Evaluates the cost function over all examples in the data.

Parameters

<i>parameters</i>	Parameters(user/item matrices, user/item bias, item implicit matrix) of the decomposition.
-------------------	--

39.465.3.3 Evaluate() [2/2]

```
double Evaluate (
    const arma::mat & parameters,
    const size_t start,
    const size_t batchSize = 1 ) const
```

Evaluates the cost function for one training example.

Useful for the SGD optimizer abstraction which uses one training example at a time.

Parameters

<i>parameters</i>	Parameters(user/item matrices, user/item bias, item implicit matrix) of the decomposition.
<i>start</i>	First index of the training examples to be used.
<i>batchSize</i>	Size of batch to evaluate.

39.465.3.4 GetInitialPoint()

```
const arma::mat& GetInitialPoint ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 107 of file `svdplusplus_function.hpp`.

39.465.3.5 Gradient() [1/2]

```
void Gradient (
    const arma::mat & parameters,
    arma::mat & gradient ) const
```

Evaluates the full gradient of the cost function over all the training examples.

Parameters

<i>parameters</i>	Parameters(user/item matrices, user/item bias, item implicit matrix) of the decomposition.
<i>gradient</i>	Calculated gradient for the parameters.

39.465.3.6 Gradient() [2/2]

```
void Gradient (
    const arma::mat & parameters,
    const size_t start,
    GradType & gradient,
    const size_t batchSize = 1 ) const
```

Evaluates the gradient of the cost function over one training example.

This function is useful for optimizers like SGD. The type of the gradient parameter is a template argument to allow the computation of a sparse gradient.

Template Parameters

<i>GradType</i>	The type of the gradient out-param.
-----------------	-------------------------------------

Parameters

<i>parameters</i>	Parameters(user/item matrices, user/item bias, item implicit matrix) of the decomposition.
<i>start</i>	The first index of the training examples to use.
<i>gradient</i>	Calculated gradient for the parameters.
<i>batchSize</i>	Size of batch to calculate gradient for.

39.465.3.7 ImplicitDataset()

```
const arma::sp_mat& ImplicitDataset ( ) const [inline]
```

Return the implicit data passed into the constructor.

Definition at line 113 of file svdplusplus_function.hpp.

39.465.3.8 Lambda()

```
double Lambda ( ) const [inline]
```

Return the regularization parameters.

Definition at line 125 of file svdplusplus_function.hpp.

39.465.3.9 NumFunctions()

```
size_t NumFunctions ( ) const [inline]
```

Return the number of training examples. Useful for SGD optimizer.

Definition at line 116 of file svdplusplus_function.hpp.

39.465.3.10 NumItems()

```
size_t NumItems ( ) const [inline]
```

Return the number of items in the data.

Definition at line 122 of file svdplusplus_function.hpp.

39.465.3.11 NumUsers()

```
size_t NumUsers ( ) const [inline]
```

Return the number of users in the data.

Definition at line 119 of file svdplusplus_function.hpp.

39.465.3.12 Rank()

```
size_t Rank ( ) const [inline]
```

Return the rank used for the factorization.

Definition at line 128 of file svdplusplus_function.hpp.

39.465.3.13 Shuffle()

```
void Shuffle ( )
```

Shuffle the points in the dataset.

This may be used by optimizers.

39.466 LinearSVM< MatType > Class Template Reference

The **LinearSVM** (p. 1959) class implements an L2-regularized support vector machine model, and supports training with multiple optimizers and classification.

Public Member Functions

- template<typename OptimizerType = ens::L_BFGS>
LinearSVM (const MatType &data, const arma::Row< size_t > &labels, const size_t numClasses=2, const double lambda=0.0001, const double delta=1.0, const bool fitIntercept=false, OptimizerType optimizer=OptimizerType())
*Construct the **LinearSVM** (p. 1959) class with the provided data and labels.*
- **LinearSVM** (const size_t inputSize, const size_t numClasses=0, const double lambda=0.0001, const double delta=1.0, const bool fitIntercept=false)
Initialize the Linear SVM without performing training.
- void **Classify** (const MatType &data, arma::Row< size_t > &labels) const
Classify the given points, returning the predicted labels for each point.
- void **Classify** (const MatType &data, arma::Row< size_t > &labels, arma::mat &scores) const
Classify the given points, returning class scores and predicted class label for each point.
- void **Classify** (const MatType &data, arma::mat &scores) const
Classify the given points, returning class scores for each point.
- template<typename VecType >
size_t **Classify** (const VecType &point) const
Classify the given point.

- double **ComputeAccuracy** (const MatType &testData, const arma::Row< size_t > &testLabels) const
Computes accuracy of the learned model given the feature data and the labels associated with each data point.
- size_t **FeatureSize** () const
Gets the features size of the training data.
- double & **Lambda** ()
Sets the regularization parameter.
- double **Lambda** () const
Gets the regularization parameter.
- size_t & **NumClasses** ()
Sets the number of classes.
- size_t **NumClasses** () const
Gets the number of classes.
- arma::mat & **Parameters** ()
Set the model parameters.
- const arma::mat & **Parameters** () const
Get the model parameters.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
*Serialize the **LinearSVM** (p. 1959) model.*
- template<typename OptimizerType = ens::L_BFGS>
double **Train** (const MatType &data, const arma::Row< size_t > &labels, const size_t numClasses=2, OptimizerType optimizer=OptimizerType())
Train the Linear SVM with the given training data.

39.466.1 Detailed Description

```
template<typename MatType = arma::mat>
class mlpack::svm::LinearSVM< MatType >
```

The **LinearSVM** (p. 1959) class implements an L2-regularized support vector machine model, and supports training with multiple optimizers and classification.

The class supports different observation types via the MatType template parameter; for instance, support vector classification can be performed on sparse datasets by specifying arma::sp_mat as the MatType parameter.

Linear SVM can be used for general classification tasks which will work on multiclass classification. More technical details about the model can be found from the following:

```
@inproceedings{weston1999support,
  title      = {Support vector machines for multi-class pattern
               recognition.},
  author     = {Weston, Jason and Watkins, Chris},
  booktitle  = {Proceedings of the 7th European Symposium on Artificial Neural
               Networks (ESANN '99)},
  volume     = {99},
  pages      = {219--224},
  year       = {1999}
}
```

```
@article{cortes1995support,
title      = {Support-vector networks},
author     = {Cortes, Corinna and Vapnik, Vladimir},
journal    = {Machine Learning},
volume     = {20},
number     = {3},
pages      = {273--297},
year       = {1995},
publisher  = {Springer}
}
```

An example on how to use the interface is shown below:

```
arma::mat train_data; // Training data matrix.
arma::Row<size_t> labels; // Labels associated with the data.
const size_t inputSize = 1000; // Size of input feature vector.
const size_t numClasses = 5; // Number of classes.

// Train the model using default options.
LinearSVM<> lsvm(train_data, labels, inputSize, numClasses, lambda,
    delta, L_BFGS());

arma::mat test_data;
arma::Row<size_t> predictions;
lsvm.Classify(test_data, predictions);
```

Template Parameters

<i>MatType</i>	Type of data matrix.
----------------	----------------------

Definition at line 80 of file linear_svm.hpp.

39.466.2 Constructor & Destructor Documentation

39.466.2.1 LinearSVM() [1/2]

```
LinearSVM (
    const MatType & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses = 2,
    const double lambda = 0.0001,
    const double delta = 1.0,
    const bool fitIntercept = false,
    OptimizerType optimizer = OptimizerType() )
```

Construct the **LinearSVM** (p. 1959) class with the provided data and labels.

This will train the model. Optionally, the parameter 'lambda' can be passed, which controls the amount of L2-regularization in the objective function. By default, the model takes a small value.

Template Parameters

<i>OptimizerType</i>	Desired differentiable separable optimizer
----------------------	--

Parameters

<i>data</i>	Input training features. Each column associate with one sample
<i>labels</i>	Labels associated with the feature data.
<i>numClasses</i>	Number of classes for classification.
<i>lambda</i>	L2-regularization constant. delta Margin of difference between correct class and other classes.
<i>optimizer</i>	Desired optimizer.

39.466.2.2 LinearSVM() [2/2]

```

LinearSVM (
    const size_t inputSize,
    const size_t numClasses = 0,
    const double lambda = 0.0001,
    const double delta = 1.0,
    const bool fitIntercept = false )

```

Initialize the Linear SVM without performing training.

Default value of lambda is 0.0001. Be sure to use **Train()** (p. 1966) before calling **Classify()** (p. 1962) or **ComputeAccuracy()** (p. 1964), otherwise the results may be meaningless.

Parameters

<i>inputSize</i>	Size of the input feature vector.
<i>numClasses</i>	Number of classes for classification.
<i>lambda</i>	L2-regularization constant. delta Margin of difference between correct class and other classes.
<i>fitIntercept</i>	add intercept term or not.

39.466.3 Member Function Documentation

39.466.3.1 Classify() [1/4]

```

void Classify (
    const MatType & data,
    arma::Row< size_t > & labels ) const

```

Classify the given points, returning the predicted labels for each point.

The function calculates the probabilities for every class, given a data point. It then chooses the class which has the highest probability among all.

Parameters

<i>data</i>	Set of points to classify.
<i>labels</i>	Predicted labels for each point.

39.466.3.2 Classify() [2/4]

```
void Classify (
    const MatType & data,
    arma::Row< size_t > & labels,
    arma::mat & scores ) const
```

Classify the given points, returning class scores and predicted class label for each point.

The function calculates the scores for every class, given a data point. It then chooses the class which has the highest probability among all.

Parameters

<i>data</i>	Matrix of data points to be classified.
<i>labels</i>	Predicted labels for each point.
<i>scores</i>	Class probabilities for each point.

39.466.3.3 Classify() [3/4]

```
void Classify (
    const MatType & data,
    arma::mat & scores ) const
```

Classify the given points, returning class scores for each point.

Parameters

<i>data</i>	Matrix of data points to be classified.
<i>scores</i>	Class scores for each point.

39.466.3.4 Classify() [4/4]

```
size_t Classify (
    const VecType & point ) const
```

Classify the given point.

The predicted class label is returned. The function calculates the scores for every class, given the point. It then chooses the class which has the highest probability among all.

Parameters

<i>point</i>	Point to be classified.
--------------	-------------------------

Returns

Predicted class label of the point.

39.466.3.5 ComputeAccuracy()

```
double ComputeAccuracy (
    const MatType & testData,
    const arma::Row< size_t > & testLabels ) const
```

Computes accuracy of the learned model given the feature data and the labels associated with each data point.

Predictions are made using the provided data and are compared with the actual labels.

Parameters

<i>testData</i>	Matrix of data points using which predictions are made.
<i>testLabels</i>	Vector of labels associated with the data.

Returns

Accuracy of the model.

39.466.3.6 FeatureSize()

```
size_t FeatureSize ( ) const [inline]
```

Gets the features size of the training data.

Definition at line 216 of file linear_svm.hpp.

39.466.3.7 Lambda() [1/2]

```
double& Lambda ( ) [inline]
```

Sets the regularization parameter.

Definition at line 206 of file linear_svm.hpp.

39.466.3.8 Lambda() [2/2]

```
double Lambda ( ) const [inline]
```

Gets the regularization parameter.

Definition at line 208 of file linear_svm.hpp.

39.466.3.9 NumClasses() [1/2]

```
size_t& NumClasses ( ) [inline]
```

Sets the number of classes.

Definition at line 201 of file linear_svm.hpp.

39.466.3.10 NumClasses() [2/2]

```
size_t NumClasses ( ) const [inline]
```

Gets the number of classes.

Definition at line 203 of file linear_svm.hpp.

39.466.3.11 Parameters() [1/2]

```
arma::mat& Parameters ( ) [inline]
```

Set the model parameters.

Definition at line 211 of file linear_svm.hpp.

39.466.3.12 Parameters() [2/2]

```
const arma::mat& Parameters ( ) const [inline]
```

Get the model parameters.

Definition at line 213 of file linear_svm.hpp.

39.466.3.13 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the **LinearSVM** (p. 1959) model.

Definition at line 224 of file linear_svm.hpp.

39.466.3.14 Train()

```
double Train (
    const MatType & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses = 2,
    OptimizerType optimizer = OptimizerType() )
```

Train the Linear SVM with the given training data.

Template Parameters

<i>OptimizerType</i>	Desired optimizer
----------------------	-------------------

Parameters

<i>data</i>	Input training features. Each column associate with one sample
<i>labels</i>	Labels associated with the feature data.
<i>numClasses</i>	Number of classes for classification.
<i>lambda</i>	L2-regularization constant.
<i>optimizer</i>	Desired optimizer.

Returns

Objective value of the final point.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/linear_svm/ **linear_svm.hpp**

39.467 LinearSVMFunction< MatType > Class Template Reference

The hinge loss function for the linear SVM objective function.

Public Member Functions

- **LinearSVMFunction** (const MatType &dataset, const arma::Row< size_t > &labels, const size_t numClasses, const double lambda=0.0001, const double delta=1.0, const bool fitIntercept=false)
Construct the Linear SVM objective function with given parameters.
- const arma::sp_mat & **Dataset** () const
Get the dataset.
- arma::sp_mat & **Dataset** ()
Modify the dataset.
- double **Evaluate** (const arma::mat ¶meters)
Evaluate the hinge loss function for all the datapoints.
- double **Evaluate** (const arma::mat ¶meters, const size_t firstId, const size_t batchSize=1)
Evaluate the hinge loss function on the specified datapoints.
- template<typename GradType >
double **EvaluateWithGradient** (const arma::mat ¶meters, GradType &gradient) const
Evaluate the gradient of the hinge loss function, following the LinearFunctionType requirements on the Gradient function followed by evaluation of the hinge loss function on all the datapoints.
- template<typename GradType >
double **EvaluateWithGradient** (const arma::mat ¶meters, const size_t firstId, GradType &gradient, const size_t batchSize=1) const
Evaluate the gradient of the hinge loss function, following the LinearFunctionType requirements on the Gradient function followed by evaluation of the hinge loss function on the specified datapoints.
- bool **FitIntercept** () const
Gets the intercept flag.
- void **GetGroundTruthMatrix** (const arma::Row< size_t > &labels, arma::sp_mat &groundTruth)
Constructs the ground truth label matrix with the passed labels.
- template<typename GradType >
void **Gradient** (const arma::mat ¶meters, GradType &gradient)
Evaluate the gradient of the hinge loss function following the LinearFunctionType requirements on the Gradient function.
- template<typename GradType >
void **Gradient** (const arma::mat ¶meters, const size_t firstId, GradType &gradient, const size_t batchSize=1)
Evaluate the gradient of the hinge loss function, following the LinearFunctionType requirements on the Gradient function.
- const arma::mat & **InitialPoint** () const
Return the initial point for the optimization.

- `arma::mat & InitialPoint ()`
Modify the initial point for the optimization.
- `double & Lambda ()`
Sets the regularization parameter.
- `double Lambda () const`
Gets the regularization parameter.
- `size_t NumFunctions () const`
Return the number of functions.
- `void Shuffle ()`
Shuffle the dataset.

Static Public Member Functions

- `static void InitializeWeights (arma::mat &weights, const size_t featureSize, const size_t numClasses, const bool fitIntercept=false)`
Initialize Linear SVM weights (trainable parameters) with the given parameters.

39.467.1 Detailed Description

```
template<typename MatType = arma::mat>
class mlpack::svm::LinearSVMFunction< MatType >
```

The hinge loss function for the linear SVM objective function.

This is used by various ensmallen optimizers to train the linear SVM model.

Definition at line 28 of file `linear_svm_function.hpp`.

39.467.2 Constructor & Destructor Documentation

39.467.2.1 LinearSVMFunction()

```
LinearSVMFunction (
    const MatType & dataset,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const double lambda = 0.0001,
    const double delta = 1.0,
    const bool fitIntercept = false )
```

Construct the Linear SVM objective function with given parameters.

Parameters

<i>dataset</i>	Input training data, each column associate with one sample
<i>labels</i>	Labels associated with the feature data.
<i>numClasses</i>	Number of classes for classification.
<i>lambda</i>	L2-regularization constant. delta Margin of difference between correct class and other classes.
<i>fitIntercept</i>	Intercept term flag.

39.467.3 Member Function Documentation

39.467.3.1 Dataset() [1/2]

```
const arma::sp_mat& Dataset ( ) const [inline]
```

Get the dataset.

Definition at line 167 of file linear_svm_function.hpp.

39.467.3.2 Dataset() [2/2]

```
arma::sp_mat& Dataset ( ) [inline]
```

Modify the dataset.

Definition at line 169 of file linear_svm_function.hpp.

39.467.3.3 Evaluate() [1/2]

```
double Evaluate (
    const arma::mat & parameters )
```

Evaluate the hinge loss function for all the datapoints.

Parameters

<i>parameters</i>	The parameters of the SVM.
-------------------	----------------------------

Returns

The value of the loss function for the entire dataset.

39.467.3.4 Evaluate() [2/2]

```
double Evaluate (
    const arma::mat & parameters,
    const size_t firstId,
    const size_t batchSize = 1 )
```

Evaluate the hinge loss function on the specified datapoints.

Parameters

<i>parameters</i>	The parameters of the SVM.
<i>firstId</i>	Index of the datapoints to use for function evaluation.
<i>batchSize</i>	Size of batch to process.

Returns

The value of the loss function for the given parameters.

39.467.3.5 EvaluateWithGradient() [1/2]

```
double EvaluateWithGradient (
    const arma::mat & parameters,
    GradType & gradient ) const
```

Evaluate the gradient of the hinge loss function, following the LinearFunctionType requirements on the Gradient function followed by evaluation of the hinge loss function on all the datapoints.

Template Parameters

<i>GradType</i>	Type of the gradient matrix.
-----------------	------------------------------

Parameters

<i>parameters</i>	The parameters of the SVM.
<i>gradient</i>	Linear matrix to output the gradient into.

Returns

The value of the loss function at the given parameters.

39.467.3.6 EvaluateWithGradient() [2/2]

```
double EvaluateWithGradient (
    const arma::mat & parameters,
    const size_t firstId,
    GradType & gradient,
    const size_t batchSize = 1 ) const
```

Evaluate the gradient of the hinge loss function, following the LinearFunctionType requirements on the Gradient function followed by evaluation of the hinge loss function on the specified datapoints.

Template Parameters

<i>GradType</i>	Type of the gradient matrix.
-----------------	------------------------------

Parameters

<i>parameters</i>	The parameters of the SVM.
<i>firstId</i>	Index of the datapoint to use for the gradient and function evaluation.
<i>gradient</i>	Linear matrix to output the gradient into.
<i>batchSize</i>	Size of the batch to process.

Returns

The value of the loss function at the given parameters.

39.467.3.7 FitIntercept()

```
bool FitIntercept ( ) const [inline]
```

Gets the intercept flag.

Definition at line 177 of file linear_svm_function.hpp.

References LinearSVMFunction< MatType >::NumFunctions().

39.467.3.8 GetGroundTruthMatrix()

```
void GetGroundTruthMatrix (
    const arma::Row< size_t > & labels,
    arma::sp_mat & groundTruth )
```

Constructs the ground truth label matrix with the passed labels.

Parameters

<i>labels</i>	Labels associated with the training data.
<i>groundTruth</i>	Pointer to arma::mat which stores the computed matrix.

39.467.3.9 Gradient() [1/2]

```
void Gradient (
    const arma::mat & parameters,
    GradType & gradient )
```

Evaluate the gradient of the hinge loss function following the LinearFunctionType requirements on the Gradient function.

Template Parameters

<i>GradType</i>	Type of the gradient matrix.
-----------------	------------------------------

Parameters

<i>parameters</i>	The parameters of the SVM.
<i>gradient</i>	Linear matrix to output the gradient into.

39.467.3.10 Gradient() [2/2]

```
void Gradient (
    const arma::mat & parameters,
    const size_t firstId,
    GradType & gradient,
    const size_t batchSize = 1 )
```

Evaluate the gradient of the hinge loss function, following the LinearFunctionType requirements on the Gradient function.

Template Parameters

<i>GradType</i>	Type of the gradient matrix.
-----------------	------------------------------

Parameters

<i>parameters</i>	The parameters of the SVM.
<i>firstId</i>	Index of the datapoint to use for the gradient evaluation.
<i>gradient</i>	Linear matrix to output the gradient into.
<i>batchSize</i>	Size of the batch to process.

39.467.3.11 InitializeWeights()

```
static void InitializeWeights (
    arma::mat & weights,
    const size_t featureSize,
    const size_t numClasses,
    const bool fitIntercept = false ) [static]
```

Initialize Linear SVM weights (trainable parameters) with the given parameters.

Parameters

<i>weights</i>	This will be filled with the initialized model weights.
<i>featureSize</i>	The number of features in the training set.
<i>numClasses</i>	Number of classes for classification.
<i>fitIntercept</i>	If true, an intercept is fitted.

Returns

Initialized model weights.

39.467.3.12 InitialPoint() [1/2]

```
const arma::mat& InitialPoint ( ) const [inline]
```

Return the initial point for the optimization.

Definition at line 162 of file linear_svm_function.hpp.

39.467.3.13 InitialPoint() [2/2]

```
arma::mat& InitialPoint ( ) [inline]
```

Modify the initial point for the optimization.

Definition at line 164 of file linear_svm_function.hpp.

39.467.3.14 Lambda() [1/2]

```
double& Lambda ( ) [inline]
```

Sets the regularization parameter.

Definition at line 172 of file linear_svm_function.hpp.

39.467.3.15 Lambda() [2/2]

```
double Lambda ( ) const [inline]
```

Gets the regularization parameter.

Definition at line 174 of file linear_svm_function.hpp.

39.467.3.16 NumFunctions()

```
size_t NumFunctions ( ) const
```

Return the number of functions.

Referenced by LinearSVMFunction< MatType >::FitIntercept().

39.467.3.17 Shuffle()

```
void Shuffle ( )
```

Shuffle the dataset.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/linear_svm/ **linear_svm_function.hpp**

39.468 Timer Class Reference

The timer class provides a way for mpack methods to be timed.

Static Public Member Functions

- static void **DisableTiming** ()
Disable timing of mpack programs.
- static void **EnableTiming** ()
Enable timing of mpack programs.
- static std::chrono::microseconds **Get** (const std::string &name)
Get the value of the given timer.
- static void **ResetAll** ()
Stop and reset all running timers.
- static void **Start** (const std::string &name)
Start the given timer.
- static void **Stop** (const std::string &name)
Stop the given timer.

39.468.1 Detailed Description

The timer class provides a way for mpack methods to be timed.

The three methods contained in this class allow a named timer to be started and stopped, and its value to be obtained. A named timer is specific to the thread it is running on, so if you start a timer in one thread, it cannot be stopped from a different thread.

Definition at line 45 of file timers.hpp.

39.468.2 Member Function Documentation

39.468.2.1 DisableTiming()

```
static void DisableTiming ( ) [static]
```

Disable timing of mpack programs.

Do not run this while timers are running!

39.468.2.2 EnableTiming()

```
static void EnableTiming ( ) [static]
```

Enable timing of mpack programs.

Do not run this while timers are running!

Referenced by mpack::util::EnableTimers().

39.468.2.3 Get()

```
static std::chrono::microseconds Get (
    const std::string & name ) [static]
```

Get the value of the given timer.

Parameters

<i>name</i>	Name of timer to return value of.
-------------	-----------------------------------

39.468.2.4 ResetAll()

```
static void ResetAll ( ) [static]
```

Stop and reset all running timers.

This removes all knowledge of any existing timers.

39.468.2.5 Start()

```
static void Start (
    const std::string & name ) [static]
```

Start the given timer.

If a timer is started, then stopped, then re-started, then re-stopped, the final value of the timer is the length of both runs – that is, mpack timers are additive for each time they are run, and do not reset.

Note

A `std::runtime_error` exception will be thrown if a timer is started twice.

Parameters

<i>name</i>	Name of timer to be started.
-------------	------------------------------

39.468.2.6 Stop()

```
static void Stop (
    const std::string & name ) [static]
```

Stop the given timer.

Note

A `std::runtime_error` exception will be thrown if a timer is started twice.

Parameters

<i>name</i>	Name of timer to be stopped.
-------------	------------------------------

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/util/ **timers.hpp**

39.469 Timers Class Reference

Public Member Functions

- **Timers** ()
Default to disabled.
- `std::atomic< bool > & Enabled ()`
Modify whether or not timing is enabled.
- `bool Enabled () const`
Get whether or not timing is enabled.
- `std::map< std::string, std::chrono::microseconds > GetAllTimers ()`
Returns a copy of all the timers used via this interface.
- `bool GetState (const std::string &timerName, const std::thread::id &threadId=std::thread::id())`
Returns state of the given timer.
- `std::chrono::microseconds GetTimer (const std::string &timerName)`
Returns a copy of the timer specified.
- `void PrintTimer (const std::string &timerName)`
Prints the specified timer.

- void **Reset** ()
Reset the timers.
- void **StartTimer** (const std::string &timerName, const std::thread::id &threadId=std::thread::id())
** Initializes a timer, available like a normal value specified on * the command line.*
- void **StopAllTimers** ()
Stop all timers.
- void **StopTimer** (const std::string &timerName, const std::thread::id &threadId=std::thread::id())
** Halts the timer, and replaces its value with the delta time from its start.*

39.469.1 Detailed Description

Definition at line 97 of file timers.hpp.

39.469.2 Constructor & Destructor Documentation

39.469.2.1 Timers()

```
Timers ( ) [inline]
```

Default to disabled.

Definition at line 101 of file timers.hpp.

39.469.3 Member Function Documentation

39.469.3.1 Enabled() [1/2]

```
std::atomic<bool>& Enabled ( ) [inline]
```

Modify whether or not timing is enabled.

Definition at line 166 of file timers.hpp.

39.469.3.2 Enabled() [2/2]

```
bool Enabled ( ) const [inline]
```

Get whether or not timing is enabled.

Definition at line 168 of file timers.hpp.

39.469.3.3 GetAllTimers()

```
std::map<std::string, std::chrono::microseconds> GetAllTimers ( )
```

Returns a copy of all the timers used via this interface.

Referenced by `mlpack::bindings::cli::EndProgram()`.

39.469.3.4 GetState()

```
bool GetState (
    const std::string & timerName,
    const std::thread::id & threadId = std::thread::id() )
```

Returns state of the given timer.

Parameters

<i>timerName</i>	The name of the timer in question.
<i>threadId</i>	Id of the thread accessing the timer.

39.469.3.5 GetTimer()

```
std::chrono::microseconds GetTimer (
    const std::string & timerName )
```

Returns a copy of the timer specified.

This contains the sum of the timing results for timers that have been stopped with this name.

Parameters

<i>timerName</i>	The name of the timer in question.
------------------	------------------------------------

39.469.3.6 PrintTimer()

```
void PrintTimer (
    const std::string & timerName )
```

Prints the specified timer.

If it took longer than a minute to complete the timer will be displayed in days, hours, and minutes as well.

Parameters

<i>timerName</i>	The name of the timer in question.
------------------	------------------------------------

Referenced by `mlpack::bindings::cli::EndProgram()`.

39.469.3.7 Reset()

```
void Reset ( )
```

Reset the timers.

This stops all running timers and removes them. Whether or not timing is enabled will not be changed.

Referenced by `mlpack::util::ResetTimers()`.

39.469.3.8 StartTimer()

```
void StartTimer (
    const std::string & timerName,
    const std::thread::id & threadId = std::thread::id() )
```

* Initializes a timer, available like a normal value specified on * the command line.

Timers (p. 1977) are of type `timeval`. If a timer is started, then stopped, then re-started, then stopped, the final timer value will be the length of both runs of the timer. * *

Parameters

<i>timerName</i>	The name of the timer in question.
<i>threadId</i>	Id of the thread accessing the timer.

39.469.3.9 StopAllTimers()

```
void StopAllTimers ( )
```

Stop all timers.

Referenced by `mlpack::bindings::cli::EndProgram()`.

39.469.3.10 StopTimer()

```
void StopTimer (
    const std::string & timerName,
    const std::thread::id & threadId = std::thread::id() )
```

* Halts the timer, and replaces its value with the delta time from its start.

* *

Parameters

<i>timerName</i>	The name of the timer in question.
<i>threadId</i>	Id of the thread accessing the timer.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/util/ timers.hpp`

39.470 AllCategoricalSplit< FitnessFunction > Class Template Reference

The **AllCategoricalSplit** (p. 1981) is a splitting function that will split categorical features into many children: one child for each category.

Classes

- class **AuxiliarySplitInfo**

Static Public Member Functions

- `template<typename ElemType >`
`static size_t CalculateDirection (const ElemType &point, const arma::Col< ElemType > &classProbabilities,`
`const AuxiliarySplitInfo< ElemType > &)`
Calculate the direction a point should percolate to.
- `template<typename ElemType >`
`static size_t NumChildren (const arma::Col< ElemType > &classProbabilities, const AuxiliarySplitInfo<`
`ElemType > &)`
Return the number of children in the split.
- `template<bool UseWeights, typename VecType , typename WeightVecType >`
`static double SplitIfBetter (const double bestGain, const VecType &data, const size_t numCategories, const`
`arma::Row< size_t > &labels, const size_t numClasses, const WeightVecType &weights, const size_t minimum←`
`LeafSize, const double minimumGainSplit, arma::Col< typename VecType::elem_type > &classProbabilities,`
`AuxiliarySplitInfo< typename VecType::elem_type > &aux)`
Check if we can split a node.

39.470.1 Detailed Description

```
template<typename FitnessFunction>
class mlpack::tree::AllCategoricalSplit< FitnessFunction >
```

The **AllCategoricalSplit** (p. 1981) is a splitting function that will split categorical features into many children: one child for each category.

Template Parameters

<i>FitnessFunction</i>	Fitness function to evaluate gain with.
------------------------	---

Definition at line 28 of file `all_categorical_split.hpp`.

39.470.2 Member Function Documentation

39.470.2.1 CalculateDirection()

```
static size_t CalculateDirection (
    const ElemType & point,
    const arma::Col< ElemType > & classProbabilities,
    const AuxiliarySplitInfo< ElemType > & ) [static]
```

Calculate the direction a point should percolate to.

Parameters

<i>classProbabilities</i>	Auxiliary information for the split.
<i>aux</i>	(Unused) auxiliary information for the split.

39.470.2.2 NumChildren()

```
static size_t NumChildren (
    const arma::Col< ElemType > & classProbabilities,
    const AuxiliarySplitInfo< ElemType > & ) [static]
```

Return the number of children in the split.

Parameters

<i>classProbabilities</i>	Auxiliary information for the split.
<i>aux</i>	(Unused) auxiliary information for the split.

39.470.2.3 SplitIfBetter()

```
static double SplitIfBetter (
    const double bestGain,
    const VecType & data,
    const size_t numCategories,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const WeightVecType & weights,
    const size_t minimumLeafSize,
    const double minimumGainSplit,
    arma::Col< typename VecType::elem_type > & classProbabilities,
    AuxiliarySplitInfo< typename VecType::elem_type > & aux ) [static]
```

Check if we can split a node.

If we can split a node in a way that improves on 'bestGain', then we return the improved gain. Otherwise we return the value 'bestGain'. If a split is made, then classProbabilities and aux may be modified. For this particular split type, aux will be empty and classProbabilities will hold one element—the number of children.

Parameters

<i>bestGain</i>	Best gain seen so far (we'll only split if we find gain better than this).
<i>data</i>	The dimension of data points to check for a split in.
<i>numCategories</i>	Number of categories in the categorical data.

Parameters

<i>labels</i>	Labels for each point.
<i>numClasses</i>	Number of classes in the dataset.
<i>minimumLeafSize</i>	Minimum number of points in a leaf node for splitting.
<i>classProbabilities</i>	Class probabilities vector, which may be filled with split information a successful split.
<i>aux</i>	Auxiliary split information, which may be modified on a successful split.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_tree/ **all_categorical_split.hpp**

39.471 AllCategoricalSplit< FitnessFunction >::AuxiliarySplitInfo< ElemType > Class Template Reference

39.471.1 Detailed Description

```
template<typename FitnessFunction>
template<typename ElemType>
class mlpack::tree::AllCategoricalSplit< FitnessFunction >::AuxiliarySplitInfo< ElemType >
```

Definition at line 33 of file all_categorical_split.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_tree/ **all_categorical_split.hpp**

39.472 AllDimensionSelect Class Reference

This dimension selection policy allows any dimension to be selected for splitting.

Public Member Functions

- **AllDimensionSelect** ()
*Construct the **AllDimensionSelect** (p. 1984) object for the given number of dimensions.*
- size_t **Begin** ()
Get the first dimension to select from.
- size_t **Dimensions** () const
Get the number of dimensions.
- size_t & **Dimensions** ()
Modify the number of dimensions.
- size_t **End** () const
Get the last dimension to select from.
- size_t **Next** ()
Get the next dimension.

39.472.1 Detailed Description

This dimension selection policy allows any dimension to be selected for splitting.

Definition at line 22 of file all_dimension_select.hpp.

39.472.2 Constructor & Destructor Documentation

39.472.2.1 AllDimensionSelect()

```
AllDimensionSelect ( ) [inline]
```

Construct the **AllDimensionSelect** (p. 1984) object for the given number of dimensions.

Definition at line 28 of file all_dimension_select.hpp.

39.472.3 Member Function Documentation

39.472.3.1 Begin()

```
size_t Begin ( ) [inline]
```

Get the first dimension to select from.

Definition at line 33 of file all_dimension_select.hpp.

39.472.3.2 Dimensions() [1/2]

```
size_t Dimensions ( ) const [inline]
```

Get the number of dimensions.

Definition at line 50 of file all_dimension_select.hpp.

39.472.3.3 Dimensions() [2/2]

```
size_t& Dimensions ( ) [inline]
```

Modify the number of dimensions.

Definition at line 52 of file all_dimension_select.hpp.

39.472.3.4 End()

```
size_t End ( ) const [inline]
```

Get the last dimension to select from.

Definition at line 42 of file all_dimension_select.hpp.

39.472.3.5 Next()

```
size_t Next ( ) [inline]
```

Get the next dimension.

Definition at line 47 of file all_dimension_select.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_tree/ **all_dimension_select.hpp**

39.473 AxisParallelProjVector Class Reference

AxisParallelProjVector (p. 1986) defines an axis-parallel projection vector.

Public Member Functions

- **AxisParallelProjVector** (size_t dim=0)
Create the projection vector based on the specified dimension.
- template<typename VecType >
double **Project** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0) const
Project the given point on the projection vector.
- template<typename MetricType , typename ElemType >
math::RangeType< ElemType > **Project** (const **bound::HRectBound**< MetricType, ElemType > &bound) const
Project the given hrect bound on the projection vector.
- template<typename MetricType , typename VecType >
math::RangeType< typename VecType::elem_type > **Project** (const **bound::BallBound**< MetricType, VecType > &bound) const
Project the given ball bound on the projection vector.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialization.

39.473.1 Detailed Description

AxisParallelProjVector (p. 1986) defines an axis-parallel projection vector.

We can efficiently project points, simply analyzing a specific dimension.

Definition at line 24 of file projection_vector.hpp.

39.473.2 Constructor & Destructor Documentation

39.473.2.1 AxisParallelProjVector()

```
AxisParallelProjVector (  
    size_t dim = 0 ) [inline]
```

Create the projection vector based on the specified dimension.

Parameters

<i>dim</i>	Dimension to be considered.
------------	-----------------------------

Definition at line 35 of file projection_vector.hpp.

39.473.3 Member Function Documentation

39.473.3.1 Project() [1/3]

```
double Project (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Project the given point on the projection vector.

Parameters

<i>point</i>	Point to be projected.
--------------	------------------------

Definition at line 45 of file projection_vector.hpp.

Referenced by ProjVector::Project().

39.473.3.2 Project() [2/3]

```
math::RangeType<ElemType> Project (
    const bound::HRectBound< MetricType, ElemType > & bound ) const [inline]
```

Project the given hrect bound on the projection vector.

Parameters

<i>bound</i>	Bound to be projected.
--------------	------------------------

Returns

Range of projected values.

Definition at line 58 of file projection_vector.hpp.

39.473.3.3 Project() [3/3]

```
math::RangeType<typename VecType::elem_type> Project (
    const bound::BallBound< MetricType, VecType > & bound ) const [inline]
```

Project the given ball bound on the projection vector.

Parameters

<i>bound</i>	Bound to be projected.
--------------	------------------------

Returns

Range of projected values.

Definition at line 71 of file `projection_vector.hpp`.

39.473.3.4 **serialize()**

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialization.

Definition at line 81 of file `projection_vector.hpp`.

The documentation for this class was generated from the following file:

39.474 **BestBinaryNumericSplit**< **FitnessFunction** > Class Template Reference

The **BestBinaryNumericSplit** (p. 1989) is a splitting function for decision trees that will exhaustively search a numeric dimension for the best binary split.

Classes

- class **AuxiliarySplitInfo**

Static Public Member Functions

- `template<typename ElemType >`
`static size_t CalculateDirection (const ElemType &point, const arma::Col< ElemType > &classProbabilities, const AuxiliarySplitInfo< ElemType > &)`
Given a point, calculate which child it should go to (left or right).
- `template<typename ElemType >`
`static size_t NumChildren (const arma::Col< ElemType > &, const AuxiliarySplitInfo< ElemType > &)`
Returns 2, since the binary split always has two children.
- `template<bool UseWeights, typename VecType, typename WeightVecType >`
`static double SplitIfBetter (const double bestGain, const VecType &data, const arma::Row< size_t > &labels, const size_t numClasses, const WeightVecType &weights, const size_t minimumLeafSize, const double minimumGainSplit, arma::Col< typename VecType::elem_type > &classProbabilities, AuxiliarySplitInfo< typename VecType::elem_type > &aux)`
Check if we can split a node.

39.474.1 Detailed Description

```
template<typename FitnessFunction>
class mlpack::tree::BestBinaryNumericSplit< FitnessFunction >
```

The **BestBinaryNumericSplit** (p. 1989) is a splitting function for decision trees that will exhaustively search a numeric dimension for the best binary split.

Template Parameters

<i>FitnessFunction</i>	Fitness function to use to calculate gain.
------------------------	--

Definition at line 27 of file `best_binary_numeric_split.hpp`.

39.474.2 Member Function Documentation

39.474.2.1 CalculateDirection()

```
static size_t CalculateDirection (
    const ElemType & point,
    const arma::Col< ElemType > & classProbabilities,
    const AuxiliarySplitInfo< ElemType > & ) [static]
```

Given a point, calculate which child it should go to (left or right).

Parameters

<i>point</i>	Point to calculate direction of.
<i>classProbabilities</i>	Auxiliary information for the split.
<i>aux</i>	(Unused) auxiliary information for the split.

Referenced by `BestBinaryNumericSplit< FitnessFunction >::NumChildren()`.

39.474.2.2 NumChildren()

```
static size_t NumChildren (
    const arma::Col< ElemType > & ,
    const AuxiliarySplitInfo< ElemType > & ) [inline], [static]
```

Returns 2, since the binary split always has two children.

Definition at line 69 of file best_binary_numeric_split.hpp.

References BestBinaryNumericSplit< FitnessFunction >::CalculateDirection().

39.474.2.3 SplitIfBetter()

```
static double SplitIfBetter (
    const double bestGain,
    const VecType & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const WeightVecType & weights,
    const size_t minimumLeafSize,
    const double minimumGainSplit,
    arma::Col< typename VecType::elem_type > & classProbabilities,
    AuxiliarySplitInfo< typename VecType::elem_type > & aux ) [static]
```

Check if we can split a node.

If we can split a node in a way that improves on 'bestGain', then we return the improved gain. Otherwise we return the value 'bestGain'. If a split is made, then classProbabilities and aux may be modified.

Parameters

<i>bestGain</i>	Best gain seen so far (we'll only split if we find gain better than this).
<i>data</i>	The dimension of data points to check for a split in.
<i>numCategories</i>	Number of categories in the categorical data.
<i>labels</i>	Labels for each point.
<i>numClasses</i>	Number of classes in the dataset.
<i>minimumLeafSize</i>	Minimum number of points in a leaf node for splitting.
<i>classProbabilities</i>	Class probabilities vector, which may be filled with split information a successful split.
<i>aux</i>	Auxiliary split information, which may be modified on a successful split.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_tree/ **best_binary_numeric_split.hpp**

39.475 BestBinaryNumericSplit< FitnessFunction >::AuxiliarySplitInfo< ElemType > Class Template Reference

39.475.1 Detailed Description

```
template<typename FitnessFunction>
template<typename ElemType>
class mlpack::tree::BestBinaryNumericSplit< FitnessFunction >::AuxiliarySplitInfo< ElemType >
```

Definition at line 32 of file best_binary_numeric_split.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_tree/ **best_binary_numeric_split.hpp**

39.476 BinaryNumericSplit< FitnessFunction, ObservationType > Class Template Reference

The **BinaryNumericSplit** (p. 1992) class implements the numeric feature splitting strategy devised by Gama, Rocha, and Medas in the following paper:

Public Types

- typedef **BinaryNumericSplitInfo**< ObservationType > **SplitInfo**
*The splitting information required by the **BinaryNumericSplit** (p. 1992).*

Public Member Functions

- **BinaryNumericSplit** (const size_t numClasses=0)
*Create the **BinaryNumericSplit** (p. 1992) object with the given number of classes.*
- **BinaryNumericSplit** (const size_t numClasses, const **BinaryNumericSplit** &other)
*Create the **BinaryNumericSplit** (p. 1992) object with the given number of classes, using information from the given other split for other parameters.*
- void **EvaluateFitnessFunction** (double &bestFitness, double &secondBestFitness)
Given the points seen so far, evaluate the fitness function, returning the best possible gain of a binary split.
- size_t **MajorityClass** () const
The majority class of the points seen so far.
- double **MajorityProbability** () const
The probability of the majority class given the points seen so far.
- size_t **NumChildren** () const
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the object.
- void **Split** (arma::Col< size_t > &childMajorities, **SplitInfo** &splitInfo)
Given that a split should happen, return the majority classes of the (two) children and an initialized SplitInfo object.
- void **Train** (ObservationType value, const size_t label)
Train on the given value with the given label.

39.476.1 Detailed Description

```
template<typename FitnessFunction, typename ObservationType = double>
class mlpack::tree::BinaryNumericSplit< FitnessFunction, ObservationType >
```

The **BinaryNumericSplit** (p. 1992) class implements the numeric feature splitting strategy devised by Gama, Rocha, and Medas in the following paper:

```
@inproceedings{gama2003accurate,
  title={Accurate Decision Trees for Mining High-Speed Data Streams},
  author={Gama, J. and Rocha, R. and Medas, P.},
  year={2003},
  booktitle={Proceedings of the Ninth ACM SIGKDD International Conference on
    Knowledge Discovery and Data Mining (KDD '03)},
  pages={523--528}
}
```

This splitting procedure builds a binary tree on points it has seen so far, and then **EvaluateFitnessFunction()** (p. 1994) returns the best possible split in $O(n)$ time, where n is the number of samples seen so far. Every split with this split type returns only two splits (greater than or equal to the split point, and less than the split point). The **Train()** (p. 1996) function should take $O(1)$ time.

Template Parameters

<i>FitnessFunction</i>	Fitness function to use for calculating gain.
<i>ObservationType</i>	Type of observation used by this dimension.

Definition at line 47 of file `binary_numeric_split.hpp`.

39.476.2 Member Typedef Documentation

39.476.2.1 SplitInfo

```
typedef BinaryNumericSplitInfo<ObservationType> SplitInfo
```

The splitting information required by the **BinaryNumericSplit** (p. 1992).

Definition at line 51 of file `binary_numeric_split.hpp`.

39.476.3 Constructor & Destructor Documentation

39.476.3.1 BinaryNumericSplit() [1/2]

```
BinaryNumericSplit (
  const size_t numClasses = 0 )
```

Create the **BinaryNumericSplit** (p. 1992) object with the given number of classes.

Parameters

<i>numClasses</i>	Number of classes in dataset.
-------------------	-------------------------------

39.476.3.2 **BinaryNumericSplit()** [2/2]

```

BinaryNumericSplit (
    const size_t numClasses,
    const BinaryNumericSplit< FitnessFunction, ObservationType > & other )

```

Create the **BinaryNumericSplit** (p. 1992) object with the given number of classes, using information from the given other split for other parameters.

In this case, there are no other parameters, but this function is required by the **HoeffdingTree** (p. 2113) class.

39.476.4 Member Function Documentation

39.476.4.1 **EvaluateFitnessFunction()**

```

void EvaluateFitnessFunction (
    double & bestFitness,
    double & secondBestFitness )

```

Given the points seen so far, evaluate the fitness function, returning the best possible gain of a binary split.

Note that this takes $O(n)$ time, where n is the number of points seen so far. So this may not exactly be fast...

The best possible split will be stored in `bestFitness`, and the second best possible split will be stored in `secondBestFitness`.

Parameters

<i>bestFitness</i>	Fitness function value for best possible split.
<i>secondBestFitness</i>	Fitness function value for second best possible split.

39.476.4.2 **MajorityClass()**

```

size_t MajorityClass ( ) const

```

The majority class of the points seen so far.

Referenced by BinaryNumericSplit< FitnessFunction, ObservationType >::NumChildren().

39.476.4.3 MajorityProbability()

```
double MajorityProbability ( ) const
```

The probability of the majority class given the points seen so far.

Referenced by BinaryNumericSplit< FitnessFunction, ObservationType >::NumChildren().

39.476.4.4 NumChildren()

```
size_t NumChildren ( ) const [inline]
```

Definition at line 93 of file binary_numeric_split.hpp.

References BinaryNumericSplit< FitnessFunction, ObservationType >::MajorityClass(), BinaryNumericSplit< FitnessFunction, ObservationType >::MajorityProbability(), BinaryNumericSplit< FitnessFunction, ObservationType >::serialize(), and BinaryNumericSplit< FitnessFunction, ObservationType >::Split().

39.476.4.5 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the object.

Referenced by BinaryNumericSplit< FitnessFunction, ObservationType >::NumChildren().

39.476.4.6 Split()

```
void Split (
    arma::Col< size_t > & childMajorities,
    SplitInfo & splitInfo )
```

Given that a split should happen, return the majority classes of the (two) children and an initialized SplitInfo object.

Parameters

<i>childMajorities</i>	Majority classes of the children after the split.
<i>splitInfo</i>	Split information.

Referenced by BinaryNumericSplit< FitnessFunction, ObservationType >::NumChildren().

39.476.4.7 Train()

```
void Train (
    ObservationType value,
    const size_t label )
```

Train on the given value with the given label.

Parameters

<i>value</i>	The value to train on.
<i>label</i>	The label to train on.

39.478 BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > Class Template Reference

A binary space partitioning tree, such as a KD-tree or a ball tree.

Classes

- class **BreadthFirstDualTreeTraverser**
- class **DualTreeTraverser**
A dual-tree traverser for binary space trees; see dual_tree_traverser.hpp.
- class **SingleTreeTraverser**
A single-tree traverser for binary space trees; see single_tree_traverser.hpp for implementation.

Public Types

- typedef MatType::elem_type **ElemType**
The type of element held in MatType.
- typedef MatType **Mat**
So other classes can use TreeType::Mat.
- typedef SplitType< BoundType< MetricType >, MatType > **Split**

Public Member Functions

- **BinarySpaceTree** (const MatType &data, const size_t maxLeafSize=20)
Construct this as the root node of a binary space tree using the given dataset.
- **BinarySpaceTree** (const MatType &data, std::vector< size_t > &oldFromNew, const size_t maxLeafSize=20)
Construct this as the root node of a binary space tree using the given dataset.
- **BinarySpaceTree** (const MatType &data, std::vector< size_t > &oldFromNew, std::vector< size_t > &newFromOld, const size_t maxLeafSize=20)
Construct this as the root node of a binary space tree using the given dataset.
- **BinarySpaceTree** (MatType &&data, const size_t maxLeafSize=20)
Construct this as the root node of a binary space tree using the given dataset.
- **BinarySpaceTree** (MatType &&data, std::vector< size_t > &oldFromNew, const size_t maxLeafSize=20)
Construct this as the root node of a binary space tree using the given dataset.
- **BinarySpaceTree** (MatType &&data, std::vector< size_t > &oldFromNew, std::vector< size_t > &newFromOld, const size_t maxLeafSize=20)
Construct this as the root node of a binary space tree using the given dataset.
- **BinarySpaceTree** (**BinarySpaceTree** *parent, const size_t begin, const size_t count, SplitType< BoundType< MetricType >, MatType > &splitter, const size_t maxLeafSize=20)
Construct this node as a child of the given parent, starting at column begin and using count points.
- **BinarySpaceTree** (**BinarySpaceTree** *parent, const size_t begin, const size_t count, std::vector< size_t > &oldFromNew, SplitType< BoundType< MetricType >, MatType > &splitter, const size_t maxLeafSize=20)
Construct this node as a child of the given parent, starting at column begin and using count points.

- **BinarySpaceTree** (**BinarySpaceTree** *parent, const size_t begin, const size_t count, std::vector< size_t > &oldFromNew, std::vector< size_t > &newFromOld, SplitType< BoundType< MetricType >, MatType > &splitter, const size_t maxLeafSize=20)
Construct this node as a child of the given parent, starting at column begin and using count points.
- **BinarySpaceTree** (const **BinarySpaceTree** &other)
Create a binary space tree by copying the other tree.
- **BinarySpaceTree** (**BinarySpaceTree** &&other)
*Move constructor for a **BinarySpaceTree** (p. 1998); possess all the members of the given tree.*
- template<typename Archive >
BinarySpaceTree (Archive &ar, const typename **std::enable_if_t**< Archive::is_loading::value > *=0)
*Initialize the tree from a **boost::serialization** (p. 251) archive.*
- ~**BinarySpaceTree** ()
Deletes this node, deallocating the memory for the children and calling their destructors in turn.
- size_t **Begin** () const
Return the index of the beginning point of this subset.
- size_t & **Begin** ()
Modify the index of the beginning point of this subset.
- const BoundType< MetricType > & **Bound** () const
Return the bound object for this node.
- BoundType< MetricType > & **Bound** ()
Return the bound object for this node.
- void **Center** (arma::vec ¢er) const
Store the center of the bounding region in the given vector.
- **BinarySpaceTree** & **Child** (const size_t child) const
Return the specified child (0 will be left, 1 will be right).
- **BinarySpaceTree** *& **ChildPtr** (const size_t child)
- size_t **Count** () const
Return the number of points in this subset.
- size_t & **Count** ()
Modify the number of points in this subset.
- const MatType & **Dataset** () const
Get the dataset which the tree is built on.
- MatType & **Dataset** ()
Modify the dataset which the tree is built on. Be careful!
- size_t **Descendant** (const size_t index) const
Return the index (with reference to the dataset) of a particular descendant of this node.
- ElemType **FurthestDescendantDistance** () const
Return the furthest possible descendant distance.
- ElemType **FurthestPointDistance** () const
Return the furthest distance to a point held in this node.
- template<typename VecType >
size_t **GetFurthestChild** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > *=0)
Return the index of the furthest child node to the given query point.
- size_t **GetFurthestChild** (const **BinarySpaceTree** &queryNode)
Return the index of the furthest child node to the given query node.

- `template<typename VecType >`
`size_t GetNearestChild (const VecType &point, typename std::enable_if_t< IsVector< VecType >::value > ==0)`
Return the index of the nearest child node to the given query point.
- `size_t GetNearestChild (const BinarySpaceTree &queryNode)`
Return the index of the nearest child node to the given query node.
- `bool IsLeaf () const`
Return whether or not this node is a leaf (true if it has no children).
- `BinarySpaceTree * Left () const`
Gets the left child of this node.
- `BinarySpaceTree *& Left ()`
Modify the left child of this node.
- `ElemType MaxDistance (const BinarySpaceTree &other) const`
Return the maximum distance to another node.
- `template<typename VecType >`
`ElemType MaxDistance (const VecType &point, typename std::enable_if_t< IsVector< VecType >::value > ==0) const`
Return the maximum distance to another point.
- `MetricType Metric () const`
Get the metric that the tree uses.
- `ElemType MinDistance (const BinarySpaceTree &other) const`
Return the minimum distance to another node.
- `template<typename VecType >`
`ElemType MinDistance (const VecType &point, typename std::enable_if_t< IsVector< VecType >::value > ==0) const`
Return the minimum distance to another point.
- `ElemType MinimumBoundDistance () const`
Return the minimum distance from the center of the node to any bound edge.
- `size_t NumChildren () const`
Return the number of children in this node.
- `size_t NumDescendants () const`
Return the number of descendants of this node.
- `size_t NumPoints () const`
Return the number of points in this node (0 if not a leaf).
- `BinarySpaceTree * Parent () const`
Gets the parent of this node.
- `BinarySpaceTree *& Parent ()`
Modify the parent of this node.
- `ElemType ParentDistance () const`
Return the distance from the center of this node to the center of the parent node.
- `ElemType & ParentDistance ()`
Modify the distance from the center of this node to the center of the parent node.
- `size_t Point (const size_t index) const`
Return the index (with reference to the dataset) of a particular point in this node.
- `math::RangeType< ElemType > RangeDistance (const BinarySpaceTree &other) const`
Return the minimum and maximum distance to another node.

- `template<typename VecType >`
`math::RangeType< ElemType > RangeDistance` (const VecType &point, typename `std::enable_if_t< IsVector< VecType >::value > !=0`) const
Return the minimum and maximum distance to another point.
- `BinarySpaceTree * Right ()` const
Gets the right child of this node.
- `BinarySpaceTree *& Right ()`
Modify the right child of this node.
- `template<typename Archive >`
`void serialize` (Archive &ar, const unsigned int version)
Serialize the tree.
- `const StatisticType & Stat ()` const
Return the statistic object for this node.
- `StatisticType & Stat ()`
Return the statistic object for this node.

Protected Member Functions

- `BinarySpaceTree ()`
A default constructor.

39.478.1 Detailed Description

```
template<typename MetricType, typename StatisticType = EmptyStatistic, typename MatType = arma::mat, template< typename
BoundMetricType, typename... > class BoundType = bound::HRectBound, template< typename SplitBoundType, typename Split<
MatType > class SplitType = MidpointSplit>
class mlpack::tree::BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >
```

A binary space partitioning tree, such as a KD-tree or a ball tree.

Once the bound and type of dataset is defined, the tree will construct itself. Call the constructor with the dataset to build the tree on, and the entire tree will be built.

This particular tree does not allow growth, so you cannot add or delete nodes from it. If you need to add or delete a node, the better procedure is to rebuild the tree entirely.

This tree does take one runtime parameter in the constructor, which is the max leaf size to be used.

Template Parameters

<i>MetricType</i>	The metric used for tree-building. The BoundType may place restrictions on the metrics that can be used.
<i>StatisticType</i>	Extra data contained in the node. See <code>statistic.hpp</code> (p. 2688) for the necessary skeleton interface.
<i>MatType</i>	The dataset class.
<i>BoundType</i>	The bound used for each node. HRectBound, the default, requires that an LMetric<> is used for MetricType (so, EuclideanDistance, ManhattanDistance, etc.).
<i>SplitType</i>	The class that partitions the dataset/points at a particular node into two parts. Its definition decides the way this split is done.

Definition at line 54 of file `binary_space_tree.hpp`.

39.478.2 Member Typedef Documentation

39.478.2.1 ElemType

```
typedef MatType::elem_type ElemType
```

The type of element held in `MatType`.

Definition at line 60 of file `binary_space_tree.hpp`.

39.478.2.2 Mat

```
typedef MatType Mat
```

So other classes can use `TreeType::Mat`.

Definition at line 58 of file `binary_space_tree.hpp`.

39.478.2.3 Split

```
typedef SplitType<BoundType<MetricType>, MatType> Split
```

Definition at line 62 of file `binary_space_tree.hpp`.

39.478.3 Constructor & Destructor Documentation

39.478.3.1 BinarySpaceTree() [1/13]

```
BinarySpaceTree (  
    const MatType & data,  
    const size_t maxLeafSize = 20 )
```

Construct this as the root node of a binary space tree using the given dataset.

This will copy the input matrix; if you don't want this, consider using the constructor that takes an rvalue reference and use `std::move()`.

Parameters

<i>data</i>	Dataset to create tree from. This will be copied!
<i>maxLeafSize</i>	Size of each leaf in the tree.

39.478.3.2 BinarySpaceTree() [2/13]

```
BinarySpaceTree (
    const MatType & data,
    std::vector< size_t > & oldFromNew,
    const size_t maxLeafSize = 20 )
```

Construct this as the root node of a binary space tree using the given dataset.

This will copy the input matrix and modify its ordering; a mapping of the old point indices to the new point indices is filled. If you don't want the matrix to be copied, consider using the constructor that takes an rvalue reference and use `std::move()`.

Parameters

<i>data</i>	Dataset to create tree from. This will be copied!
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.
<i>maxLeafSize</i>	Size of each leaf in the tree.

39.478.3.3 BinarySpaceTree() [3/13]

```
BinarySpaceTree (
    const MatType & data,
    std::vector< size_t > & oldFromNew,
    std::vector< size_t > & newFromOld,
    const size_t maxLeafSize = 20 )
```

Construct this as the root node of a binary space tree using the given dataset.

This will copy the input matrix and modify its ordering; a mapping of the old point indices to the new point indices is filled, as well as a mapping of the new point indices to the old point indices. If you don't want the matrix to be copied, consider using the constructor that takes an rvalue reference and use `std::move()`.

Parameters

<i>data</i>	Dataset to create tree from. This will be copied!
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.
<i>newFromOld</i>	Vector which will be filled with the new positions for each old point.
<i>maxLeafSize</i>	Size of each leaf in the tree.

39.478.3.4 BinarySpaceTree() [4/13]

```

BinarySpaceTree (
    MatType && data,
    const size_t maxLeafSize = 20 )

```

Construct this as the root node of a binary space tree using the given dataset.

This will take ownership of the data matrix; if you don't want this, consider using the constructor that takes a const reference to a dataset.

Parameters

<i>data</i>	Dataset to create tree from.
<i>maxLeafSize</i>	Size of each leaf in the tree.

39.478.3.5 BinarySpaceTree() [5/13]

```

BinarySpaceTree (
    MatType && data,
    std::vector< size_t > & oldFromNew,
    const size_t maxLeafSize = 20 )

```

Construct this as the root node of a binary space tree using the given dataset.

This will take ownership of the data matrix; a mapping of the old point indices to the new point indices is filled. If you don't want the matrix to have its ownership taken, consider using the constructor that takes a const reference to a dataset.

Parameters

<i>data</i>	Dataset to create tree from.
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.
<i>maxLeafSize</i>	Size of each leaf in the tree.

39.478.3.6 BinarySpaceTree() [6/13]

```

BinarySpaceTree (
    MatType && data,
    std::vector< size_t > & oldFromNew,

```

```
std::vector< size_t > & newFromOld,  
const size_t maxLeafSize = 20 )
```

Construct this as the root node of a binary space tree using the given dataset.

This will take ownership of the data matrix; a mapping of the old point indices to the new point indices is filled, as well as a mapping of the new point indices to the old point indices. If you don't want the matrix to have its ownership taken, consider using the constructor that takes a const reference to a dataset.

Parameters

<i>data</i>	Dataset to create tree from.
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.
<i>newFromOld</i>	Vector which will be filled with the new positions for each old point.
<i>maxLeafSize</i>	Size of each leaf in the tree.

39.478.3.7 BinarySpaceTree() [7/13]

```
BinarySpaceTree (  
    BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > * parent,  
    const size_t begin,  
    const size_t count,  
    SplitType< BoundType< MetricType >, MatType > & splitter,  
    const size_t maxLeafSize = 20 )
```

Construct this node as a child of the given parent, starting at column begin and using count points.

The ordering of that subset of points in the parent's data matrix will be modified! This is used for recursive tree-building by the other constructors which don't specify point indices.

Parameters

<i>parent</i>	Parent of this node. Its dataset will be modified!
<i>begin</i>	Index of point to start tree construction with.
<i>count</i>	Number of points to use to construct tree.
<i>splitter</i>	Instantiated node splitter object.
<i>maxLeafSize</i>	Size of each leaf in the tree.

39.478.3.8 BinarySpaceTree() [8/13]

```
BinarySpaceTree (  
    BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > * parent,
```

```

const size_t begin,
const size_t count,
std::vector< size_t > & oldFromNew,
SplitType< BoundType< MetricType >, MatType > & splitter,
const size_t maxLeafSize = 20 )

```

Construct this node as a child of the given parent, starting at column begin and using count points.

The ordering of that subset of points in the parent's data matrix will be modified! This is used for recursive tree-building by the other constructors which don't specify point indices.

A mapping of the old point indices to the new point indices is filled, but it is expected that the vector is already allocated with size greater than or equal to (begin + count), and if that is not true, invalid memory reads (and writes) will occur.

Parameters

<i>parent</i>	Parent of this node. Its dataset will be modified!
<i>begin</i>	Index of point to start tree construction with.
<i>count</i>	Number of points to use to construct tree.
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.
<i>splitter</i>	Instantiated node splitter object.
<i>maxLeafSize</i>	Size of each leaf in the tree.

39.478.3.9 BinarySpaceTree() [9/13]

BinarySpaceTree (

```

    BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > * parent,
const size_t begin,
const size_t count,
std::vector< size_t > & oldFromNew,
std::vector< size_t > & newFromOld,
SplitType< BoundType< MetricType >, MatType > & splitter,
const size_t maxLeafSize = 20 )

```

Construct this node as a child of the given parent, starting at column begin and using count points.

The ordering of that subset of points in the parent's data matrix will be modified! This is used for recursive tree-building by the other constructors which don't specify point indices.

A mapping of the old point indices to the new point indices is filled, as well as a mapping of the new point indices to the old point indices. It is expected that the vector is already allocated with size greater than or equal to (begin_in + count_in), and if that is not true, invalid memory reads (and writes) will occur.

Parameters

<i>parent</i>	Parent of this node. Its dataset will be modified!
<i>begin</i>	Index of point to start tree construction with.
<i>count</i>	Number of points to use to construct tree.
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.
<i>newFromOld</i>	Vector which will be filled with the new positions for each old point.
<i>maxLeafSize</i>	Size of each leaf in the tree.

39.478.3.10 BinarySpaceTree() [10/13]

```
BinarySpaceTree (
    const BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > &
    other )
```

Create a binary space tree by copying the other tree.

Be careful! This can take a long time and use a lot of memory.

Parameters

<i>other</i>	Tree to be replicated.
--------------	------------------------

39.478.3.11 BinarySpaceTree() [11/13]

```
BinarySpaceTree (
    BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > &&
    other )
```

Move constructor for a **BinarySpaceTree** (p. 1998); possess all the members of the given tree.

39.478.3.12 BinarySpaceTree() [12/13]

```
BinarySpaceTree (
    Archive & ar,
    const typename std::enable_if_t< Archive::is_loading::value > * = 0 )
```

Initialize the tree from a **boost::serialization** (p. 251) archive.

Parameters

<i>ar</i>	Archive to load tree from. Must be an iarchive, not an oarchive.
-----------	--

39.478.3.13 ~BinarySpaceTree()

```
~ BinarySpaceTree ( )
```

Deletes this node, deallocating the memory for the children and calling their destructors in turn.

This will invalidate any pointers or references to any nodes which are children of this one.

39.478.3.14 `BinarySpaceTree()` [13/13]

```
BinarySpaceTree ( ) [protected]
```

A default constructor.

This is meant to only be used with **boost::serialization** (p. 251), which is allowed with the friend declaration below. This does not return a valid tree! The method must be protected, so that the serialization shim can work with the default constructor.

Referenced by `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::Center()`.

39.478.4 Member Function Documentation

39.478.4.1 `Begin()` [1/2]

```
size_t Begin ( ) const [inline]
```

Return the index of the beginning point of this subset.

Definition at line 483 of file `binary_space_tree.hpp`.

39.478.4.2 `Begin()` [2/2]

```
size_t& Begin ( ) [inline]
```

Modify the index of the beginning point of this subset.

Definition at line 485 of file `binary_space_tree.hpp`.

39.478.4.3 Bound() [1/2]

```
const BoundType<MetricType>& Bound ( ) const [inline]
```

Return the bound object for this node.

Definition at line 304 of file `binary_space_tree.hpp`.

Referenced by `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::MaxDistance()`, `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::MinDistance()`, and `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::RangeDistance()`.

39.478.4.4 Bound() [2/2]

```
BoundType<MetricType>& Bound ( ) [inline]
```

Return the bound object for this node.

Definition at line 306 of file `binary_space_tree.hpp`.

39.478.4.5 Center()

```
void Center (
    arma::vec & center ) const [inline]
```

Store the center of the bounding region in the given vector.

Definition at line 493 of file `binary_space_tree.hpp`.

References `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::BinarySpaceTree()`.

39.478.4.6 Child()

```
BinarySpaceTree& Child (
    const size_t child ) const
```

Return the specified child (0 will be left, 1 will be right).

If the index is greater than 1, this will return the right child.

Parameters

<i>child</i>	Index of child to return.
--------------	---------------------------

Referenced by `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::ParentDistance()`.

39.478.4.7 ChildPtr()

```
BinarySpaceTree*& ChildPtr (
    const size_t child ) [inline]
```

Definition at line 405 of file `binary_space_tree.hpp`.

References `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::Descendant()`, `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::NumDescendants()`, `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::NumPoints()`, and `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::Point()`.

39.478.4.8 Count() [1/2]

```
size_t Count ( ) const [inline]
```

Return the number of points in this subset.

Definition at line 488 of file `binary_space_tree.hpp`.

39.478.4.9 Count() [2/2]

```
size_t& Count ( ) [inline]
```

Modify the number of points in this subset.

Definition at line 490 of file `binary_space_tree.hpp`.

39.478.4.10 Dataset() [1/2]

```
const MatType& Dataset ( ) const [inline]
```

Get the dataset which the tree is built on.

Definition at line 332 of file binary_space_tree.hpp.

39.478.4.11 Dataset() [2/2]

```
MatType& Dataset ( ) [inline]
```

Modify the dataset which the tree is built on. Be careful!

Definition at line 334 of file binary_space_tree.hpp.

39.478.4.12 Descendant()

```
size_t Descendant (
    const size_t index ) const
```

Return the index (with reference to the dataset) of a particular descendant of this node.

The index should be greater than zero but less than the number of descendants.

Parameters

<i>index</i>	Index of the descendant.
--------------	--------------------------

Referenced by BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::ChildPtr().

39.478.4.13 FurthestDescendantDistance()

```
ElemType FurthestDescendantDistance ( ) const
```

Return the furthest possible descendant distance.

This returns the maximum distance from the centroid to the edge of the bound and not the empirical quantity which is the actual furthest descendant distance. So the actual furthest descendant distance may be less than what this method returns (but it will never be greater than this).

Referenced by BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::Metric().

39.478.4.14 FurthestPointDistance()

```
ElemType FurthestPointDistance ( ) const
```

Return the furthest distance to a point held in this node.

If this is not a leaf node, then the distance is 0 because the node holds no points.

Referenced by `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::Metric()`.

39.478.4.15 GetFurthestChild() [1/2]

```
size_t GetFurthestChild (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 )
```

Return the index of the furthest child node to the given query point.

If this is a leaf node, it will return **NumChildren()** (p. 2015) (invalid index).

Referenced by `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::Metric()`.

39.478.4.16 GetFurthestChild() [2/2]

```
size_t GetFurthestChild (
    const BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > &
    queryNode )
```

Return the index of the furthest child node to the given query node.

If it can't decide, it will return **NumChildren()** (p. 2015) (invalid index).

39.478.4.17 GetNearestChild() [1/2]

```
size_t GetNearestChild (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 )
```

Return the index of the nearest child node to the given query point.

If this is a leaf node, it will return **NumChildren()** (p. 2015) (invalid index).

Referenced by `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::Metric()`.

39.478.4.18 GetNearestChild() [2/2]

```
size_t GetNearestChild (
    const BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > &
    queryNode )
```

Return the index of the nearest child node to the given query node.

If it can't decide, it will return **NumChildren()** (p.2015) (invalid index).

39.478.4.19 IsLeaf()

```
bool IsLeaf ( ) const
```

Return whether or not this node is a leaf (true if it has no children).

Referenced by **BinarySpaceTree**< MetricType, StatisticType, MatType, BoundType, SplitType >::Stat().

39.478.4.20 Left() [1/2]

```
BinarySpaceTree* Left ( ) const [inline]
```

Gets the left child of this node.

Definition at line 317 of file `binary_space_tree.hpp`.

39.478.4.21 Left() [2/2]

```
BinarySpaceTree*& Left ( ) [inline]
```

Modify the left child of this node.

Definition at line 319 of file `binary_space_tree.hpp`.

39.478.4.22 MaxDistance() [1/2]

```
ElemType MaxDistance (
    const BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > &
    other ) const [inline]
```

Return the maximum distance to another node.

Definition at line 444 of file `binary_space_tree.hpp`.

References **BinarySpaceTree**< MetricType, StatisticType, MatType, BoundType, SplitType >::Bound().

39.478.4.23 MaxDistance() [2/2]

```
ElemType MaxDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Return the maximum distance to another point.

Definition at line 466 of file `binary_space_tree.hpp`.

39.478.4.24 Metric()

```
MetricType Metric ( ) const [inline]
```

Get the metric that the tree uses.

Definition at line 337 of file `binary_space_tree.hpp`.

References `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::FurthestDescendantDistance()`, `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::FurthestPointDistance()`, `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::GetFurthestChild()`, `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::GetNearestChild()`, `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::MinimumBoundDistance()`, and `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::NumChildren()`.

39.478.4.25 MinDistance() [1/2]

```
ElemType MinDistance (
    const BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > &
    other ) const [inline]
```

Return the minimum distance to another node.

Definition at line 438 of file `binary_space_tree.hpp`.

References `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::Bound()`.

39.478.4.26 MinDistance() [2/2]

```
ElemType MinDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Return the minimum distance to another point.

Definition at line 457 of file `binary_space_tree.hpp`.

39.478.4.27 MinimumBoundDistance()

```
ElemType MinimumBoundDistance ( ) const
```

Return the minimum distance from the center of the node to any bound edge.

Referenced by BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::Metric().

39.478.4.28 NumChildren()

```
size_t NumChildren ( ) const
```

Return the number of children in this node.

Referenced by BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::Metric().

39.478.4.29 NumDescendants()

```
size_t NumDescendants ( ) const
```

Return the number of descendants of this node.

For a non-leaf in a binary space tree, this is the number of points at the descendant leaves. For a leaf, this is the number of points in the leaf.

Referenced by BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::ChildPtr().

39.478.4.30 NumPoints()

```
size_t NumPoints ( ) const
```

Return the number of points in this node (0 if not a leaf).

Referenced by BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::ChildPtr().

39.478.4.31 Parent() [1/2]

```
BinarySpaceTree* Parent ( ) const [inline]
```

Gets the parent of this node.

Definition at line 327 of file `binary_space_tree.hpp`.

39.478.4.32 Parent() [2/2]

```
BinarySpaceTree*& Parent ( ) [inline]
```

Modify the parent of this node.

Definition at line 329 of file `binary_space_tree.hpp`.

39.478.4.33 ParentDistance() [1/2]

```
ElemType ParentDistance ( ) const [inline]
```

Return the distance from the center of this node to the center of the parent node.

Definition at line 392 of file `binary_space_tree.hpp`.

39.478.4.34 ParentDistance() [2/2]

```
ElemType& ParentDistance ( ) [inline]
```

Modify the distance from the center of this node to the center of the parent node.

Definition at line 395 of file `binary_space_tree.hpp`.

References `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::Child()`.

39.478.4.35 Point()

```
size_t Point (
    const size_t index ) const
```

Return the index (with reference to the dataset) of a particular point in this node.

This will happily return invalid indices if the given index is greater than the number of points in this node (obtained with **NumPoints()** (p. 2015)) – be careful.

Parameters

<i>index</i>	Index of point for which a dataset index is wanted.
--------------	---

Referenced by BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::ChildPtr().

39.478.4.36 RangeDistance() [1/2]

```
math::RangeType< ElemType> RangeDistance (
    const BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > &
    other ) const [inline]
```

Return the minimum and maximum distance to another node.

Definition at line 450 of file binary_space_tree.hpp.

References BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::Bound().

39.478.4.37 RangeDistance() [2/2]

```
math::RangeType< ElemType> RangeDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Return the minimum and maximum distance to another point.

Definition at line 476 of file binary_space_tree.hpp.

39.478.4.38 Right() [1/2]

```
BinarySpaceTree* Right ( ) const [inline]
```

Gets the right child of this node.

Definition at line 322 of file binary_space_tree.hpp.

39.478.4.39 Right() [2/2]

```
BinarySpaceTree*& Right ( ) [inline]
```

Modify the right child of this node.

Definition at line 324 of file `binary_space_tree.hpp`.

39.478.4.40 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int version )
```

Serialize the tree.

39.478.4.41 Stat() [1/2]

```
const StatisticType& Stat ( ) const [inline]
```

Return the statistic object for this node.

Definition at line 309 of file `binary_space_tree.hpp`.

39.478.4.42 Stat() [2/2]

```
StatisticType& Stat ( ) [inline]
```

Return the statistic object for this node.

Definition at line 311 of file `binary_space_tree.hpp`.

References `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::IsLeaf()`.

```
size_t& NumVisited ( ) [inline]
```

Modify the number of visited combinations.

Definition at line 75 of file `breadth_first_dual_tree_traverser.hpp`.

39.479.4.9 Traverse() [1/2]

```
void Traverse (
    BinarySpaceTree & queryNode,
    BinarySpaceTree & referenceNode )
```

Traverse the two trees.

This does not reset the number of prunes.

Parameters

<i>queryNode</i>	The query node to be traversed.
<i>referenceNode</i>	The reference node to be traversed.
<i>score</i>	The score of the current node combination.

39.479.4.10 Traverse() [2/2]

```
void Traverse (
    BinarySpaceTree & queryNode,
    std::priority_queue< QueueFrameType > & referenceQueue )
```

The documentation for this class was generated from the following files:

Modify the number of prunes.
- size_t **NumScores** () const
Get the number of times a node combination was scored.
- size_t & **NumScores** ()
Modify the number of times a node combination was scored.
- size_t **NumVisited** () const
Get the number of visited combinations.
- size_t & **NumVisited** ()
Modify the number of visited combinations.
- void **Traverse** (BinarySpaceTree &queryNode, BinarySpaceTree &referenceNode)
Traverse the two trees.

39.480.1 Detailed Description

```
template<typename MetricType, typename StatisticType = EmptyStatistic, typename MatType = arma::mat, template< typename
BoundMetricType, typename... > class BoundType = bound::HRectBound, template< typename SplitBoundType, typename SplitType>
class SplitType = MidpointSplit>
template<typename RuleType>
class mpack::tree::BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::DualTreeTraverser< RuleType >
```

A dual-tree traverser for binary space trees; see dual_tree_traverser.hpp.

Definition at line 100 of file binary_space_tree.hpp.

39.480.2 Constructor & Destructor Documentation

39.480.2.1 DualTreeTraverser()

```
DualTreeTraverser (
    RuleType & rule )
```

Instantiate the dual-tree traverser with the given rule set.

39.480.3 Member Function Documentation

39.480.3.1 NumBaseCases() [1/2]

```
size_t NumBaseCases ( ) const [inline]
```

Get the number of times a base case was calculated.

Definition at line 67 of file dual_tree_traverser.hpp.

39.480.3.2 NumBaseCases() [2/2]

```
size_t& NumBaseCases ( ) [inline]
```

Modify the number of times a base case was calculated.

Definition at line 69 of file dual_tree_traverser.hpp.

39.480.3.3 NumPrunes() [1/2]

```
size_t NumPrunes ( ) const [inline]
```

Get the number of prunes.

Definition at line 52 of file dual_tree_traverser.hpp.

39.480.3.4 NumPrunes() [2/2]

```
size_t& NumPrunes ( ) [inline]
```

Modify the number of prunes.

Definition at line 54 of file dual_tree_traverser.hpp.

39.480.3.5 NumScores() [1/2]

```
size_t NumScores ( ) const [inline]
```

Get the number of times a node combination was scored.

Definition at line 62 of file dual_tree_traverser.hpp.

39.480.3.6 NumScores() [2/2]

```
size_t& NumScores ( ) [inline]
```

Modify the number of times a node combination was scored.

Definition at line 64 of file dual_tree_traverser.hpp.

39.480.3.7 NumVisited() [1/2]

```
size_t NumVisited ( ) const [inline]
```

Get the number of visited combinations.

Definition at line 57 of file dual_tree_traverser.hpp.

39.480.3.8 NumVisited() [2/2]

```
size_t& NumVisited ( ) [inline]
```

Modify the number of visited combinations.

Definition at line 59 of file dual_tree_traverser.hpp.

39.480.3.9 Traverse()

```
void Traverse (
    BinarySpaceTree & queryNode,
    BinarySpaceTree & referenceNode )
```

Traverse the two trees.

This does not reset the number of prunes.

Parameters

<i>queryNode</i>	The query node to be traversed.
<i>referenceNode</i>	The reference node to be traversed.
<i>score</i>	The score of the current node combination.

The documentation for this class was generated from the following files:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/ **binary_space_tree.hpp**

39.481 BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::SingleTreeTraverser< RuleType > Class Template Reference

A single-tree traverser for binary space trees; see single_tree_traverser.hpp for implementation.

Public Member Functions

- **SingleTreeTraverser** (RuleType &rule)
Instantiate the single tree traverser with the given rule set.
- size_t **NumPrunes** () const
Get the number of prunes.
- size_t & **NumPrunes** ()
Modify the number of prunes.
- void **Traverse** (const size_t queryIndex, **BinarySpaceTree** &referenceNode)
Traverse the tree with the given point.

39.481.1 Detailed Description

```
template<typename MetricType, typename StatisticType = EmptyStatistic, typename MatType = arma::mat, template< typename
BoundMetricType, typename... > class BoundType = bound::HRectBound, template< typename SplitBoundType, typename Split<
MatType > class SplitType = MidpointSplit>
template<typename RuleType>
class mlpack::tree::BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::SingleTreeTraverser< RuleType
>
```

A single-tree traverser for binary space trees; see single_tree_traverser.hpp for implementation.

Definition at line 96 of file binary_space_tree.hpp.

39.481.2 Constructor & Destructor Documentation

39.481.2.1 SingleTreeTraverser()

```
SingleTreeTraverser (
    RuleType & rule )
```

Instantiate the single tree traverser with the given rule set.

39.481.3 Member Function Documentation

39.481.3.1 NumPrunes() [1/2]

```
size_t NumPrunes ( ) const [inline]
```

Get the number of prunes.

Definition at line 50 of file single_tree_traverser.hpp.

39.481.3.2 NumPrunes() [2/2]

```
size_t& NumPrunes ( ) [inline]
```

Modify the number of prunes.

Definition at line 52 of file single_tree_traverser.hpp.

39.481.3.3 Traverse()

```
void Traverse (
    const size_t queryIndex,
    BinarySpaceTree & referenceNode )
```

Traverse the tree with the given point.

Parameters

<i>queryIndex</i>	The index of the point in the query set which is being used as the query point.
<i>referenceNode</i>	The tree node to be traversed.

The documentation for this class was generated from the following files:

39.484 CosineTree Class Reference

Public Member Functions

- **CosineTree** (const arma::mat &dataset)
***CosineTree** (p. 2030) constructor for the root node of the tree.*
- **CosineTree** (**CosineTree** &parentNode, const std::vector< size_t > &subIndices)
***CosineTree** (p. 2030) constructor for nodes other than the root node of the tree.*
- **CosineTree** (const arma::mat &dataset, const double epsilon, const double delta)
*Construct the **CosineTree** (p. 2030) and the basis for the given matrix, and passed 'epsilon' and 'delta' parameters.*
- **~CosineTree** ()
*Clean up the **CosineTree** (p. 2030): release allocated memory (including children).*
- void **BasisVector** (arma::vec &bVector)
Set the basis vector of the node.
- arma::vec & **BasisVector** ()
Get the basis vector of the node.
- size_t **BinarySearch** (arma::vec &cDistribution, double value, size_t start, size_t end)
Sample a column based on the cumulative Length-Squared distribution of the cosine node, and a randomly generated value in the range [0, 1].
- void **CalculateCentroid** ()
Calculate centroid of the columns present in the node.
- void **CalculateCosines** (arma::vec &cosines)
Calculate cosines of the columns present in the node, with respect to the sampled splitting point.
- arma::vec & **Centroid** ()
Get pointer to the centroid vector.
- size_t **ColumnSampleLS** ()
Sample a point from the Length-Squared distribution of the cosine node.
- void **ColumnSamplesLS** (std::vector< size_t > &sampledIndices, arma::vec &probabilities, size_t numSamples)
Sample 'numSamples' points from the Length-Squared distribution of the cosine node.
- void **ConstructBasis** (**CosineNodeQueue** &treeQueue)
Constructs the final basis matrix, after the cosine tree construction.
- void **CosineNodeSplit** ()

This function splits the cosine node into two children based on the cosines of the columns contained in the node, with respect to the sampled splitting point.

- double **FrobNormSquared** () const
Get the Frobenius norm squared of columns in the node.
- const arma::mat & **GetDataset** () const
Get pointer to the dataset matrix.
- void **GetFinalBasis** (arma::mat &finalBasis)
Returns the basis of the constructed subspace.
- void **L2Error** (const double error)
Set the Monte Carlo error.
- double **L2Error** () const
Get the Monte Carlo error.
- **CosineTree** * **Left** () const
Get pointer to the left child of the node.
- **CosineTree** *& **Left** ()
Modify the pointer to the left child of the node.
- void **ModifiedGramSchmidt** (**CosineNodeQueue** &treeQueue, arma::vec ¢roid, arma::vec &newBasis←
Vector, arma::vec *addBasisVector=NULL)
Calculates the orthonormalization of the passed centroid, with respect to the current vector subspace.
- double **MonteCarloError** (**CosineTree** *node, **CosineNodeQueue** &treeQueue, arma::vec *addBasis←
Vector1=NULL, arma::vec *addBasisVector2=NULL)
Estimates the squared error of the projection of the input node's matrix onto the current vector subspace.
- size_t **NumColumns** () const
Get number of columns of input matrix in the node.
- **CosineTree** * **Parent** () const
Get pointer to the parent node.
- **CosineTree** *& **Parent** ()
Modify the pointer to the parent node.
- **CosineTree** * **Right** () const
Get pointer to the right child of the node.
- **CosineTree** *& **Right** ()
Modify the pointer to the left child of the node.
- size_t **SplitPointIndex** () const
Get the column index of split point of the node.
- std::vector< size_t > & **VectorIndices** ()
Get the indices of columns in the node.

39.484.1 Detailed Description

Definition at line 29 of file cosine_tree.hpp.

39.484.2 Constructor & Destructor Documentation

39.484.2.1 **CosineTree()** [1/3]

```
CosineTree (
    const arma::mat & dataset )
```

CosineTree (p. 2030) constructor for the root node of the tree.

It initializes the necessary variables required for splitting of the node, and building the tree further. It takes a pointer to the input matrix and calculates the relevant variables using it.

Parameters

<i>dataset</i>	Matrix for which cosine tree is constructed.
----------------	--

39.484.2.2 **CosineTree()** [2/3]

```
CosineTree (
    CosineTree & parentNode,
    const std::vector< size_t > & subIndices )
```

CosineTree (p. 2030) constructor for nodes other than the root node of the tree.

It takes in a pointer to the parent node and a list of column indices which mentions the columns to be included in the node. The function calculate the relevant variables just like the constructor above.

Parameters

<i>parentNode</i>	Pointer to the parent cosine node.
<i>subIndices</i>	Pointer to vector of column indices to be included.

39.484.2.3 **CosineTree()** [3/3]

```
CosineTree (
    const arma::mat & dataset,
    const double epsilon,
    const double delta )
```

Construct the **CosineTree** (p. 2030) and the basis for the given matrix, and passed 'epsilon' and 'delta' parameters.

The **CosineTree** (p. 2030) is constructed by splitting nodes in the direction of maximum error, stored using a priority queue. Basis vectors are added from the left and right children of the split node. The basis vector from a node is the orthonormalized centroid of its columns. The splitting continues till the Monte Carlo estimate of the input matrix's projection on the obtained subspace is less than a fraction of the norm of the input matrix.

Parameters

<i>dataset</i>	Matrix for which the CosineTree (p. 2030) is constructed.
<i>epsilon</i>	Error tolerance fraction for calculated subspace.
<i>delta</i>	Cumulative probability for Monte Carlo error lower bound.

39.484.2.4 \sim CosineTree()

\sim **CosineTree** ()

Clean up the **CosineTree** (p. 2030): release allocated memory (including children).

39.484.3 Member Function Documentation

39.484.3.1 BasisVector() [1/2]

```
void BasisVector (
    arma::vec & bVector ) [inline]
```

Set the basis vector of the node.

Definition at line 186 of file cosine_tree.hpp.

39.484.3.2 BasisVector() [2/2]

```
arma::vec& BasisVector ( ) [inline]
```

Get the basis vector of the node.

Definition at line 189 of file cosine_tree.hpp.

39.484.3.3 BinarySearch()

```
size_t BinarySearch (
    arma::vec & cDistribution,
    double value,
    size_t start,
    size_t end )
```

Sample a column based on the cumulative Length-Squared distribution of the cosine node, and a randomly generated value in the range [0, 1].

Binary search is more efficient than searching linearly for the same. This leads a significant speedup when there are large number of columns to choose from and when a number of samples are to be drawn from the distribution.

Parameters

<i>cDistribution</i>	Cumulative LS distribution of columns in the node.
<i>value</i>	Randomly generated value in the range [0, 1].
<i>start</i>	Starting index of the distribution interval to search in.
<i>end</i>	Ending index of the distribution interval to search in.

39.484.3.4 CalculateCentroid()

```
void CalculateCentroid ( )
```

Calculate centroid of the columns present in the node.

The calculated centroid is used as a basis vector for the cosine tree being constructed.

39.484.3.5 CalculateCosines()

```
void CalculateCosines (
    arma::vec & cosines )
```

Calculate cosines of the columns present in the node, with respect to the sampled splitting point.

The calculated cosine values are useful for splitting the node into its children.

Parameters

<i>cosines</i>	Vector to store the cosine values in.
----------------	---------------------------------------

39.484.3.6 Centroid()

```
arma::vec& Centroid ( ) [inline]
```

Get pointer to the centroid vector.

Definition at line 183 of file cosine_tree.hpp.

39.484.3.7 ColumnSampleLS()

```
size_t ColumnSampleLS ( )
```

Sample a point from the Length-Squared distribution of the cosine node.

The function uses 'l2NormsSquared' to calculate the cumulative probability distribution of the column vectors. The sampling is based on a randomly generated value in the range [0, 1].

39.484.3.8 ColumnSamplesLS()

```
void ColumnSamplesLS (
    std::vector< size_t > & sampledIndices,
    arma::vec & probabilities,
    size_t numSamples )
```

Sample 'numSamples' points from the Length-Squared distribution of the cosine node.

The function uses 'l2NormsSquared' to calculate the cumulative probability distribution of the column vectors. The sampling is based on a randomly generated values in the range [0, 1].

39.484.3.9 ConstructBasis()

```
void ConstructBasis (
    CosineNodeQueue & treeQueue )
```

Constructs the final basis matrix, after the cosine tree construction.

Parameters

<i>treeQueue</i>	Priority queue of cosine nodes.
------------------	---------------------------------

39.484.3.10 CosineNodeSplit()

```
void CosineNodeSplit ( )
```

This function splits the cosine node into two children based on the cosines of the columns contained in the node, with respect to the sampled splitting point.

The function also calls the **CosineTree** (p. 2030) constructor for the children.

39.484.3.11 FrobNormSquared()

```
double FrobNormSquared ( ) const [inline]
```

Get the Frobenius norm squared of columns in the node.

Definition at line 210 of file cosine_tree.hpp.

39.484.3.12 GetDataset()

```
const arma::mat& GetDataset ( ) const [inline]
```

Get pointer to the dataset matrix.

Definition at line 172 of file cosine_tree.hpp.

39.484.3.13 GetFinalBasis()

```
void GetFinalBasis (
    arma::mat & finalBasis ) [inline]
```

Returns the basis of the constructed subspace.

Definition at line 169 of file cosine_tree.hpp.

39.484.3.14 L2Error() [1/2]

```
void L2Error (
    const double error ) [inline]
```

Set the Monte Carlo error.

Definition at line 178 of file cosine_tree.hpp.

Referenced by CompareCosineNode::operator()().

39.484.3.15 L2Error() [2/2]

```
double L2Error ( ) const [inline]
```

Get the Monte Carlo error.

Definition at line 180 of file cosine_tree.hpp.

39.484.3.16 Left() [1/2]

```
CosineTree* Left ( ) const [inline]
```

Get pointer to the left child of the node.

Definition at line 197 of file cosine_tree.hpp.

39.484.3.17 Left() [2/2]

```
CosineTree*& Left ( ) [inline]
```

Modify the pointer to the left child of the node.

Definition at line 199 of file cosine_tree.hpp.

39.484.3.18 ModifiedGramSchmidt()

```
void ModifiedGramSchmidt (
    CosineNodeQueue & treeQueue,
    arma::vec & centroid,
    arma::vec & newBasisVector,
    arma::vec * addBasisVector = NULL )
```

Calculates the orthonormalization of the passed centroid, with respect to the current vector subspace.

Parameters

<i>treeQueue</i>	Priority queue of cosine nodes.
<i>centroid</i>	Centroid of the node being added to the basis.
<i>newBasisVector</i>	Orthonormalized centroid of the node.
<i>addBasisVector</i>	Address to additional basis vector.

39.484.3.19 MonteCarloError()

```
double MonteCarloError (
    CosineTree * node,
    CosineNodeQueue & treeQueue,
    arma::vec * addBasisVector1 = NULL,
    arma::vec * addBasisVector2 = NULL )
```

Estimates the squared error of the projection of the input node's matrix onto the current vector subspace.

A normal distribution is fit using weighted norms of projections of samples drawn from the input node's matrix columns. The error is calculated as the difference between the Frobenius norm of the input node's matrix and lower bound of the normal distribution.

Parameters

<i>node</i>	Node for which Monte Carlo estimate is calculated.
<i>treeQueue</i>	Priority queue of cosine nodes.
<i>addBasisVector1</i>	Address to first additional basis vector.
<i>addBasisVector2</i>	Address to second additional basis vector.

39.484.3.20 NumColumns()

```
size_t NumColumns ( ) const [inline]
```

Get number of columns of input matrix in the node.

Definition at line 207 of file cosine_tree.hpp.

39.484.3.21 Parent() [1/2]

```
CosineTree* Parent ( ) const [inline]
```

Get pointer to the parent node.

Definition at line 192 of file cosine_tree.hpp.

39.484.3.22 Parent() [2/2]

```
CosineTree*& Parent ( ) [inline]
```

Modify the pointer to the parent node.

Definition at line 194 of file cosine_tree.hpp.

39.484.3.23 Right() [1/2]

```
CosineTree* Right ( ) const [inline]
```

Get pointer to the right child of the node.

Definition at line 202 of file cosine_tree.hpp.

39.484.3.24 Right() [2/2]

```
CosineTree*& Right ( ) [inline]
```

Modify the pointer to the left child of the node.

Definition at line 204 of file cosine_tree.hpp.

39.484.3.25 SplitPointIndex()

```
size_t SplitPointIndex ( ) const [inline]
```

Get the column index of split point of the node.

Definition at line 213 of file cosine_tree.hpp.

39.484.3.26 VectorIndices()

```
std::vector<size_t>& VectorIndices ( ) [inline]
```

Get the indices of columns in the node.

Definition at line 175 of file cosine_tree.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/cosine_tree/ **cosine_tree.hpp**

39.485 CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > Class Template Reference

A cover tree is a tree specifically designed to speed up nearest-neighbor computation in high-dimensional spaces.

Classes

- class **DualTreeTraverser**
A dual-tree cover tree traverser; see dual_tree_traverser.hpp.
- class **SingleTreeTraverser**
A single-tree cover tree traverser; see single_tree_traverser.hpp for implementation.

Public Types

- template<typename RuleType >
using **BreadthFirstDualTreeTraverser** = **DualTreeTraverser**< RuleType >
- typedef MatType::elem_type **ElemType**
The type held by the matrix type.
- typedef MatType **Mat**
So that other classes can access the matrix type.

Public Member Functions

- **CoverTree** (const MatType &dataset, const **ElemType** base=2.0, MetricType *metric=NULL)
Create the cover tree with the given dataset and given base.
- **CoverTree** (const MatType &dataset, MetricType &metric, const **ElemType** base=2.0)
Create the cover tree with the given dataset and the given instantiated metric.
- **CoverTree** (MatType &&dataset, const **ElemType** base=2.0)
Create the cover tree with the given dataset, taking ownership of the dataset.
- **CoverTree** (MatType &&dataset, MetricType &metric, const **ElemType** base=2.0)
Create the cover tree with the given dataset and the given instantiated metric, taking ownership of the dataset.
- **CoverTree** (const MatType &dataset, const **ElemType** base, const size_t pointIndex, const int scale, **CoverTree** *parent, const **ElemType** parentDistance, arma::Col< size_t > &indices, arma::vec &distances, size_t nearSetSize, size_t &farSetSize, size_t &usedSetSize, MetricType &metric=NULL)
Construct a child cover tree node.
- **CoverTree** (const MatType &dataset, const **ElemType** base, const size_t pointIndex, const int scale, **CoverTree** *parent, const **ElemType** parentDistance, const **ElemType** furthestDescendantDistance, MetricType *metric=NULL)
*Manually construct a cover tree node; no tree assembly is done in this constructor, and children must be added manually (use **Children()** (p. 2051)).*
- **CoverTree** (const **CoverTree** &other)
Create a cover tree from another tree.
- **CoverTree** (**CoverTree** &&other)
Move constructor for a Cover Tree, possess all the members of the given tree.

- template<typename Archive >
CoverTree (Archive &ar, const typename **std::enable_if_t**< Archive::is_loading::value > !=0)
*Create a cover tree from a **boost::serialization** (p. 251) archive.*
- ~**CoverTree** ()
Delete this cover tree node and its children.
- **ElemType Base** () const
Get the base.
- **ElemType & Base** ()
Modify the base; don't do this, you'll break everything.
- void **Center** (arma::vec ¢er) const
Get the center of the node and store it in the given vector.
- const **CoverTree & Child** (const size_t index) const
Get a particular child node.
- **CoverTree & Child** (const size_t index)
Modify a particular child node.
- **CoverTree *& ChildPtr** (const size_t index)
- const std::vector< **CoverTree *** > & **Children** () const
Get the children.
- std::vector< **CoverTree *** > & **Children** ()
Modify the children manually (maybe not a great idea).
- const MatType & **Dataset** () const
Get a reference to the dataset.
- size_t **Descendant** (const size_t index) const
Get the index of a particular descendant point.
- size_t **DistanceComps** () const
- size_t & **DistanceComps** ()
- **ElemType FurthestDescendantDistance** () const
Get the distance from the center of the node to the furthest descendant.
- **ElemType & FurthestDescendantDistance** ()
Modify the distance from the center of the node to the furthest descendant.
- **ElemType FurthestPointDistance** () const
Get the distance to the furthest point. This is always 0 for cover trees.
- template<typename VecType >
size_t **GetFurthestChild** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0)
Return the index of the furthest child node to the given query point.
- size_t **GetFurthestChild** (const **CoverTree** &queryNode)
Return the index of the furthest child node to the given query node.
- template<typename VecType >
size_t **GetNearestChild** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0)
Return the index of the nearest child node to the given query point.
- size_t **GetNearestChild** (const **CoverTree** &queryNode)
Return the index of the nearest child node to the given query node.
- bool **IsLeaf** () const
- **ElemType MaxDistance** (const **CoverTree** &other) const
Return the maximum distance to another node.
- **ElemType MaxDistance** (const **CoverTree** &other, const **ElemType** distance) const

Return the maximum distance to another node given that the point-to-point distance has already been calculated.

- **ElemType MaxDistance** (const arma::vec &other) const

Return the maximum distance to another point.

- **ElemType MaxDistance** (const arma::vec &other, const **ElemType** distance) const

Return the maximum distance to another point given that the distance from the center to the point has already been calculated.

- **MetricType & Metric** () const

Get the instantiated metric.

- **ElemType MinDistance** (const **CoverTree** &other) const

Return the minimum distance to another node.

- **ElemType MinDistance** (const **CoverTree** &other, const **ElemType** distance) const

Return the minimum distance to another node given that the point-to-point distance has already been calculated.

- **ElemType MinDistance** (const arma::vec &other) const

Return the minimum distance to another point.

- **ElemType MinDistance** (const arma::vec &other, const **ElemType** distance) const

Return the minimum distance to another point given that the distance from the center to the point has already been calculated.

- **ElemType MinimumBoundDistance** () const

Get the minimum distance from the center to any bound edge (this is the same as furthestDescendantDistance).

- **size_t NumChildren** () const

Get the number of children.

- **size_t NumDescendants** () const

Get the number of descendant points.

- **size_t NumPoints** () const

- **CoverTree * Parent** () const

Get the parent node.

- **CoverTree *& Parent** ()

Modify the parent node.

- **ElemType ParentDistance** () const

Get the distance to the parent.

- **ElemType & ParentDistance** ()

Modify the distance to the parent.

- **size_t Point** () const

Get the index of the point which this node represents.

- **size_t Point** (const size_t) const

For compatibility with other trees; the argument is ignored.

- **math::RangeType< ElemType > RangeDistance** (const **CoverTree** &other) const

Return the minimum and maximum distance to another node.

- **math::RangeType< ElemType > RangeDistance** (const **CoverTree** &other, const **ElemType** distance) const

Return the minimum and maximum distance to another node given that the point-to-point distance has already been calculated.

- **math::RangeType< ElemType > RangeDistance** (const arma::vec &other) const

Return the minimum and maximum distance to another point.

- **math::RangeType< ElemType > RangeDistance** (const arma::vec &other, const **ElemType** distance) const

Return the minimum and maximum distance to another point given that the point-to-point distance has already been calculated.

- **int Scale** () const

Get the scale of this node.

- int & **Scale** ()
Modify the scale of this node. Be careful...
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the tree.
- const StatisticType & **Stat** () const
Get the statistic for this node.
- StatisticType & **Stat** ()
Modify the statistic for this node.

Protected Member Functions

- **CoverTree** ()
A default constructor.

39.485.1 Detailed Description

```
template<typename MetricType = metric::LMetric<2, true>, typename StatisticType = EmptyStatistic, typename MatType = arma::mat,
typename RootPointPolicy = FirstPointIsRoot>
class mlpack::tree::CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >
```

A cover tree is a tree specifically designed to speed up nearest-neighbor computation in high-dimensional spaces.

Each non-leaf node references a point and has a nonzero number of children, including a "self-child" which references the same point. A leaf node represents only one point.

The tree can be thought of as a hierarchy with the root node at the top level and the leaf nodes at the bottom level. Each level in the tree has an assigned 'scale' i . The tree follows these two invariants:

- nesting: the level C_i is a subset of the level C_{i-1} .
- covering: all node in level C_{i-1} have at least one node in the level C_i with distance less than or equal to b^i (exactly one of these is a parent of the point in level C_{i-1}).

Note that in the cover tree paper, there is a third invariant (the 'separation invariant'), but that does not apply to our implementation, because we have relaxed the invariant.

The value 'b' refers to the base, which is a parameter of the tree. These three properties make the cover tree very good for fast, high-dimensional nearest-neighbor search.

The theoretical structure of the tree contains many 'implicit' nodes which only have a "self-child" (a child referencing the same point, but at a lower scale level). This practical implementation only constructs explicit nodes – non-leaf nodes with more than one child. A leaf node has no children, and its scale level is INT_MIN.

For more information on cover trees, see

```

    and A. Culotta},
  pages = {1527--1535},
  year = {2009}
}
```

The **CoverTree** (p.2040) class offers three template parameters; a custom metric type can be used with `MetricType` (this class defaults to the L2-squared metric). The root node's point can be chosen with the `RootPointPolicy`; by default, the **FirstPointIsRoot** (p.2089) policy is used, meaning the first point in the dataset is used. The `StatisticType` policy allows you to define statistics which can be gathered during the creation of the tree.

Template Parameters

<i>MetricType</i>	Metric type to use during tree construction.
<i>RootPointPolicy</i>	Determines which point to use as the root node.
<i>StatisticType</i>	Statistic to be used during tree creation.
<i>MatType</i>	Type of matrix to build the tree on (generally <code>mat</code> or <code>sp_mat</code>).

39.485.2 Member Typedef Documentation

39.485.2.1 BreadthFirstDualTreeTraverser

```
using BreadthFirstDualTreeTraverser = DualTreeTraverser<RuleType>
```

Definition at line 264 of file `cover_tree.hpp`.

39.485.2.2 ElemType

```
typedef MatType::elem_type ElemType
```

The type held by the matrix type.

Definition at line 105 of file cover_tree.hpp.

39.485.2.3 Mat

```
typedef MatType Mat
```

So that other classes can access the matrix type.

Definition at line 103 of file cover_tree.hpp.

39.485.3 Constructor & Destructor Documentation

39.485.3.1 CoverTree() [1/10]

```
CoverTree (  
    const MatType & dataset,  
    const ElemType base = 2.0,  
    MetricType * metric = NULL )
```

Create the cover tree with the given dataset and given base.

The dataset will not be modified during the building procedure (unlike **BinarySpaceTree** (p. 1998)).

The last argument will be removed in mpack 1.1.0 (see #274 and #273).

Parameters

<i>dataset</i>	Reference to the dataset to build a tree on.
<i>base</i>	Base to use during tree building (default 2.0).

39.485.3.2 CoverTree() [2/10]

```
CoverTree (  
    const MatType & dataset,
```

```

MetricType & metric,
const ElemType base = 2.0 )

```

Create the cover tree with the given dataset and the given instantiated metric.

Optionally, set the base. The dataset will not be modified during the building procedure (unlike **BinarySpaceTree** (p. 1998)).

Parameters

<i>dataset</i>	Reference to the dataset to build a tree on.
<i>metric</i>	Instantiated metric to use during tree building.
<i>base</i>	Base to use during tree building (default 2.0).

39.485.3.3 **CoverTree()** [3/10]

```

CoverTree (
    MatType && dataset,
    const ElemType base = 2.0 )

```

Create the cover tree with the given dataset, taking ownership of the dataset.

Optionally, set the base.

Parameters

<i>dataset</i>	Reference to the dataset to build a tree on.
<i>base</i>	Base to use during tree building (default 2.0).

39.485.3.4 **CoverTree()** [4/10]

```

CoverTree (
    MatType && dataset,
    MetricType & metric,
    const ElemType base = 2.0 )

```

Create the cover tree with the given dataset and the given instantiated metric, taking ownership of the dataset.

Optionally, set the base.

Parameters

<i>dataset</i>	Reference to the dataset to build a tree on.
<i>metric</i>	Instantiated metric to use during tree building.
<i>base</i>	Base to use during tree building (default 2.0).

39.485.3.5 CoverTree() [5/10]

```

CoverTree (
    const MatType & dataset,
    const ElemType base,
    const size_t pointIndex,
    const int scale,
    CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > * parent,
    const ElemType parentDistance,
    arma::Col< size_t > & indices,
    arma::vec & distances,
    size_t nearSetSize,
    size_t & farSetSize,
    size_t & usedSetSize,
    MetricType & metric = NULL )

```

Construct a child cover tree node.

This constructor is not meant to be used externally, but it could be used to insert another node into a tree. This procedure uses only one vector for the near set, the far set, and the used set (this is to prevent unnecessary memory allocation in recursive calls to this constructor). Therefore, the size of the near set, far set, and used set must be passed in. The near set will be entirely used up, and some of the far set may be used. The value of usedSetSize will be set to the number of points used in the construction of this node, and the value of farSetSize will be modified to reflect the number of points in the far set *after* the construction of this node.

If you are calling this manually, be careful that the given scale is as small as possible, or you may be creating an implicit node in your tree.

Parameters

<i>dataset</i>	Reference to the dataset to build a tree on.
<i>base</i>	Base to use during tree building.
<i>pointIndex</i>	Index of the point this node references.
<i>scale</i>	Scale of this level in the tree.
<i>parent</i>	Parent of this node (NULL indicates no parent).
<i>parentDistance</i>	Distance to the parent node.
<i>indices</i>	Array of indices, ordered [nearSet farSet usedSet]; will be modified to [farSet usedSet].
<i>distances</i>	Array of distances, ordered the same way as the indices. These represent the distances between the point specified by pointIndex and each point in the indices array.
<i>nearSetSize</i>	Size of the near set; if 0, this will be a leaf.
<i>farSetSize</i>	Size of the far set; may be modified (if this node uses any points in the far set).
<i>usedSetSize</i>	The number of points used will be added to this number.

39.485.3.6 **CoverTree()** [6/10]

```

CoverTree (
    const MatType & dataset,
    const ElemType base,
    const size_t pointIndex,
    const int scale,
    CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > * parent,
    const ElemType parentDistance,
    const ElemType furthestDescendantDistance,
    MetricType * metric = NULL )

```

Manually construct a cover tree node; no tree assembly is done in this constructor, and children must be added manually (use **Children()** (p. 2051)).

This constructor is useful when the tree is being "imported" into the **CoverTree** (p. 2040) class after being created in some other manner.

Parameters

<i>dataset</i>	Reference to the dataset this node is a part of.
<i>base</i>	Base that was used for tree building.
<i>pointIndex</i>	Index of the point in the dataset which this node refers to.
<i>scale</i>	Scale of this node's level in the tree.
<i>parent</i>	Parent node (NULL indicates no parent).
<i>parentDistance</i>	Distance to parent node point.
<i>furthestDescendantDistance</i>	Distance to furthest descendant point.
<i>metric</i>	Instantiated metric (optional).

39.485.3.7 **CoverTree()** [7/10]

```

CoverTree (
    const CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > & other )

```

Create a cover tree from another tree.

Be careful! This may use a lot of memory and take a lot of time. This will also make a copy of the dataset.

Parameters

<i>other</i>	Cover tree to copy from.
--------------	--------------------------

39.485.3.8 CoverTree() [8/10]

```

CoverTree (
    CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > && other )

```

Move constructor for a Cover Tree, possess all the members of the given tree.

Parameters

<i>other</i>	Cover Tree to move.
--------------	---------------------

39.485.3.9 CoverTree() [9/10]

```

CoverTree (
    Archive & ar,
    const typename std::enable_if_t< Archive::is_loading::value > * = 0 )

```

Create a cover tree from a **boost::serialization** (p. 251) archive.

39.485.3.10 ~CoverTree()

```

~ CoverTree ( )

```

Delete this cover tree node and its children.

39.485.3.11 CoverTree() [10/10]

```

CoverTree ( ) [protected]

```

A default constructor.

This is meant to only be used with **boost::serialization** (p. 251), which is allowed with the friend declaration below. This does not return a valid tree! This method must be protected, so that the serialization shim can work with the default constructor.

Referenced by CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::Metric().

39.485.4 Member Function Documentation

39.485.4.1 Base() [1/2]

```
ElemType Base ( ) const [inline]
```

Get the base.

Definition at line 304 of file cover_tree.hpp.

39.485.4.2 Base() [2/2]

```
ElemType& Base ( ) [inline]
```

Modify the base; don't do this, you'll break everything.

Definition at line 306 of file cover_tree.hpp.

39.485.4.3 Center()

```
void Center (
    arma::vec & center ) const [inline]
```

Get the center of the node and store it in the given vector.

Definition at line 412 of file cover_tree.hpp.

39.485.4.4 Child() [1/2]

```
const CoverTree& Child (
    const size_t index ) const [inline]
```

Get a particular child node.

Definition at line 278 of file cover_tree.hpp.

39.485.4.5 Child() [2/2]

```
CoverTree& Child (
    const size_t index ) [inline]
```

Modify a particular child node.

Definition at line 280 of file cover_tree.hpp.

39.485.4.6 ChildPtr()

```
CoverTree*& ChildPtr (
    const size_t index ) [inline]
```

Definition at line 282 of file cover_tree.hpp.

39.485.4.7 Children() [1/2]

```
const std::vector< CoverTree*>& Children ( ) const [inline]
```

Get the children.

Definition at line 288 of file cover_tree.hpp.

39.485.4.8 Children() [2/2]

```
std::vector< CoverTree*>& Children ( ) [inline]
```

Modify the children manually (maybe not a great idea).

Definition at line 290 of file cover_tree.hpp.

References CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::Descendant(), and CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::NumDescendants().

39.485.4.9 Dataset()

```
const MatType& Dataset ( ) const [inline]
```

Get a reference to the dataset.

Definition at line 267 of file cover_tree.hpp.

39.485.4.10 Descendant()

```
size_t Descendant (
    const size_t index ) const
```

Get the index of a particular descendant point.

Referenced by CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::Children().

39.485.4.11 DistanceComps() [1/2]

```
size_t DistanceComps ( ) const [inline]
```

Definition at line 555 of file cover_tree.hpp.

39.485.4.12 DistanceComps() [2/2]

```
size_t& DistanceComps ( ) [inline]
```

Definition at line 556 of file cover_tree.hpp.

39.485.4.13 FurthestDescendantDistance() [1/2]

```
ElemType FurthestDescendantDistance ( ) const [inline]
```

Get the distance from the center of the node to the furthest descendant.

Definition at line 401 of file cover_tree.hpp.

39.485.4.14 FurthestDescendantDistance() [2/2]

```
ElemType& FurthestDescendantDistance ( ) [inline]
```

Modify the distance from the center of the node to the furthest descendant.

Definition at line 405 of file cover_tree.hpp.

39.485.4.15 FurthestPointDistance()

```
ElemType FurthestPointDistance ( ) const [inline]
```

Get the distance to the furthest point. This is always 0 for cover trees.

Definition at line 398 of file cover_tree.hpp.

39.485.4.16 GetFurthestChild() [1/2]

```
size_t GetFurthestChild (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 )
```

Return the index of the furthest child node to the given query point.

If this is a leaf node, it will return **NumChildren()** (p. 2056) (invalid index).

Referenced by CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::Stat().

39.485.4.17 GetFurthestChild() [2/2]

```
size_t GetFurthestChild (
    const CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > & queryNode
)
```

Return the index of the furthest child node to the given query node.

If it can't decide, it will return **NumChildren()** (p. 2056) (invalid index).

39.485.4.18 GetNearestChild() [1/2]

```
size_t GetNearestChild (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 )
```

Return the index of the nearest child node to the given query point.

If this is a leaf node, it will return **NumChildren()** (p. 2056) (invalid index).

Referenced by `CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::Stat()`.

39.485.4.19 GetNearestChild() [2/2]

```
size_t GetNearestChild (
    const CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > & queryNode
)
```

Return the index of the nearest child node to the given query node.

If it can't decide, it will return **NumChildren()** (p. 2056) (invalid index).

39.485.4.20 IsLeaf()

```
bool IsLeaf ( ) const [inline]
```

Definition at line 274 of file `cover_tree.hpp`.

39.485.4.21 MaxDistance() [1/4]

```
ElemType MaxDistance (
    const CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > & other )
const
```

Return the maximum distance to another node.

Referenced by `CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::Stat()`.

39.485.4.22 MaxDistance() [2/4]

```
ElemType MaxDistance (
    const CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > & other,
    const ElemType distance ) const
```

Return the maximum distance to another node given that the point-to-point distance has already been calculated.

39.485.4.23 MaxDistance() [3/4]

```
ElemType MaxDistance (
    const arma::vec & other ) const
```

Return the maximum distance to another point.

39.485.4.24 MaxDistance() [4/4]

```
ElemType MaxDistance (
    const arma::vec & other,
    const ElemType distance ) const
```

Return the maximum distance to another point given that the distance from the center to the point has already been calculated.

39.485.4.25 Metric()

```
MetricType& Metric ( ) const [inline]
```

Get the instantiated metric.

Definition at line 418 of file cover_tree.hpp.

References CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::CoverTree().

39.485.4.26 MinDistance() [1/4]

```
ElemType MinDistance (
    const CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > & other )
const
```

Return the minimum distance to another node.

Referenced by `CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::Stat()`.

39.485.4.27 MinDistance() [2/4]

```
ElemType MinDistance (
    const CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > & other,
    const ElemType distance ) const
```

Return the minimum distance to another node given that the point-to-point distance has already been calculated.

39.485.4.28 MinDistance() [3/4]

```
ElemType MinDistance (
    const arma::vec & other ) const
```

Return the minimum distance to another point.

39.485.4.29 MinDistance() [4/4]

```
ElemType MinDistance (
    const arma::vec & other,
    const ElemType distance ) const
```

Return the minimum distance to another point given that the distance from the center to the point has already been calculated.

39.485.4.30 MinimumBoundDistance()

```
ElemType MinimumBoundDistance ( ) const [inline]
```

Get the minimum distance from the center to any bound edge (this is the same as `furthestDescendantDistance`).

Definition at line 409 of file `cover_tree.hpp`.

39.485.4.31 NumChildren()

```
size_t NumChildren ( ) const [inline]
```

Get the number of children.

Definition at line 285 of file cover_tree.hpp.

39.485.4.32 NumDescendants()

```
size_t NumDescendants ( ) const
```

Get the number of descendant points.

Referenced by CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::Children().

39.485.4.33 NumPoints()

```
size_t NumPoints ( ) const [inline]
```

Definition at line 275 of file cover_tree.hpp.

39.485.4.34 Parent() [1/2]

```
CoverTree* Parent ( ) const [inline]
```

Get the parent node.

Definition at line 388 of file cover_tree.hpp.

39.485.4.35 Parent() [2/2]

```
CoverTree*& Parent ( ) [inline]
```

Modify the parent node.

Definition at line 390 of file cover_tree.hpp.

39.485.4.36 ParentDistance() [1/2]

```
ElemType ParentDistance ( ) const [inline]
```

Get the distance to the parent.

Definition at line 393 of file cover_tree.hpp.

39.485.4.37 ParentDistance() [2/2]

```
ElemType& ParentDistance ( ) [inline]
```

Modify the distance to the parent.

Definition at line 395 of file cover_tree.hpp.

39.485.4.38 Point() [1/2]

```
size_t Point ( ) const [inline]
```

Get the index of the point which this node represents.

Definition at line 270 of file cover_tree.hpp.

39.485.4.39 Point() [2/2]

```
size_t Point (
    const size_t ) const [inline]
```

For compatibility with other trees; the argument is ignored.

Definition at line 272 of file cover_tree.hpp.

39.485.4.40 RangeDistance() [1/4]

```
math::RangeType< ElemType> RangeDistance (
    const CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > & other )
const
```

Return the minimum and maximum distance to another node.

Referenced by `CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::Stat()`.

39.485.4.41 RangeDistance() [2/4]

```
math::RangeType< ElemType> RangeDistance (
    const CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > & other,
    const ElemType distance ) const
```

Return the minimum and maximum distance to another node given that the point-to-point distance has already been calculated.

39.485.4.42 RangeDistance() [3/4]

```
math::RangeType< ElemType> RangeDistance (
    const arma::vec & other ) const
```

Return the minimum and maximum distance to another point.

39.485.4.43 RangeDistance() [4/4]

```
math::RangeType< ElemType> RangeDistance (
    const arma::vec & other,
    const ElemType distance ) const
```

Return the minimum and maximum distance to another point given that the point-to-point distance has already been calculated.

39.485.4.44 Scale() [1/2]

```
int Scale ( ) const [inline]
```

Get the scale of this node.

Definition at line 299 of file cover_tree.hpp.

39.485.4.45 Scale() [2/2]

```
int& Scale ( ) [inline]
```

Modify the scale of this node. Be careful...

Definition at line 301 of file cover_tree.hpp.

39.485.4.46 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the tree.

39.485.4.47 `Stat()` [1/2]

```
const StatisticType& Stat ( ) const [inline]
```

Get the statistic for this node.

Definition at line 309 of file `cover_tree.hpp`.

39.485.4.48 `Stat()` [2/2]

```
StatisticType& Stat ( ) [inline]
```

Modify the statistic for this node.

Definition at line 311 of file `cover_tree.hpp`.

References `CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::GetFurthestChild()`, `CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::GetNearestChild()`, `CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::MaxDistance()`, `CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::MinDistance()`, and `CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::RangeDistance()`.

39.486 `CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::DualTreeTraverser< RuleType >` **Class Template Reference**

A dual-tree cover tree traverser; see `dual_tree_traverser.hpp`.

Public Member Functions

- **DualTreeTraverser** (**RuleType** &rule)
Initialize the dual tree traverser with the given rule type.
- size_t **NumBaseCases** () const
- size_t **NumPrunes** () const
Get the number of pruned nodes.
- size_t & **NumPrunes** ()
Modify the number of pruned nodes.
- size_t **NumScores** () const
- size_t **NumVisited** () const
- void **Traverse** (**CoverTree** &queryNode, **CoverTree** &referenceNode)
Traverse the two specified trees.

39.486.1 Detailed Description

```
template<typename MetricType = metric::LMetric<2, true>, typename StatisticType = EmptyStatistic, typename MatType = arma::mat,
typename RootPointPolicy = FirstPointIsRoot>
template<typename RuleType>
class mlpack::tree::CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::DualTreeTraverser< RuleType >
```

A dual-tree cover tree traverser; see dual_tree_traverser.hpp.

Definition at line 261 of file cover_tree.hpp.

39.486.2 Constructor & Destructor Documentation

39.486.2.1 DualTreeTraverser()

```
DualTreeTraverser (
    RuleType & rule )
```

Initialize the dual tree traverser with the given rule type.

39.486.3 Member Function Documentation

39.486.3.1 NumBaseCases()

```
size_t NumBaseCases ( ) const [inline]
```

Definition at line 54 of file dual_tree_traverser.hpp.

39.486.3.2 NumPrunes() [1/2]

```
size_t NumPrunes ( ) const [inline]
```

Get the number of pruned nodes.

Definition at line 46 of file dual_tree_traverser.hpp.

39.486.3.3 NumPrunes() [2/2]

```
size_t& NumPrunes ( ) [inline]
```

Modify the number of pruned nodes.

Definition at line 48 of file dual_tree_traverser.hpp.

39.486.3.4 NumScores()

```
size_t NumScores ( ) const [inline]
```

Definition at line 53 of file dual_tree_traverser.hpp.

39.486.3.5 NumVisited()

```
size_t NumVisited ( ) const [inline]
```

Definition at line 52 of file dual_tree_traverser.hpp.

39.486.3.6 Traverse()

```
void Traverse (
    CoverTree & queryNode,
    CoverTree & referenceNode )
```

Traverse the two specified trees.

Parameters

<i>queryNode</i>	Root of query tree.
<i>referenceNode</i>	Root of reference tree.

The documentation for this class was generated from the following files:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/cover_tree/ **cover_tree.hpp**
- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/cover_tree/ **dual_tree_traverser.hpp**

39.487 CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::SingleTreeTraverser< RuleType > Class Template Reference

A single-tree cover tree traverser; see single_tree_traverser.hpp for implementation.

Public Member Functions

- **SingleTreeTraverser** (RuleType &rule)
Initialize the single tree traverser with the given rule.
- size_t **NumPrunes** () const
Get the number of prunes so far.
- size_t & **NumPrunes** ()
Set the number of prunes (good for a reset to 0).
- void **Traverse** (const size_t queryIndex, **CoverTree** &referenceNode)
Traverse the tree with the given point.

39.487.1 Detailed Description

```
template<typename MetricType = metric::LMetric<2, true>, typename StatisticType = EmptyStatistic, typename MatType = arma::mat,
typename RootPointPolicy = FirstPointsRoot>
template<typename RuleType>
class mlpack::tree::CoverTree< MetricType, StatisticType, MatType, RootPointPolicy >::SingleTreeTraverser< RuleType >
```

A single-tree cover tree traverser; see single_tree_traverser.hpp for implementation.

Definition at line 257 of file cover_tree.hpp.

39.487.2 Constructor & Destructor Documentation

39.487.2.1 SingleTreeTraverser()

```
SingleTreeTraverser (
    RuleType & rule )
```

Initialize the single tree traverser with the given rule.

39.487.3 Member Function Documentation

39.487.3.1 NumPrunes() [1/2]

```
size_t NumPrunes ( ) const [inline]
```

Get the number of prunes so far.

Definition at line 50 of file `single_tree_traverser.hpp`.

39.487.3.2 NumPrunes() [2/2]

```
size_t& NumPrunes ( ) [inline]
```

Set the number of prunes (good for a reset to 0).

Definition at line 52 of file `single_tree_traverser.hpp`.

39.487.3.3 Traverse()

```
void Traverse (
    const size_t queryIndex,
    CoverTree & referenceNode )
```

Traverse the tree with the given point.

Parameters

<i>queryIndex</i>	The index of the point in the query set which is used as the query point.
<i>referenceNode</i>	The tree node to be traversed.

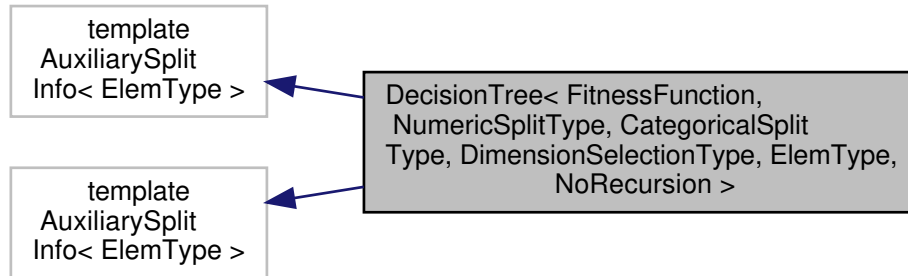

The documentation for this class was generated from the following files:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/cover_tree/ **cover_tree.hpp**

39.488 **DecisionTree**< **FitnessFunction**, **NumericSplitType**, **CategoricalSplitType**, **DimensionSelectionType**, **ElemType**, **NoRecursion** > **Class Template Reference**

This class implements a generic decision tree learner.

Inheritance diagram for **DecisionTree**< **FitnessFunction**, **NumericSplitType**, **CategoricalSplitType**, **DimensionSelectionType**, **ElemType**, **NoRecursion** >:

Public Types

- typedef **CategoricalSplitType**< **FitnessFunction** > **CategoricalSplit**
Allow access to the categorical split type.
- typedef **DimensionSelectionType** **DimensionSelection**
Allow access to the dimension selection type.
- typedef **NumericSplitType**< **FitnessFunction** > **NumericSplit**
Allow access to the numeric split type.

Public Member Functions

- template<typename MatType , typename LabelsType >
DecisionTree (MatType data, const **data::DatasetInfo** &datasetInfo, LabelsType labels, const size_t numClasses, const size_t minimumLeafSize=10, const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType())
Construct the decision tree on the given data and labels, where the data can be both numeric and categorical.
- template<typename MatType , typename LabelsType >
DecisionTree (MatType data, LabelsType labels, const size_t numClasses, const size_t minimumLeafSize=10, const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType())
Construct the decision tree on the given data and labels, assuming that the data is all of the numeric type.

- `template<typename MatType , typename LabelsType , typename WeightsType >`
DecisionTree (MatType data, const **data::DatasetInfo** &datasetInfo, LabelsType labels, const size_t numClasses, WeightsType weights, const size_t minimumLeafSize=10, const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType(), const std::enable_if_t< arma::is_arma_type< typename std::remove_reference< WeightsType >::type >::value > !=0)
Construct the decision tree on the given data and labels with weights, where the data can be both numeric and categorical.
- `template<typename MatType , typename LabelsType , typename WeightsType >`
DecisionTree (MatType data, LabelsType labels, const size_t numClasses, WeightsType weights, const size_t minimumLeafSize=10, const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType(), const std::enable_if_t< arma::is_arma_type< typename std::remove_reference< WeightsType >::type >::value > !=0)
Construct the decision tree on the given data and labels with weights, assuming that the data is all of the numeric type.
- **DecisionTree** (const size_t numClasses=1)
Construct a decision tree without training it.
- **DecisionTree** (const **DecisionTree** &other)
Copy another tree.
- **DecisionTree** (**DecisionTree** &&other)
Take ownership of another tree.
- **~DecisionTree** ()
Clean up memory.
- `template<typename VecType >`
size_t **CalculateDirection** (const VecType &point) const
Given a point and that this node is not a leaf, calculate the index of the child node this point would go towards.
- const **DecisionTree** & **Child** (const size_t i) const
Get the child of the given index.
- **DecisionTree** & **Child** (const size_t i)
Modify the child of the given index (be careful!).
- `template<typename VecType >`
size_t **Classify** (const VecType &point) const
Classify the given point, using the entire tree.
- `template<typename VecType >`
void **Classify** (const VecType &point, size_t &prediction, arma::vec &probabilities) const
Classify the given point and also return estimates of the probability for each class in the given vector.
- `template<typename MatType >`
void **Classify** (const MatType &data, arma::Row< size_t > &predictions) const
Classify the given points, using the entire tree.
- `template<typename MatType >`
void **Classify** (const MatType &data, arma::Row< size_t > &predictions, arma::mat &probabilities) const
Classify the given points and also return estimates of the probabilities for each class in the given matrix.
- size_t **NumChildren** () const
Get the number of children.
- size_t **NumClasses** () const
Get the number of classes in the tree.
- **DecisionTree** & **operator=** (const **DecisionTree** &other)
Copy another tree.
- **DecisionTree** & **operator=** (**DecisionTree** &&other)
Take ownership of another tree.
- `template<typename Archive >`
void **serialize** (Archive &ar, const unsigned int)

Serialize the tree.

- `size_t SplitDimension () const`

Get the split dimension (only meaningful if this is a non-leaf in a trained tree).

- `template<typename MatType , typename LabelsType >
double Train (MatType data, const data::DatasetInfo &datasetInfo, LabelsType labels, const size_t numClasses,
const size_t minimumLeafSize=10, const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType())`

Train the decision tree on the given data.

- `template<typename MatType , typename LabelsType >
double Train (MatType data, LabelsType labels, const size_t numClasses, const size_t minimumLeafSize=10,
const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType())`

Train the decision tree on the given data, assuming that all dimensions are numeric.

- `template<typename MatType , typename LabelsType , typename WeightsType >
double Train (MatType data, const data::DatasetInfo &datasetInfo, LabelsType labels, const size_t numClasses,
WeightsType weights, const size_t minimumLeafSize=10, const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType(), const std::enable_if_t< arma::is_arma_type< typename std::remove_reference< WeightsType >::type >::value > !=0)`

Train the decision tree on the given weighted data.

- `template<typename MatType , typename LabelsType , typename WeightsType >
double Train (MatType data, LabelsType labels, const size_t numClasses, WeightsType weights, const size_t minimumLeafSize=10, const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType(), const std::enable_if_t< arma::is_arma_type< typename std::remove_reference< WeightsType >::type >::value > !=0)`

Train the decision tree on the given weighted data, assuming that all dimensions are numeric.

39.488.1 Detailed Description

```
template<typename FitnessFunction = GiniGain, template< typename > class NumericSplitType = BestBinaryNumericSplit,
template< typename > class CategoricalSplitType = AllCategoricalSplit, typename DimensionSelectionType = AllDimensionSelect,
typename ElemType = double, bool NoRecursion = false>
class mlpack::tree::DecisionTree< FitnessFunction, NumericSplitType, CategoricalSplitType, DimensionSelectionType, ElemType,
NoRecursion >
```

This class implements a generic decision tree learner.

Its behavior can be controlled via its template arguments.

The class inherits from the auxiliary split information in order to prevent an empty auxiliary split information struct from taking any extra size.

Definition at line 39 of file `decision_tree.hpp`.

39.488.2 Member Typedef Documentation

39.488.2.1 CategoricalSplit

```
typedef CategoricalSplitType<FitnessFunction> CategoricalSplit
```

Allow access to the categorical split type.

Definition at line 49 of file decision_tree.hpp.

39.488.2.2 DimensionSelection

```
typedef DimensionSelectionType DimensionSelection
```

Allow access to the dimension selection type.

Definition at line 51 of file decision_tree.hpp.

39.488.2.3 NumericSplit

```
typedef NumericSplitType<FitnessFunction> NumericSplit
```

Allow access to the numeric split type.

Definition at line 47 of file decision_tree.hpp.

39.488.3 Constructor & Destructor Documentation

39.488.3.1 DecisionTree() [1/7]

```
DecisionTree (
    MatType data,
    const data::DatasetInfo & datasetInfo,
    LabelsType labels,
    const size_t numClasses,
    const size_t minimumLeafSize = 10,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType() )
```

Construct the decision tree on the given data and labels, where the data can be both numeric and categorical.

Setting minimumLeafSize and minimumGainSplit too small may cause the tree to overfit, but setting them too large may cause it to underfit.

Use std::move if data or labels are no longer needed to avoid copies.

Parameters

<i>data</i>	Dataset to train on.
<i>datasetInfo</i>	Type information for each dimension of the dataset.
<i>labels</i>	Labels for each training point.
<i>numClasses</i>	Number of classes in the dataset.
<i>minimumLeafSize</i>	Minimum number of points in each leaf node.
<i>minimumGainSplit</i>	Minimum gain for the node to split.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

39.488.3.2 DecisionTree() [2/7]

```

DecisionTree (
    MatType data,
    LabelsType labels,
    const size_t numClasses,
    const size_t minimumLeafSize = 10,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType() )

```

Construct the decision tree on the given data and labels, assuming that the data is all of the numeric type.

Setting minimumLeafSize and minimumGainSplit too small may cause the tree to overfit, but setting them too large may cause it to underfit.

Use std::move if data or labels are no longer needed to avoid copies.

Parameters

<i>data</i>	Dataset to train on.
<i>labels</i>	Labels for each training point.
<i>numClasses</i>	Number of classes in the dataset.
<i>minimumLeafSize</i>	Minimum number of points in each leaf node.
<i>minimumGainSplit</i>	Minimum gain for the node to split.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

39.488.3.3 DecisionTree() [3/7]

```

DecisionTree (
    MatType data,
    const data::DatasetInfo & datasetInfo,

```

```

LabelsType labels,
const size_t numClasses,
WeightsType weights,
const size_t minimumLeafSize = 10,
const double minimumGainSplit = 1e-7,
DimensionSelectionType dimensionSelector = DimensionSelectionType(),
const std::enable_if_t< arma::is_arma_type< typename std::remove_reference< WeightsType >::type >::value > * = 0 >

```

Construct the decision tree on the given data and labels with weights, where the data can be both numeric and categorical.

Setting minimumLeafSize and minimumGainSplit too small may cause the tree to overfit, but setting them too large may cause it to underfit.

Use std::move if data, labels or weights are no longer needed to avoid copies.

Parameters

<i>data</i>	Dataset to train on.
<i>datasetInfo</i>	Type information for each dimension of the dataset.
<i>labels</i>	Labels for each training point.
<i>numClasses</i>	Number of classes in the dataset.
<i>weights</i>	The weight list of given label.
<i>minimumLeafSize</i>	Minimum number of points in each leaf node.
<i>minimumGainSplit</i>	Minimum gain for the node to split.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

39.488.3.4 DecisionTree() [4/7]

```

DecisionTree (
    MatType data,
    LabelsType labels,
    const size_t numClasses,
    WeightsType weights,
    const size_t minimumLeafSize = 10,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType(),
    const std::enable_if_t< arma::is_arma_type< typename std::remove_reference< WeightsType >::type >::value > * = 0 >

```

Construct the decision tree on the given data and labels with weights, assuming that the data is all of the numeric type.

Setting minimumLeafSize and minimumGainSplit too small may cause the tree to overfit, but setting them too large may cause it to underfit.

Use std::move if data, labels or weights are no longer needed to avoid copies.

Parameters

<i>data</i>	Dataset to train on.
<i>labels</i>	Labels for each training point.
<i>numClasses</i>	Number of classes in the dataset.
<i>weights</i>	The Weight list of given labels.
<i>minimumLeafSize</i>	Minimum number of points in each leaf node.
<i>minimumGainSplit</i>	Minimum gain for the node to split.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

39.488.3.5 `DecisionTree()` [5/7]

```
DecisionTree (
    const size_t numClasses = 1 )
```

Construct a decision tree without training it.

It will be a leaf node with equal probabilities for each class.

Parameters

<i>numClasses</i>	Number of classes in the dataset.
-------------------	-----------------------------------

39.488.3.6 `DecisionTree()` [6/7]

```
DecisionTree (
    const DecisionTree< FitnessFunction, NumericSplitType, CategoricalSplitType, Dimension←
SelectionType, ElemType, NoRecursion > & other )
```

Copy another tree.

This may use a lot of memory—be sure that it's what you want to do.

Parameters

<i>other</i>	Tree to copy.
--------------	---------------

39.488.3.7 `DecisionTree()` [7/7]

```

DecisionTree (
    DecisionTree< FitnessFunction, NumericSplitType, CategoricalSplitType, Dimension↔
SelectionType, ElemType, NoRecursion > && other )

```

Take ownership of another tree.

Parameters

<i>other</i>	Tree to take ownership of.
--------------	----------------------------

39.488.3.8 `~DecisionTree()`

```

~ DecisionTree ( )

```

Clean up memory.

39.488.4 Member Function Documentation

39.488.4.1 `CalculateDirection()`

```

size_t CalculateDirection (
    const VecType & point ) const

```

Given a point and that this node is not a leaf, calculate the index of the child node this point would go towards.

This method is primarily used by the **Classify()** (p. 2073) function, but it can be used in a standalone sense too.

Parameters

<i>point</i>	Point to classify.
--------------	--------------------

Referenced by `DecisionTree< FitnessFunction, NumericSplitType, CategoricalSplitType, DimensionSelectionType, ElemType, NoRecursion >::SplitDimension()`.

39.488.4.2 Child() [1/2]

```
const DecisionTree& Child (
    const size_t i ) const [inline]
```

Get the child of the given index.

Definition at line 386 of file decision_tree.hpp.

39.488.4.3 Child() [2/2]

```
DecisionTree& Child (
    const size_t i ) [inline]
```

Modify the child of the given index (be careful!).

Definition at line 388 of file decision_tree.hpp.

39.488.4.4 Classify() [1/4]

```
size_t Classify (
    const VecType & point ) const
```

Classify the given point, using the entire tree.

The predicted label is returned.

Parameters

<i>point</i>	Point to classify.
--------------	--------------------

39.488.4.5 Classify() [2/4]

```
void Classify (
    const VecType & point,
    size_t & prediction,
    arma::vec & probabilities ) const
```

Classify the given point and also return estimates of the probability for each class in the given vector.

Parameters

<i>point</i>	Point to classify.
<i>prediction</i>	This will be set to the predicted class of the point.
<i>probabilities</i>	This will be filled with class probabilities for the point.

39.488.4.6 Classify() [3/4]

```
void Classify (
    const MatType & data,
    arma::Row< size_t > & predictions ) const
```

Classify the given points, using the entire tree.

The predicted labels for each point are stored in the given vector.

Parameters

<i>data</i>	Set of points to classify.
<i>predictions</i>	This will be filled with predictions for each point.

39.488.4.7 Classify() [4/4]

```
void Classify (
    const MatType & data,
    arma::Row< size_t > & predictions,
    arma::mat & probabilities ) const
```

Classify the given points and also return estimates of the probabilities for each class in the given matrix.

The predicted labels for each point are stored in the given vector.

Parameters

<i>data</i>	Set of points to classify.
<i>predictions</i>	This will be filled with predictions for each point.
<i>probabilities</i>	This will be filled with class probabilities for each point.

39.488.4.8 NumChildren()

```
size_t NumChildren ( ) const [inline]
```

Get the number of children.

Definition at line 383 of file decision_tree.hpp.

39.488.4.9 NumClasses()

```
size_t NumClasses ( ) const
```

Get the number of classes in the tree.

Referenced by DecisionTree< FitnessFunction, NumericSplitType, CategoricalSplitType, DimensionSelectionType, ElemType, NoRecursion >::SplitDimension().

39.488.4.10 operator=() [1/2]

```
DecisionTree& operator= (
    const DecisionTree< FitnessFunction, NumericSplitType, CategoricalSplitType, DimensionSelectionType, ElemType, NoRecursion > & other )
```

Copy another tree.

This may use a lot of memory—be sure that it's what you want to do.

Parameters

<i>other</i>	Tree to copy.
--------------	---------------

39.488.4.11 operator=() [2/2]

```
DecisionTree& operator= (
    DecisionTree< FitnessFunction, NumericSplitType, CategoricalSplitType, DimensionSelectionType, ElemType, NoRecursion > && other )
```

Take ownership of another tree.

Parameters

<i>other</i>	Tree to take ownership of.
--------------	----------------------------

39.488.4.12 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the tree.

39.488.4.13 `SplitDimension()`

```
size_t SplitDimension ( ) const [inline]
```

Get the split dimension (only meaningful if this is a non-leaf in a trained tree).

Definition at line 392 of file `decision_tree.hpp`.

References `DecisionTree< FitnessFunction, NumericSplitType, CategoricalSplitType, DimensionSelectionType, ElemType, NoRecursion >::CalculateDirection()`, `DecisionTree< FitnessFunction, NumericSplitType, CategoricalSplitType, DimensionSelectionType, ElemType, NoRecursion >::NumClasses()`, and `DecisionTree< FitnessFunction, NumericSplitType, CategoricalSplitType, DimensionSelectionType, ElemType, NoRecursion >::Train()`.

39.488.4.14 `Train()` [1/4]

```
double Train (
    MatType data,
    const data::DatasetInfo & datasetInfo,
    LabelsType labels,
    const size_t numClasses,
    const size_t minimumLeafSize = 10,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType() )
```

Train the decision tree on the given data.

This will overwrite the existing model. The data may have numeric and categorical types, specified by the `datasetInfo` parameter. Setting `minimumLeafSize` and `minimumGainSplit` too small may cause the tree to overfit, but setting them too large may cause it to underfit.

Use `std::move` if data or labels are no longer needed to avoid copies.

Parameters

<i>data</i>	Dataset to train on.
<i>datasetInfo</i>	Type information for each dimension.
<i>labels</i>	Labels for each training point.
<i>numClasses</i>	Number of classes in the dataset.
<i>weights</i>	Weights of all the labels
<i>minimumLeafSize</i>	Minimum number of points in each leaf node.
<i>minimumGainSplit</i>	Minimum gain for the node to split.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

Returns

The final entropy of decision tree.

Referenced by DecisionTree< FitnessFunction, NumericSplitType, CategoricalSplitType, DimensionSelectionType, ElemType, NoRecursion >::SplitDimension().

39.488.4.15 Train() [2/4]

```
double Train (
    MatType data,
    LabelsType labels,
    const size_t numClasses,
    const size_t minimumLeafSize = 10,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType() )
```

Train the decision tree on the given data, assuming that all dimensions are numeric.

This will overwrite the given model. Setting minimumLeafSize and minimumGainSplit too small may cause the tree to overfit, but setting them too large may cause it to underfit.

Use std::move if data or labels are no longer needed to avoid copies.

Parameters

<i>data</i>	Dataset to train on.
<i>labels</i>	Labels for each training point.
<i>numClasses</i>	Number of classes in the dataset.
<i>weights</i>	Weights of all the labels
<i>minimumLeafSize</i>	Minimum number of points in each leaf node.
<i>minimumGainSplit</i>	Minimum gain for the node to split.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

Returns

The final entropy of decision tree.

39.488.4.16 Train() [3/4]

```
double Train (
    MatType data,
    const data::DatasetInfo & datasetInfo,
    LabelsType labels,
    const size_t numClasses,
    WeightsType weights,
    const size_t minimumLeafSize = 10,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType(),
    const std::enable_if_t< arma::is_arma_type< typename std::remove_reference< WeightsType >::type >::value > * = 0 > )
```

Train the decision tree on the given weighted data.

This will overwrite the existing model. The data may have numeric and categorical types, specified by the datasetInfo parameter. Setting minimumLeafSize and minimumGainSplit too small may cause the tree to overfit, but setting them too large may cause it to underfit.

Use std::move if data, labels or weights are no longer needed to avoid copies.

Parameters

<i>data</i>	Dataset to train on.
<i>datasetInfo</i>	Type information for each dimension.
<i>labels</i>	Labels for each training point.
<i>numClasses</i>	Number of classes in the dataset.
<i>weights</i>	Weights of all the labels
<i>minimumLeafSize</i>	Minimum number of points in each leaf node.
<i>minimumGainSplit</i>	Minimum gain for the node to split.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

Returns

The final entropy of decision tree.

39.488.4.17 Train() [4/4]

```
double Train (
    MatType data,
```

```

LabelsType labels,
const size_t numClasses,
WeightsType weights,
const size_t minimumLeafSize = 10,
const double minimumGainSplit = 1e-7,
DimensionSelectionType dimensionSelector = DimensionSelectionType(),
const std::enable_if_t< arma::is_arma_type< typename std::remove_reference< WeightsType >::type >::value > * = 0 >

```

Train the decision tree on the given weighted data, assuming that all dimensions are numeric.

This will overwrite the given model. Setting minimumLeafSize and minimumGainSplit too small may cause the tree to overfit, but setting them too large may cause it to underfit.

Use std::move if data, labels or weights are no longer needed to avoid copies.

Parameters

<i>data</i>	Dataset to train on.
<i>labels</i>	Labels for each training point.
<i>numClasses</i>	Number of classes in the dataset.
<i>weights</i>	Weights of all the labels
<i>minimumLeafSize</i>	Minimum number of points in each leaf node.
<i>minimumGainSplit</i>	Minimum gain for the node to split.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

Returns

The final entropy of decision tree.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_tree/ **decision_tree.hpp**

39.489 DiscreteHilbertValue< TreeElemType > Class Template Reference

The **DiscreteHilbertValue** (p. 2079) class stores Hilbert values for all of the points in a **RectangleTree** (p. 2207) node, and calculates Hilbert values for new points.

39.489.1 Detailed Description

```

template<typename TreeElemType>
class mlpack::tree::DiscreteHilbertValue< TreeElemType >

```

The **DiscreteHilbertValue** (p. 2079) class stores Hilbert values for all of the points in a **RectangleTree** (p. 2207) node, and calculates Hilbert values for new points.

This implementation calculates the full discrete Hilbert value; for a d-dimensional vector filled with elements of size E, each Hilbert value will take dE space.

Definition at line 29 of file `discrete_hilbert_value.hpp`.

The documentation for this class was generated from the following file:

39.490 EmptyStatistic Class Reference

Empty statistic if you are not interested in storing statistics in your tree.

Public Member Functions

- **EmptyStatistic** ()
- `template<typename TreeType >`
EmptyStatistic (TreeType &)
This constructor is called when a node is finished being created.
- **~EmptyStatistic** ()
- `template<typename Archive >`
`void` **serialize** (Archive &, const unsigned int)
Serialize the statistic (there's nothing to be saved).

39.490.1 Detailed Description

Empty statistic if you are not interested in storing statistics in your tree.

Use this as a template for your own.

Definition at line 24 of file `statistic.hpp`.

39.490.2 Constructor & Destructor Documentation

39.490.2.1 EmptyStatistic() [1/2]

```
EmptyStatistic ( ) [inline]
```

Definition at line 27 of file `statistic.hpp`.

39.490.2.2 ~EmptyStatistic()

```
~ EmptyStatistic ( ) [inline]
```

Definition at line 28 of file statistic.hpp.

39.490.2.3 EmptyStatistic() [2/2]

```
EmptyStatistic (
    TreeType & ) [inline]
```

This constructor is called when a node is finished being created.

The node is finished, and its children are finished, but it is not necessarily true that the statistics of other nodes are initialized yet.

Parameters

<i>node</i>	Node which this corresponds to.
-------------	---------------------------------

Definition at line 38 of file statistic.hpp.

39.490.3 Member Function Documentation

39.490.3.1 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serialize the statistic (there's nothing to be saved).

Definition at line 44 of file statistic.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/ **statistic.hpp**

39.491 ExampleTree< MetricType, StatisticType, MatType > Class Template Reference

This is not an actual space tree but instead an example tree that exists to show and document all the functions that mlpack trees must implement.

Public Member Functions

- **ExampleTree** (const MatType &dataset, MetricType &metric)
This constructor will build the tree given a dataset and an instantiated metric.
- void **Centroid** (arma::vec ¢roid) const
Fill the given vector with the center of the node.
- const **ExampleTree** & **Child** (const size_t i) const
Return a particular child of this node.
- **ExampleTree** & **Child** (const size_t i)
Modify a particular child of this node.
- size_t **Descendant** (const size_t i) const
Get the index of a particular descendant point.
- double **FurthestDescendantDistance** () const
Get the distance from the center of the node to the furthest descendant point of this node.
- double **MaxDistance** (const MatType &point) const
Return the maximum distance between this node and a point.
- double **MaxDistance** (const **ExampleTree** &other) const
Return the maximum distance between this node and another node.
- const MetricType & **Metric** () const
Get the instantiated metric for this node.
- MetricType & **Metric** ()
Modify the instantiated metric for this node.
- double **MinDistance** (const MatType &point) const
Return the minimum distance between this node and a point.
- double **MinDistance** (const **ExampleTree** &other) const
Return the minimum distance between this node and another node.
- size_t **NumChildren** () const
Return the number of children of this node.
- size_t **NumDescendants** () const
Get the number of descendant points.
- size_t **NumPoints** () const
Return the number of points held in this node.
- **ExampleTree** * **Parent** () const
Return the parent node (NULL if this is the root of the tree).
- double **ParentDistance** () const
Get the distance from the center of this node to the center of the parent node.
- size_t **Point** (const size_t i) const
Return the index of a particular point of this node.
- **math::Range** **RangeDistance** (const MatType &point) const
*Return both the minimum and maximum distances between this node and a point as a **math::Range** (p. 409) object.*
- **math::Range** **RangeDistance** (const **ExampleTree** &other) const
*Return both the minimum and maximum distances between this node and another node as a **math::Range** (p. 409) object.*
- const StatisticType & **Stat** () const
Get the statistic for this node.
- StatisticType & **Stat** ()
Modify the statistic for this node.

39.491.1 Detailed Description

```
template<typename MetricType = metric::LMetric<2, true>, typename StatisticType = EmptyStatistic, typename MatType = arma<
::mat>
class mlpack::tree::ExampleTree< MetricType, StatisticType, MatType >
```

This is not an actual space tree but instead an example tree that exists to show and document all the functions that mlpack trees must implement.

For a better overview of trees, see **The TreeType policy in mlpack** (p. 179). Also be aware that the implementations of each of the methods in this example tree are entirely fake and do not work; this example tree exists for its API, not its implementation.

Note that trees often have different properties. These properties are known at compile-time through the **mlpack::tree::TreeTraits** (p. 2302) class, and some properties may imply the existence (or non-existence) of certain functions. Refer to the **TreeTraits** (p. 2302) for more documentation on that.

The three template parameters below must be template parameters to the tree, in the order given below. More template parameters are fine, but they must come after the first three.

Template Parameters

<i>MetricType</i>	This defines the space in which the tree will be built. For some trees, arbitrary metrics cannot be used, and a template metaprogramming approach should be used to issue a compile-time error if a metric cannot be used with a specific tree type. One example is the tree::BinarySpaceTree (p. 1998) tree type, which cannot work with the metric::IPMetric (p. 1565) class.
<i>StatisticType</i>	A tree node can hold a statistic, which is sometimes useful for various dual-tree algorithms. The tree itself does not need to know anything about how the statistic works, but it needs to hold a <i>StatisticType</i> in each node. It can be assumed that the <i>StatisticType</i> class has a constructor <code>StatisticType(const ExampleTree&)</code> .
<i>MatType</i>	A tree could be built on a dense matrix or a sparse matrix. All mlpack trees should be able to support any Armadillo-compatible matrix type. When the tree is written it should be assumed that <i>MatType</i> has the same functionality as <code>arma::mat</code> .

Definition at line 56 of file `example_tree.hpp`.

39.491.2 Constructor & Destructor Documentation

39.491.2.1 ExampleTree()

```
ExampleTree (
    const MatType & dataset,
    MetricType & metric )
```

This constructor will build the tree given a dataset and an instantiated metric.

Note that the parameter is a `MatType&` and not an `arma::mat&`. The dataset is not modified by the tree-building process (if it is, see the documentation for `mlpack::tree::TreeTraits::RearrangesDataset` (p. 2304) for how to deal with that situation). The `MetricType` parameter is necessary even though some metrics do not hold any state. This is so that the tree does not have to worry about instantiating the metric (if the tree had to worry about this, this would almost certainly incur additional runtime complexity and a larger runtime size of the tree node objects, which is to be avoided). The metric can't be `const`, in case `MetricType::Evaluate()` is non-`const`.

When this constructor is finished, the entire tree will be built and ready to use. The constructor should call the constructor of the statistic for each node that is built (see `tree::EmptyStatistic` (p. 2080) for more information).

Parameters

<i>dataset</i>	The dataset that the tree will be built on.
<i>metric</i>	The instantiated metric to use to build the dataset.

39.491.3 Member Function Documentation

39.491.3.1 Centroid()

```
void Centroid (
    arma::vec & centroid ) const
```

Fill the given vector with the center of the node.

Parameters

<i>centroid</i>	Vector to be filled with the center of the node.
-----------------	--

39.491.3.2 Child() [1/2]

```
const ExampleTree& Child (
    const size_t i ) const
```

Return a particular child of this node.

39.491.3.3 Child() [2/2]

```
ExampleTree& Child (
    const size_t i )
```

Modify a particular child of this node.

39.491.3.4 Descendant()

```
size_t Descendant (
    const size_t i ) const
```

Get the index of a particular descendant point.

The ordering of the descendants does not matter, as long as calling Descendant(0) through Descendant(**NumDescendants()** (p. 2087) - 1) will return the indices of every unique descendant point of the node.

39.491.3.5 FurthestDescendantDistance()

```
double FurthestDescendantDistance ( ) const
```

Get the distance from the center of the node to the furthest descendant point of this node.

This does not necessarily need to be the exact furthest descendant distance but instead can be an upper bound. See the definitions in **The TreeType policy in mlpack** (p. 179) for more information.

39.491.3.6 MaxDistance() [1/2]

```
double MaxDistance (
    const MatType & point ) const
```

Return the maximum distance between this node and a point.

It is not required that the exact maximum distance between the node and the point is returned but instead an upper bound on the maximum distance will suffice. See the definitions in **The TreeType policy in mlpack** (p. 179) for more information.

Parameters

<i>point</i>	Point to return [upper bound on] maximum distance to.
--------------	---

39.491.3.7 MaxDistance() [2/2]

```
double MaxDistance (
    const ExampleTree< MetricType, StatisticType, MatType > & other ) const
```

Return the maximum distance between this node and another node.

It is not required that the exact maximum distance between the two nodes be returned but instead an upper bound on the maximum distance will suffice. See the definitions in **The TreeType policy in mlpack** (p. 179) for more information.

Parameters

<i>node</i>	Node to return [upper bound on] maximum distance to.
-------------	--

39.491.3.8 Metric() [1/2]

```
const MetricType& Metric ( ) const
```

Get the instantiated metric for this node.

39.491.3.9 Metric() [2/2]

```
MetricType& Metric ( )
```

Modify the instantiated metric for this node.

39.491.3.10 MinDistance() [1/2]

```
double MinDistance (
    const MatType & point ) const
```

Return the minimum distance between this node and a point.

It is not required that the exact minimum distance between the node and the point is returned but instead a lower bound on the minimum distance will suffice. See the definitions in **The TreeType policy in mlpack** (p. 179) for more information.

Parameters

<i>point</i>	Point to return [lower bound on] minimum distance to.
--------------	---

39.491.3.11 MinDistance() [2/2]

```
double MinDistance (
    const ExampleTree< MetricType, StatisticType, MatType > & other ) const
```

Return the minimum distance between this node and another node.

It is not required that the exact minimum distance between the two nodes be returned but instead a lower bound on the minimum distance will suffice. See the definitions in **The TreeType policy in mlpack** (p. 179) for more information.

Parameters

<i>node</i>	Node to return [lower bound on] minimum distance to.
-------------	--

39.491.3.12 NumChildren()

```
size_t NumChildren ( ) const
```

Return the number of children of this node.

39.491.3.13 NumDescendants()

```
size_t NumDescendants ( ) const
```

Get the number of descendant points.

This is the number of unique points held in this node plus the number of points held in all descendant nodes. This could be calculated at build-time and cached, or could be calculated at run-time. This may be harder to calculate for trees that may hold points in multiple nodes (like cover trees and spill trees, for instance).

39.491.3.14 NumPoints()

```
size_t NumPoints ( ) const
```

Return the number of points held in this node.

39.491.3.15 Parent()

```
ExampleTree* Parent ( ) const
```

Return the parent node (NULL if this is the root of the tree).

39.491.3.16 ParentDistance()

```
double ParentDistance ( ) const
```

Get the distance from the center of this node to the center of the parent node.

39.491.3.17 Point()

```
size_t Point (
    const size_t i ) const
```

Return the index of a particular point of this node.

mlpack trees do not, in general, hold the actual dataset, and instead just hold the indices of the points they contain. Thus, you might use this function in code like this:

```
arma::vec thirdPoint = dataset.col(treeNode.Point(2));
```

39.491.3.18 RangeDistance() [1/2]

```
math::Range RangeDistance (
    const MatType & point ) const
```

Return both the minimum and maximum distances between this node and a point as a **math::Range** (p. 409) object.

This overload is given because it is possible that, for some tree types, calculation of both at once is faster than a call to **MinDistance()** (p. 2086) then **MaxDistance()** (p. 2085). It is not necessary that the minimum and maximum distances be exact; it is sufficient to return a lower bound on the minimum distance and an upper bound on the maximum distance. See the definitions in **The TreeType policy in mlpack** (p. 179) for more information.

Parameters

<i>point</i>	Point to return [bounds on] minimum and maximum distances to.
--------------	---

39.491.3.19 RangeDistance() [2/2]

```
math::Range RangeDistance (
    const ExampleTree< MetricType, StatisticType, MatType > & other ) const
```

Return both the minimum and maximum distances between this node and another node as a **math::Range** (p. 409) object.

This overload is given because it is possible that, for some tree types, calculation of both at once is faster than a call to **MinDistance()** (p. 2086) then **MaxDistance()** (p. 2085). It is not necessary that the minimum and maximum distances be exact; it is sufficient to return a lower bound on the minimum distance and an upper bound on the maximum distance. See the definitions in **The TreeType policy in mlpack** (p. 179) for more information.

Parameters

<i>node</i>	Node to return [bounds on] minimum and maximum distances to.
-------------	--

39.491.3.20 Stat() [1/2]

```
const StatisticType& Stat ( ) const
```

Get the statistic for this node.

39.491.3.21 Stat() [2/2]

```
StatisticType& Stat ( )
```

Modify the statistic for this node.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/ **example_tree.hpp**

39.492 FirstPointIsRoot Class Reference

This class is meant to be used as a choice for the policy class RootPointPolicy of the **CoverTree** (p. 2040) class.

Static Public Member Functions

- `template<typename MatType >`
`static size_t ChooseRoot (const MatType &)`
Return the point to be used as the root point of the cover tree.

39.492.1 Detailed Description

This class is meant to be used as a choice for the policy class RootPointPolicy of the **CoverTree** (p. 2040) class.

This policy determines which point is used for the root node of the cover tree. This particular implementation simply chooses the first point in the dataset as the root. A more complex implementation might choose, for instance, the point with least maximum distance to other points (the closest to the "middle").

Definition at line 29 of file first_point_is_root.hpp.

39.492.2 Member Function Documentation

39.492.2.1 ChooseRoot()

```
static size_t ChooseRoot (
    const MatType & ) [inline], [static]
```

Return the point to be used as the root point of the cover tree.

This just returns 0.

Definition at line 37 of file first_point_is_root.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/cover_tree/ **first_point_is_root.hpp**

39.493 GiniGain Class Reference

The Gini gain, a measure of set purity usable as a fitness function (FitnessFunction) for decision trees.

Static Public Member Functions

- template<bool UseWeights, typename RowType, typename WeightVecType >
static double **Evaluate** (const RowType &labels, const size_t numClasses, const WeightVecType &weights)
Evaluate the Gini impurity on the given set of labels.
- template<bool UseWeights, typename CountType >
static double **EvaluatePtr** (const CountType *counts, const size_t countLength, const CountType totalCount)
Evaluate the Gini impurity given a vector of class weight counts.
- static double **Range** (const size_t numClasses)
Return the range of the Gini impurity for the given number of classes.

39.493.1 Detailed Description

The Gini gain, a measure of set purity usable as a fitness function (FitnessFunction) for decision trees.

This is the exact same thing as the well-known Gini impurity, but negated—since the decision tree will be trying to maximize gain (and the Gini impurity would need to be minimized).

Definition at line 27 of file gini_gain.hpp.

39.493.2 Member Function Documentation

39.493.2.1 Evaluate()

```
static double Evaluate (  
    const RowType & labels,  
    const size_t numClasses,  
    const WeightVecType & weights ) [inline], [static]
```

Evaluate the Gini impurity on the given set of labels.

RowType should be an Armadillo vector that holds size_t objects.

Note that it is possible that due to floating-point representation issues, it is possible that the gain returned can be very slightly greater than 0! Thus, if you are checking for a perfect fit, be sure to use 'gain >= 0.0' not 'gain == 0.0'.

Parameters

<i>labels</i>	Set of labels to evaluate Gini impurity on.
<i>numClasses</i>	Number of classes in the dataset.
<i>weights</i>	Weight of labels.

Definition at line 62 of file gini_gain.hpp.

39.493.2.2 EvaluatePtr()

```
static double EvaluatePtr (  
    const CountType * counts,  
    const size_t countLength,  
    const CountType totalCount ) [inline], [static]
```

Evaluate the Gini impurity given a vector of class weight counts.

Definition at line 34 of file gini_gain.hpp.

39.493.2.3 Range()

```
static double Range (
    const size_t numClasses ) [inline], [static]
```

Return the range of the Gini impurity for the given number of classes.

(That is, the difference between the maximum possible value and the minimum possible value.)

Parameters

<i>numClasses</i>	Number of classes in the dataset.
-------------------	-----------------------------------

Definition at line 203 of file gini_gain.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_tree/ **gini_gain.hpp**

39.494 GinImpurity Class Reference

Static Public Member Functions

- static double **Evaluate** (const arma::Mat< size_t > &counts)
- static double **Range** (const size_t numClasses)
Return the range of the Gini impurity for the given number of classes.

39.494.1 Detailed Description

Definition at line 21 of file gini_impurity.hpp.

39.494.2 Member Function Documentation

39.494.2.1 Evaluate()

```
static double Evaluate (
    const arma::Mat< size_t > & counts ) [inline], [static]
```

Definition at line 24 of file gini_impurity.hpp.

39.494.2.2 Range()

```
static double Range (
    const size_t numClasses ) [inline], [static]
```

Return the range of the Gini impurity for the given number of classes.

(That is, the difference between the maximum possible value and the minimum possible value.)

Definition at line 77 of file gini_impurity.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hoeffding_trees/ **gini_impurity.hpp**

39.495 GreedySingleTreeTraverser< TreeType, RuleType > Class Template Reference

Public Member Functions

- **GreedySingleTreeTraverser** (RuleType &rule)
Instantiate the greedy single tree traverser with the given rule set.
- size_t & **MinBaseCases** ()
Set value of minBaseCases.
- size_t **MinBaseCases** () const
Get value of minBaseCases.
- size_t **NumPrunes** () const
Get the number of prunes.
- void **Traverse** (const size_t queryIndex, TreeType &referenceNode)
Traverse the tree with the given point.

39.495.1 Detailed Description

```
template<typename TreeType, typename RuleType>
class mlpack::tree::GreedySingleTreeTraverser< TreeType, RuleType >
```

Definition at line 23 of file greedy_single_tree_traverser.hpp.

39.495.2 Constructor & Destructor Documentation

39.495.2.1 GreedySingleTreeTraverser()

```
GreedySingleTreeTraverser (  
    RuleType & rule )
```

Instantiate the greedy single tree traverser with the given rule set.

39.495.3 Member Function Documentation

39.495.3.1 MinBaseCases() [1/2]

```
size_t& MinBaseCases ( ) [inline]
```

Set value of minBaseCases.

Definition at line 44 of file greedy_single_tree_traverser.hpp.

39.495.3.2 MinBaseCases() [2/2]

```
size_t MinBaseCases ( ) const [inline]
```

Get value of minBaseCases.

Definition at line 47 of file greedy_single_tree_traverser.hpp.

39.495.3.3 NumPrunes()

```
size_t NumPrunes ( ) const [inline]
```

Get the number of prunes.

Definition at line 41 of file greedy_single_tree_traverser.hpp.

39.495.3.4 Traverse()

```
void Traverse (  
    const size_t queryIndex,  
    TreeType & referenceNode )
```

Traverse the tree with the given point.

Parameters

<i>queryIndex</i>	The index of the point in the query set which is being used as the query point.
<i>referenceNode</i>	The tree node to be traversed.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/ **greedy_single_tree_traverser.hpp**

39.496 HilbertRTreeAuxiliaryInformation< TreeType, HilbertValueType > Class Template Reference

Public Types

- typedef TreeType::ElemType **ElemType**
The element type held by the tree.

Public Member Functions

- **HilbertRTreeAuxiliaryInformation** ()
Default constructor.
- **HilbertRTreeAuxiliaryInformation** (const TreeType *node)
Construct this as an auxiliary information for the given node.
- **HilbertRTreeAuxiliaryInformation** (const **HilbertRTreeAuxiliaryInformation** &other, TreeType *tree=NULL, bool deepCopy=true)
Create an auxiliary information object by copying from another object.
- **HilbertRTreeAuxiliaryInformation** (**HilbertRTreeAuxiliaryInformation** &&other)
Create an auxiliary information object by moving from the other node.
- bool **HandleNodeInsertion** (TreeType *node, TreeType *nodeToInsert, bool insertionLevel)
The Hilbert R tree requires to insert nodes according to their Hilbert value.
- bool **HandleNodeRemoval** (TreeType *node, const size_t nodeIndex)
The Hilbert R tree requires all nodes to be arranged according to their Hilbert value.
- bool **HandlePointDeletion** (TreeType *node, const size_t localIndex)
The Hilbert R tree requires all points to be arranged according to their Hilbert value.
- bool **HandlePointInsertion** (TreeType *node, const size_t point)
The Hilbert R tree requires to insert points according to their Hilbert value.
- const HilbertValueType< **ElemType** > & **HilbertValue** () const
Return the largest Hilbert value of a point covered by the node.
- HilbertValueType< **ElemType** > & **HilbertValue** ()
Modify the largest Hilbert value of a point covered by the node.
- void **NullifyData** ()
Clear memory.
- **HilbertRTreeAuxiliaryInformation** & **operator=** (const **HilbertRTreeAuxiliaryInformation** &other)
Copy the auxiliary information.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the information.
- bool **UpdateAuxiliaryInfo** (TreeType *node)
Update the auxiliary information in the node.

Static Public Member Functions

- static const std::vector< TreeType * > **Children** (const TreeType *tree)
Return the children vector of the tree.

39.496.1 Detailed Description

```
template<typename TreeType, template< typename > class HilbertValueType>
class mpack::tree::HilbertRTreeAuxiliaryInformation< TreeType, HilbertValueType >
```

Definition at line 22 of file hilbert_r_tree_auxiliary_information.hpp.

39.496.2 Member Typedef Documentation

39.496.2.1 ElemType

```
typedef TreeType::ElemType ElemType
```

The element type held by the tree.

Definition at line 26 of file hilbert_r_tree_auxiliary_information.hpp.

39.496.3 Constructor & Destructor Documentation

39.496.3.1 HilbertRTreeAuxiliaryInformation() [1/4]

```
HilbertRTreeAuxiliaryInformation ( )
```

Default constructor.

39.496.3.2 HilbertRTreeAuxiliaryInformation() [2/4]

```
HilbertRTreeAuxiliaryInformation (
    const TreeType * node )
```

Construct this as an auxiliary information for the given node.

Parameters

<i>node</i>	The node that stores this auxiliary information.
-------------	--

39.496.3.3 HilbertRTreeAuxiliaryInformation() [3 / 4]

```
HilbertRTreeAuxiliaryInformation (
    const HilbertRTreeAuxiliaryInformation< TreeType, HilbertValueType > & other,
    TreeType * tree = NULL,
    bool deepCopy = true )
```

Create an auxiliary information object by copying from another object.

Parameters

<i>other</i>	Another auxiliary information object from which the information will be copied.
<i>tree</i>	The node that holds the auxiliary information.
<i>deepCopy</i>	If false, the new object uses the same memory (not used here).

39.496.3.4 HilbertRTreeAuxiliaryInformation() [4 / 4]

```
HilbertRTreeAuxiliaryInformation (
    HilbertRTreeAuxiliaryInformation< TreeType, HilbertValueType > && other )
```

Create an auxiliary information object by moving from the other node.

Parameters

<i>other</i>	The object from which the information will be moved.
--------------	--

39.496.4 Member Function Documentation

39.496.4.1 Children()

```
static const std::vector<TreeType*> Children (
    const TreeType * tree ) [inline], [static]
```

Return the children vector of the tree.

Definition at line 124 of file `hilbert_r_tree_auxiliary_information.hpp`.

39.496.4.2 HandleNodeInsertion()

```
bool HandleNodeInsertion (
    TreeType * node,
    TreeType * nodeToInsert,
    bool insertionLevel )
```

The Hilbert R tree requires to insert nodes according to their Hilbert value.

This method should take care of it. It returns false if it does nothing and true if it handles the insertion process.

Parameters

<i>node</i>	The node in which the nodeToInsert is being inserted.
<i>nodeToInsert</i>	The node being inserted.
<i>insertionLevel</i>	The level of the tree at which the nodeToInsert should be inserted.

39.496.4.3 HandleNodeRemoval()

```
bool HandleNodeRemoval (
    TreeType * node,
    const size_t nodeIndex )
```

The Hilbert R tree requires all nodes to be arranged according to their Hilbert value.

This method should take care of saving this property after the deletion process. It returns false if it does nothing and true if it handles the deletion process.

Parameters

<i>node</i>	The node from which the node is being deleted.
<i>nodeIndex</i>	The index of the node being deleted.

39.496.4.4 HandlePointDeletion()

```
bool HandlePointDeletion (
```

```
TreeType * node,
const size_t localIndex )
```

The Hilbert R tree requires all points to be arranged according to their Hilbert value.

This method should take care of saving this property after the deletion process. It returns false if it does nothing and true if it handles the deletion process.

Parameters

<i>node</i>	The node from which the point is being deleted.
<i>localIndex</i>	The index of the point being deleted.

39.496.4.5 HandlePointInsertion()

```
bool HandlePointInsertion (
    TreeType * node,
    const size_t point )
```

The Hilbert R tree requires to insert points according to their Hilbert value.

This method should take care of it. It returns false if it does nothing and true if it handles the insertion process.

Parameters

<i>node</i>	The node in which the point is being inserted.
<i>point</i>	The number of the point being inserted.

39.496.4.6 HilbertValue() [1/2]

```
const HilbertValueType< ElemType>& HilbertValue ( ) const [inline]
```

Return the largest Hilbert value of a point covered by the node.

Definition at line 133 of file hilbert_r_tree_auxiliary_information.hpp.

39.496.4.7 HilbertValue() [2/2]

```
HilbertValueType< ElemType>& HilbertValue ( ) [inline]
```

Modify the largest Hilbert value of a point covered by the node.

Definition at line 136 of file hilbert_r_tree_auxiliary_information.hpp.

References HilbertRTreeAuxiliaryInformation< TreeType, HilbertValueType >::serialize().

39.496.4.8 NullifyData()

```
void NullifyData ( )
```

Clear memory.

39.496.4.9 operator=()

```
HilbertRTreeAuxiliaryInformation& operator= (
    const HilbertRTreeAuxiliaryInformation< TreeType, HilbertValueType > & other )
```

Copy the auxiliary information.

Parameters

<i>other</i>	The object from which the information will be moved.
--------------	--

39.496.4.10 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the information.

Referenced by `HilbertRTreeAuxiliaryInformation< TreeType, HilbertValueType >::HilbertValue()`.

39.496.4.11 UpdateAuxiliaryInfo()

```
bool UpdateAuxiliaryInfo (
    TreeType * node )
```

Update the auxiliary information in the node.

The method returns true if the update should be propagated downward.

Parameters

<i>node</i>	The node in which the auxiliary information being update.
-------------	---

39.497 HilbertRTreeDescentHeuristic Class Reference

This class chooses the best child of a node in a Hilbert R tree when inserting a new point.

Static Public Member Functions

- `template<typename TreeType >`
`static size_t ChooseDescentNode (const TreeType *node, const size_t point)`
Evaluate the node using a heuristic.
- `template<typename TreeType >`
`static size_t ChooseDescentNode (const TreeType *node, const TreeType *insertedNode)`
Evaluate the node using a heuristic.

39.497.1 Detailed Description

This class chooses the best child of a node in a Hilbert R tree when inserting a new point.

This is done, in this class, by using the Hilbert value of the point to be inserted.

Definition at line 26 of file `hilbert_r_tree_descent_heuristic.hpp`.

39.497.2 Member Function Documentation

39.497.2.1 ChooseDescentNode() [1/2]

```
static size_t ChooseDescentNode (
    const TreeType * node,
    const size_t point ) [static]
```

Evaluate the node using a heuristic.

Returns the number of the node with minimum largest Hilbert value that is greater than the Hilbert value of the point being inserted.

Parameters

<i>node</i>	The node that is being evaluated.
<i>point</i>	The number of the point that is being inserted.

39.497.2.2 ChooseDescentNode() [2/2]

```
static size_t ChooseDescentNode (
    const TreeType * node,
    const TreeType * insertedNode ) [static]
```

Evaluate the node using a heuristic.

Returns the number of the node with minimum largest Hilbert value that is greater than the largest Hilbert value of the point being inserted.

Parameters

<i>node</i>	The node that is being evaluated.
<i>insertedNode</i>	The node that is being inserted.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ **hilbert_r_tree_descent_heuristic.**↵

39.498 HilbertRTreeSplit< splitOrder > Class Template Reference

The splitting procedure for the Hilbert R tree.

Static Public Member Functions

- template<typename TreeType >
static void **SplitLeafNode** (TreeType *tree, std::vector< bool > &relevels)
Split a leaf node using the "default" algorithm.
- template<typename TreeType >
static bool **SplitNonLeafNode** (TreeType *tree, std::vector< bool > &relevels)
Split a non-leaf node using the "default" algorithm.

39.498.1 Detailed Description

```
template<size_t splitOrder = 2>
class mlpack::tree::HilbertRTreeSplit< splitOrder >
```

The splitting procedure for the Hilbert R tree.

The template parameter `splitOrder` is the order of the splitting policy. The Hilbert R tree splits a node on overflow, turning `splitOrder` nodes into `(splitOrder + 1)` nodes.

Template Parameters

<i>splitOrder</i>	Number of nodes to split.
-------------------	---------------------------

Definition at line 29 of file `hilbert_r_tree_split.hpp`.

39.498.2 Member Function Documentation

39.498.2.1 SplitLeafNode()

```
static void SplitLeafNode (
    TreeType * tree,
    std::vector< bool > & relevels ) [static]
```

Split a leaf node using the "default" algorithm.

If necessary, this split will propagate upwards through the tree.

Parameters

<i>node</i>	The node that is being split.
<i>relevels</i>	Not used.

39.498.2.2 SplitNonLeafNode()

```
static bool SplitNonLeafNode (
    TreeType * tree,
    std::vector< bool > & relevels ) [static]
```

Split a non-leaf node using the "default" algorithm.

If this is a root node, the tree increases in depth.

Parameters

<i>node</i>	The node that is being split.
<i>relevels</i>	Not used.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ **hilbert_r_tree_split.hpp**

39.499 HoeffdingCategoricalSplit< FitnessFunction > Class Template Reference

This is the standard Hoeffding-bound categorical feature proposed in the paper below:

Public Types

- typedef **CategoricalSplitInfo** **SplitInfo**
*The type of split information required by the **HoeffdingCategoricalSplit** (p. 2104).*

Public Member Functions

- **HoeffdingCategoricalSplit** (const size_t numCategories=0, const size_t numClasses=0)
*Create the **HoeffdingCategoricalSplit** (p. 2104) given a number of categories for this dimension and a number of classes.*
- **HoeffdingCategoricalSplit** (const size_t numCategories, const size_t numClasses, const **HoeffdingCategoricalSplit** &other)
*Create the **HoeffdingCategoricalSplit** (p. 2104) given a number of categories for this dimension and a number of classes and another **HoeffdingCategoricalSplit** (p. 2104) to take parameters from.*
- void **EvaluateFitnessFunction** (double &bestFitness, double &secondBestFitness) const
Given the points seen so far, evaluate the fitness function, returning the gain for the best possible split and the second best possible split.
- size_t **MajorityClass** () const
Get the majority class seen so far.
- double **MajorityProbability** () const
Get the probability of the majority class given the points seen so far.
- size_t **NumChildren** () const
Return the number of children, if the node were to split.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the categorical split.
- void **Split** (arma::Col< size_t > &childMajorities, **SplitInfo** &splitInfo)
Gather the information for a split: get the labels of the child majorities, and initialize the SplitInfo object.
- template<typename eT >
void **Train** (eT value, const size_t label)
Train on the given value with the given label.

39.499.1 Detailed Description

```
template<typename FitnessFunction>
class mlpack::tree::HoeffdingCategoricalSplit< FitnessFunction >
```

This is the standard Hoeffding-bound categorical feature proposed in the paper below:

```
@inproceedings{domingos2000mining,
  title={Mining High-Speed Data Streams},
  author={Domingos, P. and Hulten, G.},
  year={2000},
  booktitle={Proceedings of the Sixth ACM SIGKDD International Conference on
    Knowledge Discovery and Data Mining (KDD '00)},
  pages={71--80}
}
```

This class will track the sufficient statistics of the training points it has seen. The HoeffdingSplit class (and other related classes) can use this class to track categorical features and split decision tree nodes.

Template Parameters

<i>FitnessFunction</i>	Fitness function to use for calculating gain.
------------------------	---

Definition at line 44 of file hoeffding_categorical_split.hpp.

39.499.2 Member Typedef Documentation

39.499.2.1 SplitInfo

```
typedef CategoricalSplitInfo SplitInfo
```

The type of split information required by the **HoeffdingCategoricalSplit** (p.2104).

Definition at line 48 of file hoeffding_categorical_split.hpp.

39.499.3 Constructor & Destructor Documentation

39.499.3.1 HoeffdingCategoricalSplit() [1/2]

```
HoeffdingCategoricalSplit (
    const size_t numCategories = 0,
    const size_t numClasses = 0 )
```

Create the **HoeffdingCategoricalSplit** (p.2104) given a number of categories for this dimension and a number of classes.

Parameters

<i>numCategories</i>	Number of categories in this dimension.
<i>numClasses</i>	Number of classes in this dimension.

39.499.3.2 HoeffdingCategoricalSplit() [2/2]

```

HoeffdingCategoricalSplit (
    const size_t numCategories,
    const size_t numClasses,
    const HoeffdingCategoricalSplit< FitnessFunction > & other )

```

Create the **HoeffdingCategoricalSplit** (p.2104) given a number of categories for this dimension and a number of classes and another **HoeffdingCategoricalSplit** (p. 2104) to take parameters from.

In this particular case, there are no parameters to take, but this constructor is required by the **HoeffdingTree** (p. 2113) class.

39.499.4 Member Function Documentation

39.499.4.1 EvaluateFitnessFunction()

```

void EvaluateFitnessFunction (
    double & bestFitness,
    double & secondBestFitness ) const

```

Given the points seen so far, evaluate the fitness function, returning the gain for the best possible split and the second best possible split.

In this splitting technique, we only split one possible way, so *secondBestFitness* will always be 0.

Parameters

<i>bestFitness</i>	The fitness function result for this split.
<i>secondBestFitness</i>	This is always set to 0 (this split only splits one way).

39.499.4.2 MajorityClass()

```

size_t MajorityClass ( ) const

```

Get the majority class seen so far.

Referenced by HoeffdingCategoricalSplit< FitnessFunction >::NumChildren().

39.499.4.3 MajorityProbability()

```
double MajorityProbability ( ) const
```

Get the probability of the majority class given the points seen so far.

Referenced by HoeffdingCategoricalSplit< FitnessFunction >::NumChildren().

39.499.4.4 NumChildren()

```
size_t NumChildren ( ) const [inline]
```

Return the number of children, if the node were to split.

Definition at line 93 of file hoeffding_categorical_split.hpp.

References HoeffdingCategoricalSplit< FitnessFunction >::MajorityClass(), HoeffdingCategoricalSplit< FitnessFunction >::MajorityProbability(), and HoeffdingCategoricalSplit< FitnessFunction >::Split().

39.499.4.5 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the categorical split.

Definition at line 111 of file hoeffding_categorical_split.hpp.

39.499.4.6 Split()

```
void Split (
    arma::Col< size_t > & childMajorities,
    SplitInfo & splitInfo )
```

Gather the information for a split: get the labels of the child majorities, and initialize the SplitInfo object.

Parameters

<i>childMajorities</i>	Majorities of child nodes to be created.
<i>splitInfo</i>	Information for splitting.

Referenced by `HoeffdingCategoricalSplit< FitnessFunction >::NumChildren()`.

39.499.4.7 Train()

```
void Train (
    eT value,
    const size_t label )
```

Train on the given value with the given label.

Parameters

<i>value</i>	Value to train on.
<i>label</i>	Label to train on.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hoeffding_trees/ hoeffding_categorical_split.hpp`

39.500 HoeffdingNumericSplit< FitnessFunction, ObservationType > Class Template Reference

The **HoeffdingNumericSplit** (p. 2108) class implements the numeric feature splitting strategy alluded to by Domingos and Hulten in the following paper:

Public Types

- typedef **NumericSplitInfo**< ObservationType > **SplitInfo**

*The splitting information type required by the **HoeffdingNumericSplit** (p. 2108).*

Public Member Functions

- **HoeffdingNumericSplit** (const size_t numClasses=0, const size_t bins=10, const size_t observationsBefore←Binning=100)
Create the **HoeffdingNumericSplit** (p. 2108) class, and specify some basic parameters about how the binning should take place.
- **HoeffdingNumericSplit** (const size_t numClasses, const **HoeffdingNumericSplit** &other)
Create the **HoeffdingNumericSplit** (p. 2108) class, using the parameters from the given other split object.
- size_t **Bins** () const
Return the number of bins.
- void **EvaluateFitnessFunction** (double &bestFitness, double &secondBestFitness) const
Evaluate the fitness function given what has been calculated so far.
- size_t **MajorityClass** () const
Return the majority class.
- double **MajorityProbability** () const
Return the probability of the majority class.
- size_t **NumChildren** () const
Return the number of children if this node splits on this feature.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the object.
- void **Split** (arma::Col< size_t > &childMajorities, **SplitInfo** &splitInfo) const
Return the majority class of each child to be created, if a split on this dimension was performed.
- void **Train** (ObservationType value, const size_t label)
Train the **HoeffdingNumericSplit** (p. 2108) on the given observed value (remember that this object only cares about the information for a single feature, not an entire point).

39.500.1 Detailed Description

```
template<typename FitnessFunction, typename ObservationType = double>
class mlpack::tree::HoeffdingNumericSplit< FitnessFunction, ObservationType >
```

The **HoeffdingNumericSplit** (p. 2108) class implements the numeric feature splitting strategy alluded to by Domingos and Hulten in the following paper:

```
@inproceedings{domingos2000mining,
  title={Mining High-Speed Data Streams},
  author={Domingos, P. and Hulten, G.},
  year={2000},
  booktitle={Proceedings of the Sixth ACM SIGKDD International Conference on
    Knowledge Discovery and Data Mining (KDD '00)},
  pages={71--80}
}
```

The strategy alluded to is very simple: we discretize the numeric features that we see. But in this case, we don't know how many bins we have, which makes things a little difficult. This class only makes binary splits, and has a maximum number of bins. The binning strategy is simple: the split caches the minimum and maximum value of points seen so far, and when the number of points hits a predefined threshold, the cached minimum-maximum range is equally split into bins, and splitting proceeds in the same way as with the categorical splits. This is a simple and stupid strategy, so don't expect it to be the best possible thing you can do.

Template Parameters

<i>FitnessFunction</i>	Fitness function to use for calculating gain.
<i>ObservationType</i>	Type of observations in this dimension.

Definition at line 53 of file hoeffding_numeric_split.hpp.

39.500.2 Member Typedef Documentation

39.500.2.1 SplitInfo

```
typedef NumericSplitInfo<ObservationType> SplitInfo
```

The splitting information type required by the **HoeffdingNumericSplit** (p. 2108).

Definition at line 57 of file hoeffding_numeric_split.hpp.

39.500.3 Constructor & Destructor Documentation

39.500.3.1 HoeffdingNumericSplit() [1/2]

```
HoeffdingNumericSplit (
    const size_t numClasses = 0,
    const size_t bins = 10,
    const size_t observationsBeforeBinning = 100 )
```

Create the **HoeffdingNumericSplit** (p. 2108) class, and specify some basic parameters about how the binning should take place.

Parameters

<i>numClasses</i>	Number of classes.
<i>bins</i>	Number of bins.
<i>observationsBeforeBinning</i>	Number of points to see before binning is performed.

39.500.3.2 HoeffdingNumericSplit() [2/2]

```
HoeffdingNumericSplit (
    const size_t numClasses,
    const HoeffdingNumericSplit< FitnessFunction, ObservationType > & other )
```

Create the **HoeffdingNumericSplit** (p. 2108) class, using the parameters from the given other split object.

39.500.4 Member Function Documentation

39.500.4.1 Bins()

```
size_t Bins ( ) const [inline]
```

Return the number of bins.

Definition at line 120 of file hoeffding_numeric_split.hpp.

References `HoeffdingNumericSplit< FitnessFunction, ObservationType >::serialize()`.

39.500.4.2 EvaluateFitnessFunction()

```
void EvaluateFitnessFunction (
    double & bestFitness,
    double & secondBestFitness ) const
```

Evaluate the fitness function given what has been calculated so far.

In this case, if binning has not yet been performed, 0 will be returned (i.e., no gain). Because this split can only split one possible way, `secondBestFitness` (the fitness function for the second best possible split) will be set to 0.

Parameters

<i>bestFitness</i>	Value of the fitness function for the best possible split.
<i>secondBestFitness</i>	Value of the fitness function for the second best possible split (always 0 for this split).

39.500.4.3 MajorityClass()

```
size_t MajorityClass ( ) const
```

Return the majority class.

Referenced by `HoeffdingNumericSplit< FitnessFunction, ObservationType >::NumChildren()`.

39.500.4.4 MajorityProbability()

```
double MajorityProbability ( ) const
```

Return the probability of the majority class.

Referenced by `HoeffdingNumericSplit< FitnessFunction, ObservationType >::NumChildren()`.

39.500.4.5 NumChildren()

```
size_t NumChildren ( ) const [inline]
```

Return the number of children if this node splits on this feature.

Definition at line 106 of file `hoeffding_numeric_split.hpp`.

References `HoeffdingNumericSplit< FitnessFunction, ObservationType >::MajorityClass()`, `HoeffdingNumericSplit< FitnessFunction, ObservationType >::MajorityProbability()`, and `HoeffdingNumericSplit< FitnessFunction, ObservationType >::Split()`.

39.500.4.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the object.

Referenced by `HoeffdingNumericSplit< FitnessFunction, ObservationType >::Bins()`.

39.500.4.7 Split()

```
void Split (
    arma::Col< size_t > & childMajorities,
    SplitInfo & splitInfo ) const
```

Return the majority class of each child to be created, if a split on this dimension was performed.

Also create the split object.

Referenced by HoeffdingNumericSplit< FitnessFunction, ObservationType >::NumChildren().

39.500.4.8 Train()

```
void Train (
    ObservationType value,
    const size_t label )
```

Train the **HoeffdingNumericSplit** (p.2108) on the given observed value (remember that this object only cares about the information for a single feature, not an entire point).

Parameters

<i>value</i>	Value in the dimension that this HoeffdingNumericSplit (p.2108) refers to.
<i>label</i>	Label of the given point.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hoeffding_trees/ **hoeffding_numeric_split.hpp**

39.501 HoeffdingTree< FitnessFunction, NumericSplitType, CategoricalSplitType > Class Template Reference

The **HoeffdingTree** (p.2113) object represents all of the necessary information for a Hoeffding-bound-based decision tree.

Public Types

- typedef CategoricalSplitType< FitnessFunction > **CategoricalSplit**
Allow access to the categorical split type.
- typedef NumericSplitType< FitnessFunction > **NumericSplit**
Allow access to the numeric split type.

Public Member Functions

- `template<typename MatType >`
HoeffdingTree (const MatType &data, const **data::DatasetInfo** &datasetInfo, const arma::Row< size_t > &labels, const size_t numClasses, const bool batchTraining=true, const double successProbability=0.95, const size_t maxSamples=0, const size_t checkInterval=100, const size_t minSamples=100, const CategoricalSplitType< FitnessFunction > &categoricalSplitIn=CategoricalSplitType< FitnessFunction >(0, 0), const NumericSplitType< FitnessFunction > &numericSplitIn=NumericSplitType< FitnessFunction >(0))
Construct the Hoeffding tree with the given parameters and given training data.
- **HoeffdingTree** (const **data::DatasetInfo** &datasetInfo, const size_t numClasses, const double successProbability=0.95, const size_t maxSamples=0, const size_t checkInterval=100, const size_t minSamples=100, const CategoricalSplitType< FitnessFunction > &categoricalSplitIn=CategoricalSplitType< FitnessFunction >(0, 0), const NumericSplitType< FitnessFunction > &numericSplitIn=NumericSplitType< FitnessFunction >(0), std::unordered_map< size_t, std::pair< size_t, size_t >> *dimensionMappings=NULL)
Construct the Hoeffding tree with the given parameters, but training on no data.
- **HoeffdingTree** ()
Construct a Hoeffding tree with no data and no information.
- **HoeffdingTree** (const **HoeffdingTree** &other)
Copy another tree (warning: this will duplicate the tree entirely, and may use a lot of memory).
- `~HoeffdingTree` ()
Clean up memory.
- `template<typename VecType >`
size_t **CalculateDirection** (const VecType &point) const
Given a point and that this node is not a leaf, calculate the index of the child node this point would go towards.
- size_t **CheckInterval** () const
Get the number of samples before a split check is performed.
- void **CheckInterval** (const size_t checkInterval)
Modify the number of samples before a split check is performed.
- const **HoeffdingTree & Child** (const size_t i) const
Get a child.
- **HoeffdingTree & Child** (const size_t i)
Modify a child.
- `template<typename VecType >`
size_t **Classify** (const VecType &point) const
Classify the given point, using this node and the entire (sub)tree beneath it.
- `template<typename VecType >`
void **Classify** (const VecType &point, size_t &prediction, double &probability) const
Classify the given point and also return an estimate of the probability that the prediction is correct.
- `template<typename MatType >`
void **Classify** (const MatType &data, arma::Row< size_t > &predictions) const
Classify the given points, using this node and the entire (sub)tree beneath it.
- `template<typename MatType >`
void **Classify** (const MatType &data, arma::Row< size_t > &predictions, arma::rowvec &probabilities) const
Classify the given points, using this node and the entire (sub)tree beneath it.
- void **CreateChildren** ()
Given that this node should split, create the children.
- size_t **MajorityClass** () const
Get the majority class.
- size_t & **MajorityClass** ()

- *Modify the majority class.*
- double **MajorityProbability** () const
Get the probability of the majority class (based on training samples).
- double & **MajorityProbability** ()
Modify the probability of the majority class.
- size_t **MaxSamples** () const
Get the maximum number of samples before a split is forced.
- void **MaxSamples** (const size_t maxSamples)
Modify the maximum number of samples before a split is forced.
- size_t **MinSamples** () const
Get the minimum number of samples for a split.
- void **MinSamples** (const size_t minSamples)
Modify the minimum number of samples for a split.
- size_t **NumChildren** () const
Get the number of children.
- size_t **NumDescendants** () const
Get the size of the Hoeffding Tree.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the split.
- size_t **SplitCheck** ()
Check if a split would satisfy the conditions of the Hoeffding bound with the node's specified success probability.
- size_t **SplitDimension** () const
Get the splitting dimension (size_t(-1) if no split).
- double **SuccessProbability** () const
Get the confidence required for a split.
- void **SuccessProbability** (const double successProbability)
Modify the confidence required for a split.
- template<typename MatType >
void **Train** (const MatType &data, const arma::Row< size_t > &labels, const bool batchTraining=true)
Train on a set of points, either in streaming mode or in batch mode, with the given labels.
- template<typename MatType >
void **Train** (const MatType &data, const **data::DatasetInfo** &info, const arma::Row< size_t > &labels, const bool batchTraining=true)
Train on a set of points, either in streaming mode or in batch mode, with the given labels and the given DatasetInfo.
- template<typename VecType >
void **Train** (const VecType &point, const size_t label)
Train on a single point in streaming mode, with the given label.

39.501.1 Detailed Description

```
template<typename FitnessFunction = GinImpurity, template< typename > class NumericSplitType = HoeffdingDoubleNumericSplit,
template< typename > class CategoricalSplitType = HoeffdingCategoricalSplit>
class mlpack::tree::HoeffdingTree< FitnessFunction, NumericSplitType, CategoricalSplitType >
```

The **HoeffdingTree** (p. 2113) object represents all of the necessary information for a Hoeffding-bound-based decision tree.

This class is able to train on samples in streaming settings and batch settings, and perform splits based on the Hoeffding bound. The Hoeffding tree (also known as the "very fast decision tree" – VFDT) is described in the following paper:

```
@inproceedings{domingos2000mining,
  title={Mining High-Speed Data Streams}},
  author={Domingos, P. and Hulten, G.},
  year={2000},
  booktitle={Proceedings of the Sixth ACM SIGKDD International Conference
    on Knowledge Discovery and Data Mining (KDD '00)},
  pages={71--80}
}
```

The class is modular, and takes three template parameters. The first, `FitnessFunction`, is the fitness function that should be used to determine whether a split is beneficial; examples might be **GiniImpurity** (p. 2092) or **Information↔Gain** (p. 2138). The `NumericSplitType` determines how numeric attributes are handled, and the `CategoricalSplitType` determines how categorical attributes are handled. As far as the actual splitting goes, the meat of the splitting procedure will be contained in those two classes.

Template Parameters

<i><code>FitnessFunction</code></i>	Fitness function to use.
<i><code>NumericSplitType</code></i>	Technique for splitting numeric features.
<i><code>CategoricalSplitType</code></i>	Technique for splitting categorical features.

Definition at line 61 of file `hoeffding_tree.hpp`.

39.501.2 Member Typedef Documentation

39.501.2.1 CategoricalSplit

```
typedef CategoricalSplitType<FitnessFunction> CategoricalSplit
```

Allow access to the categorical split type.

Definition at line 67 of file `hoeffding_tree.hpp`.

39.501.2.2 NumericSplit

```
typedef NumericSplitType<FitnessFunction> NumericSplit
```

Allow access to the numeric split type.

Definition at line 65 of file `hoeffding_tree.hpp`.

39.501.3 Constructor & Destructor Documentation

39.501.3.1 HoeffdingTree() [1/4]

```

HoeffdingTree (
    const MatType & data,
    const data::DatasetInfo & datasetInfo,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const bool batchTraining = true,
    const double successProbability = 0.95,
    const size_t maxSamples = 0,
    const size_t checkInterval = 100,
    const size_t minSamples = 100,
    const CategoricalSplitType< FitnessFunction > & categoricalSplitIn = CategoricalSplitType< FitnessFunction >(),
    const NumericSplitType< FitnessFunction > & numericSplitIn = NumericSplitType< FitnessFunction >()
)

```

Construct the Hoeffding tree with the given parameters and given training data.

The tree may be trained either in batch mode (which looks at all points before splitting, and propagates these points to the created children for further training), or in streaming mode, where each point is only considered once. (In general, batch mode will give better-performing trees, but will have higher memory and runtime costs for the same dataset.)

Parameters

<i>data</i>	Dataset to train on.
<i>datasetInfo</i>	Information on the dataset (types of each feature).
<i>labels</i>	Labels of each point in the dataset.
<i>numClasses</i>	Number of classes in the dataset.
<i>batchTraining</i>	Whether or not to train in batch.
<i>successProbability</i>	Probability of success required in Hoeffding bounds before a split can happen.
<i>maxSamples</i>	Maximum number of samples before a split is forced (0 never forces a split); ignored in batch training mode.
<i>checkInterval</i>	Number of samples required before each split; ignored in batch training mode.
<i>minSamples</i>	If the node has seen this many points or fewer, no split will be allowed.

39.501.3.2 HoeffdingTree() [2/4]

```

HoeffdingTree (
    const data::DatasetInfo & datasetInfo,
    const size_t numClasses,
    const double successProbability = 0.95,
    const size_t maxSamples = 0,
    const size_t checkInterval = 100,
    const size_t minSamples = 100,
    const CategoricalSplitType< FitnessFunction > & categoricalSplitIn = CategoricalSplitType< FitnessFunction >(),
    const NumericSplitType< FitnessFunction > & numericSplitIn = NumericSplitType< FitnessFunction >()
)

```

```

        std::unordered_map< size_t, std::pair< size_t, size_t >> * dimensionMappings = NULL
    )

```

Construct the Hoeffding tree with the given parameters, but training on no data.

The dimensionMappings parameter is only used if it is desired that this node does not create its own dimensionMappings object (for instance, if this is a child of another node in the tree).

Parameters

<i>dimensionality</i>	Dimensionality of the dataset.
<i>numClasses</i>	Number of classes in the dataset.
<i>datasetInfo</i>	Information on the dataset (types of each feature).
<i>successProbability</i>	Probability of success required in Hoeffding bound before a split can happen.
<i>maxSamples</i>	Maximum number of samples before a split is forced.
<i>checkInterval</i>	Number of samples required before each split check.
<i>minSamples</i>	If the node has seen this many points or fewer, no split will be allowed.
<i>dimensionMappings</i>	Mappings from dimension indices to positions in numeric and categorical split vectors. If left NULL, a new one will be created.

39.501.3.3 HoeffdingTree() [3 / 4]

```
HoeffdingTree ( )
```

Construct a Hoeffding tree with no data and no information.

Be sure to call **Train()** (p. 2125) before trying to use the tree.

39.501.3.4 HoeffdingTree() [4 / 4]

```

HoeffdingTree (
    const HoeffdingTree< FitnessFunction, NumericSplitType, CategoricalSplitType > &
    other )

```

Copy another tree (warning: this will duplicate the tree entirely, and may use a lot of memory).

Make sure it's what you want before you do it).

Parameters

<i>other</i>	Tree to copy.
--------------	---------------

39.501.3.5 ~HoeffdingTree()

`~ HoeffdingTree ()`

Clean up memory.

39.501.4 Member Function Documentation

39.501.4.1 CalculateDirection()

```
size_t CalculateDirection (
    const VecType & point ) const
```

Given a point and that this node is not a leaf, calculate the index of the child node this point would go towards.

This method is primarily used by the **Classify()** (p. 2120) function, but it can be used in a standalone sense too.

Parameters

<i>point</i>	Point to classify.
--------------	--------------------

Referenced by HoeffdingTree< FitnessFunction, NumericSplitType, CategoricalSplitType >::CheckInterval().

39.501.4.2 CheckInterval() [1/2]

```
size_t CheckInterval ( ) const [inline]
```

Get the number of samples before a split check is performed.

Definition at line 233 of file hoeffding_tree.hpp.

References HoeffdingTree< FitnessFunction, NumericSplitType, CategoricalSplitType >::CalculateDirection(), HoeffdingTree< FitnessFunction, NumericSplitType, CategoricalSplitType >::Classify(), HoeffdingTree< FitnessFunction, NumericSplitType, CategoricalSplitType >::CreateChildren(), HoeffdingTree< FitnessFunction, NumericSplitType, CategoricalSplitType >::NumDescendants(), and HoeffdingTree< FitnessFunction, NumericSplitType, CategoricalSplitType >::serialize().

39.501.4.3 CheckInterval() [2/2]

```
void CheckInterval (
    const size_t checkInterval )
```

Modify the number of samples before a split check is performed.

39.501.4.4 Child() [1/2]

```
const HoeffdingTree& Child (
    const size_t i ) const [inline]
```

Get a child.

Definition at line 213 of file `hoeffding_tree.hpp`.

39.501.4.5 Child() [2/2]

```
HoeffdingTree& Child (
    const size_t i ) [inline]
```

Modify a child.

Definition at line 215 of file `hoeffding_tree.hpp`.

39.501.4.6 Classify() [1/4]

```
size_t Classify (
    const VecType & point ) const
```

Classify the given point, using this node and the entire (sub)tree beneath it.

The predicted label is returned.

Parameters

<i>point</i>	Point to classify.
--------------	--------------------

Returns

Predicted label of point.

Referenced by HoeffdingTree< FitnessFunction, NumericSplitType, CategoricalSplitType >::CheckInterval().

39.501.4.7 Classify() [2/4]

```
void Classify (
    const VecType & point,
    size_t & prediction,
    double & probability ) const
```

Classify the given point and also return an estimate of the probability that the prediction is correct.

(This estimate is simply the probability that a training point was from the majority class in the leaf that this point binned to.)

Parameters

<i>point</i>	Point to classify.
<i>prediction</i>	Predicted label of point.
<i>probability</i>	An estimate of the probability that the prediction is correct.

39.501.4.8 Classify() [3/4]

```
void Classify (
    const MatType & data,
    arma::Row< size_t > & predictions ) const
```

Classify the given points, using this node and the entire (sub)tree beneath it.

The predicted labels for each point are returned.

Parameters

<i>data</i>	Points to classify.
<i>predictions</i>	Predicted labels for each point.

39.501.4.9 Classify() [4/4]

```
void Classify (
    const MatType & data,
    arma::Row< size_t > & predictions,
    arma::rowvec & probabilities ) const
```

Classify the given points, using this node and the entire (sub)tree beneath it.

The predicted labels for each point are returned, as well as an estimate of the probability that the prediction is correct for each point. This estimate is simply the **MajorityProbability()** (p. 2123) for the leaf that each point bins to.

Parameters

<i>data</i>	Points to classify.
<i>predictions</i>	Predicted labels for each point.
<i>probabilities</i>	Probability estimates for each predicted label.

39.501.4.10 CreateChildren()

```
void CreateChildren ( )
```

Given that this node should split, create the children.

Referenced by `HoeffdingTree< FitnessFunction, NumericSplitType, CategoricalSplitType >::CheckInterval()`.

39.501.4.11 MajorityClass() [1/2]

```
size_t MajorityClass ( ) const [inline]
```

Get the majority class.

Definition at line 200 of file `hoeffding_tree.hpp`.

39.501.4.12 MajorityClass() [2/2]

```
size_t& MajorityClass ( ) [inline]
```

Modify the majority class.

Definition at line 202 of file `hoeffding_tree.hpp`.

39.501.4.13 MajorityProbability() [1/2]

```
double MajorityProbability ( ) const [inline]
```

Get the probability of the majority class (based on training samples).

Definition at line 205 of file hoeffding_tree.hpp.

39.501.4.14 MajorityProbability() [2/2]

```
double& MajorityProbability ( ) [inline]
```

Modify the probability of the majority class.

Definition at line 207 of file hoeffding_tree.hpp.

39.501.4.15 MaxSamples() [1/2]

```
size_t MaxSamples ( ) const [inline]
```

Get the maximum number of samples before a split is forced.

Definition at line 228 of file hoeffding_tree.hpp.

39.501.4.16 MaxSamples() [2/2]

```
void MaxSamples (
    const size_t maxSamples )
```

Modify the maximum number of samples before a split is forced.

39.501.4.17 MinSamples() [1/2]

```
size_t MinSamples ( ) const [inline]
```

Get the minimum number of samples for a split.

Definition at line 223 of file hoeffding_tree.hpp.

39.501.4.18 MinSamples() [2/2]

```
void MinSamples (
    const size_t minSamples )
```

Modify the minimum number of samples for a split.

39.501.4.19 NumChildren()

```
size_t NumChildren ( ) const [inline]
```

Get the number of children.

Definition at line 210 of file hoeffding_tree.hpp.

39.501.4.20 NumDescendants()

```
size_t NumDescendants ( ) const
```

Get the size of the Hoeffding Tree.

Referenced by HoeffdingTree< FitnessFunction, NumericSplitType, CategoricalSplitType >::CheckInterval().

39.501.4.21 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the split.

Referenced by HoeffdingTree< FitnessFunction, NumericSplitType, CategoricalSplitType >::CheckInterval().

39.501.4.22 SplitCheck()

```
size_t SplitCheck ( )
```

Check if a split would satisfy the conditions of the Hoeffding bound with the node's specified success probability.

If so, the number of children that would be created is returned. If not, 0 is returned.

39.501.4.23 SplitDimension()

```
size_t SplitDimension ( ) const [inline]
```

Get the splitting dimension (size_t(-1) if no split).

Definition at line 197 of file hoeffding_tree.hpp.

39.501.4.24 SuccessProbability() [1/2]

```
double SuccessProbability ( ) const [inline]
```

Get the confidence required for a split.

Definition at line 218 of file hoeffding_tree.hpp.

39.501.4.25 SuccessProbability() [2/2]

```
void SuccessProbability (
    const double successProbability )
```

Modify the confidence required for a split.

39.501.4.26 Train() [1/3]

```
void Train (
    const MatType & data,
    const arma::Row< size_t > & labels,
    const bool batchTraining = true )
```

Train on a set of points, either in streaming mode or in batch mode, with the given labels.

Parameters

<i>data</i>	Data points to train on.
<i>label</i>	Labels of data points.
<i>batchTraining</i>	If true, perform training in batch.

39.501.4.27 Train() [2/3]

```
void Train (
    const MatType & data,
    const data::DatasetInfo & info,
    const arma::Row< size_t > & labels,
    const bool batchTraining = true )
```

Train on a set of points, either in streaming mode or in batch mode, with the given labels and the given DatasetInfo.

This will reset the tree.

39.501.4.28 Train() [3/3]

```
void Train (
    const VecType & point,
    const size_t label )
```

Train on a single point in streaming mode, with the given label.

Parameters

<i>point</i>	Point to train on.
<i>label</i>	Label of point to train on.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hoeffding_trees/ **hoeffding_tree.hpp**

39.502 HoeffdingTreeModel Class Reference

This class is a serializable Hoeffding tree model that can hold four different types of Hoeffding trees.

Public Types

- typedef **HoeffdingTree**< **GiniImpurity**, **BinaryDoubleNumericSplit**, **HoeffdingCategoricalSplit** > **Gini**↩
BinaryTreeType
Convenience typedef for GINI_BINARY tree type.
- typedef **HoeffdingTree**< **GiniImpurity**, **HoeffdingDoubleNumericSplit**, **HoeffdingCategoricalSplit** >
GiniHoeffdingTreeType
Convenience typedef for GINI_HOEFFDING tree type.
- typedef **HoeffdingTree**< **InformationGain**, **BinaryDoubleNumericSplit**, **HoeffdingCategoricalSplit** >
InfoBinaryTreeType
Convenience typedef for INFO_BINARY tree type.

- typedef **HoeffdingTree**< **InformationGain**, **HoeffdingDoubleNumericSplit**, **HoeffdingCategoricalSplit** > **InfoHoeffdingTreeType**

Convenience typedef for INFO_HOEFFDING tree type.

- enum **TreeType** {
GINI_HOEFFDING,
GINI_BINARY,
INFO_HOEFFDING,
INFO_BINARY }

This enumerates the four types of trees we can hold.

Public Member Functions

- **HoeffdingTreeModel** (const **TreeType** &type= **GINI_HOEFFDING**)
Construct the Hoeffding tree model, but don't initialize any tree.
- **HoeffdingTreeModel** (const **HoeffdingTreeModel** &other)
Copy the Hoeffding tree model from the given other model.
- **HoeffdingTreeModel** (**HoeffdingTreeModel** &&other)
Move the Hoeffding tree model from the given other model.
- **~HoeffdingTreeModel** ()
Clean up the given model.
- void **BuildModel** (const arma::mat &dataset, const **data::DatasetInfo** &datasetInfo, const arma::Row< size_t > &labels, const size_t numClasses, const bool batchTraining, const double successProbability, const size_t maxSamples, const size_t checkInterval, const size_t minSamples, const size_t bins, const size_t observationsBeforeBinning)
Train the model on the given dataset with the given labels.
- void **Classify** (const arma::mat &dataset, arma::Row< size_t > &predictions) const
Using the model, classify the given test points.
- void **Classify** (const arma::mat &dataset, arma::Row< size_t > &predictions, arma::rowvec &probabilities) const
Using the model, classify the given test points, returning class probabilities.
- size_t **NumNodes** () const
Get the number of nodes in the tree.
- **HoeffdingTreeModel** & **operator=** (const **HoeffdingTreeModel** &other)
Copy the Hoeffding tree model from the given other model.
- **HoeffdingTreeModel** & **operator=** (**HoeffdingTreeModel** &&other)
Move the Hoeffding tree model from the given other model.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the model.
- void **Train** (const arma::mat &dataset, const arma::Row< size_t > &labels, const bool batchTraining)
Train in streaming mode on the given dataset.

39.502.1 Detailed Description

This class is a serializable Hoeffding tree model that can hold four different types of Hoeffding trees.

It is meant to be used by the command-line program for Hoeffding trees.

Definition at line 27 of file hoeffding_tree_model.hpp.

39.502.2 Member Typedef Documentation

39.502.2.1 GiniBinaryTreeType

```
typedef HoeffdingTree< GiniImpurity, BinaryDoubleNumericSplit, HoeffdingCategoricalSplit>  
GiniBinaryTreeType
```

Convenience typedef for GINI_BINARY tree type.

Definition at line 44 of file hoeffding_tree_model.hpp.

39.502.2.2 GiniHoeffdingTreeType

```
typedef HoeffdingTree< GiniImpurity, HoeffdingDoubleNumericSplit, HoeffdingCategoricalSplit>  
GiniHoeffdingTreeType
```

Convenience typedef for GINI_HOEFFDING tree type.

Definition at line 41 of file hoeffding_tree_model.hpp.

39.502.2.3 InfoBinaryTreeType

```
typedef HoeffdingTree< InformationGain, BinaryDoubleNumericSplit, HoeffdingCategoricalSplit>  
InfoBinaryTreeType
```

Convenience typedef for INFO_BINARY tree type.

Definition at line 50 of file hoeffding_tree_model.hpp.

39.502.2.4 InfoHoeffdingTreeType

```
typedef HoeffdingTree< InformationGain, HoeffdingDoubleNumericSplit, HoeffdingCategorical↔  
Split> InfoHoeffdingTreeType
```

Convenience typedef for INFO_HOEFFDING tree type.

Definition at line 47 of file hoeffding_tree_model.hpp.

39.502.3 Member Enumeration Documentation

39.502.3.1 TreeType

```
enum TreeType
```

This enumerates the four types of trees we can hold.

Enumerator

GINI_HOEFFDING	
GINI_BINARY	
INFO_HOEFFDING	
INFO_BINARY	

Definition at line 31 of file hoeffding_tree_model.hpp.

39.502.4 Constructor & Destructor Documentation

39.502.4.1 HoeffdingTreeModel() [1/3]

```
HoeffdingTreeModel (  
    const TreeType & type = GINI_HOEFFDING )
```

Construct the Hoeffding tree model, but don't initialize any tree.

Be sure to call **Train()** (p. 2133) before doing anything with the model!

Parameters

<i>type</i>	Type of tree that will be used.
-------------	---------------------------------

39.502.4.2 HoeffdingTreeModel() [2/3]

```
HoeffdingTreeModel (  
    const HoeffdingTreeModel & other )
```

Copy the Hoeffding tree model from the given other model.

Parameters

<i>other</i>	Hoeffding tree model to copy.
--------------	-------------------------------

39.502.4.3 HoeffdingTreeModel() [3/3]

```
HoeffdingTreeModel (
    HoeffdingTreeModel && other )
```

Move the Hoeffding tree model from the given other model.

Parameters

<i>other</i>	Hoeffding tree model to move.
--------------	-------------------------------

39.502.4.4 ~HoeffdingTreeModel()

```
~ HoeffdingTreeModel ( )
```

Clean up the given model.

39.502.5 Member Function Documentation

39.502.5.1 BuildModel()

```
void BuildModel (
    const arma::mat & dataset,
    const data::DatasetInfo & datasetInfo,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const bool batchTraining,
    const double successProbability,
    const size_t maxSamples,
    const size_t checkInterval,
    const size_t minSamples,
    const size_t bins,
    const size_t observationsBeforeBinning )
```

Train the model on the given dataset with the given labels.

This method just passes to the appropriate HoeffdingTree<...> constructor, and will train with one pass over the dataset.

Parameters

<i>dataset</i>	Dataset to train on.
<i>datasetInfo</i>	Information about dimensions of dataset.
<i>labels</i>	Labels for training set.

Parameters

<i>numClasses</i>	Number of classes in dataset.
<i>batchTraining</i>	Whether or not to train in batch.
<i>successProbability</i>	Probability of success required in Hoeffding bound before a split can happen.
<i>maxSamples</i>	Maximum number of samples before a split is forced.
<i>checkInterval</i>	Number of samples required before each split check.
<i>minSamples</i>	If the node has seen this many points or fewer, no split will be allowed.
<i>bins</i>	Number of bins, for Hoeffding numeric split.
<i>observationsBeforeBinning</i>	Number of observations before binning, for Hoeffding numeric split.

39.502.5.2 Classify() [1/2]

```
void Classify (
    const arma::mat & dataset,
    arma::Row< size_t > & predictions ) const
```

Using the model, classify the given test points.

Be sure that **BuildModel()** (p. 2130) has been called first!

Parameters

<i>dataset</i>	Dataset to classify.
<i>predictions</i>	Vector to store predictions for test points in.

39.502.5.3 Classify() [2/2]

```
void Classify (
    const arma::mat & dataset,
    arma::Row< size_t > & predictions,
    arma::rowvec & probabilities ) const
```

Using the model, classify the given test points, returning class probabilities.

Parameters

<i>dataset</i>	Dataset to classify.
<i>predictions</i>	Vector to store predictions for test points in.
<i>probabilities</i>	Vector to store probabilities for test points in.

39.502.5.4 NumNodes()

```
size_t NumNodes ( ) const
```

Get the number of nodes in the tree.

39.502.5.5 operator=() [1/2]

```
HoeffdingTreeModel& operator= (
    const HoeffdingTreeModel & other )
```

Copy the Hoeffding tree model from the given other model.

Parameters

<i>other</i>	Hoeffding tree model to copy.
--------------	-------------------------------

39.502.5.6 operator=() [2/2]

```
HoeffdingTreeModel& operator= (
    HoeffdingTreeModel && other )
```

Move the Hoeffding tree model from the given other model.

Parameters

<i>other</i>	Hoeffding tree model to move.
--------------	-------------------------------

39.502.5.7 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the model.

Definition at line 169 of file hoeffding_tree_model.hpp.

References HoeffdingTreeModel::GINI_BINARY, HoeffdingTreeModel::GINI_HOEFFDING, HoeffdingTreeModel::INFO_BINARY, and HoeffdingTreeModel::INFO_HOEFFDING.

39.502.5.8 Train()

```
void Train (
    const arma::mat & dataset,
    const arma::Row< size_t > & labels,
    const bool batchTraining )
```

Train in streaming mode on the given dataset.

This takes one pass. Be sure that **BuildModel()** (p. 2130) has been called first!

Parameters

<i>dataset</i>	Dataset to train on.
<i>labels</i>	Labels for training set.
<i>batchTraining</i>	Whether or not to train in batch.

The documentation for this class was generated from the following file:

39.503 HyperplaneBase< BoundT, ProjVectorT > Class Template Reference

HyperplaneBase (p. 2133) defines a splitting hyperplane based on a projection vector and projection value.

Public Types

- typedef BoundT **BoundType**
Useful typedef for the bound type.
- typedef ProjVectorT **ProjVectorType**
Useful typedef for the projection vector type.

Public Member Functions

- **HyperplaneBase** ()
Empty Constructor.
- **HyperplaneBase** (const **ProjVectorType** &projVect, double splitVal)
Create the hyperplane with the specified projection vector and split value.
- template<typename VecType >
bool **Left** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0) const
Determine if the given point is to the left of the hyperplane, this means if the projection over the projection vector is negative or zero.
- bool **Left** (const **BoundType** &bound) const
Determine if the given bound is to the left of the hyperplane.
- template<typename VecType >
double **Project** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0) const
Project the given point on the projection vector and subtract the split value.
- template<typename VecType >
bool **Right** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0) const
Determine if the given point is to the right of the hyperplane, this means if the projection over the projection vector is positive.
- bool **Right** (const **BoundType** &bound) const
Determine if the given bound is to the right of the hyperplane.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialization.

39.503.1 Detailed Description

```
template<typename BoundT, typename ProjVectorT>
class mlpack::tree::HyperplaneBase< BoundT, ProjVectorT >
```

HyperplaneBase (p. 2133) defines a splitting hyperplane based on a projection vector and projection value.

Template Parameters

<i>BoundT</i>	The bound type considered.
<i>ProjVectorT</i>	Type of projection vector (AxisParallelProjVector (p. 1986), ProjVector (p. 2190)).

Definition at line 30 of file hyperplane.hpp.

39.503.2 Member Typedef Documentation

39.503.2.1 BoundType

```
typedef BoundT BoundType
```

Useful typedef for the bound type.

Definition at line 34 of file hyperplane.hpp.

39.503.2.2 ProjVectorType

```
typedef ProjVectorT ProjVectorType
```

Useful typedef for the projection vector type.

Definition at line 36 of file hyperplane.hpp.

39.503.3 Constructor & Destructor Documentation

39.503.3.1 HyperplaneBase() [1/2]

```
HyperplaneBase ( ) [inline]
```

Empty Constructor.

By default will consider all points to the left.

Definition at line 49 of file hyperplane.hpp.

39.503.3.2 HyperplaneBase() [2/2]

```
HyperplaneBase (  
    const ProjVectorType & projVect,  
    double splitVal ) [inline]
```

Create the hyperplane with the specified projection vector and split value.

Parameters

<i>projVect</i>	Projection vector.
<i>splitVal</i>	Split value.

Definition at line 59 of file hyperplane.hpp.

39.503.4 Member Function Documentation

39.503.4.1 Left() [1/2]

```
bool Left (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Determine if the given point is to the left of the hyperplane, this means if the projection over the projection vector is negative or zero.

Parameters

<i>point</i>	Point to be analyzed.
--------------	-----------------------

Definition at line 86 of file hyperplane.hpp.

References HyperplaneBase< BoundT, ProjVectorT >::Project().

39.503.4.2 Left() [2/2]

```
bool Left (
    const BoundType & bound ) const [inline]
```

Determine if the given bound is to the left of the hyperplane.

Parameters

<i>point</i>	Bound to be analyzed.
--------------	-----------------------

Definition at line 110 of file hyperplane.hpp.

39.503.4.3 Project()

```
double Project (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Project the given point on the projection vector and subtract the split value.

Parameters

<i>point</i>	Point to be projected.
--------------	------------------------

Definition at line 71 of file hyperplane.hpp.

Referenced by HyperplaneBase< BoundT, ProjVectorT >::Left(), and HyperplaneBase< BoundT, ProjVectorT >::Right().

39.503.4.4 Right() [1/2]

```
bool Right (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Determine if the given point is to the right of the hyperplane, this means if the projection over the projection vector is positive.

Parameters

<i>point</i>	Point to be analyzed.
--------------	-----------------------

Definition at line 99 of file hyperplane.hpp.

References HyperplaneBase< BoundT, ProjVectorT >::Project().

39.503.4.5 Right() [2/2]

```
bool Right (
    const BoundType & bound ) const [inline]
```

Determine if the given bound is to the right of the hyperplane.

Parameters

<i>point</i>	Bound to be analyzed.
--------------	-----------------------

Definition at line 122 of file hyperplane.hpp.

39.503.4.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialization.

Definition at line 133 of file hyperplane.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/space_split/ **hyperplane.hpp**

39.504 InformationGain Class Reference

The standard information gain criterion, used for calculating gain in decision trees.

Static Public Member Functions

- static double **Evaluate** (const arma::Mat< size_t > &counts)
Given the sufficient statistics of a proposed split, calculate the information gain if that split was to be used.
- template<bool UseWeights>
static double **Evaluate** (const arma::Row< size_t > &labels, const size_t numClasses, const arma::Row< double > &weights)
Given a set of labels, calculate the information gain of those labels.
- template<bool UseWeights, typename CountType >
static double **EvaluatePtr** (const CountType *counts, const size_t countLength, const CountType totalCount)
Evaluate the Gini impurity given a vector of class weight counts.
- static double **Range** (const size_t numClasses)
Return the range of the information gain for the given number of classes.
- static double **Range** (const size_t numClasses)
Return the range of the information gain for the given number of classes.

39.504.1 Detailed Description

The standard information gain criterion, used for calculating gain in decision trees.

Definition at line 25 of file information_gain.hpp.

39.504.2 Member Function Documentation**39.504.2.1 Evaluate()** [1/2]

```
static double Evaluate (
    const arma::Mat< size_t > & counts ) [inline], [static]
```

Given the sufficient statistics of a proposed split, calculate the information gain if that split was to be used.

The 'counts' matrix should contain the number of points in each class in each column, so the size of 'counts' is children x classes, where 'children' is the number of child nodes in the proposed split.

Parameters

<i>counts</i>	Matrix of sufficient statistics.
---------------	----------------------------------

Definition at line 31 of file `information_gain.hpp`.

39.504.2.2 Evaluate() [2/2]

```
static double Evaluate (  
    const arma::Row< size_t > & labels,  
    const size_t numClasses,  
    const arma::Row< double > & weights ) [inline], [static]
```

Given a set of labels, calculate the information gain of those labels.

Note that it is possible that due to floating-point representation issues, it is possible that the gain returned can be very slightly greater than 0! Thus, if you are checking for a perfect fit, be sure to use 'gain >= 0.0' not 'gain == 0.0'.

Parameters

<i>labels</i>	Labels of the dataset.
<i>numClasses</i>	Number of classes in the dataset.

Definition at line 59 of file `information_gain.hpp`.

39.504.2.3 EvaluatePtr()

```
static double EvaluatePtr (  
    const CountType * counts,  
    const size_t countLength,  
    const CountType totalCount ) [inline], [static]
```

Evaluate the Gini impurity given a vector of class weight counts.

Definition at line 32 of file `information_gain.hpp`.

39.504.2.4 Range() [1/2]

```
static double Range (  
    const size_t numClasses ) [inline], [static]
```

Return the range of the information gain for the given number of classes.

(That is, the difference between the maximum possible value and the minimum possible value.)

Definition at line 84 of file `information_gain.hpp`.

39.504.2.5 Range() [2/2]

```
static double Range (
    const size_t numClasses ) [inline], [static]
```

Return the range of the information gain for the given number of classes.

(That is, the difference between the maximum possible value and the minimum possible value.)

Parameters

<i>numClasses</i>	Number of classes in the dataset.
-------------------	-----------------------------------

Definition at line 202 of file `information_gain.hpp`.

39.507 MeanSpaceSplit< MetricType, MatType > Class Template Reference

Static Public Member Functions

- template<typename HyperplaneType >
static bool **SplitSpace** (const typename HyperplaneType::BoundType &bound, const MatType &data, const arma::Col< size_t > &points, HyperplaneType &hyp)

Create a splitting hyperplane considering the mean of the values in a certain projection.

39.507.1 Detailed Description

```
template<typename MetricType, typename MatType>
class mlpack::tree::MeanSpaceSplit< MetricType, MatType >
```

Definition at line 23 of file mean_space_split.hpp.

39.507.2 Member Function Documentation

39.507.2.1 SplitSpace()

```
static bool SplitSpace (
    const typename HyperplaneType::BoundType & bound,
    const MatType & data,
    const arma::Col< size_t > & points,
    HyperplaneType & hyp ) [static]
```

Create a splitting hyperplane considering the mean of the values in a certain projection.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the tree.
<i>points</i>	Vector of indexes of points to be considered.
<i>hyp</i>	Resulting splitting hyperplane.

Returns

Flag to determine if split is possible.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/space_split/ **mean_space_split.hpp**

39.508 MeanSplit< BoundType, MatType > Class Template Reference

A binary space partitioning tree node is split into its left and right child.

Classes

- struct **SplitInfo**
An information about the partition.

Static Public Member Functions

- `template<typename VecType >`
`static bool AssignToLeftNode (const VecType &point, const SplitInfo &splitInfo)`
Indicates that a point should be assigned to the left subtree.
- `static size_t PerformSplit (MatType &data, const size_t begin, const size_t count, const SplitInfo &splitInfo)`
Perform the split process according to the information about the split.
- `static size_t PerformSplit (MatType &data, const size_t begin, const size_t count, const SplitInfo &splitInfo, std::vector< size_t > &oldFromNew)`
Perform the split process according to the information about the split and return the list of changed indices.
- `static bool SplitNode (const BoundType &bound, MatType &data, const size_t begin, const size_t count, SplitInfo &splitInfo)`
Find the partition of the node.

39.508.1 Detailed Description

```
template<typename BoundType, typename MatType = arma::mat>
class mpack::tree::MeanSplit< BoundType, MatType >
```

A binary space partitioning tree node is split into its left and right child.

The split is done in the dimension that has the maximum width. The points are divided into two parts based on the mean in this dimension.

Definition at line 29 of file mean_split.hpp.

39.508.2 Member Function Documentation

39.508.2.1 AssignToLeftNode()

```
static bool AssignToLeftNode (
    const VecType & point,
    const SplitInfo & splitInfo ) [inline], [static]
```

Indicates that a point should be assigned to the left subtree.

Parameters

<i>point</i>	The point that is being assigned.
<i>splitInfo</i>	An information about the split.

Definition at line 115 of file mean_split.hpp.

References `MeanSplit< BoundType, MatType >::SplitInfo::splitDimension`, and `MeanSplit< BoundType, MatType >::SplitInfo::splitVal`.

39.508.2.2 PerformSplit() [1/2]

```
static size_t PerformSplit (
    MatType & data,
    const size_t begin,
    const size_t count,
    const SplitInfo & splitInfo ) [inline], [static]
```

Perform the split process according to the information about the split.

This will order the dataset such that points that belong to the left subtree are on the left of the split column, and points from the right subtree are on the right side of the split column.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	The information about the split.

Definition at line 73 of file `mean_split.hpp`.

39.508.2.3 PerformSplit() [2/2]

```
static size_t PerformSplit (
    MatType & data,
    const size_t begin,
    const size_t count,
    const SplitInfo & splitInfo,
    std::vector< size_t > & oldFromNew ) [inline], [static]
```

Perform the split process according to the information about the split and return the list of changed indices.

This will order the dataset such that points that belong to the left subtree are on the left of the split column, and points from the right subtree are on the right side of the split column.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	The information about the split.
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.

Definition at line 98 of file mean_split.hpp.

39.508.2.4 SplitNode()

```
static bool SplitNode (
    const BoundType & bound,
    MatType & data,
    const size_t begin,
    const size_t count,
    SplitInfo & splitInfo ) [static]
```

Find the partition of the node.

This method fills up the dimension that will be used to split the node and the value according which the split will be performed.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	An information about the split. This information contains the dimension and the value.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/ **mean_split.hpp**

39.509 MeanSplit< BoundType, MatType >::SplitInfo Struct Reference

An information about the partition.

Public Attributes

- size_t **splitDimension**
The dimension to split the node on.
- double **splitVal**
The split in dimension *splitDimension* is based on this value.

39.509.1 Detailed Description

```
template<typename BoundType, typename MatType = arma::mat>
struct mlpack::tree::MeanSplit< BoundType, MatType >::SplitInfo
```

An information about the partition.

Definition at line 33 of file mean_split.hpp.

39.509.2 Member Data Documentation

39.509.2.1 splitDimension

```
size_t splitDimension
```

The dimension to split the node on.

Definition at line 36 of file mean_split.hpp.

Referenced by MeanSplit< BoundType, MatType >::AssignToLeftNode().

39.509.2.2 splitVal

```
double splitVal
```

The split in dimension splitDimension is based on this value.

Definition at line 38 of file mean_split.hpp.

Referenced by MeanSplit< BoundType, MatType >::AssignToLeftNode().

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/ **mean_split.hpp**

39.510 MidpointSpaceSplit< MetricType, MatType > Class Template Reference

Static Public Member Functions

- template<typename HyperplaneType >
static bool **SplitSpace** (const typename HyperplaneType::BoundType &bound, const MatType &data, const arma::Col< size_t > &points, HyperplaneType &hyp)

Create a splitting hyperplane considering the midpoint of the values in a certain projection.

39.510.1 Detailed Description

```
template<typename MetricType, typename MatType>
class mlpack::tree::MidpointSpaceSplit< MetricType, MatType >
```

Definition at line 23 of file midpoint_space_split.hpp.

39.510.2 Member Function Documentation

39.510.2.1 SplitSpace()

```
static bool SplitSpace (
    const typename HyperplaneType::BoundType & bound,
    const MatType & data,
    const arma::Col< size_t > & points,
    HyperplaneType & hyp ) [static]
```

Create a splitting hyperplane considering the midpoint of the values in a certain projection.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the tree.
<i>points</i>	Vector of indexes of points to be considered.
<i>hyp</i>	Resulting splitting hyperplane.

Returns

Flag to determine if split is possible.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/space_split/ **midpoint_space_split.hpp**

39.511 MidpointSplit< BoundType, MatType > Class Template Reference

A binary space partitioning tree node is split into its left and right child.

Classes

- struct **SplitInfo**
A struct that contains an information about the split.

Static Public Member Functions

- `template<typename VecType >`
`static bool AssignToLeftNode (const VecType &point, const SplitInfo &splitInfo)`
Indicates that a point should be assigned to the left subtree.
- `static size_t PerformSplit (MatType &data, const size_t begin, const size_t count, const SplitInfo &splitInfo)`
Perform the split process according to the information about the split.
- `static size_t PerformSplit (MatType &data, const size_t begin, const size_t count, const SplitInfo &splitInfo, std::vector< size_t > &oldFromNew)`
Perform the split process according to the information about the split and return the list of changed indices.
- `static bool SplitNode (const BoundType &bound, MatType &data, const size_t begin, const size_t count, SplitInfo &splitInfo)`
Find the partition of the node.

39.511.1 Detailed Description

```
template<typename BoundType, typename MatType = arma::mat>
class mpack::tree::MidpointSplit< BoundType, MatType >
```

A binary space partitioning tree node is split into its left and right child.

The split is done in the dimension that has the maximum width. The points are divided into two parts based on the midpoint in this dimension.

Definition at line 30 of file `midpoint_split.hpp`.

39.511.2 Member Function Documentation

39.511.2.1 AssignToLeftNode()

```
static bool AssignToLeftNode (
    const VecType & point,
    const SplitInfo & splitInfo ) [inline], [static]
```

Indicates that a point should be assigned to the left subtree.

Parameters

<i>point</i>	The point that is being assigned.
<i>splitInfo</i>	An information about the split.

Definition at line 115 of file `midpoint_split.hpp`.

References MidpointSplit< BoundType, MatType >::SplitInfo::splitDimension, and MidpointSplit< BoundType, MatType >::SplitInfo::splitVal.

39.511.2.2 PerformSplit() [1/2]

```
static size_t PerformSplit (
    MatType & data,
    const size_t begin,
    const size_t count,
    const SplitInfo & splitInfo ) [inline], [static]
```

Perform the split process according to the information about the split.

This will order the dataset such that points that belong to the left subtree are on the left of the split column, and points from the right subtree are on the right side of the split column.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	The information about the split.

Definition at line 73 of file midpoint_split.hpp.

39.511.2.3 PerformSplit() [2/2]

```
static size_t PerformSplit (
    MatType & data,
    const size_t begin,
    const size_t count,
    const SplitInfo & splitInfo,
    std::vector< size_t > & oldFromNew ) [inline], [static]
```

Perform the split process according to the information about the split and return the list of changed indices.

This will order the dataset such that points that belong to the left subtree are on the left of the split column, and points from the right subtree are on the right side of the split column.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	The information about the split.
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.

Definition at line 98 of file midpoint_split.hpp.

39.511.2.4 SplitNode()

```
static bool SplitNode (
    const BoundType & bound,
    MatType & data,
    const size_t begin,
    const size_t count,
    SplitInfo & splitInfo ) [static]
```

Find the partition of the node.

This method fills up the dimension that will be used to split the node and the value according which the split will be performed.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	An information about the split. This information contains the dimension and the value.

The documentation for this class was generated from the following file:

39.512 MidpointSplit< BoundType, MatType >::SplitInfo Struct Reference

A struct that contains an information about the split.

Public Attributes

- size_t **splitDimension**
The dimension to split the node on.
- double **splitVal**
The split in dimension splitDimension is based on this value.

39.512.1 Detailed Description

```
template<typename BoundType, typename MatType = arma::mat>
struct mpack::tree::MidpointSplit< BoundType, MatType >::SplitInfo
```

A struct that contains an information about the split.

Definition at line 34 of file midpoint_split.hpp.

39.512.2 Member Data Documentation

39.512.2.1 splitDimension

```
size_t splitDimension
```

The dimension to split the node on.

Definition at line 37 of file midpoint_split.hpp.

Referenced by MidpointSplit< BoundType, MatType >::AssignToLeftNode().

39.512.2.2 splitVal

```
double splitVal
```

The split in dimension splitDimension is based on this value.

Definition at line 39 of file midpoint_split.hpp.

Referenced by MidpointSplit< BoundType, MatType >::AssignToLeftNode().

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/ midpoint_split.hpp

39.513 MinimalCoverageSweep< SplitPolicy > Class Template Reference

The **MinimalCoverageSweep** (p. 2151) class finds a partition along which we can split a node according to the coverage of two resulting nodes.

Classes

- struct **SweepCost**

A struct that provides the type of the sweep cost.

Static Public Member Functions

- template<typename TreeType , typename ElemType >
static bool **CheckLeafSweep** (const TreeType *node, const size_t cutAxis, const ElemType cut)
Check if a leaf node can be split along the axis at the provided coordinate.
- template<typename TreeType , typename ElemType >
static bool **CheckNonLeafSweep** (const TreeType *node, const size_t cutAxis, const ElemType cut)
Check if an intermediate node can be split along the axis at the provided coordinate.
- template<typename TreeType >
static TreeType::ElemType **SweepLeafNode** (const size_t axis, const TreeType *node, typename TreeType::ElemType &axisCut)
Find a suitable partition of a leaf node along the provided axis.
- template<typename TreeType >
static TreeType::ElemType **SweepNonLeafNode** (const size_t axis, const TreeType *node, typename TreeType::ElemType &axisCut)
Find a suitable partition of a non-leaf node along the provided axis.

39.513.1 Detailed Description

```
template<typename SplitPolicy>
class mlpack::tree::MinimalCoverageSweep< SplitPolicy >
```

The **MinimalCoverageSweep** (p. 2151) class finds a partition along which we can split a node according to the coverage of two resulting nodes.

The class finds a partition along a given axis. Moreover, the class evaluates the cost of each split. The cost is proportional to the total coverage of resulting nodes. If the resulting nodes are overflowed the maximum cost is returned.

Template Parameters

<i>SplitPolicy</i>	The class that provides rules for inserting children of a node that is being split into two new subtrees.
--------------------	---

Definition at line 30 of file minimal_coverage_sweep.hpp.

39.513.2 Member Function Documentation

39.513.2.1 CheckLeafSweep()

```
static bool CheckLeafSweep (
    const TreeType * node,
    const size_t cutAxis,
    const ElemType cut ) [static]
```

Check if a leaf node can be split along the axis at the provided coordinate.

Parameters

<i>node</i>	The node that is being split.
<i>cutAxis</i>	The axis that we want to check.
<i>cut</i>	The coordinate that we want to check.

39.513.2.2 CheckNonLeafSweep()

```
static bool CheckNonLeafSweep (
    const TreeType * node,
    const size_t cutAxis,
    const ElemType cut ) [static]
```

Check if an intermediate node can be split along the axis at the provided coordinate.

Parameters

<i>node</i>	The node that is being split.
<i>cutAxis</i>	The axis that we want to check.
<i>cut</i>	The coordinate that we want to check.

39.513.2.3 SweepLeafNode()

```
static TreeType::ElemType SweepLeafNode (
    const size_t axis,
    const TreeType * node,
    typename TreeType::ElemType & axisCut ) [static]
```

Find a suitable partition of a leaf node along the provided axis.

The method returns the cost of the split.

Parameters

<i>axis</i>	The axis along which we are finding a partition.
<i>node</i>	The node that is being split.
<i>axisCut</i>	The coordinate at which the node may be split.

39.513.2.4 SweepNonLeafNode()

```
static TreeType::ElemType SweepNonLeafNode (
    const size_t axis,
    const TreeType * node,
    typename TreeType::ElemType & axisCut ) [static]
```

Find a suitable partition of a non-leaf node along the provided axis.

The method returns the cost of the split.

Parameters

<i>axis</i>	The axis along which we are finding a partition.
<i>node</i>	The node that is being split.
<i>axisCut</i>	The coordinate at which the node may be split.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ **minimal_coverage_sweep.hpp**

39.514 MinimalCoverageSweep< SplitPolicy >::SweepCost< TreeType > Struct Template Reference

A struct that provides the type of the sweep cost.

Public Types

- typedef TreeType::ElemType **type**

39.514.1 Detailed Description

```
template<typename SplitPolicy>
template<typename TreeType>
struct mlpack::tree::MinimalCoverageSweep< SplitPolicy >::SweepCost< TreeType >
```

A struct that provides the type of the sweep cost.

Definition at line 35 of file `minimal_coverage_sweep.hpp`.

39.514.2 Member Typedef Documentation

39.514.2.1 type

```
typedef TreeType::ElemType type
```

Definition at line 37 of file `minimal_coverage_sweep.hpp`.

The documentation for this struct was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ minimal_coverage_sweep.hpp`

39.515 MinimalSplitsNumberSweep< SplitPolicy > Class Template Reference

The **MinimalSplitsNumberSweep** (p.2155) class finds a partition along which we can split a node according to the number of required splits of the node.

Classes

- struct **SweepCost**
A struct that provides the type of the sweep cost.

Static Public Member Functions

- `template<typename TreeType >`
static `size_t` **SweepLeafNode** (`const size_t axis`, `const TreeType *node`, `typename TreeType::ElemType &axisCut`)
Find a suitable partition of a leaf node along the provided axis.
- `template<typename TreeType >`
static `size_t` **SweepNonLeafNode** (`const size_t axis`, `const TreeType *node`, `typename TreeType::ElemType &axisCut`)
Find a suitable partition of a non-leaf node along the provided axis.

39.515.1 Detailed Description

```
template<typename SplitPolicy>
class mlpack::tree::MinimalSplitsNumberSweep< SplitPolicy >
```

The **MinimalSplitsNumberSweep** (p.2155) class finds a partition along which we can split a node according to the number of required splits of the node.

The class finds a partition along a given axis. Moreover, the class evaluates the cost of each split. The cost is proportional to the number of required splits and the difference of sizes of resulting nodes. If the resulting nodes are overflowed the maximum cost is returned.

Template Parameters

<i>SplitPolicy</i>	The class that provides rules for inserting children of a node that is being split into two new subtrees.
--------------------	---

Definition at line 31 of file `minimal_splits_number_sweep.hpp`.

39.515.2 Member Function Documentation

39.515.2.1 SweepLeafNode()

```
static size_t SweepLeafNode (
    const size_t axis,
    const TreeType * node,
    typename TreeType::ElemType & axisCut ) [static]
```

Find a suitable partition of a leaf node along the provided axis.

The method returns the cost of the split.

Parameters

<i>axis</i>	The axis along which we are finding a partition.
<i>node</i>	The node that is being split.
<i>axisCut</i>	The coordinate at which the node may be split.

39.515.2.2 SweepNonLeafNode()

```
static size_t SweepNonLeafNode (
    const size_t axis,
    const TreeType * node,
    typename TreeType::ElemType & axisCut ) [static]
```

Find a suitable partition of a non-leaf node along the provided axis.

The method returns the cost of the split.

Parameters

<i>axis</i>	The axis along which we are finding a partition.
<i>node</i>	The node that is being split.
<i>axisCut</i>	The coordinate at which the node may be split.

The documentation for this class was generated from the following file:

39.516 MinimalSplitsNumberSweep< SplitPolicy >::SweepCost< typename > Struct Template Reference

A struct that provides the type of the sweep cost.

Public Types

- typedef size_t **type**

39.516.1 Detailed Description

```
template<typename SplitPolicy>
template<typename>
struct mlpack::tree::MinimalSplitsNumberSweep< SplitPolicy >::SweepCost< typename >
```

A struct that provides the type of the sweep cost.

Definition at line 36 of file minimal_splits_number_sweep.hpp.

39.516.2 Member Typedef Documentation

39.516.2.1 type

```
typedef size_t type
```

Definition at line 38 of file minimal_splits_number_sweep.hpp.

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ **minimal_splits_number_sweep.**↵

39.517 MultipleRandomDimensionSelect Class Reference

This dimension selection policy allows the selection from a few random dimensions.

Public Member Functions

- **MultipleRandomDimensionSelect** (const size_t numDimensions=0)
*Instantiate the **MultipleRandomDimensionSelect** (p. 2158) object.*
- size_t **Begin** ()
Get the first random value.
- size_t **Dimensions** () const
Get the number of dimensions.
- size_t & **Dimensions** ()
Set the number of dimensions.
- size_t **End** () const
Get the last random value.
- size_t **Next** ()
Get the next index.

39.517.1 Detailed Description

This dimension selection policy allows the selection from a few random dimensions.

The number of random dimensions to use is specified in the constructor.

Definition at line 23 of file multiple_random_dimension_select.hpp.

39.517.2 Constructor & Destructor Documentation

39.517.2.1 MultipleRandomDimensionSelect()

```
MultipleRandomDimensionSelect (  
    const size_t numDimensions = 0 ) [inline]
```

Instantiate the **MultipleRandomDimensionSelect** (p. 2158) object.

Parameters

<i>numDimensions</i>	Number of random dimensions to try for each split.
----------------------	--

Definition at line 31 of file multiple_random_dimension_select.hpp.

39.517.3 Member Function Documentation

39.517.3.1 Begin()

```
size_t Begin ( ) [inline]
```

Get the first random value.

Definition at line 40 of file `multiple_random_dimension_select.hpp`.

References `mlpack::math::RandInt()`.

39.517.3.2 Dimensions() [1/2]

```
size_t Dimensions ( ) const [inline]
```

Get the number of dimensions.

Definition at line 93 of file `multiple_random_dimension_select.hpp`.

39.517.3.3 Dimensions() [2/2]

```
size_t& Dimensions ( ) [inline]
```

Set the number of dimensions.

Definition at line 95 of file `multiple_random_dimension_select.hpp`.

39.517.3.4 End()

```
size_t End ( ) const [inline]
```

Get the last random value.

Definition at line 82 of file `multiple_random_dimension_select.hpp`.

39.517.3.5 Next()

```
size_t Next ( ) [inline]
```

Get the next index.

Definition at line 87 of file `multiple_random_dimension_select.hpp`.

The documentation for this class was generated from the following file:

39.518 NoAuxiliaryInformation< TreeType > Class Template Reference**Public Member Functions**

- **NoAuxiliaryInformation** ()
Construct the auxiliary information object.
- **NoAuxiliaryInformation** (const TreeType *)
Construct the auxiliary information object.
- **NoAuxiliaryInformation** (const **NoAuxiliaryInformation** &, TreeType *, bool=true)
Construct the auxiliary information object.
- **NoAuxiliaryInformation** (**NoAuxiliaryInformation** &&)
Construct the auxiliary information object.
- bool **HandleNodeInsertion** (TreeType *, TreeType *, bool)
Some tree types require to save some properties at the insertion process.
- bool **HandleNodeRemoval** (TreeType *, const size_t)
Some tree types require to save some properties at the deletion process.
- bool **HandlePointDeletion** (TreeType *, const size_t)
Some tree types require to save some properties at the deletion process.
- bool **HandlePointInsertion** (TreeType *, const size_t)
Some tree types require to save some properties at the insertion process.
- void **NullifyData** ()
Nullify the auxiliary information in order to prevent an invalid free.
- **NoAuxiliaryInformation** & **operator=** (const **NoAuxiliaryInformation** &)
Copy the auxiliary information object.
- template<typename Archive >
void **serialize** (Archive &, const unsigned int)
Serialize the information.
- void **SplitAuxiliaryInfo** (TreeType *, TreeType *, size_t, typename TreeType::ElemType)
The R++ tree requires to split the maximum bounding rectangle of a node that is being split.
- bool **UpdateAuxiliaryInfo** (TreeType *)
Some tree types require to propagate the information upward.

39.518.1 Detailed Description

```
template<typename TreeType>
class mlpack::tree::NoAuxiliaryInformation< TreeType >
```

Definition at line 20 of file no_auxiliary_information.hpp.

39.518.2 Constructor & Destructor Documentation

39.518.2.1 NoAuxiliaryInformation() [1/4]

```
NoAuxiliaryInformation ( ) [inline]
```

Construct the auxiliary information object.

Definition at line 24 of file no_auxiliary_information.hpp.

39.518.2.2 NoAuxiliaryInformation() [2/4]

```
NoAuxiliaryInformation (
    const TreeType * ) [inline]
```

Construct the auxiliary information object.

Definition at line 26 of file no_auxiliary_information.hpp.

39.518.2.3 NoAuxiliaryInformation() [3/4]

```
NoAuxiliaryInformation (
    const NoAuxiliaryInformation< TreeType > & ,
    TreeType * ,
    bool = true ) [inline]
```

Construct the auxiliary information object.

Definition at line 28 of file no_auxiliary_information.hpp.

39.518.2.4 NoAuxiliaryInformation() [4/4]

```
NoAuxiliaryInformation (
    NoAuxiliaryInformation< TreeType > && ) [inline]
```

Construct the auxiliary information object.

Definition at line 32 of file no_auxiliary_information.hpp.

39.518.3 Member Function Documentation

39.518.3.1 HandleNodeInsertion()

```
bool HandleNodeInsertion (
    TreeType * ,
    TreeType * ,
    bool ) [inline]
```

Some tree types require to save some properties at the insertion process.

This method allows the auxiliary information the option of manipulating the tree in order to perform the insertion process. If the auxiliary information does that, then the method should return true; if the method returns false the **RectangleTree** (p. 2207) performs its default behavior.

Parameters

<i>node</i>	The node in which the nodeToInsert is being inserted.
<i>nodeToInsert</i>	The node being inserted.
<i>insertionLevel</i>	The level of the tree at which the nodeToInsert should be inserted.

Definition at line 67 of file no_auxiliary_information.hpp.

39.518.3.2 HandleNodeRemoval()

```
bool HandleNodeRemoval (
    TreeType * ,
    const size_t ) [inline]
```

Some tree types require to save some properties at the deletion process.

This method allows the auxiliary information the option of manipulating the tree in order to perform the deletion process. If the auxiliary information does that, then the method should return true; if the method returns false the **RectangleTree** (p. 2207) performs its default behavior.

Parameters

<i>node</i>	The node from which the node is being deleted.
<i>nodeIndex</i>	The local index of the node being deleted.

Definition at line 99 of file no_auxiliary_information.hpp.

39.518.3.3 HandlePointDeletion()

```
bool HandlePointDeletion (
    TreeType * ,
    const size_t ) [inline]
```

Some tree types require to save some properties at the deletion process.

This method allows the auxiliary information the option of manipulating the tree in order to perform the deletion process. If the auxiliary information does that, then the method should return true; if the method returns false the **RectangleTree** (p. 2207) performs its default behavior.

Parameters

<i>node</i>	The node from which the point is being deleted.
<i>localIndex</i>	The local index of the point being deleted.

Definition at line 84 of file no_auxiliary_information.hpp.

39.518.3.4 HandlePointInsertion()

```
bool HandlePointInsertion (
    TreeType * ,
    const size_t ) [inline]
```

Some tree types require to save some properties at the insertion process.

This method allows the auxiliary information the option of manipulating the tree in order to perform the insertion process. If the auxiliary information does that, then the method should return true; if the method returns false the **RectangleTree** (p. 2207) performs its default behavior.

Parameters

<i>node</i>	The node in which the point is being inserted.
<i>point</i>	The global number of the point being inserted.

Definition at line 50 of file no_auxiliary_information.hpp.

39.518.3.5 NullifyData()

```
void NullifyData ( ) [inline]
```

Nullify the auxiliary information in order to prevent an invalid free.

Definition at line 137 of file no_auxiliary_information.hpp.

39.518.3.6 operator=()

```
NoAuxiliaryInformation& operator= (
    const NoAuxiliaryInformation< TreeType > & ) [inline]
```

Copy the auxiliary information object.

Definition at line 35 of file no_auxiliary_information.hpp.

39.518.3.7 serialize()

```
void serialize (
    Archive & ,
    const unsigned int ) [inline]
```

Serialize the information.

Definition at line 144 of file no_auxiliary_information.hpp.

39.518.3.8 SplitAuxiliaryInfo()

```
void SplitAuxiliaryInfo (
    TreeType * ,
    TreeType * ,
    size_t ,
    typename TreeType::ElemType ) [inline]
```

The R++ tree requires to split the maximum bounding rectangle of a node that is being split.

This method is intended for that. This method is only necessary for an AuxiliaryInformationType that is being used in conjunction with **RPlusTreeSplit** (p.2251).

Parameters

<i>treeOne</i>	The first subtree.
<i>treeTwo</i>	The second subtree.
<i>axis</i>	The axis along which the split is performed.
<i>cut</i>	The coordinate at which the node is split.

Definition at line 127 of file no_auxiliary_information.hpp.

39.518.3.9 UpdateAuxiliaryInfo()

```
bool UpdateAuxiliaryInfo (
    TreeType * ) [inline]
```

Some tree types require to propagate the information upward.

This method should return false if this is not the case. If true is returned, the update will be propagated upward.

Parameters

<i>node</i>	The node in which the auxiliary information being update.
-------------	---

Definition at line 111 of file no_auxiliary_information.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ no_auxiliary_information.hpp

39.519 NumericSplitInfo< ObservationType > Class Template Reference

Public Member Functions

- **NumericSplitInfo** ()
- **NumericSplitInfo** (const arma::Col< ObservationType > &splitPoints)
- template<typename eT >
size_t **CalculateDirection** (const eT &value) const
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the split (save/load the split points).

39.519.1 Detailed Description

```
template<typename ObservationType = double>
class mpack::tree::NumericSplitInfo< ObservationType >
```

Definition at line 21 of file `numeric_split_info.hpp`.

39.519.2 Constructor & Destructor Documentation

39.519.2.1 NumericSplitInfo() [1/2]

```
NumericSplitInfo ( ) [inline]
```

Definition at line 24 of file `numeric_split_info.hpp`.

39.519.2.2 NumericSplitInfo() [2/2]

```
NumericSplitInfo (
    const arma::Col< ObservationType > & splitPoints ) [inline]
```

Definition at line 25 of file `numeric_split_info.hpp`.

39.519.3 Member Function Documentation

39.519.3.1 CalculateDirection()

```
size_t CalculateDirection (
    const eT & value ) const [inline]
```

Definition at line 29 of file `numeric_split_info.hpp`.

39.519.3.2 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the split (save/load the split points).

Definition at line 41 of file numeric_split_info.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hoeffding_trees/ **numeric_split_info.hpp**

39.520 Octree< MetricType, StatisticType, MatType > Class Template Reference

Classes

- class **DualTreeTraverser**
A dual-tree traverser; see dual_tree_traverser.hpp.
- class **SingleTreeTraverser**
A single-tree traverser; see single_tree_traverser.hpp.

Public Types

- typedef MatType::elem_type **ElemType**
The type of element held in MatType.
- typedef MatType **Mat**
So other classes can use TreeType::Mat.

Public Member Functions

- **Octree** (const MatType &data, const size_t maxLeafSize=20)
Construct this as the root node of an octree on the given dataset.
- **Octree** (const MatType &data, std::vector< size_t > &oldFromNew, const size_t maxLeafSize=20)
Construct this as the root node of an octree on the given dataset.
- **Octree** (const MatType &data, std::vector< size_t > &oldFromNew, std::vector< size_t > &newFromOld, const size_t maxLeafSize=20)
Construct this as the root node of an octree on the given dataset.
- **Octree** (MatType &&data, const size_t maxLeafSize=20)
Construct this as the root node of an octree on the given dataset.
- **Octree** (MatType &&data, std::vector< size_t > &oldFromNew, const size_t maxLeafSize=20)
Construct this as the root node of an octree on the given dataset.
- **Octree** (MatType &&data, std::vector< size_t > &oldFromNew, std::vector< size_t > &newFromOld, const size_t maxLeafSize=20)

Construct this as the root node of an octree on the given dataset.

- **Octree** (**Octree** *parent, const size_t begin, const size_t count, const arma::vec ¢er, const double width, const size_t maxLeafSize=20)

Construct this node as a child of the given parent, starting at column begin and using count points.

- **Octree** (**Octree** *parent, const size_t begin, const size_t count, std::vector< size_t > &oldFromNew, const arma::vec ¢er, const double width, const size_t maxLeafSize=20)

Construct this node as a child of the given parent, starting at column begin and using count points.

- **Octree** (const **Octree** &other)

Copy the given tree.

- **Octree** (**Octree** &&other)

Move the given tree.

- template<typename Archive >

Octree (Archive &ar, const typename **std::enable_if_t**< Archive::is_loading::value > *=0)

*Initialize the tree from a **boost::serialization** (p. 251) archive.*

- ~**Octree** ()

Destroy the tree.

- const **bound::HRectBound**< MetricType > & **Bound** () const

Return the bound object for this node.

- **bound::HRectBound**< MetricType > & **Bound** ()

Modify the bound object for this node.

- void **Center** (arma::vec ¢er) const

Store the center of the bounding region in the given vector.

- const **Octree** & **Child** (const size_t child) const

Return the specified child.

- **Octree** & **Child** (const size_t child)

Return the specified child.

- **Octree** *& **ChildPtr** (const size_t child)

Return the pointer to the given child.

- const MatType & **Dataset** () const

Return the dataset used by this node.

- size_t **Descendant** (const size_t index) const

Return the index (with reference to the dataset) of a particular descendant.

- **ElemType** **FurthestDescendantDistance** () const

Return the furthest possible descendant distance.

- **ElemType** **FurthestPointDistance** () const

Return the furthest distance to a point held in this node.

- template<typename VecType >

size_t **GetFurthestChild** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > *=0) const

Return the index of the furthest child node to the given query point.

- size_t **GetFurthestChild** (const **Octree** &queryNode) const

Return the index of the furthest child node to the given query node.

- template<typename VecType >

size_t **GetNearestChild** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > *=0) const

Return the index of the nearest child node to the given query point.

- size_t **GetNearestChild** (const **Octree** &queryNode) const

Return the index of the nearest child node to the given query node.

- bool **IsLeaf** () const
Return whether or not the node is a leaf.
- **ElemType MaxDistance** (const **Octree** &other) const
Return the maximum distance to another node.
- template<typename VecType >
ElemType MaxDistance (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0) const
Return the maximum distance to the given point.
- MetricType **Metric** () const
Return the metric that this tree uses.
- **ElemType MinDistance** (const **Octree** &other) const
Return the minimum distance to another node.
- template<typename VecType >
ElemType MinDistance (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0) const
Return the minimum distance to the given point.
- **ElemType MinimumBoundDistance** () const
Return the minimum distance from the center of the node to any bound edge.
- size_t **NumChildren** () const
Return the number of children in this node.
- size_t **NumDescendants** () const
Return the number of descendants of this node.
- size_t **NumPoints** () const
Return the number of points in this node (0 if not a leaf).
- **Octree * Parent** () const
Get the pointer to the parent.
- **Octree *& Parent** ()
Modify the pointer to the parent (be careful!).
- **ElemType ParentDistance** () const
Return the distance from the center of this node to the center of the parent node.
- **ElemType & ParentDistance** ()
Modify the distance from the center of this node to the center of the parent node.
- size_t **Point** (const size_t index) const
Return the index (with reference to the dataset) of a particular point in this node.
- **math::RangeType**< **ElemType** > **RangeDistance** (const **Octree** &other) const
Return the minimum and maximum distance to another node.
- template<typename VecType >
math::RangeType< **ElemType** > **RangeDistance** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0) const
Return the minimum and maximum distance to another node.
- template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
Serialize the tree.
- const StatisticType & **Stat** () const
Return the statistic object for this node.
- StatisticType & **Stat** ()
Modify the statistic object for this node.

Protected Member Functions

- **Octree ()**

A default constructor.

39.520.1 Detailed Description

```
template<typename MetricType = metric::EuclideanDistance, typename StatisticType = EmptyStatistic, typename MatType = arma<↵
::mat>
class mlpack::tree::Octree< MetricType, StatisticType, MatType >
```

Definition at line 25 of file octree.hpp.

39.520.2 Member Typedef Documentation

39.520.2.1 ElemType

```
typedef MatType::elem_type ElemType
```

The type of element held in MatType.

Definition at line 31 of file octree.hpp.

39.520.2.2 Mat

```
typedef MatType Mat
```

So other classes can use TreeType::Mat.

Definition at line 29 of file octree.hpp.

39.520.3 Constructor & Destructor Documentation

39.520.3.1 Octree() [1/12]

```
Octree (
    const MatType & data,
    const size_t maxLeafSize = 20 )
```

Construct this as the root node of an octree on the given dataset.

This copies the dataset. If you don't want to copy the input dataset, consider using the constructor that takes an rvalue reference and use `std::move()`.

Parameters

<i>data</i>	Dataset to create tree from. This will be copied!
<i>maxLeafSize</i>	Maximum number of points in a leaf node.

39.520.3.2 Octree() [2/12]

```
Octree (
    const MatType & data,
    std::vector< size_t > & oldFromNew,
    const size_t maxLeafSize = 20 )
```

Construct this as the root node of an octree on the given dataset.

This copies the dataset and modifies its ordering; a mapping of the old point indices to the new point indices is filled. If you don't want the matrix to be copied, consider using the constructor that takes an rvalue reference and use `std::move()`.

Parameters

<i>data</i>	Dataset to create tree from. This will be copied!
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.
<i>maxLeafSize</i>	Maximum number of points in a leaf node.

39.520.3.3 Octree() [3/12]

```
Octree (
    const MatType & data,
    std::vector< size_t > & oldFromNew,
    std::vector< size_t > & newFromOld,
    const size_t maxLeafSize = 20 )
```

Construct this as the root node of an octree on the given dataset.

This copies the dataset and modifies its ordering; a mapping of the old point indices to the new point indices is filled, and a mapping of the new point indices to the old point indices is filled. If you don't want the matrix to be copied, consider using the constructor that takes an rvalue reference and use `std::move()`.

Parameters

<i>data</i>	Dataset to create tree from. This will be copied!
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.
<i>newFromOld</i>	Vector which will be filled with the new positions for each old point.
<i>maxLeafSize</i>	Maximum number of points in a leaf node.

39.520.3.4 Octree() [4/12]

```
Octree (
    MatType && data,
    const size_t maxLeafSize = 20 )
```

Construct this as the root node of an octree on the given dataset.

This will take ownership of the dataset; if you don't want this, consider using the constructor that takes a const reference to the dataset.

Parameters

<i>data</i>	Dataset to create tree from. This will be copied!
<i>maxLeafSize</i>	Maximum number of points in a leaf node.

39.520.3.5 Octree() [5/12]

```
Octree (
    MatType && data,
    std::vector< size_t > & oldFromNew,
    const size_t maxLeafSize = 20 )
```

Construct this as the root node of an octree on the given dataset.

This will take ownership of the dataset; if you don't want this, consider using the constructor that takes a const reference to the dataset. This modifies the ordering of the dataset; a mapping of the old point indices to the new point indices is filled.

Parameters

<i>data</i>	Dataset to create tree from. This will be copied!
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.
<i>maxLeafSize</i>	Maximum number of points in a leaf node.

39.520.3.6 Octree() [6/12]

```
Octree (
    MatType && data,
```

```
std::vector< size_t > & oldFromNew,
std::vector< size_t > & newFromOld,
const size_t maxLeafSize = 20 )
```

Construct this as the root node of an octree on the given dataset.

This will take ownership of the dataset; if you don't want this, consider using the constructor that takes a const reference to the dataset. This modifies the ordering of the dataset; a mapping of the old point indices to the new point indices is filled, and a mapping of the new point indices to the old point indices is filled.

Parameters

<i>data</i>	Dataset to create tree from. This will be copied!
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.
<i>newFromOld</i>	Vector which will be filled with the new positions for each old point.
<i>maxLeafSize</i>	Maximum number of points in a leaf node.

39.520.3.7 Octree() [7/12]

```
Octree (
    Octree< MetricType, StatisticType, MatType > * parent,
    const size_t begin,
    const size_t count,
    const arma::vec & center,
    const double width,
    const size_t maxLeafSize = 20 )
```

Construct this node as a child of the given parent, starting at column begin and using count points.

The ordering of that subset of points in the parent's data matrix will be modified! This is used for recursive tree-building by the other constructors that don't specify point indices.

Parameters

<i>parent</i>	Parent of this node. Its dataset will be modified!
<i>begin</i>	Index of point to start tree construction with.
<i>count</i>	Number of points to use to construct tree.
<i>center</i>	Center of the node (for splitting).
<i>width</i>	Width of the node in each dimension.
<i>maxLeafSize</i>	Maximum number of points in a leaf node.

39.520.3.8 Octree() [8/12]

```
Octree (
```

```

    Octree< MetricType, StatisticType, MatType > * parent,
    const size_t begin,
    const size_t count,
    std::vector< size_t > & oldFromNew,
    const arma::vec & center,
    const double width,
    const size_t maxLeafSize = 20 )

```

Construct this node as a child of the given parent, starting at column *begin* and using *count* points.

The ordering of that subset of points in the parent's data matrix will be modified! This is used for recursive tree-building by the other constructors that don't specify point indices.

A mapping of the old point indices to the new point indices is filled, but it is expected that the vector is already allocated with size greater than or equal to (*begin* + *count*), and if that is not true, invalid memory reads (and writes) will occur.

Parameters

<i>parent</i>	Parent of this node. Its dataset will be modified!
<i>begin</i>	Index of point to start tree construction with.
<i>count</i>	Number of points to use to construct tree.
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.
<i>center</i>	Center of the node (for splitting).
<i>width</i>	Width of the node in each dimension.
<i>maxLeafSize</i>	Maximum number of points in a leaf node.

39.520.3.9 Octree() [9/12]

```

Octree (
    const Octree< MetricType, StatisticType, MatType > & other )

```

Copy the given tree.

Be careful! This may use a lot of memory.

Parameters

<i>other</i>	Tree to copy from.
--------------	--------------------

39.520.3.10 Octree() [10/12]

```

Octree (
    Octree< MetricType, StatisticType, MatType > && other )

```

Move the given tree.

The tree passed as a parameter will be emptied and will not be usable after this call.

Parameters

<i>other</i>	Tree to move.
--------------	---------------

39.520.3.11 Octree() [11/12]

```
Octree (
    Archive & ar,
    const typename std::enable_if_t< Archive::is_loading::value > * = 0 )
```

Initialize the tree from a **boost::serialization** (p. 251) archive.

Parameters

<i>ar</i>	Archive to load tree from. Must be an iarchive, not an oarchive.
-----------	--

39.520.3.12 ~Octree()

```
~ Octree ( )
```

Destroy the tree.

39.520.3.13 Octree() [12/12]

```
Octree ( ) [protected]
```

A default constructor.

This is meant to only be used with **boost::serialization** (p. 251), which is allowed with the friend declaration below. This does not return a valid tree! The method must be protected, so that the serialization shim can work with the default constructor.

Referenced by Octree< MetricType, StatisticType, MatType >::Center().

39.520.4 Member Function Documentation

39.520.4.1 Bound() [1/2]

```
const bound::HRectBound<MetricType>& Bound ( ) const [inline]
```

Return the bound object for this node.

Definition at line 247 of file octree.hpp.

39.520.4.2 Bound() [2/2]

```
bound::HRectBound<MetricType>& Bound ( ) [inline]
```

Modify the bound object for this node.

Definition at line 249 of file octree.hpp.

39.520.4.3 Center()

```
void Center (
    arma::vec & center ) const [inline]
```

Store the center of the bounding region in the given vector.

Definition at line 383 of file octree.hpp.

References HRectBound< MetricType, ElemType >::Center(), Octree< MetricType, StatisticType, MatType >::Octree(), and Octree< MetricType, StatisticType, MatType >::serialize().

39.520.4.4 Child() [1/2]

```
const Octree& Child (
    const size_t child ) const [inline]
```

Return the specified child.

If the index is out of bounds, unspecified behavior will occur.

Definition at line 326 of file octree.hpp.

39.520.4.5 Child() [2/2]

```
Octree& Child (
    const size_t child ) [inline]
```

Return the specified child.

If the index is out of bounds, unspecified behavior will occur.

Definition at line 332 of file octree.hpp.

39.520.4.6 ChildPtr()

```
Octree* ChildPtr (
    const size_t child ) [inline]
```

Return the pointer to the given child.

This allows the child itself to be modified.

Definition at line 338 of file octree.hpp.

References Octree< MetricType, StatisticType, MatType >::Descendant(), Octree< MetricType, StatisticType, MatType >::MaxDistance(), Octree< MetricType, StatisticType, MatType >::MinDistance(), Octree< MetricType, StatisticType, MatType >::NumDescendants(), Octree< MetricType, StatisticType, MatType >::NumPoints(), Octree< MetricType, StatisticType, MatType >::Point(), and Octree< MetricType, StatisticType, MatType >::RangeDistance().

39.520.4.7 Dataset()

```
const MatType& Dataset ( ) const [inline]
```

Return the dataset used by this node.

Definition at line 239 of file octree.hpp.

39.520.4.8 Descendant()

```
size_t Descendant (
    const size_t index ) const
```

Return the index (with reference to the dataset) of a particular descendant.

Referenced by Octree< MetricType, StatisticType, MatType >::ChildPtr().

39.520.4.9 FurthestDescendantDistance()

```
ElemType FurthestDescendantDistance ( ) const
```

Return the furthest possible descendant distance.

This returns the maximum distance from the centroid to the edge of the bound and not the empirical quantity which is the actual furthest descendant distance. So the actual furthest descendant distance may be less than what this method returns (but it will never be greater than this).

Referenced by Octree< MetricType, StatisticType, MatType >::IsLeaf().

39.520.4.10 FurthestPointDistance()

```
ElemType FurthestPointDistance ( ) const
```

Return the furthest distance to a point held in this node.

If this is not a leaf node, then the distance is 0 because the node holds no points.

Referenced by Octree< MetricType, StatisticType, MatType >::IsLeaf().

39.520.4.11 GetFurthestChild() [1/2]

```
size_t GetFurthestChild (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const
```

Return the index of the furthest child node to the given query point.

If this is a leaf node, it will return **NumChildren()** (p. 2181) (invalid index).

Referenced by Octree< MetricType, StatisticType, MatType >::IsLeaf(), and Octree< MetricType, StatisticType, MatType >::Metric().

39.520.4.12 GetFurthestChild() [2/2]

```
size_t GetFurthestChild (
    const Octree< MetricType, StatisticType, MatType > & queryNode ) const
```

Return the index of the furthest child node to the given query node.

If it can't decide, it will return **NumChildren()** (p. 2181) (invalid index).

39.520.4.13 GetNearestChild() [1/2]

```
size_t GetNearestChild (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const
```

Return the index of the nearest child node to the given query point.

If this is a leaf node, it will return **NumChildren()** (p. 2181) (invalid index).

Referenced by Octree< MetricType, StatisticType, MatType >::IsLeaf(), and Octree< MetricType, StatisticType, MatType >::Metric().

39.520.4.14 GetNearestChild() [2/2]

```
size_t GetNearestChild (
    const Octree< MetricType, StatisticType, MatType > & queryNode ) const
```

Return the index of the nearest child node to the given query node.

If it can't decide, it will return **NumChildren()** (p. 2181) (invalid index).

39.520.4.15 IsLeaf()

```
bool IsLeaf ( ) const [inline]
```

Return whether or not the node is a leaf.

Definition at line 283 of file octree.hpp.

References Octree< MetricType, StatisticType, MatType >::FurthestDescendantDistance(), Octree< MetricType, StatisticType, MatType >::FurthestPointDistance(), Octree< MetricType, StatisticType, MatType >::GetFurthestChild(), Octree< MetricType, StatisticType, MatType >::GetNearestChild(), Octree< MetricType, StatisticType, MatType >::MinimumBoundDistance(), and Octree< MetricType, StatisticType, MatType >::NumChildren().

39.520.4.16 MaxDistance() [1/2]

```
ElemType MaxDistance (
    const Octree< MetricType, StatisticType, MatType > & other ) const
```

Return the maximum distance to another node.

Referenced by Octree< MetricType, StatisticType, MatType >::ChildPtr().

39.520.4.17 MaxDistance() [2/2]

```
ElemType MaxDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const
```

Return the maximum distance to the given point.

39.520.4.18 Metric()

```
MetricType Metric ( ) const [inline]
```

Return the metric that this tree uses.

Definition at line 260 of file octree.hpp.

References Octree< MetricType, StatisticType, MatType >::GetFurthestChild(), and Octree< MetricType, StatisticType, MatType >::GetNearestChild().

39.520.4.19 MinDistance() [1/2]

```
ElemType MinDistance (
    const Octree< MetricType, StatisticType, MatType > & other ) const
```

Return the minimum distance to another node.

Referenced by Octree< MetricType, StatisticType, MatType >::ChildPtr().

39.520.4.20 MinDistance() [2/2]

```
ElemType MinDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const
```

Return the minimum distance to the given point.

39.520.4.21 MinimumBoundDistance()

```
ElemType MinimumBoundDistance ( ) const
```

Return the minimum distance from the center of the node to any bound edge.

Referenced by Octree< MetricType, StatisticType, MatType >::IsLeaf().

39.520.4.22 NumChildren()

```
size_t NumChildren ( ) const
```

Return the number of children in this node.

Referenced by Octree< MetricType, StatisticType, MatType >::IsLeaf(), and Octree< MetricType, StatisticType, MatType >::Stat().

39.520.4.23 NumDescendants()

```
size_t NumDescendants ( ) const
```

Return the number of descendants of this node.

Referenced by Octree< MetricType, StatisticType, MatType >::ChildPtr().

39.520.4.24 NumPoints()

```
size_t NumPoints ( ) const
```

Return the number of points in this node (0 if not a leaf).

Referenced by Octree< MetricType, StatisticType, MatType >::ChildPtr().

39.520.4.25 Parent() [1/2]

```
Octree* Parent ( ) const [inline]
```

Get the pointer to the parent.

Definition at line 242 of file octree.hpp.

39.520.4.26 Parent() [2/2]

```
Octree*& Parent ( ) [inline]
```

Modify the pointer to the parent (be careful!).

Definition at line 244 of file octree.hpp.

39.520.4.27 ParentDistance() [1/2]

```
ElementType ParentDistance ( ) const [inline]
```

Return the distance from the center of this node to the center of the parent node.

Definition at line 317 of file octree.hpp.

39.520.4.28 ParentDistance() [2/2]

```
ElementType& ParentDistance ( ) [inline]
```

Modify the distance from the center of this node to the center of the parent node.

Definition at line 320 of file octree.hpp.

39.520.4.29 Point()

```
size_t Point (
    const size_t index ) const
```

Return the index (with reference to the dataset) of a particular point in this node.

If the given index is invalid (i.e. if it is greater than **NumPoints()** (p. 2181)), the indices returned will be invalid.

Referenced by Octree< MetricType, StatisticType, MatType >::ChildPtr().

39.520.4.30 RangeDistance() [1/2]

```
math::RangeType< ElemType> RangeDistance (
    const Octree< MetricType, StatisticType, MatType > & other ) const
```

Return the minimum and maximum distance to another node.

Referenced by Octree< MetricType, StatisticType, MatType >::ChildPtr().

39.520.4.31 RangeDistance() [2/2]

```
math::RangeType< ElemType> RangeDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const
```

Return the minimum and maximum distance to another node.

39.520.4.32 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the tree.

Referenced by Octree< MetricType, StatisticType, MatType >::Center().

39.520.4.33 Stat() [1/2]

```
const StatisticType& Stat ( ) const [inline]
```

Return the statistic object for this node.

Definition at line 252 of file octree.hpp.

39.520.4.34 Stat() [2/2]

```
StatisticType& Stat ( ) [inline]
```

Modify the statistic object for this node.

Definition at line 254 of file octree.hpp.

References Octree< MetricType, StatisticType, MatType >::NumChildren().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/octree/ **octree.hpp**

39.521 Octree< MetricType, StatisticType, MatType >::DualTreeTraverser< MetricType, StatisticType, MatType > Class Template Reference

A dual-tree traverser; see dual_tree_traverser.hpp.

Public Member Functions

- **DualTreeTraverser** (RuleType &rule)
Instantiate the given dual-tree traverser with the given rule set.
- size_t **NumBaseCases** () const
Get the number of times a base case was computed.
- size_t & **NumBaseCases** ()
Modify the number of times a base case was computed.
- size_t **NumPrunes** () const
Get the number of pruned nodes.
- size_t & **NumPrunes** ()
Modify the number of pruned nodes (i.e. to reset it).
- size_t **NumScores** () const
Get the number of times a node was scored.
- size_t & **NumScores** ()
Modify the number of times a node was scored.
- size_t **NumVisited** () const
Get the number of visited node combinations.
- size_t & **NumVisted** ()
Modify the number of visited node combinations.
- void **Traverse** (Octree &queryNode, Octree &referenceNode)
Traverse the two trees.

39.521.1 Detailed Description

```
template<typename MetricType = metric::EuclideanDistance, typename StatisticType = EmptyStatistic, typename MatType = arma<
::mat>
template<typename MetricType, typename StatisticType, typename MatType>
class mlpack::tree::Octree< MetricType, StatisticType, MatType >::DualTreeTraverser< MetricType, StatisticType, MatType >
```

A dual-tree traverser; see dual_tree_traverser.hpp.

Definition at line 25 of file dual_tree_traverser.hpp.

39.521.2 Constructor & Destructor Documentation

39.521.2.1 DualTreeTraverser()

```
DualTreeTraverser (
    RuleType & rule )
```

Instantiate the given dual-tree traverser with the given rule set.

39.521.3 Member Function Documentation

39.521.3.1 NumBaseCases() [1/2]

```
size_t NumBaseCases ( ) const [inline]
```

Get the number of times a base case was computed.

Definition at line 55 of file dual_tree_traverser.hpp.

39.521.3.2 NumBaseCases() [2/2]

```
size_t& NumBaseCases ( ) [inline]
```

Modify the number of times a base case was computed.

Definition at line 57 of file dual_tree_traverser.hpp.

39.521.3.3 NumPrunes() [1/2]

```
size_t NumPrunes ( ) const [inline]
```

Get the number of pruned nodes.

Definition at line 40 of file dual_tree_traverser.hpp.

39.521.3.4 NumPrunes() [2/2]

```
size_t& NumPrunes ( ) [inline]
```

Modify the number of pruned nodes (i.e. to reset it).

Definition at line 42 of file dual_tree_traverser.hpp.

39.521.3.5 NumScores() [1/2]

```
size_t NumScores ( ) const [inline]
```

Get the number of times a node was scored.

Definition at line 50 of file dual_tree_traverser.hpp.

39.521.3.6 NumScores() [2/2]

```
size_t& NumScores ( ) [inline]
```

Modify the number of times a node was scored.

Definition at line 52 of file dual_tree_traverser.hpp.

39.521.3.7 NumVisited()

```
size_t NumVisited ( ) const [inline]
```

Get the number of visited node combinations.

Definition at line 45 of file dual_tree_traverser.hpp.

39.521.3.8 NumVisted()

```
size_t& NumVisted ( ) [inline]
```

Modify the number of visited node combinations.

Definition at line 47 of file dual_tree_traverser.hpp.

39.521.3.9 Traverse()

```
void Traverse (
    Octree & queryNode,
    Octree & referenceNode )
```

Traverse the two trees.

This does not reset the statistics of the traversals (it just adds to them).

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/octree/ **dual_tree_traverser.hpp**

39.522 Octree< MetricType, StatisticType, MatType >::SingleTreeTraverser< RuleType > Class Template Reference

A single-tree traverser; see single_tree_traverser.hpp.

Public Member Functions

- **SingleTreeTraverser** (RuleType &rule)
Instantiate the traverser with the given rule set.
- size_t **NumPrunes** () const
Get the number of pruned nodes.
- size_t & **NumPrunes** ()
Modify the number of pruned nodes.
- void **Traverse** (const size_t queryIndex, **Octree** &referenceNode)
Traverse the reference tree with the given query point.

39.522.1 Detailed Description

```
template<typename MetricType = metric::EuclideanDistance, typename StatisticType = EmptyStatistic, typename MatType = arma<
::mat>
template<typename RuleType>
class mlpack::tree::Octree< MetricType, StatisticType, MatType >::SingleTreeTraverser< RuleType >
```

A single-tree traverser; see `single_tree_traverser.hpp`.

Definition at line 35 of file `octree.hpp`.

39.522.2 Constructor & Destructor Documentation

39.522.2.1 SingleTreeTraverser()

```
SingleTreeTraverser (
    RuleType & rule )
```

Instantiate the traverser with the given rule set.

39.522.3 Member Function Documentation

39.522.3.1 NumPrunes() [1/2]

```
size_t NumPrunes ( ) const [inline]
```

Get the number of pruned nodes.

Definition at line 41 of file `single_tree_traverser.hpp`.

39.522.3.2 NumPrunes() [2/2]

```
size_t& NumPrunes ( ) [inline]
```

Modify the number of pruned nodes.

Definition at line 43 of file `single_tree_traverser.hpp`.

39.522.3.3 Traverse()

```
void Traverse (
    const size_t queryIndex,
    Octree & referenceNode )
```

Traverse the reference tree with the given query point.

This does not reset the number of pruned nodes.

Parameters

<i>queryIndex</i>	Index of query point.
<i>referenceNode</i>	Node in reference tree.

The documentation for this class was generated from the following files:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/octree/ **octree.hpp**

39.523 Octree< MetricType, StatisticType, MatType >::SplitType::SplitInfo Struct Reference

Public Member Functions

- **SplitInfo** (const size_t **d**, const arma::vec &c)
*Create the **SplitInfo** (p. 2189) object.*

Public Attributes

- const arma::vec & **center**
The center of the node.
- size_t **d**
The dimension we are splitting on.

39.523.1 Detailed Description

```
template<typename MetricType = metric::EuclideanDistance, typename StatisticType = EmptyStatistic, typename MatType = arma::mat>
struct mlpack::tree::Octree< MetricType, StatisticType, MatType >::SplitType::SplitInfo
```

Definition at line 433 of file octree.hpp.

39.523.2 Constructor & Destructor Documentation

39.523.2.1 SplitInfo()

```
SplitInfo (
    const size_t d,
    const arma::vec & c ) [inline]
```

Create the **SplitInfo** (p. 2189) object.

Definition at line 436 of file octree.hpp.

39.523.3 Member Data Documentation

39.523.3.1 center

```
const arma::vec& center
```

The center of the node.

Definition at line 441 of file octree.hpp.

39.523.3.2 d

```
size_t d
```

The dimension we are splitting on.

Definition at line 439 of file octree.hpp.

The documentation for this struct was generated from the following file:

39.524 ProjVector Class Reference

ProjVector (p. 2190) defines a general projection vector (not necessarily axis-parallel).

Public Member Functions

- **ProjVector** ()
Empty Constructor.
 - **ProjVector** (const arma::vec &vect)
Create the projection vector based on the specified vector.
 - template<typename VecType >
double **Project** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > * = 0) const
Project the given point on the projection vector.
 - template<typename MetricType , typename VecType >
math::RangeType< typename VecType::elem_type > **Project** (const **bound::BallBound**< MetricType, VecType > &bound) const
Project the given ball bound on the projection vector.
 - template<typename Archive >
void **serialize** (Archive &ar, const unsigned int)
- Serialization.*

39.524.1 Detailed Description

ProjVector (p. 2190) defines a general projection vector (not necessarily axis-parallel).

Definition at line 91 of file projection_vector.hpp.

39.524.2 Constructor & Destructor Documentation

39.524.2.1 ProjVector() [1/2]

```
ProjVector ( ) [inline]
```

Empty Constructor.

Definition at line 100 of file projection_vector.hpp.

39.524.2.2 ProjVector() [2/2]

```
ProjVector (
    const arma::vec & vect ) [inline]
```

Create the projection vector based on the specified vector.

Parameters

<i>vect</i>	Vector to be considered.
-------------	--------------------------

Definition at line 109 of file projection_vector.hpp.

39.524.3 Member Function Documentation

39.524.3.1 Project() [1/2]

```
double Project (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Project the given point on the projection vector.

Parameters

<i>point</i>	Point to be projected.
--------------	------------------------

Definition at line 119 of file `projection_vector.hpp`.

39.524.3.2 `Project()` [2/2]

```
math::RangeType<typename VecType::elem_type> Project (
    const    bound::BallBound< MetricType, VecType > & bound ) const    [inline]
```

Project the given ball bound on the projection vector.

Parameters

<i>bound</i>	Bound to be projected.
--------------	------------------------

Returns

Range of projected values.

Definition at line 132 of file `projection_vector.hpp`.

References `BallBound< MetricType, VecType >::Center()`, `AxisParallelProjVector::Project()`, and `BallBound< MetricType, VecType >::Radius()`.

39.524.3.3 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int )    [inline]
```

Serialization.

Definition at line 145 of file `projection_vector.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/space_split/ projection_vector.hpp`

39.525 QueueFrame< TreeType, TraversalInfoType > Struct Template Reference

Public Attributes

- `size_t` **queryDepth**
- `TreeType *` **queryNode**
- `TreeType *` **referenceNode**
- `double` **score**
- `TraversalInfoType` **traversalInfo**

39.525.1 Detailed Description

```
template<typename TreeType, typename TraversalInfoType>  
struct mpack::tree::QueueFrame< TreeType, TraversalInfoType >
```

Definition at line 27 of file `breadth_first_dual_tree_traverser.hpp`.

39.525.2 Member Data Documentation

39.525.2.1 queryDepth

```
size_t queryDepth
```

Definition at line 31 of file `breadth_first_dual_tree_traverser.hpp`.

39.525.2.2 queryNode

```
TreeType* queryNode
```

Definition at line 29 of file `breadth_first_dual_tree_traverser.hpp`.

39.525.2.3 referenceNode

```
TreeType* referenceNode
```

Definition at line 30 of file `breadth_first_dual_tree_traverser.hpp`.

39.525.2.4 score

```
double score
```

Definition at line 32 of file `breadth_first_dual_tree_traverser.hpp`.

39.525.2.5 traversalInfo

```
TraversalInfoType traversalInfo
```

Definition at line 33 of file `breadth_first_dual_tree_traverser.hpp`.

Referenced by `BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType >::BreadthFirstDualTreeTraverser< RuleType >::NumBaseCases()`.

The documentation for this struct was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/breadth_first_dual_tree_traverser.hpp`

39.526 RandomDimensionSelect Class Reference

This dimension selection policy only selects one single random dimension.

Public Member Functions

- **RandomDimensionSelect ()**
*Construct the **RandomDimensionSelect** (p. 2194) object with the given number of dimensions.*
- `size_t Begin () const`
Get the first dimension to select from.
- `size_t Dimensions () const`
Get the number of dimensions.
- `size_t & Dimensions ()`
Set the number of dimensions.
- `size_t End () const`
Get the last dimension to select from.
- `size_t Next () const`
Get the next (last) dimensions.

39.526.1 Detailed Description

This dimension selection policy only selects one single random dimension.

Definition at line 21 of file `random_dimension_select.hpp`.

39.526.2 Constructor & Destructor Documentation

39.526.2.1 RandomDimensionSelect()

```
RandomDimensionSelect ( ) [inline]
```

Construct the **RandomDimensionSelect** (p. 2194) object with the given number of dimensions.

Definition at line 28 of file random_dimension_select.hpp.

39.526.3 Member Function Documentation

39.526.3.1 Begin()

```
size_t Begin ( ) const [inline]
```

Get the first dimension to select from.

Definition at line 33 of file random_dimension_select.hpp.

References `mlpack::math::RandInt()`.

39.526.3.2 Dimensions() [1/2]

```
size_t Dimensions ( ) const [inline]
```

Get the number of dimensions.

Definition at line 47 of file random_dimension_select.hpp.

39.526.3.3 Dimensions() [2/2]

```
size_t& Dimensions ( ) [inline]
```

Set the number of dimensions.

Definition at line 49 of file random_dimension_select.hpp.

39.526.3.4 End()

```
size_t End ( ) const [inline]
```

Get the last dimension to select from.

Definition at line 38 of file random_dimension_select.hpp.

39.526.3.5 Next()

```
size_t Next ( ) const [inline]
```

Get the next (last) dimensions.

We only allow one dimension, so any 'next' dimension is past our bounds.

Definition at line 44 of file random_dimension_select.hpp.

39.527 RandomForest< FitnessFunction, DimensionSelectionType, NumericSplitType, CategoricalSplitType, ElemType > Class Template Reference

Public Types

- typedef **DecisionTree**< FitnessFunction, NumericSplitType, CategoricalSplitType, DimensionSelectionType, ElemType > **DecisionTreeType**

Allow access to the underlying decision tree type.

Public Member Functions

- **RandomForest** ()

Construct the random forest without any training or specifying the number of trees.

- template<typename MatType >

RandomForest (const MatType &dataset, const arma::Row< size_t > &labels, const size_t numClasses, const size_t numTrees=20, const size_t minimumLeafSize=1, const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType())

Create a random forest, training on the given labeled training data with the given number of trees.

- template<typename MatType >

RandomForest (const MatType &dataset, const **data::DatasetInfo** &datasetInfo, const arma::Row< size_t > &labels, const size_t numClasses, const size_t numTrees=20, const size_t minimumLeafSize=1, const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType())

Create a random forest, training on the given labeled training data with the given dataset info and the given number of trees.

- template<typename MatType >

RandomForest (const MatType &dataset, const arma::Row< size_t > &labels, const size_t numClasses, const arma::rowvec &weights, const size_t numTrees=20, const size_t minimumLeafSize=1, const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType())

Create a random forest, training on the given weighted labeled training data with the given number of trees.

- template<typename MatType >

RandomForest (const MatType &dataset, const **data::DatasetInfo** &datasetInfo, const arma::Row< size_t > &labels, const size_t numClasses, const arma::rowvec &weights, const size_t numTrees=20, const size_t minimumLeafSize=1, const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType())

Create a random forest, training on the given weighted labeled training data with the given dataset info and the given number of trees.

- template<typename VecType >

size_t **Classify** (const VecType &point) const

Predict the class of the given point.

- template<typename VecType >

void **Classify** (const VecType &point, size_t &prediction, arma::vec &probabilities) const

Predict the class of the given point and return the predicted class probabilities for each class.

- template<typename MatType >

void **Classify** (const MatType &data, arma::Row< size_t > &predictions) const

Predict the classes of each point in the given dataset.

- template<typename MatType >

void **Classify** (const MatType &data, arma::Row< size_t > &predictions, arma::mat &probabilities) const

Predict the classes of each point in the given dataset, also returning the predicted class probabilities for each point.

- size_t **NumTrees** () const

Get the number of trees in the forest.

- template<typename Archive >

void **serialize** (Archive &ar, const unsigned int)

Serialize the random forest.

- template<typename MatType >

double **Train** (const MatType &data, const arma::Row< size_t > &labels, const size_t numClasses, const size_t numTrees=20, const size_t minimumLeafSize=1, const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType())

Train the random forest on the given labeled training data with the given number of trees.

- `template<typename MatType >`
`double Train (const MatType &data, const data::DatasetInfo &datasetInfo, const arma::Row< size_t > &labels,`
`const size_t numClasses, const size_t numTrees=20, const size_t minimumLeafSize=1, const double minimumGain←`
`GainSplit=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType())`
Train the random forest on the given labeled training data with the given dataset info and the given number of trees.
- `template<typename MatType >`
`double Train (const MatType &data, const arma::Row< size_t > &labels, const size_t numClasses, const arma←`
`::rowvec &weights, const size_t numTrees=20, const size_t minimumLeafSize=1, const double minimumGain←`
`Split=1e-7, DimensionSelectionType dimensionSelector=DimensionSelectionType())`
Train the random forest on the given weighted labeled training data with the given number of trees.
- `template<typename MatType >`
`double Train (const MatType &data, const data::DatasetInfo &datasetInfo, const arma::Row< size_t > &labels,`
`const size_t numClasses, const arma::rowvec &weights, const size_t numTrees=20, const size_t minimum←`
`LeafSize=1, const double minimumGainSplit=1e-7, DimensionSelectionType dimensionSelector=Dimension←`
`SelectionType())`
Train the random forest on the given weighted labeled training data with the given dataset info and the given number of trees.
- `const DecisionTreeType & Tree (const size_t i) const`
Access a tree in the forest.
- `DecisionTreeType & Tree (const size_t i)`
Modify a tree in the forest (be careful!).

39.527.1 Detailed Description

```
template<typename FitnessFunction = GiniGain, typename DimensionSelectionType = MultipleRandomDimensionSelect, template<
typename > class NumericSplitType = BestBinaryNumericSplit, template< typename > class CategoricalSplitType = AllCategorical←
Split, typename ElemType = double>
class mlpack::tree::RandomForest< FitnessFunction, DimensionSelectionType, NumericSplitType, CategoricalSplitType, ElemType >
```

Definition at line 27 of file random_forest.hpp.

39.527.2 Member Typedef Documentation

39.527.2.1 DecisionTreeType

```
typedef DecisionTree<FitnessFunction, NumericSplitType, CategoricalSplitType, DimensionSelection←
Type, ElemType> DecisionTreeType
```

Allow access to the underlying decision tree type.

Definition at line 32 of file random_forest.hpp.

39.527.3 Constructor & Destructor Documentation

39.527.3.1 RandomForest() [1/5]

```
RandomForest ( ) [inline]
```

Construct the random forest without any training or specifying the number of trees.

Predict() will throw an exception until **Train()** (p. 2203) is called.

Definition at line 38 of file random_forest.hpp.

References RandomForest< FitnessFunction, DimensionSelectionType, NumericSplitType, CategoricalSplitType, ElemType >::Classify(), and RandomForest< FitnessFunction, DimensionSelectionType, NumericSplitType, CategoricalSplitType, ElemType >::Train().

39.527.3.2 RandomForest() [2/5]

```
RandomForest (
    const MatType & dataset,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const size_t numTrees = 20,
    const size_t minimumLeafSize = 1,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType() )
```

Create a random forest, training on the given labeled training data with the given number of trees.

The minimumLeafSize and minimumGainSplit parameters are given to each individual decision tree during tree building. Optionally, you may specify a DimensionSelectionType to set parameters for the strategy used to choose dimensions.

Parameters

<i>dataset</i>	Dataset to train on.
<i>labels</i>	Labels for dataset.
<i>numClasses</i>	Number of classes in dataset.
<i>numTrees</i>	Number of trees in the forest.
<i>minimumLeafSize</i>	Minimum number of points in each tree's leaf nodes.
<i>minimumGainSplit</i>	Minimum gain for splitting a decision tree node.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

39.527.3.3 RandomForest() [3/5]

```

RandomForest (
    const MatType & dataset,
    const data::DatasetInfo & datasetInfo,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const size_t numTrees = 20,
    const size_t minimumLeafSize = 1,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType() )

```

Create a random forest, training on the given labeled training data with the given dataset info and the given number of trees.

The minimumLeafSize and minimumGainSplit parameters are given to each individual decision tree during tree building. Optionally, you may specify a DimensionSelectionType to set parameters for the strategy used to choose dimensions. This constructor can be used to train on categorical data.

Parameters

<i>dataset</i>	Dataset to train on.
<i>datasetInfo</i>	Dimension info for the dataset.
<i>labels</i>	Labels for dataset.
<i>numClasses</i>	Number of classes in dataset.
<i>numTrees</i>	Number of trees in the forest.
<i>minimumLeafSize</i>	Minimum number of points in each tree's leaf nodes.
<i>minimumGainSplit</i>	Minimum gain for splitting a decision tree node.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

39.527.3.4 RandomForest() [4/5]

```

RandomForest (
    const MatType & dataset,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const arma::rowvec & weights,
    const size_t numTrees = 20,
    const size_t minimumLeafSize = 1,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType() )

```

Create a random forest, training on the given weighted labeled training data with the given number of trees.

The minimumLeafSize parameter is given to each individual decision tree during tree building.

Parameters

<i>dataset</i>	Dataset to train on.
<i>labels</i>	Labels for dataset.
<i>numClasses</i>	Number of classes in dataset.
<i>weights</i>	Weights (importances) of each point in the dataset.
<i>numTrees</i>	Number of trees in the forest.
<i>minimumLeafSize</i>	Minimum number of points in each tree's leaf nodes.

39.527.3.5 RandomForest() [5/5]

```

RandomForest (
    const MatType & dataset,
    const data::DatasetInfo & datasetInfo,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const arma::rowvec & weights,
    const size_t numTrees = 20,
    const size_t minimumLeafSize = 1,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType() )

```

Create a random forest, training on the given weighted labeled training data with the given dataset info and the given number of trees.

The minimumLeafSize and minimumGainSplit parameters are given to each individual decision tree during tree building. Optionally, you may specify a DimensionSelectionType to set parameters for the strategy used to choose dimensions. This can be used for categorical weighted training.

Parameters

<i>dataset</i>	Dataset to train on.
<i>datasetInfo</i>	Dimension info for the dataset.
<i>labels</i>	Labels for dataset.
<i>numClasses</i>	Number of classes in dataset.
<i>weights</i>	Weights (importances) of each point in the dataset.
<i>numTrees</i>	Number of trees in the forest.
<i>minimumLeafSize</i>	Minimum number of points in each tree's leaf nodes.
<i>minimumGainSplit</i>	Minimum gain for splitting a decision tree node.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

39.527.4 Member Function Documentation

39.527.4.1 Classify() [1/4]

```
size_t Classify (
    const VecType & point ) const
```

Predict the class of the given point.

If the random forest has not been trained, this will throw an exception.

Parameters

<i>point</i>	Point to be classified.
--------------	-------------------------

Referenced by RandomForest< FitnessFunction, DimensionSelectionType, NumericSplitType, CategoricalSplitType, ElemType >::RandomForest().

39.527.4.2 Classify() [2/4]

```
void Classify (
    const VecType & point,
    size_t & prediction,
    arma::vec & probabilities ) const
```

Predict the class of the given point and return the predicted class probabilities for each class.

If the random forest has not been trained, this will throw an exception.

Parameters

<i>point</i>	Point to be classified.
<i>prediction</i>	size_t to store predicted class in.
<i>probabilities</i>	Output vector of class probabilities.

39.527.4.3 Classify() [3/4]

```
void Classify (
    const MatType & data,
    arma::Row< size_t > & predictions ) const
```

Predict the classes of each point in the given dataset.

If the random forest has not been trained, this will throw an exception.

Parameters

<i>data</i>	Dataset to be classified.
<i>predictions</i>	Output predictions for each point in the dataset.

39.527.4.4 Classify() [4/4]

```
void Classify (
    const MatType & data,
    arma::Row< size_t > & predictions,
    arma::mat & probabilities ) const
```

Predict the classes of each point in the given dataset, also returning the predicted class probabilities for each point.

If the random forest has not been trained, this will throw an exception.

Parameters

<i>data</i>	Dataset to be classified.
<i>predictions</i>	Output predictions for each point in the dataset.
<i>probabilities</i>	Output matrix of class probabilities for each point.

39.527.4.5 NumTrees()

```
size_t NumTrees ( ) const [inline]
```

Get the number of trees in the forest.

Definition at line 315 of file random_forest.hpp.

References RandomForest< FitnessFunction, DimensionSelectionType, NumericSplitType, CategoricalSplitType, ElemType >::serialize(), and RandomForest< FitnessFunction, DimensionSelectionType, NumericSplitType, CategoricalSplitType, ElemType >::Train().

39.527.4.6 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the random forest.

Referenced by RandomForest< FitnessFunction, DimensionSelectionType, NumericSplitType, CategoricalSplitType, ElemType >::NumTrees().

39.527.4.7 Train() [1/4]

```
double Train (
    const MatType & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const size_t numTrees = 20,
    const size_t minimumLeafSize = 1,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType() )
```

Train the random forest on the given labeled training data with the given number of trees.

The minimumLeafSize and minimumGainSplit parameters are given to each individual decision tree during tree building. Optionally, you may specify a DimensionSelectionType to set parameters for the strategy used to choose dimensions.

Parameters

<i>data</i>	Dataset to train on.
<i>labels</i>	Labels for dataset.
<i>numClasses</i>	Number of classes in dataset.
<i>numTrees</i>	Number of trees in the forest.
<i>minimumLeafSize</i>	Minimum number of points in each tree's leaf nodes.
<i>minimumGainSplit</i>	Minimum gain for splitting a decision tree node.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

Returns

The average entropy of all the decision trees trained under forest.

Referenced by RandomForest< FitnessFunction, DimensionSelectionType, NumericSplitType, CategoricalSplitType, ElemType >::NumTrees(), and RandomForest< FitnessFunction, DimensionSelectionType, NumericSplitType, CategoricalSplitType, ElemType >::RandomForest().

39.527.4.8 Train() [2/4]

```
double Train (
    const MatType & data,
    const data::DatasetInfo & datasetInfo,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const size_t numTrees = 20,
    const size_t minimumLeafSize = 1,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType() )
```

Train the random forest on the given labeled training data with the given dataset info and the given number of trees.

The minimumLeafSize parameter is given to each individual decision tree during tree building. Optionally, you may specify a DimensionSelectionType to set parameters for the strategy used to choose dimensions. This overload can be used to train on categorical data.

Parameters

<i>data</i>	Dataset to train on.
<i>datasetInfo</i>	Dimension info for the dataset.
<i>labels</i>	Labels for dataset.
<i>numClasses</i>	Number of classes in dataset.
<i>numTrees</i>	Number of trees in the forest.
<i>minimumLeafSize</i>	Minimum number of points in each tree's leaf nodes.
<i>minimumGainSplit</i>	Minimum gain for splitting a decision tree node.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

Returns

The average entropy of all the decision trees trained under forest.

39.527.4.9 Train() [3/4]

```
double Train (
    const MatType & data,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const arma::rowvec & weights,
    const size_t numTrees = 20,
    const size_t minimumLeafSize = 1,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType() )
```

Train the random forest on the given weighted labeled training data with the given number of trees.

The minimumLeafSize and minimumGainSplit parameters are given to each individual decision tree during tree building. Optionally, you may specify a DimensionSelectionType to set parameters for the strategy used to choose dimensions.

Parameters

<i>data</i>	Dataset to train on.
<i>labels</i>	Labels for dataset.
<i>numClasses</i>	Number of classes in dataset.
<i>weights</i>	Weights (importances) of each point in the dataset.
<i>numTrees</i>	Number of trees in the forest.
<i>minimumLeafSize</i>	Minimum number of points in each tree's leaf nodes.
<i>minimumGainSplit</i>	Minimum gain for splitting a decision tree node.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

Returns

The average entropy of all the decision trees trained under forest.

39.527.4.10 Train() [4/4]

```
double Train (
    const MatType & data,
    const data::DatasetInfo & datasetInfo,
    const arma::Row< size_t > & labels,
    const size_t numClasses,
    const arma::rowvec & weights,
    const size_t numTrees = 20,
    const size_t minimumLeafSize = 1,
    const double minimumGainSplit = 1e-7,
    DimensionSelectionType dimensionSelector = DimensionSelectionType() )
```

Train the random forest on the given weighted labeled training data with the given dataset info and the given number of trees.

The minimumLeafSize and minimumGainSplit parameters are given to each individual decision tree during tree building. Optionally, you may specify a DimensionSelectionType to set parameters for the strategy used to choose dimensions. This overload can be used for categorical weighted training.

Parameters

<i>data</i>	Dataset to train on.
<i>datasetInfo</i>	Dimension info for the dataset.
<i>labels</i>	Labels for dataset.
<i>numClasses</i>	Number of classes in dataset.
<i>weights</i>	Weights (importances) of each point in the dataset.
<i>numTrees</i>	Number of trees in the forest.
<i>minimumLeafSize</i>	Minimum number of points in each tree's leaf nodes.
<i>minimumGainSplit</i>	Minimum gain for splitting a decision tree node.
<i>dimensionSelector</i>	Instantiated dimension selection policy.

Returns

The average entropy of all the decision trees trained under forest.

39.527.4.11 Tree() [1/2]

```
const DecisionTreeType& Tree (
    const size_t i ) const [inline]
```

Access a tree in the forest.

Definition at line 310 of file random_forest.hpp.

39.527.4.12 Tree() [2/2]

```
DecisionTreeType& Tree (  
    const size_t i ) [inline]
```

Modify a tree in the forest (be careful!).

Definition at line 312 of file random_forest.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/random_forest/ **random_forest.hpp**

39.528 RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType > Class Template Reference

A rectangle type tree tree, such as an R-tree or X-tree.

Classes

- class **DualTreeTraverser**
A dual tree traverser for rectangle type trees.
- class **SingleTreeTraverser**
A single traverser for rectangle type trees.

Public Types

- typedef AuxiliaryInformationType< **RectangleTree** > **AuxiliaryInformation**
The auxiliary information type held by the tree.
- typedef MatType::elem_type **ElemType**
The element type held by the matrix type.
- typedef MatType **Mat**
So other classes can use TreeType::Mat.

Public Member Functions

- **RectangleTree** (const MatType &data, const size_t maxLeafSize=20, const size_t minLeafSize=8, const size_t maxNumChildren=5, const size_t minNumChildren=2, const size_t firstDataIndex=0)
Construct this as the root node of a rectangle type tree using the given dataset.
- **RectangleTree** (MatType &&data, const size_t maxLeafSize=20, const size_t minLeafSize=8, const size_t maxNumChildren=5, const size_t minNumChildren=2, const size_t firstDataIndex=0)
Construct this as the root node of a rectangle tree type using the given dataset, and taking ownership of the given dataset.
- **RectangleTree** (**RectangleTree** *parentNode, const size_t numMaxChildren=0)
Construct this as an empty node with the specified parent.
- **RectangleTree** (const **RectangleTree** &other, const bool deepCopy=true, **RectangleTree** *newParent=NULL)
Create a rectangle tree by copying the other tree.
- **RectangleTree** (**RectangleTree** &&other)
Create a rectangle tree by moving the other tree.
- template<typename Archive >
RectangleTree (Archive &ar, const typename **std::enable_if_t**< Archive::is_loading::value > *=0)
*Construct the tree from a **boost::serialization** (p. 251) archive.*
- ~**RectangleTree** ()
Deletes this node, deallocating the memory for the children and calling their destructors in turn.
- const AuxiliaryInformationType< **RectangleTree** > & **AuxiliaryInfo** () const
Return the auxiliary information object of this node.
- AuxiliaryInformationType< **RectangleTree** > & **AuxiliaryInfo** ()
Modify the split object of this node.
- size_t **Begin** () const
Return the index of the beginning point of this subset.
- size_t & **Begin** ()
Modify the index of the beginning point of this subset.
- const **bound::HRectBound**< MetricType > & **Bound** () const
Return the bound object for this node.
- **bound::HRectBound**< MetricType > & **Bound** ()
Modify the bound object for this node.
- void **Center** (arma::vec ¢er)
Get the centroid of the node and store it in the given vector.
- **RectangleTree** & **Child** (const size_t child) const
Get the specified child.
- **RectangleTree** & **Child** (const size_t child)
Modify the specified child.
- void **CondenseTree** (const arma::vec &point, std::vector< bool > &relevels, const bool usePoint)
Condense the bounding rectangles for this node based on the removal of the point specified by the arma::vec&.
- size_t **Count** () const
Return the number of points in this subset.
- size_t & **Count** ()
Modify the number of points in this subset.
- const MatType & **Dataset** () const
Get the dataset which the tree is built on.
- MatType & **Dataset** ()
Modify the dataset which the tree is built on. Be careful!
- bool **DeletePoint** (const size_t point)

- Deletes a point from the tree and, updates the bounding rectangle.*

 - **bool DeletePoint** (const size_t point, std::vector< bool > &relevels)
- Deletes a point from the tree, updates the bounding rectangle, tracking levels.*

 - **size_t Descendant** (const size_t index) const
- Return the index (with reference to the dataset) of a particular descendant of this node.*

 - **RectangleTree * ExactClone** ()
- Make an exact copy of this node, pointers and everything.*

 - **const RectangleTree * FindByBeginCount** (size_t begin, size_t count) const
- Find a node in this tree by its begin and count (const).*

 - **RectangleTree * FindByBeginCount** (size_t begin, size_t count)
- Find a node in this tree by its begin and count.*

 - **ElemType FurthestDescendantDistance** () const
- Return the furthest possible descendant distance.*

 - **ElemType FurthestPointDistance** () const
- Return the furthest distance to a point held in this node.*

 - **template<typename VecType >**
size_t GetFurthestChild (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0)
- Return the index of the furthest child node to the given query point.*

 - **size_t GetFurthestChild** (const **RectangleTree** &queryNode)
- Return the index of the furthest child node to the given query node.*

 - **template<typename VecType >**
size_t GetNearestChild (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0)
- Return the index of the nearest child node to the given query point.*

 - **size_t GetNearestChild** (const **RectangleTree** &queryNode)
- Return the index of the nearest child node to the given query node.*

 - **void InsertNode** (**RectangleTree** *node, const size_t level, std::vector< bool > &relevels)
- Inserts a node into the tree, tracking which levels have been inserted into.*

 - **void InsertPoint** (const size_t point)
- Inserts a point into the tree.*

 - **void InsertPoint** (const size_t point, std::vector< bool > &relevels)
- Inserts a point into the tree, tracking which levels have been inserted into.*

 - **bool IsLeaf** () const
- Return whether or not this node is a leaf (true if it has no children).*

 - **ElemType MaxDistance** (const **RectangleTree** &other) const
- Return the maximum distance to another node.*

 - **template<typename VecType >**
ElemType MaxDistance (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0) const
- Return the maximum distance to another point.*

 - **size_t MaxLeafSize** () const
- Return the maximum leaf size.*

 - **size_t & MaxLeafSize** ()
- Modify the maximum leaf size.*

 - **size_t MaxNumChildren** () const
- Return the maximum number of children (in a non-leaf node).*

 - **size_t & MaxNumChildren** ()

- Modify the maximum number of children (in a non-leaf node).*

 - **MetricType Metric** () const
 - Get the metric which the tree uses.*
 - **ElemType MinDistance** (const **RectangleTree** &other) const
 - Return the minimum distance to another node.*
 - template<typename VecType >
 - ElemType MinDistance** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0) const

Return the minimum distance to another point.
 - **ElemType MinimumBoundDistance** () const
 - Return the minimum distance from the center to any edge of the bound.*
 - size_t **MinLeafSize** () const
 - Return the minimum leaf size.*
 - size_t & **MinLeafSize** ()
 - Modify the minimum leaf size.*
 - size_t **MinNumChildren** () const
 - Return the minimum number of children (in a non-leaf node).*
 - size_t & **MinNumChildren** ()
 - Modify the minimum number of children (in a non-leaf node).*
 - void **NullifyData** ()
 - Nullify the auxiliary information.*
 - size_t **NumChildren** () const
 - Return the number of child nodes. (One level beneath this one only.)*
 - size_t & **NumChildren** ()
 - Modify the number of child nodes. Be careful.*
 - size_t **NumDescendants** () const
 - Return the number of descendants of this node.*
 - size_t **NumPoints** () const
 - Return the number of points in this node (returns 0 if this node is not a leaf).*
 - **RectangleTree * Parent** () const
 - Gets the parent of this node.*
 - **RectangleTree *& Parent** ()
 - Modify the parent of this node.*
 - **ElemType ParentDistance** () const
 - Return the distance from the center of this node to the center of the parent node.*
 - **ElemType & ParentDistance** ()
 - Modify the distance from the center of this node to the center of the parent node.*
 - size_t **Point** (const size_t index) const
 - Return the index (with reference to the dataset) of a particular point in this node.*
 - size_t & **Point** (const size_t index)
 - Modify the index of a particular point in this node.*
 - **math::RangeType**< **ElemType** > **RangeDistance** (const **RectangleTree** &other) const
 - Return the minimum and maximum distance to another node.*
 - template<typename VecType >
 - math::RangeType**< **ElemType** > **RangeDistance** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > !=0) const

Return the minimum and maximum distance to another point.
 - bool **RemoveNode** (const **RectangleTree** *node, std::vector< bool > &relevels)

Removes a node from the tree.

- `template<typename Archive >`
`void serialize (Archive &ar, const unsigned int)`
Serialize the tree.
- `bool ShrinkBoundForBound (const bound::HRectBound< MetricType > &changedBound)`
Shrink the bound object of this node for the removal of a child node.
- `bool ShrinkBoundForPoint (const arma::vec &point)`
Shrink the bound object of this node for the removal of a point.
- `void SoftDelete ()`
Delete this node of the tree, but leave the stuff contained in it intact.
- `const StatisticType & Stat () const`
Return the statistic object for this node.
- `StatisticType & Stat ()`
Modify the statistic object for this node.
- `size_t TreeDepth () const`
Obtains the number of levels below this node in the tree, starting with this.
- `size_t TreeSize () const`
Obtains the number of nodes in the tree, starting with this.

Protected Member Functions

- `RectangleTree ()`
A default constructor.

Protected Attributes

- `friend AuxiliaryInformation`
Give friend access for AuxiliaryInformationType.
- `friend DescentType`
Give friend access for DescentType.
- `friend SplitType`
Give friend access for SplitType.

39.528.1 Detailed Description

```
template<typename MetricType = metric::EuclideanDistance, typename StatisticType = EmptyStatistic, typename MatType = arma::mat,
typename SplitType = RTreeSplit, typename DescentType = RTreeDescentHeuristic, template< typename > class AuxiliaryInformationType = NoAuxiliaryInformation>
class mlpack::tree::RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >
```

A rectangle type tree tree, such as an R-tree or X-tree.

Once the bound and type of dataset is defined, the tree will construct itself. Call the constructor with the dataset to build the tree on, and the entire tree will be built.

This tree does allow growth, so you can add and delete nodes from it.

Template Parameters

<i>MetricType</i>	This <i>must</i> be EuclideanDistance, but the template parameter is required to satisfy the TreeType API.
<i>StatisticType</i>	Extra data contained in the node. See statistic.hpp (p. 2688) for the necessary skeleton interface.
<i>MatType</i>	The dataset class.
<i>SplitType</i>	The type of split to use when inserting points.
<i>DescentType</i>	The heuristic to use when descending the tree to insert points.
<i>AuxiliaryInformationType</i>	An auxiliary information contained in the node. This information depends on the type of the RectangleTree (p. 2207).

Definition at line 54 of file rectangle_tree.hpp.

39.528.2 Member Typedef Documentation

39.528.2.1 AuxiliaryInformation

```
typedef AuxiliaryInformationType< RectangleTree> AuxiliaryInformation
```

The auxiliary information type held by the tree.

Definition at line 66 of file rectangle_tree.hpp.

39.528.2.2 ElemType

```
typedef MatType::elem_type ElemType
```

The element type held by the matrix type.

Definition at line 64 of file rectangle_tree.hpp.

39.528.2.3 Mat

```
typedef MatType Mat
```

So other classes can use TreeType::Mat.

Definition at line 58 of file rectangle_tree.hpp.

39.528.3 Constructor & Destructor Documentation

39.528.3.1 RectangleTree() [1/7]

```
RectangleTree (
    const MatType & data,
    const size_t maxLeafSize = 20,
    const size_t minLeafSize = 8,
    const size_t maxNumChildren = 5,
    const size_t minNumChildren = 2,
    const size_t firstDataIndex = 0 )
```

Construct this as the root node of a rectangle type tree using the given dataset.

This will modify the ordering of the points in the dataset!

Parameters

<i>data</i>	Dataset from which to create the tree. This will be modified!
<i>maxLeafSize</i>	Maximum size of each leaf in the tree.
<i>minLeafSize</i>	Minimum size of each leaf in the tree.
<i>maxNumChildren</i>	The maximum number of child nodes a non-leaf node may have.
<i>minNumChildren</i>	The minimum number of child nodes a non-leaf node may have.
<i>firstDataIndex</i>	The index of the first data point. UNUSED UNLESS WE ADD SUPPORT FOR HAVING A "CENTRAL" DATA MATRIX.

39.528.3.2 RectangleTree() [2/7]

```
RectangleTree (
    MatType && data,
    const size_t maxLeafSize = 20,
    const size_t minLeafSize = 8,
    const size_t maxNumChildren = 5,
    const size_t minNumChildren = 2,
    const size_t firstDataIndex = 0 )
```

Construct this as the root node of a rectangle tree type using the given dataset, and taking ownership of the given dataset.

Parameters

<i>data</i>	Dataset from which to create the tree.
<i>maxLeafSize</i>	Maximum size of each leaf in the tree.
<i>minLeafSize</i>	Minimum size of each leaf in the tree.

Parameters

<i>maxNumChildren</i>	The maximum number of child nodes a non-leaf node may have.
<i>minNumChildren</i>	The minimum number of child nodes a non-leaf node may have.
<i>firstDataIndex</i>	The index of the first data point. UNUSED UNLESS WE ADD SUPPORT FOR HAVING A "CENTRAL" DATA MATRIX.

39.528.3.3 `RectangleTree()` [3/7]

```

RectangleTree (
    RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, Auxiliary↵
InformationType > * parentNode,
    const size_t numMaxChildren = 0 ) [explicit]

```

Construct this as an empty node with the specified parent.

Copying the parameters (maxLeafSize, minLeafSize, maxNumChildren, minNumChildren, firstDataIndex) from the parent.

Parameters

<i>parentNode</i>	The parent of the node that is being constructed.
<i>numMaxChildren</i>	The max number of child nodes (used in x-trees).

39.528.3.4 `RectangleTree()` [4/7]

```

RectangleTree (
    const RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType,
AuxiliaryInformationType > & other,
    const bool deepCopy = true,
    RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, Auxiliary↵
InformationType > * newParent = NULL )

```

Create a rectangle tree by copying the other tree.

Be careful! This can take a long time and use a lot of memory.

Parameters

<i>other</i>	The tree to be copied.
<i>deepCopy</i>	If false, the children are not recursively copied.

39.528.3.5 **RectangleTree**() [5/7]

```
RectangleTree (
    RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType > && other )
```

Create a rectangle tree by moving the other tree.

Parameters

<i>other</i>	The tree to be copied.
--------------	------------------------

39.528.3.6 **RectangleTree**() [6/7]

```
RectangleTree (
    Archive & ar,
    const typename std::enable_if_t< Archive::is_loading::value > * = 0 )
```

Construct the tree from a **boost::serialization** (p. 251) archive.

39.528.3.7 **~RectangleTree**()

```
~RectangleTree ( )
```

Deletes this node, deallocating the memory for the children and calling their destructors in turn.

This will invalidate any younters or references to any nodes which are children of this one.

39.528.3.8 **RectangleTree**() [7/7]

```
RectangleTree ( ) [protected]
```

A default constructor.

This is meant to only be used with **boost::serialization** (p. 251), which is allowed with the friend declaration below. This does not return a valid tree! This method must be protected, so that the serialization shim can work with the default constructor.

Referenced by **RectangleTree**< **MetricType**, **StatisticType**, **MatType**, **SplitType**, **DescentType**, **AuxiliaryInformationType**>::**Count**().

39.528.4 Member Function Documentation

39.528.4.1 AuxiliaryInfo() [1/2]

```
const AuxiliaryInformationType< RectangleTree>& AuxiliaryInfo ( ) const [inline]
```

Return the auxiliary information object of this node.

Definition at line 310 of file rectangle_tree.hpp.

39.528.4.2 AuxiliaryInfo() [2/2]

```
AuxiliaryInformationType< RectangleTree>& AuxiliaryInfo ( ) [inline]
```

Modify the split object of this node.

Definition at line 313 of file rectangle_tree.hpp.

References `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::IsLeaf()`.

39.528.4.3 Begin() [1/2]

```
size_t Begin ( ) const [inline]
```

Return the index of the beginning point of this subset.

Definition at line 528 of file rectangle_tree.hpp.

39.528.4.4 Begin() [2/2]

```
size_t& Begin ( ) [inline]
```

Modify the index of the beginning point of this subset.

Definition at line 530 of file rectangle_tree.hpp.

39.528.4.5 Bound() [1/2]

```
const bound::HRectBound<MetricType>& Bound ( ) const [inline]
```

Return the bound object for this node.

Definition at line 300 of file rectangle_tree.hpp.

Referenced by RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::MaxDistance(), RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::MinDistance(), and RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::RangeDistance().

39.528.4.6 Bound() [2/2]

```
bound::HRectBound<MetricType>& Bound ( ) [inline]
```

Modify the bound object for this node.

Definition at line 302 of file rectangle_tree.hpp.

39.528.4.7 Center()

```
void Center (
    arma::vec & center ) [inline]
```

Get the centroid of the node and store it in the given vector.

Definition at line 353 of file rectangle_tree.hpp.

References HRectBound< MetricType, ElemType >::Center().

39.528.4.8 Child() [1/2]

```
RectangleTree& Child (
    const size_t child ) const [inline]
```

Get the specified child.

Parameters

<i>child</i>	Index of child to return.
--------------	---------------------------

Definition at line 422 of file rectangle_tree.hpp.

39.528.4.9 Child() [2/2]

```
RectangleTree& Child (
    const size_t child ) [inline]
```

Modify the specified child.

Parameters

<i>child</i>	Index of child to return.
--------------	---------------------------

Definition at line 432 of file rectangle_tree.hpp.

References RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::Descendant(), RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::NumDescendants(), and RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::NumPoints().

39.528.4.10 CondenseTree()

```
void CondenseTree (
    const arma::vec & point,
    std::vector< bool > & relevels,
    const bool usePoint )
```

Condense the bounding rectangles for this node based on the removal of the point specified by the arma::vec&.

This recurses up the tree. If a node goes below the minimum fill, this function will fix the tree.

Parameters

<i>point</i>	The arma::vec& of the point that was removed to require this condensation of the tree.
<i>usePoint</i>	True if we use the optimized version of the algorithm that is possible when we now what point was deleted. False otherwise (eg. if we deleted a node instead of a point).

39.528.4.11 Count() [1/2]

```
size_t Count ( ) const [inline]
```

Return the number of points in this subset.

Definition at line 533 of file rectangle_tree.hpp.

39.528.4.12 Count() [2/2]

```
size_t& Count ( ) [inline]
```

Modify the number of points in this subset.

Definition at line 535 of file rectangle_tree.hpp.

References `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::RectangleTree()`.

39.528.4.13 Dataset() [1/2]

```
const MatType& Dataset ( ) const [inline]
```

Get the dataset which the tree is built on.

Definition at line 345 of file rectangle_tree.hpp.

39.528.4.14 Dataset() [2/2]

```
MatType& Dataset ( ) [inline]
```

Modify the dataset which the tree is built on. Be careful!

Definition at line 347 of file rectangle_tree.hpp.

39.528.4.15 DeletePoint() [1/2]

```
bool DeletePoint (
    const size_t point )
```

Deletes a point from the tree and, updates the bounding rectangle.

However, the point will be kept in the central dataset. (The user may remove it from there if he wants, but he must not change the indices of the other points.) Returns true if the point is successfully removed and false if it is not. (ie. the point is not in the tree)

39.528.4.16 DeletePoint() [2/2]

```
bool DeletePoint (
    const size_t point,
    std::vector< bool > & relevels )
```

Deletes a point from the tree, updates the bounding rectangle, tracking levels.

However, the point will be kept in the central dataset. (The user may remove it from there if he wants, but he must not change the indices of the other points.) Returns true if the point is successfully removed and false if it is not. (ie. the point is not in the tree)

39.528.4.17 Descendant()

```
size_t Descendant (
    const size_t index ) const
```

Return the index (with reference to the dataset) of a particular descendant of this node.

The index should be greater than zero but less than the number of descendants.

Parameters

<i>index</i>	Index of the descendant.
--------------	--------------------------

Referenced by RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::Child().

39.528.4.18 ExactClone()

```
RectangleTree* ExactClone ( )
```

Make an exact copy of this node, pointers and everything.

39.528.4.19 FindByBeginCount() [1/2]

```
const RectangleTree* FindByBeginCount (
    size_t begin,
    size_t count ) const
```

Find a node in this tree by its begin and count (const).

Every node is uniquely identified by these two numbers. This is useful for communicating position over the network, when pointers would be invalid.

Parameters

<i>begin</i>	The begin() of the node to find.
<i>count</i>	The count() of the node to find.

Returns

The found node, or NULL if not found.

39.528.4.20 FindByBeginCount() [2/2]

```
RectangleTree* FindByBeginCount (
    size_t begin,
    size_t count )
```

Find a node in this tree by its begin and count.

Every node is uniquely identified by these two numbers. This is useful for communicating position over the network, when pointers would be invalid.

Parameters

<i>begin</i>	The begin() of the node to find.
<i>count</i>	The count() of the node to find.

Returns

The found node, or NULL if not found.

39.528.4.21 FurthestDescendantDistance()

```
ElemType FurthestDescendantDistance ( ) const
```

Return the furthest possible descendant distance.

This returns the maximum distance from the centroid to the edge of the bound and not the empirical quantity which is the actual furthest descendant distance. So the actual furthest descendant distance may be less than what this method returns (but it will never be greater than this).

Referenced by RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::NumChildren().

39.528.4.22 FurthestPointDistance()

```
ElemType FurthestPointDistance ( ) const
```

Return the furthest distance to a point held in this node.

If this is not a leaf node, then the distance is 0 because the node holds no points.

Referenced by RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::NumChildren().

39.528.4.23 GetFurthestChild() [1/2]

```
size_t GetFurthestChild (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 )
```

Return the index of the furthest child node to the given query point.

If this is a leaf node, it will return **NumChildren()** (p. 2227) (invalid index).

Referenced by RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::NumChildren().

39.528.4.24 GetFurthestChild() [2/2]

```
size_t GetFurthestChild (
    const RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType,
    AuxiliaryInformationType > & queryNode )
```

Return the index of the furthest child node to the given query node.

If it can't decide, it will return **NumChildren()** (p. 2227) (invalid index).

39.528.4.25 GetNearestChild() [1/2]

```
size_t GetNearestChild (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 )
```

Return the index of the nearest child node to the given query point.

If this is a leaf node, it will return **NumChildren()** (p. 2227) (invalid index).

Referenced by RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::NumChildren().

39.528.4.26 **GetNearestChild()** [2/2]

```
size_t GetNearestChild (
    const RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType,
    AuxiliaryInformationType > & queryNode )
```

Return the index of the nearest child node to the given query node.

If it can't decide, it will return **NumChildren()** (p.2227) (invalid index).

39.528.4.27 **InsertNode()**

```
void InsertNode (
    RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, Auxiliary←
    InformationType > * node,
    const size_t level,
    std::vector< bool > & relevels )
```

Inserts a node into the tree, tracking which levels have been inserted into.

The node will be inserted so that the tree remains valid.

Parameters

<i>node</i>	The node to be inserted.
<i>level</i>	The depth that should match the node where this node is finally inserted. This should be the number returned by calling TreeDepth() (p. 2232) from the node that originally contained "node".
<i>relevels</i>	The levels that have been reinserted to on this top level insertion.

39.528.4.28 **InsertPoint()** [1/2]

```
void InsertPoint (
    const size_t point )
```

Inserts a point into the tree.

Parameters

<i>point</i>	The index of a point in the dataset.
--------------	--------------------------------------

39.528.4.29 InsertPoint() [2/2]

```
void InsertPoint (
    const size_t point,
    std::vector< bool > & relevels )
```

Inserts a point into the tree, tracking which levels have been inserted into.

Parameters

<i>point</i>	The index of a point in the dataset.
<i>relevels</i>	The levels that have been reinserted to on this top level insertion.

39.528.4.30 IsLeaf()

```
bool IsLeaf ( ) const
```

Return whether or not this node is a leaf (true if it has no children).

Referenced by `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::AuxiliaryInfo()`.

39.528.4.31 MaxDistance() [1/2]

```
ElemType MaxDistance (
    const RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType,
    AuxiliaryInformationType > & other ) const [inline]
```

Return the maximum distance to another node.

Definition at line 478 of file `rectangle_tree.hpp`.

References `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::Bound()`, and `HRectBound< MetricType, ElemType >::MaxDistance()`.

39.528.4.32 MaxDistance() [2/2]

```
ElemType MaxDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Return the maximum distance to another point.

Definition at line 500 of file `rectangle_tree.hpp`.

References `HRectBound< MetricType, ElemType >::MaxDistance()`.

39.528.4.33 MaxLeafSize() [1/2]

```
size_t MaxLeafSize ( ) const [inline]
```

Return the maximum leaf size.

Definition at line 320 of file rectangle_tree.hpp.

39.528.4.34 MaxLeafSize() [2/2]

```
size_t& MaxLeafSize ( ) [inline]
```

Modify the maximum leaf size.

Definition at line 322 of file rectangle_tree.hpp.

39.528.4.35 MaxNumChildren() [1/2]

```
size_t MaxNumChildren ( ) const [inline]
```

Return the maximum number of children (in a non-leaf node).

Definition at line 330 of file rectangle_tree.hpp.

39.528.4.36 MaxNumChildren() [2/2]

```
size_t& MaxNumChildren ( ) [inline]
```

Modify the maximum number of children (in a non-leaf node).

Definition at line 332 of file rectangle_tree.hpp.

39.528.4.37 Metric()

```
MetricType Metric ( ) const [inline]
```

Get the metric which the tree uses.

Definition at line 350 of file rectangle_tree.hpp.

39.528.4.38 MinDistance() [1/2]

```
ElemType MinDistance (
    const RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType,
    AuxiliaryInformationType > & other ) const [inline]
```

Return the minimum distance to another node.

Definition at line 472 of file rectangle_tree.hpp.

References `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::Bound()`, and `HRectBound< MetricType, ElemType >::MinDistance()`.

39.528.4.39 MinDistance() [2/2]

```
ElemType MinDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Return the minimum distance to another point.

Definition at line 491 of file rectangle_tree.hpp.

References `HRectBound< MetricType, ElemType >::MinDistance()`.

39.528.4.40 MinimumBoundDistance()

```
ElemType MinimumBoundDistance ( ) const [inline]
```

Return the minimum distance from the center to any edge of the bound.

Currently, this returns 0, which doesn't break algorithms, but it isn't necessarily correct, either.

Definition at line 408 of file rectangle_tree.hpp.

References `HRectBound< MetricType, ElemType >::MinWidth()`.

39.528.4.41 MinLeafSize() [1/2]

```
size_t MinLeafSize ( ) const [inline]
```

Return the minimum leaf size.

Definition at line 325 of file rectangle_tree.hpp.

39.528.4.42 MinLeafSize() [2/2]

```
size_t& MinLeafSize ( ) [inline]
```

Modify the minimum leaf size.

Definition at line 327 of file rectangle_tree.hpp.

39.528.4.43 MinNumChildren() [1/2]

```
size_t MinNumChildren ( ) const [inline]
```

Return the minimum number of children (in a non-leaf node).

Definition at line 335 of file rectangle_tree.hpp.

39.528.4.44 MinNumChildren() [2/2]

```
size_t& MinNumChildren ( ) [inline]
```

Modify the minimum number of children (in a non-leaf node).

Definition at line 337 of file rectangle_tree.hpp.

39.528.4.45 NullifyData()

```
void NullifyData ( )
```

Nullify the auxiliary information.

Used for memory management. Be careful.

39.528.4.46 NumChildren() [1/2]

```
size_t NumChildren ( ) const [inline]
```

Return the number of child nodes. (One level beneath this one only.)

Definition at line 356 of file rectangle_tree.hpp.

39.528.4.47 NumChildren() [2/2]

```
size_t& NumChildren ( ) [inline]
```

Modify the number of child nodes. Be careful.

Definition at line 358 of file rectangle_tree.hpp.

References `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::FurthestDescendantDistance()`, `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::FurthestPointDistance()`, `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::GetFurthestChild()`, and `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::GetNearestChild()`.

39.528.4.48 NumDescendants()

```
size_t NumDescendants ( ) const
```

Return the number of descendants of this node.

For a non-leaf in a binary space tree, this is the number of points at the descendant leaves. For a leaf, this is the number of points in the leaf.

Referenced by `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::Child()`.

39.528.4.49 NumPoints()

```
size_t NumPoints ( ) const
```

Return the number of points in this node (returns 0 if this node is not a leaf).

Referenced by `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::Child()`.

39.528.4.50 Parent() [1/2]

```
RectangleTree* Parent ( ) const [inline]
```

Gets the parent of this node.

Definition at line 340 of file rectangle_tree.hpp.

39.528.4.51 Parent() [2/2]

```
RectangleTree*& Parent ( ) [inline]
```

Modify the parent of this node.

Definition at line 342 of file rectangle_tree.hpp.

39.528.4.52 ParentDistance() [1/2]

```
ElemType ParentDistance ( ) const [inline]
```

Return the distance from the center of this node to the center of the parent node.

Definition at line 412 of file rectangle_tree.hpp.

39.528.4.53 ParentDistance() [2/2]

```
ElemType& ParentDistance ( ) [inline]
```

Modify the distance from the center of this node to the center of the parent node.

Definition at line 415 of file rectangle_tree.hpp.

39.528.4.54 Point() [1/2]

```
size_t Point (
    const size_t index ) const [inline]
```

Return the index (with reference to the dataset) of a particular point in this node.

This will happily return invalid indices if the given index is greater than the number of points in this node (obtained with **NumPoints()** (p. 2228)) – be careful.

Parameters

<i>index</i>	Index of point for which a dataset index is wanted.
--------------	---

Definition at line 465 of file rectangle_tree.hpp.

39.528.4.55 Point() [2/2]

```
size_t& Point (
    const size_t index ) [inline]
```

Modify the index of a particular point in this node.

Be very careful when you do this! You may make the tree invalid.

Definition at line 469 of file rectangle_tree.hpp.

39.528.4.56 RangeDistance() [1/2]

```
math::RangeType< ElemType> RangeDistance (
    const RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType,
    AuxiliaryInformationType > & other ) const [inline]
```

Return the minimum and maximum distance to another node.

Definition at line 484 of file rectangle_tree.hpp.

References RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::Bound(), and HRectBound< MetricType, ElemType >::RangeDistance().

39.528.4.57 RangeDistance() [2/2]

```
math::RangeType< ElemType> RangeDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Return the minimum and maximum distance to another point.

Definition at line 509 of file rectangle_tree.hpp.

References HRectBound< MetricType, ElemType >::RangeDistance(), RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::TreeDepth(), and RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::TreeSize().

39.528.4.58 RemoveNode()

```
bool RemoveNode (
    const RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType,
    AuxiliaryInformationType > * node,
    std::vector< bool > & relevels )
```

Removes a node from the tree.

You are responsible for deleting it if you wish to do so.

39.528.4.59 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int )
```

Serialize the tree.

39.528.4.60 ShrinkBoundForBound()

```
bool ShrinkBoundForBound (
    const bound::HRectBound< MetricType > & changedBound )
```

Shrink the bound object of this node for the removal of a child node.

Parameters

<i>bound</i>	The HRectBound <> & of the bound that was removed to require this shrinking.
--------------	---

Returns

true if the bound needed to be changed, false if it did not.

39.528.4.61 ShrinkBoundForPoint()

```
bool ShrinkBoundForPoint (
    const arma::vec & point )
```

Shrink the bound object of this node for the removal of a point.

Parameters

<i>point</i>	The arma::vec& of the point that was removed to require this shrinking.
--------------	---

Returns

true if the bound needed to be changed, false if it did not.

39.528.4.62 SoftDelete()

```
void SoftDelete ( )
```

Delete this node of the tree, but leave the stuff contained in it intact.

This is used when splitting a node, where the data in this tree is moved to two other trees.

39.528.4.63 Stat() [1/2]

```
const StatisticType& Stat ( ) const [inline]
```

Return the statistic object for this node.

Definition at line 305 of file rectangle_tree.hpp.

39.528.4.64 Stat() [2/2]

```
StatisticType& Stat ( ) [inline]
```

Modify the statistic object for this node.

Definition at line 307 of file rectangle_tree.hpp.

39.528.4.65 TreeDepth()

```
size_t TreeDepth ( ) const
```

Obtains the number of levels below this node in the tree, starting with this.

Referenced by `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::RangeDistance()`.

39.528.4.66 TreeSize()

```
size_t TreeSize ( ) const
```

Obtains the number of nodes in the tree, starting with this.

Referenced by RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::RangeDistance().

39.528.5 Member Data Documentation

39.529 `RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::DualTreeTraverser< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >` Class Template Reference

A dual tree traverser for rectangle type trees.

Public Member Functions

- **DualTreeTraverser** (RuleType &rule)
Instantiate the dual-tree traverser with the given rule set.
- `size_t` **NumBaseCases** () const
Get the number of times a base case was calculated.
- `size_t` & **NumBaseCases** ()
Modify the number of times a base case was calculated.
- `size_t` **NumPrunes** () const
Get the number of prunes.
- `size_t` & **NumPrunes** ()
Modify the number of prunes.
- `size_t` **NumScores** () const
Get the number of times a node combination was scored.
- `size_t` & **NumScores** ()
Modify the number of times a node combination was scored.
- `size_t` **NumVisited** () const
Get the number of visited combinations.
- `size_t` & **NumVisited** ()
Modify the number of visited combinations.
- `void` **Traverse** (`RectangleTree` &queryNode, `RectangleTree` &referenceNode)
Traverse the two trees.

39.529.1 Detailed Description

```
template<typename MetricType = metric::EuclideanDistance, typename StatisticType = EmptyStatistic, typename MatType = arma::mat, typename SplitType = RTreeSplit, typename DescentType = RTreeDescentHeuristic, template< typename > class AuxiliaryInformationType = NoAuxiliaryInformation>
template<typename MetricType, typename StatisticType, typename MatType, typename SplitType, typename DescentType, template< typename > class AuxiliaryInformationType>
class mlpack::tree::RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::DualTreeTraverser< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >
```

A dual tree traverser for rectangle type trees.

Definition at line 31 of file `dual_tree_traverser.hpp`.

39.529.2 Constructor & Destructor Documentation

39.529.2.1 DualTreeTraverser()

```
DualTreeTraverser (  
    RuleType & rule )
```

Instantiate the dual-tree traverser with the given rule set.

39.529.3 Member Function Documentation

39.529.3.1 NumBaseCases() [1/2]

```
size_t NumBaseCases ( ) const [inline]
```

Get the number of times a base case was calculated.

Definition at line 65 of file dual_tree_traverser.hpp.

39.529.3.2 NumBaseCases() [2/2]

```
size_t& NumBaseCases ( ) [inline]
```

Modify the number of times a base case was calculated.

Definition at line 67 of file dual_tree_traverser.hpp.

39.529.3.3 NumPrunes() [1/2]

```
size_t NumPrunes ( ) const [inline]
```

Get the number of prunes.

Definition at line 50 of file dual_tree_traverser.hpp.

39.529.3.4 NumPrunes() [2/2]

```
size_t& NumPrunes ( ) [inline]
```

Modify the number of prunes.

Definition at line 52 of file dual_tree_traverser.hpp.

39.529.3.5 NumScores() [1/2]

```
size_t NumScores ( ) const [inline]
```

Get the number of times a node combination was scored.

Definition at line 60 of file dual_tree_traverser.hpp.

39.529.3.6 NumScores() [2/2]

```
size_t& NumScores ( ) [inline]
```

Modify the number of times a node combination was scored.

Definition at line 62 of file dual_tree_traverser.hpp.

39.529.3.7 NumVisited() [1/2]

```
size_t NumVisited ( ) const [inline]
```

Get the number of visited combinations.

Definition at line 55 of file dual_tree_traverser.hpp.

39.529.3.8 NumVisited() [2/2]

```
size_t& NumVisited ( ) [inline]
```

Modify the number of visited combinations.

Definition at line 57 of file dual_tree_traverser.hpp.

39.529.3.9 Traverse()

```
void Traverse (
    RectangleTree & queryNode,
    RectangleTree & referenceNode )
```

Traverse the two trees.

This does not reset the number of prunes.

Parameters

<i>queryNode</i>	The query node to be traversed.
<i>referenceNode</i>	The reference node to be traversed.
<i>score</i>	The score of the current node combination.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ **dual_tree_traverser.hpp**

39.530 **RectangleTree**< **MetricType**, **StatisticType**, **MatType**, **SplitType**, **DescentType**, **AuxiliaryInformationType** >::**SingleTreeTraverser**< **RuleType** > **Class Template Reference**

A single traverser for rectangle type trees.

Public Member Functions

- **SingleTreeTraverser** (**RuleType** &rule)
Instantiate the traverser with the given rule set.
- size_t **NumPrunes** () const
Get the number of prunes.
- size_t & **NumPrunes** ()
Modify the number of prunes.
- void **Traverse** (const size_t queryIndex, const **RectangleTree** &referenceNode)
Traverse the tree with the given point.

39.530.1 Detailed Description

```
template<typename MetricType = metric::EuclideanDistance, typename StatisticType = EmptyStatistic, typename MatType = arma::mat, typename SplitType = RTreeSplit, typename DescentType = RTreeDescentHeuristic, template< typename > class AuxiliaryInformationType = NoAuxiliaryInformation>
template<typename RuleType>
class mlpack::tree::RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType >::SingleTreeTraverser< RuleType >
```

A single traverser for rectangle type trees.

See single_tree_traverser.hpp for implementation.

Definition at line 112 of file rectangle_tree.hpp.

39.530.2 Constructor & Destructor Documentation

39.530.2.1 SingleTreeTraverser()

```
SingleTreeTraverser (  
    RuleType & rule )
```

Instantiate the traverser with the given rule set.

39.530.3 Member Function Documentation

39.530.3.1 NumPrunes() [1/2]

```
size_t NumPrunes ( ) const [inline]
```

Get the number of prunes.

Definition at line 50 of file `single_tree_traverser.hpp`.

39.530.3.2 NumPrunes() [2/2]

```
size_t& NumPrunes ( ) [inline]
```

Modify the number of prunes.

Definition at line 52 of file `single_tree_traverser.hpp`.

39.530.3.3 Traverse()

```
void Traverse (  
    const size_t queryIndex,  
    const RectangleTree & referenceNode )
```

Traverse the tree with the given point.

Parameters

<i>queryIndex</i>	The index of the point in the query set which is being used as the query point.
<i>referenceNode</i>	The tree node to be traversed.

The documentation for this class was generated from the following files:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ **rectangle_tree.hpp**

39.531 RPlusPlusTreeAuxiliaryInformation< TreeType > Class Template Reference

Public Types

- typedef **bound::HRectBound< metric::EuclideanDistance, ElemType > BoundType**
The bound type held by the auxiliary information.
- typedef TreeType::ElemType **ElemType**
The element type held by the tree.

Public Member Functions

- **RPlusPlusTreeAuxiliaryInformation ()**
Construct the auxiliary information object.
- **RPlusPlusTreeAuxiliaryInformation (const TreeType *)**
Construct this as an auxiliary information for the given node.
- **RPlusPlusTreeAuxiliaryInformation (const RPlusPlusTreeAuxiliaryInformation &other, TreeType *tree, bool=true)**
Create an auxiliary information object by copying from another object.
- **RPlusPlusTreeAuxiliaryInformation (RPlusPlusTreeAuxiliaryInformation &&other)**
Create an auxiliary information object by moving from another node.
- bool **HandleNodeInsertion** (TreeType *, TreeType *, bool)
Some tree types require to save some properties at the insertion process.
- bool **HandleNodeRemoval** (TreeType *, const size_t)
Some tree types require to save some properties at the deletion process.
- bool **HandlePointDeletion** (TreeType *, const size_t)
Some tree types require to save some properties at the deletion process.
- bool **HandlePointInsertion** (TreeType *, const size_t)
Some tree types require to save some properties at the insertion process.
- void **NullifyData ()**
Nullify the auxiliary information in order to prevent an invalid free.
- **BoundType & OuterBound ()**
Return the maximum bounding rectangle.
- const **BoundType & OuterBound () const**
Modify the maximum bounding rectangle.

- `template<typename Archive >`
`void serialize (Archive &, const unsigned int)`
Serialize the information.
- `void SplitAuxiliaryInfo (TreeType *treeOne, TreeType *treeTwo, const size_t axis, const ElemType cut)`
The R++ tree requires to split the maximum bounding rectangle of a node that is being split.
- `bool UpdateAuxiliaryInfo (TreeType *)`
Some tree types require to propagate the information upward.

39.531.1 Detailed Description

```
template<typename TreeType>
class mpack::tree::RPlusPlusTreeAuxiliaryInformation< TreeType >
```

Definition at line 24 of file `r_plus_plus_tree_auxiliary_information.hpp`.

39.531.2 Member Typedef Documentation

39.531.2.1 BoundType

```
typedef bound::HRectBound< metric::EuclideanDistance, ElemType> BoundType
```

The bound type held by the auxiliary information.

Definition at line 30 of file `r_plus_plus_tree_auxiliary_information.hpp`.

39.531.2.2 ElemType

```
typedef TreeType::ElemType ElemType
```

The element type held by the tree.

Definition at line 28 of file `r_plus_plus_tree_auxiliary_information.hpp`.

39.531.3 Constructor & Destructor Documentation

39.531.3.1 RPlusPlusTreeAuxiliaryInformation() [1/4]

```
RPlusPlusTreeAuxiliaryInformation ( )
```

Construct the auxiliary information object.

39.531.3.2 RPlusPlusTreeAuxiliaryInformation() [2/4]

```
RPlusPlusTreeAuxiliaryInformation (
    const TreeType * )
```

Construct this as an auxiliary information for the given node.

Parameters

<i>node</i>	The node that stores this auxiliary information.
-------------	--

39.531.3.3 `RPlusPlusTreeAuxiliaryInformation()` [3/4]

```
RPlusPlusTreeAuxiliaryInformation (
    const RPlusPlusTreeAuxiliaryInformation< TreeType > & other,
    TreeType * tree,
    bool    = true )
```

Create an auxiliary information object by copying from another object.

Parameters

<i>other</i>	Another auxiliary information object from which the information will be copied.
<i>tree</i>	The node that holds the auxiliary information.
<i>deepCopy</i>	If false, the new object uses the same memory (not used here).

39.531.3.4 `RPlusPlusTreeAuxiliaryInformation()` [4/4]

```
RPlusPlusTreeAuxiliaryInformation (
    RPlusPlusTreeAuxiliaryInformation< TreeType > && other )
```

Create an auxiliary information object by moving from another node.

Parameters

<i>other</i>	The auxiliary information object from which the information will be moved.
--------------	--

39.531.4 Member Function Documentation

39.531.4.1 `HandleNodeInsertion()`

```
bool HandleNodeInsertion (
    TreeType * ,
```

```
TreeType * ,
bool )
```

Some tree types require to save some properties at the insertion process.

This method allows the auxiliary information the option of manipulating the tree in order to perform the insertion process. If the auxiliary information does that, then the method should return true; if the method returns false the **RectangleTree** (p. 2207) performs its default behavior.

Parameters

<i>node</i>	The node in which the nodeToInsert is being inserted.
<i>nodeToInsert</i>	The node being inserted.
<i>insertionLevel</i>	The level of the tree at which the nodeToInsert should be inserted.

39.531.4.2 HandleNodeRemoval()

```
bool HandleNodeRemoval (
    TreeType * ,
    const size_t )
```

Some tree types require to save some properties at the deletion process.

This method allows the auxiliary information the option of manipulating the tree in order to perform the deletion process. If the auxiliary information does that, then the method should return true; if the method returns false the **RectangleTree** (p. 2207) performs its default behavior.

Parameters

<i>node</i>	The node from which the node is being deleted.
<i>nodeIndex</i>	The local index of the node being deleted.

39.531.4.3 HandlePointDeletion()

```
bool HandlePointDeletion (
    TreeType * ,
    const size_t )
```

Some tree types require to save some properties at the deletion process.

This method allows the auxiliary information the option of manipulating the tree in order to perform the deletion process. If the auxiliary information does that, then the method should return true; if the method returns false the **RectangleTree** (p. 2207) performs its default behavior.

Parameters

<i>node</i>	The node from which the point is being deleted.
<i>localIndex</i>	The local index of the point being deleted.

39.531.4.4 **HandlePointInsertion()**

```
bool HandlePointInsertion (
    TreeType * ,
    const size_t )
```

Some tree types require to save some properties at the insertion process.

This method allows the auxiliary information the option of manipulating the tree in order to perform the insertion process. If the auxiliary information does that, then the method should return true; if the method returns false the **RectangleTree** (p. 2207) performs its default behavior.

Parameters

<i>node</i>	The node in which the point is being inserted.
<i>point</i>	The global number of the point being inserted.

39.531.4.5 **NullifyData()**

```
void NullifyData ( )
```

Nullify the auxiliary information in order to prevent an invalid free.

39.531.4.6 **OuterBound()** [1/2]

```
BoundType& OuterBound ( ) [inline]
```

Return the maximum bounding rectangle.

Definition at line 146 of file `r_plus_plus_tree_auxiliary_information.hpp`.

39.531.4.7 OuterBound() [2/2]

```
const BoundType& OuterBound ( ) const [inline]
```

Modify the maximum bounding rectangle.

Definition at line 149 of file r_plus_plus_tree_auxiliary_information.hpp.

References RPlusPlusTreeAuxiliaryInformation< TreeType >::serialize().

39.531.4.8 serialize()

```
void serialize (
    Archive & ,
    const unsigned int )
```

Serialize the information.

Referenced by RPlusPlusTreeAuxiliaryInformation< TreeType >::OuterBound().

39.531.4.9 SplitAuxiliaryInfo()

```
void SplitAuxiliaryInfo (
    TreeType * treeOne,
    TreeType * treeTwo,
    const size_t axis,
    const ElemType cut )
```

The R++ tree requires to split the maximum bounding rectangle of a node that is being split.

This method is intended for that.

Parameters

<i>treeOne</i>	The first subtree.
<i>treeTwo</i>	The second subtree.
<i>axis</i>	The axis along which the split is performed.
<i>cut</i>	The coordinate at which the node is split.

39.531.4.10 UpdateAuxiliaryInfo()

```
bool UpdateAuxiliaryInfo (
    TreeType * )
```

Some tree types require to propagate the information upward.

This method should return false if this is not the case. If true is returned, the update will be propagated upward.

Parameters

<i>node</i>	The node in which the auxiliary information being update.
-------------	---

39.532 RPlusPlusTreeDescentHeuristic Class Reference**Static Public Member Functions**

- template<typename TreeType >
static size_t **ChooseDescentNode** (TreeType *node, const size_t point)
Evaluate the node using a heuristic.
- template<typename TreeType >
static size_t **ChooseDescentNode** (const TreeType *node, const TreeType *insertedNode)
Evaluate the node using a heuristic.

39.532.1 Detailed Description

Definition at line 21 of file r_plus_plus_tree_descent_heuristic.hpp.

39.532.2 Member Function Documentation**39.532.2.1 ChooseDescentNode() [1/2]**

```
static size_t ChooseDescentNode (
    TreeType * node,
    const size_t point ) [static]
```

Evaluate the node using a heuristic.

Returns the number of the node with minimum largest Hilbert value is greater than the Hilbert value of the point being inserted.

Parameters

<i>node</i>	The node that is being evaluated.
<i>point</i>	The number of the point that is being inserted.

39.532.2.2 ChooseDescentNode() [2/2]

```
static size_t ChooseDescentNode (
    const TreeType * node,
    const TreeType * insertedNode ) [static]
```

Evaluate the node using a heuristic.

Returns the number of the node with minimum largest Hilbert value is greater than the largest Hilbert value of the point being inserted.

Parameters

<i>node</i>	The node that is being evaluated.
<i>insertedNode</i>	The node that is being inserted.

The documentation for this class was generated from the following file:

heuristic.hpp

39.533 RPlusPlusTreeSplitPolicy Class Reference

The **RPlusPlusTreeSplitPolicy** (p.2247) helps to determine the subtree into which we should insert a child of an intermediate node that is being split.

Static Public Member Functions

- `template<typename TreeType >`
static const **bound::HRectBound**< **metric::EuclideanDistance**, typename TreeType::ElemType > & **Bound**
(const TreeType &node)
Return the maximum bounding rectangle of the node.
- `template<typename TreeType >`
static int **GetSplitPolicy** (const TreeType &child, const size_t axis, const typename TreeType::ElemType cut)
This method returns SplitRequired if a child of an intermediate node should be split, AssignToFirstTree if the child should be inserted to the first subtree, AssignToSecondTree if the child should be inserted to the second subtree.

Static Public Attributes

- static const int **AssignToFirstTree** = 1
Indicate that the child should be inserted to the first subtree.
- static const int **AssignToSecondTree** = 2
Indicate that the child should be inserted to the second subtree.
- static const int **SplitRequired** = 0
Indicate that the child should be split.

39.533.1 Detailed Description

The **RPlusPlusTreeSplitPolicy** (p.2247) helps to determine the subtree into which we should insert a child of an intermediate node that is being split.

This class is designed for the R++ tree.

Definition at line 25 of file `r_plus_plus_tree_split_policy.hpp`.

39.533.2 Member Function Documentation

39.533.2.1 Bound()

```
static const bound::HRectBound< metric::EuclideanDistance, typename TreeType::ElemType>& Bound (
    const TreeType & node ) [inline], [static]
```

Return the maximum bounding rectangle of the node.

This method should always return the bound that is used for the decision-making in **GetSplitPolicy()** (p. 2248).

Parameters

<i>node</i>	The node whose bound is requested.
-------------	------------------------------------

Definition at line 70 of file `r_plus_plus_tree_split_policy.hpp`.

39.533.2.2 GetSplitPolicy()

```
static int GetSplitPolicy (
    const TreeType & child,
```

```
const size_t axis,
const typename TreeType::ElemType cut ) [inline], [static]
```

This method returns `SplitRequired` if a child of an intermediate node should be split, `AssignToFirstTree` if the child should be inserted to the first subtree, `AssignToSecondTree` if the child should be inserted to the second subtree.

The method makes decision according to the maximum bounding rectangle of the child, the axis along which the intermediate node is being split and the coordinate at which the node is being split.

Parameters

<i>child</i>	A child of the node that is being split.
<i>axis</i>	The axis along which the node is being split.
<i>cut</i>	The coordinate at which the node is being split.

Definition at line 48 of file `r_plus_plus_tree_split_policy.hpp`.

References `RPlusPlusTreeSplitPolicy::SplitRequired`.

39.533.3 Member Data Documentation

39.533.3.1 AssignToFirstTree

```
const int AssignToFirstTree = 1 [static]
```

Indicate that the child should be inserted to the first subtree.

Definition at line 31 of file `r_plus_plus_tree_split_policy.hpp`.

39.533.3.2 AssignToSecondTree

```
const int AssignToSecondTree = 2 [static]
```

Indicate that the child should be inserted to the second subtree.

Definition at line 33 of file `r_plus_plus_tree_split_policy.hpp`.

39.533.3.3 SplitRequired

```
const int SplitRequired = 0 [static]
```

Indicate that the child should be split.

Definition at line 29 of file `r_plus_plus_tree_split_policy.hpp`.

Referenced by `RPlusPlusTreeSplitPolicy::GetSplitPolicy()`.

39.534 RPlusTreeDescentHeuristic Class Reference

Static Public Member Functions

- `template<typename TreeType >`
`static size_t ChooseDescentNode (TreeType *node, const size_t point)`
Evaluate the node using a heuristic.
- `template<typename TreeType >`
`static size_t ChooseDescentNode (const TreeType *, const TreeType *)`
Evaluate the node using a heuristic.

39.534.1 Detailed Description

Definition at line 21 of file `r_plus_tree_descent_heuristic.hpp`.

39.534.2 Member Function Documentation

39.534.2.1 ChooseDescentNode() [1/2]

```
static size_t ChooseDescentNode (
    TreeType * node,
    const size_t point ) [static]
```

Evaluate the node using a heuristic.

Returns the number of the node with minimum largest Hilbert value is greater than the Hilbert value of the point being inserted.

Parameters

<i>node</i>	The node that is being evaluated.
<i>point</i>	The number of the point that is being inserted.

39.534.2.2 ChooseDescentNode() [2/2]

```
static size_t ChooseDescentNode (
    const TreeType * ,
    const TreeType * ) [static]
```

Evaluate the node using a heuristic.

Returns the number of the node with minimum largest Hilbert value is greater than the largest Hilbert value of the point being inserted.

Parameters

<i>node</i>	The node that is being evaluated.
<i>insertedNode</i>	The node that is being inserted.

The documentation for this class was generated from the following file:

39.535 RPlusTreeSplit< SplitPolicyType, SweepType > Class Template Reference

The **RPlusTreeSplit** (p. 2251) class performs the split process of a node on overflow.

Public Types

- typedef SplitPolicyType **SplitPolicy**

Static Public Member Functions

- template<typename TreeType >
static void **SplitLeafNode** (TreeType *tree, std::vector< bool > &relevels)
Split a leaf node using the "default" algorithm.
- template<typename TreeType >
static bool **SplitNonLeafNode** (TreeType *tree, std::vector< bool > &relevels)
Split a non-leaf node using the "default" algorithm.

39.535.1 Detailed Description

```
template<typename SplitPolicyType, template< typename > class SweepType>
class mlpack::tree::RPlusTreeSplit< SplitPolicyType, SweepType >
```

The **RPlusTreeSplit** (p. 2251) class performs the split process of a node on overflow.

Template Parameters

<i>SplitPolicyType</i>	The class that helps to determine the subtree into which we should insert a child node.
<i>SweepType</i>	The class that finds the partition of a node along a given axis. The partition algorithm tries to find a partition along each axis, evaluates each partition and chooses the best one.

Definition at line 32 of file `r_plus_tree_split.hpp`.

39.535.2 Member Typedef Documentation

39.535.2.1 SplitPolicy

```
typedef SplitPolicyType SplitPolicy
```

Definition at line 35 of file `r_plus_tree_split.hpp`.

39.535.3 Member Function Documentation

39.535.3.1 SplitLeafNode()

```
static void SplitLeafNode (
    TreeType * tree,
    std::vector< bool > & relevels ) [static]
```

Split a leaf node using the "default" algorithm.

If necessary, this split will propagate upwards through the tree.

Parameters

<i>node.</i>	The node that is being split.
<i>relevels</i>	Not used.

39.535.3.2 SplitNonLeafNode()

```
static bool SplitNonLeafNode (
    TreeType * tree,
    std::vector< bool > & relevels ) [static]
```

Split a non-leaf node using the "default" algorithm.

If this is a root node, the tree increases in depth.

Parameters

<i>node.</i>	The node that is being split.
<i>relevels</i>	Not used.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ **r_plus_tree_split.hpp**

39.536 RPlusTreeSplitPolicy Class Reference

The **RPlusTreeSplitPolicy** (p.2247) helps to determine the subtree into which we should insert a child of an intermediate node that is being split.

Static Public Member Functions

- template<typename TreeType >
static const **bound::HRectBound**< **metric::EuclideanDistance**, typename TreeType::ElemType > & **Bound**
(const TreeType &node)
Return the minimum bounding rectangle of the node.
- template<typename TreeType >
static int **GetSplitPolicy** (const TreeType &child, const size_t axis, const typename TreeType::ElemType cut)
This method returns SplitRequired if a child of an intermediate node should be split, AssignToFirstTree if the child should be inserted to the first subtree, AssignToSecondTree if the child should be inserted to the second subtree.

Static Public Attributes

- static const int **AssignToFirstTree** = 1
Indicate that the child should be inserted to the first subtree.
- static const int **AssignToSecondTree** = 2
Indicate that the child should be inserted to the second subtree.
- static const int **SplitRequired** = 0
Indicate that the child should be split.

39.536.1 Detailed Description

The **RPlusPlusTreeSplitPolicy** (p.2247) helps to determine the subtree into which we should insert a child of an intermediate node that is being split.

This class is designed for the R+ tree.

Definition at line 25 of file `r_plus_tree_split_policy.hpp`.

39.536.2 Member Function Documentation

39.536.2.1 Bound()

```
static const bound::HRectBound< metric::EuclideanDistance, typename TreeType::ElemType>& Bound (
    const TreeType & node ) [inline], [static]
```

Return the minimum bounding rectangle of the node.

This method should always return the bound that is used for the decision-making in **GetSplitPolicy()** (p. 2254).

Parameters

<i>node</i>	The node whose bound is requested.
-------------	------------------------------------

Definition at line 70 of file `r_plus_tree_split_policy.hpp`.

39.536.2.2 GetSplitPolicy()

```
static int GetSplitPolicy (
    const TreeType & child,
    const size_t axis,
    const typename TreeType::ElemType cut ) [inline], [static]
```

This method returns `SplitRequired` if a child of an intermediate node should be split, `AssignToFirstTree` if the child should be inserted to the first subtree, `AssignToSecondTree` if the child should be inserted to the second subtree.

The method makes desicion according to the minimum bounding rectangle of the child, the axis along which the intermediate node is being split and the coordinate at which the node is being split.

Parameters

<i>child</i>	A child of the node that is being split.
<i>axis</i>	The axis along which the node is being split.
<i>cut</i>	The coordinate at which the node is being split.

Definition at line 48 of file r_plus_tree_split_policy.hpp.

References RPlusTreeSplitPolicy::SplitRequired.

39.536.3 Member Data Documentation

39.536.3.1 AssignToFirstTree

```
const int AssignToFirstTree = 1 [static]
```

Indicate that the child should be inserted to the first subtree.

Definition at line 31 of file r_plus_tree_split_policy.hpp.

39.536.3.2 AssignToSecondTree

```
const int AssignToSecondTree = 2 [static]
```

Indicate that the child should be inserted to the second subtree.

Definition at line 33 of file r_plus_tree_split_policy.hpp.

39.536.3.3 SplitRequired

```
const int SplitRequired = 0 [static]
```

Indicate that the child should be split.

Definition at line 29 of file r_plus_tree_split_policy.hpp.

Referenced by RPlusTreeSplitPolicy::GetSplitPolicy().

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ r_plus_tree_split_policy.hpp

39.537 RPTreeMaxSplit< BoundType, MatType > Class Template Reference

This class splits a node by a random hyperplane.

Classes

- struct **SplitInfo**
An information about the partition.

Public Types

- typedef MatType::elem_type **ElemType**
The element type held by the matrix type.

Static Public Member Functions

- template<typename VecType >
static bool **AssignToLeftNode** (const VecType &point, const **SplitInfo** &splitInfo)
Indicates that a point should be assigned to the left subtree.
- static size_t **PerformSplit** (MatType &data, const size_t begin, const size_t count, const **SplitInfo** &splitInfo)
Perform the split process according to the information about the split.
- static size_t **PerformSplit** (MatType &data, const size_t begin, const size_t count, const **SplitInfo** &splitInfo, std::vector< size_t > &oldFromNew)
Perform the split process according to the information about the split and return the list of changed indices.
- static bool **SplitNode** (const BoundType &, MatType &data, const size_t begin, const size_t count, **SplitInfo** &splitInfo)
Split the node by a random hyperplane.

39.537.1 Detailed Description

```
template<typename BoundType, typename MatType = arma::mat>
class mpack::tree::RPTreeMaxSplit< BoundType, MatType >
```

This class splits a node by a random hyperplane.

In order to choose the hyperplane we need to choose the normal to the hyperplane and the position of the hyperplane i.e. the scalar product of the normal and a point.

A point will be assigned to the left subtree if the product of this point and the normal is less or equal to the split value (i.e. the position of the hyperplane).

Definition at line 32 of file rp_tree_max_split.hpp.

39.537.2 Member Typedef Documentation

39.537.2.1 ElemType

```
typedef MatType::elem_type ElemType
```

The element type held by the matrix type.

Definition at line 36 of file `rp_tree_max_split.hpp`.

39.537.3 Member Function Documentation

39.537.3.1 AssignToLeftNode()

```
static bool AssignToLeftNode (
    const VecType & point,
    const SplitInfo & splitInfo ) [inline], [static]
```

Indicates that a point should be assigned to the left subtree.

Parameters

<i>point</i>	The point that is being assigned.
<i>splitInfo</i>	An information about the split.

Definition at line 118 of file `rp_tree_max_split.hpp`.

References `RPTreeMaxSplit< BoundType, MatType >::SplitInfo::direction`, and `RPTreeMaxSplit< BoundType, MatType >::SplitInfo::splitVal`.

39.537.3.2 PerformSplit() [1/2]

```
static size_t PerformSplit (
    MatType & data,
    const size_t begin,
    const size_t count,
    const SplitInfo & splitInfo ) [inline], [static]
```

Perform the split process according to the information about the split.

This will order the dataset such that points that belong to the left subtree are on the left of the split column, and points from the right subtree are on the right side of the split column.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	The information about the split.

Definition at line 76 of file `rp_tree_max_split.hpp`.

39.537.3.3 PerformSplit() [2/2]

```
static size_t PerformSplit (
    MatType & data,
    const size_t begin,
    const size_t count,
    const SplitInfo & splitInfo,
    std::vector< size_t > & oldFromNew ) [inline], [static]
```

Perform the split process according to the information about the split and return the list of changed indices.

This will order the dataset such that points that belong to the left subtree are on the left of the split column, and points from the right subtree are on the right side of the split column.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	The information about the split.
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.

Definition at line 101 of file `rp_tree_max_split.hpp`.

39.537.3.4 SplitNode()

```
static bool SplitNode (
    const BoundType & ,
    MatType & data,
    const size_t begin,
```

```
const size_t count,  
    SplitInfo & splitInfo ) [static]
```

Split the node by a random hyperplane.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	An information about the split. This information contains the direction and the value.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/ **rp_tree_max_split.hpp**

39.538 RPTreeMaxSplit< BoundType, MatType >::SplitInfo Struct Reference

An information about the partition.

Public Attributes

- arma::Col< **ElemType** > **direction**
The normal vector to the hyperplane that splits the node.
- **ElemType** **splitVal**
The value according to which the node is being split.

39.538.1 Detailed Description

```
template<typename BoundType, typename MatType = arma::mat>
struct mlpack::tree::RPTreeMaxSplit< BoundType, MatType >::SplitInfo
```

An information about the partition.

Definition at line 38 of file rp_tree_max_split.hpp.

39.538.2 Member Data Documentation

39.538.2.1 direction

```
arma::Col< ElemType> direction
```

The normal vector to the hyperplane that splits the node.

Definition at line 41 of file rp_tree_max_split.hpp.

Referenced by RPTreeMaxSplit< BoundType, MatType >::AssignToLeftNode().

39.538.2.2 splitVal

ElemType splitVal

The value according to which the node is being split.

Definition at line 43 of file rp_tree_max_split.hpp.

Referenced by RPTreeMaxSplit< BoundType, MatType >::AssignToLeftNode().

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/ **rp_tree_max_split.hpp**

39.539 RPTreeMeanSplit< BoundType, MatType > Class Template Reference

This class splits a binary space tree.

Classes

- struct **SplitInfo**
An information about the partition.

Public Types

- typedef MatType::elem_type **ElemType**
The element type held by the matrix type.

Static Public Member Functions

- template<typename VecType >
static bool **AssignToLeftNode** (const VecType &point, const **SplitInfo** &splitInfo)
Indicates that a point should be assigned to the left subtree.
- static size_t **PerformSplit** (MatType &data, const size_t begin, const size_t count, const **SplitInfo** &splitInfo)
Perform the split process according to the information about the split.
- static size_t **PerformSplit** (MatType &data, const size_t begin, const size_t count, const **SplitInfo** &splitInfo, std::vector< size_t > &oldFromNew)
Perform the split process according to the information about the split and return the list of changed indices.
- static bool **SplitNode** (const BoundType &, MatType &data, const size_t begin, const size_t count, **SplitInfo** &splitInfo)
Split the node according to the mean value in the dimension with maximum width.

39.539.1 Detailed Description

```
template<typename BoundType, typename MatType = arma::mat>
class mlpack::tree::RPTreeMeanSplit< BoundType, MatType >
```

This class splits a binary space tree.

This class provides two different kinds of split. The mean split (i.e. all points are split by the median of their distance to the mean point) is performed if the average distance between points multiplied by a constant is greater than the diameter of the node. Otherwise, the median split (i.e. the node is split by a random hyperplane) is performed.

Definition at line 33 of file `rp_tree_mean_split.hpp`.

39.539.2 Member Typedef Documentation

39.539.2.1 ElemType

```
typedef MatType::elem_type ElemType
```

The element type held by the matrix type.

Definition at line 37 of file `rp_tree_mean_split.hpp`.

39.539.3 Member Function Documentation

39.539.3.1 AssignToLeftNode()

```
static bool AssignToLeftNode (
    const VecType & point,
    const SplitInfo & splitInfo ) [inline], [static]
```

Indicates that a point should be assigned to the left subtree.

Parameters

<i>point</i>	The point that is being assigned.
<i>splitInfo</i>	An information about the split.

Definition at line 125 of file `rp_tree_mean_split.hpp`.

References RPTreeMeanSplit< BoundType, MatType >::SplitInfo::direction, RPTreeMeanSplit< BoundType, MatType >::SplitInfo::mean, RPTreeMeanSplit< BoundType, MatType >::SplitInfo::meanSplit, and RPTreeMeanSplit< BoundType, MatType >::SplitInfo::splitVal.

39.539.3.2 PerformSplit() [1/2]

```
static size_t PerformSplit (
    MatType & data,
    const size_t begin,
    const size_t count,
    const SplitInfo & splitInfo ) [inline], [static]
```

Perform the split process according to the information about the split.

This will order the dataset such that points that belong to the left subtree are on the left of the split column, and points from the right subtree are on the right side of the split column.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	The information about the split.

Definition at line 83 of file `rp_tree_mean_split.hpp`.

39.539.3.3 PerformSplit() [2/2]

```
static size_t PerformSplit (
    MatType & data,
    const size_t begin,
    const size_t count,
    const SplitInfo & splitInfo,
    std::vector< size_t > & oldFromNew ) [inline], [static]
```

Perform the split process according to the information about the split and return the list of changed indices.

This will order the dataset such that points that belong to the left subtree are on the left of the split column, and points from the right subtree are on the right side of the split column.

Parameters

<i>bound</i>	The bound used for this node.
--------------	-------------------------------

Parameters

<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	The information about the split.
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.

Definition at line 108 of file `rp_tree_mean_split.hpp`.

39.539.3.4 SplitNode()

```
static bool SplitNode (
    const BoundType & ,
    MatType & data,
    const size_t begin,
    const size_t count,
    SplitInfo & splitInfo ) [static]
```

Split the node according to the mean value in the dimension with maximum width.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	An information about the split. This information contains the direction and the value.

The documentation for this class was generated from the following file:

39.540 RPTreeMeanSplit< BoundType, MatType >::SplitInfo Struct Reference

An information about the partition.

Public Attributes

- `arma::Col< ElemType > direction`
The normal to the hyperplane that will split the node.

- `arma::Col< ElemType > mean`
The mean of some sampled points.
- `bool meanSplit`
Indicates that we should use the mean split algorithm instead of the median split.
- `ElemType splitVal`
The value according to which the split will be performed.

39.540.1 Detailed Description

```
template<typename BoundType, typename MatType = arma::mat>
struct mlpack::tree::RPTreeMeanSplit< BoundType, MatType >::SplitInfo
```

An information about the partition.

Definition at line 39 of file `rp_tree_mean_split.hpp`.

39.540.2 Member Data Documentation

39.540.2.1 direction

```
arma::Col< ElemType> direction
```

The normal to the hyperplane that will split the node.

Definition at line 42 of file `rp_tree_mean_split.hpp`.

Referenced by `RPTreeMeanSplit< BoundType, MatType >::AssignToLeftNode()`.

39.540.2.2 mean

```
arma::Col< ElemType> mean
```

The mean of some sampled points.

Definition at line 44 of file `rp_tree_mean_split.hpp`.

39.541 RStarTreeDescentHeuristic Class Reference

When descending a **RectangleTree** (p. 2207) to insert a point, we need to have a way to choose a child node when the point isn't enclosed by any of them.

Static Public Member Functions

- `template<typename TreeType >`
`static size_t ChooseDescentNode (const TreeType *node, const size_t point)`
Evaluate the node using a heuristic.
- `template<typename TreeType >`
`static size_t ChooseDescentNode (const TreeType *node, const TreeType *insertedNode)`

39.541.1 Detailed Description

When descending a **RectangleTree** (p. 2207) to insert a point, we need to have a way to choose a child node when the point isn't enclosed by any of them.

This heuristic is used to do so using the rules for the R* tree.

Definition at line 26 of file `r_star_tree_descent_heuristic.hpp`.

39.541.2 Member Function Documentation

39.541.2.1 ChooseDescentNode() [1/2]

```
static size_t ChooseDescentNode (  
    const TreeType * node,  
    const size_t point ) [static]
```

Evaluate the node using a heuristic.

The heuristic guarantees two things:

1. If point is contained in (or on) bound, the value returned is zero.
2. If the point is not contained in (or on) bound, the value returned is greater than zero.

Parameters

<i>bound</i>	The bound used for the node that is being evaluated.
<i>point</i>	The index of the point that is being inserted.

39.541.2.2 ChooseDescentNode() [2/2]

```
static size_t ChooseDescentNode (  
    const TreeType * node,  
    const TreeType * insertedNode ) [static]
```

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ **r_star_tree_descent_heuristic.hpp**

39.542 RStarTreeSplit Class Reference

A Rectangle Tree has new points inserted at the bottom.

Static Public Member Functions

- `template<typename TreeType >`
`static void PickLeafSplit (TreeType *tree, size_t &bestAxis, size_t &bestIndex)`
Given a node, return the best dimension and the best index to split on.
- `template<typename TreeType >`
`static size_t ReinsertPoints (TreeType *tree, std::vector< bool > &relevels)`
Reinsert any points into the tree, if needed.
- `template<typename TreeType >`
`static void SplitLeafNode (TreeType *tree, std::vector< bool > &relevels)`
Split a leaf node using the algorithm described in "The R-tree: An Efficient and Robust Access method for Points and Rectangles."*
- `template<typename TreeType >`
`static bool SplitNonLeafNode (TreeType *tree, std::vector< bool > &relevels)`
Split a non-leaf node using the "default" algorithm.

39.542.1 Detailed Description

A Rectangle Tree has new points inserted at the bottom.

When these nodes overflow, we split them, moving up the tree and splitting nodes as necessary.

Definition at line 26 of file `r_star_tree_split.hpp`.

39.542.2 Member Function Documentation

39.542.2.1 PickLeafSplit()

```
static void PickLeafSplit (
    TreeType * tree,
    size_t & bestAxis,
    size_t & bestIndex ) [static]
```

Given a node, return the best dimension and the best index to split on.

39.542.2.2 ReinsertPoints()

```
static size_t ReinsertPoints (
    TreeType * tree,
    std::vector< bool > & relevels ) [static]
```

Reinsert any points into the tree, if needed.

This returns the number of points reinserted.

39.542.2.3 SplitLeafNode()

```
static void SplitLeafNode (
    TreeType * tree,
    std::vector< bool > & relevels ) [static]
```

Split a leaf node using the algorithm described in "The R*-tree: An Efficient and Robust Access method for Points and Rectangles.

" If necessary, this split will propagate upwards through the tree.

39.542.2.4 SplitNonLeafNode()

```
static bool SplitNonLeafNode (
    TreeType * tree,
    std::vector< bool > & relevels ) [static]
```

Split a non-leaf node using the "default" algorithm.

If this is a root node, the tree increases in depth.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ **r_star_tree_split.hpp**

39.543 RTreeDescentHeuristic Class Reference

When descending a **RectangleTree** (p. 2207) to insert a point, we need to have a way to choose a child node when the point isn't enclosed by any of them.

Static Public Member Functions

- template<typename TreeType >
static size_t **ChooseDescentNode** (const TreeType *node, const size_t point)
Evaluate the node using a heuristic.
- template<typename TreeType >
static size_t **ChooseDescentNode** (const TreeType *node, const TreeType *insertedNode)
Evaluate the node using a heuristic.

39.543.1 Detailed Description

When descending a **RectangleTree** (p. 2207) to insert a point, we need to have a way to choose a child node when the point isn't enclosed by any of them.

This heuristic is used to do so.

Definition at line 26 of file r_tree_descent_heuristic.hpp.

39.543.2 Member Function Documentation

39.543.2.1 ChooseDescentNode() [1/2]

```
static size_t ChooseDescentNode (
    const TreeType * node,
    const size_t point ) [static]
```

Evaluate the node using a heuristic.

The heuristic guarantees two things:

1. If point is contained in (or on) the bound, the value returned is zero.
2. If the point is not contained in (or on) the bound, the value returned is greater than zero.

Parameters

<i>node</i>	The node that is being evaluated.
<i>point</i>	The index of the point that is being inserted.

39.543.2.2 ChooseDescentNode() [2/2]

```
static size_t ChooseDescentNode (
    const TreeType * node,
    const TreeType * insertedNode ) [static]
```

Evaluate the node using a heuristic.

The heuristic guarantees two things:

1. If point is contained in (or on) the bound, the value returned is zero.
2. If the point is not contained in (or on) the bound, the value returned is greater than zero.

Parameters

<i>node</i>	The node that is being evaluated.
<i>insertedNode</i>	The node that is being inserted.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ **r_tree_descent_heuristic.hpp**

39.544 RTreeSplit Class Reference

A Rectangle Tree has new points inserted at the bottom.

Static Public Member Functions

- template<typename TreeType >
static void **SplitLeafNode** (TreeType *tree, std::vector< bool > &relevels)
Split a leaf node using the "default" algorithm.
- template<typename TreeType >
static bool **SplitNonLeafNode** (TreeType *tree, std::vector< bool > &relevels)
Split a non-leaf node using the "default" algorithm.

39.544.1 Detailed Description

A Rectangle Tree has new points inserted at the bottom.

When these nodes overflow, we split them, moving up the tree and splitting nodes as necessary.

Definition at line 26 of file r_tree_split.hpp.

39.544.2 Member Function Documentation

39.544.2.1 SplitLeafNode()

```
static void SplitLeafNode (  
    TreeType * tree,  
    std::vector< bool > & relevels ) [static]
```

Split a leaf node using the "default" algorithm.

If necessary, this split will propagate upwards through the tree.

39.544.2.2 SplitNonLeafNode()

```
static bool SplitNonLeafNode (
    TreeType * tree,
    std::vector< bool > & relevels ) [static]
```

Split a non-leaf node using the "default" algorithm.

If this is a root node, the tree increases in depth.

The documentation for this class was generated from the following file:

39.545 SpaceSplit< MetricType, MatType > Class Template Reference

Static Public Member Functions

- static bool **GetProjVector** (const **bound::HRectBound**< MetricType > &bound, const MatType &data, const arma::Col< size_t > &points, **AxisParallelProjVector** &projVector, double &midValue)
Create a projection vector based on the given set of point.
- template<typename BoundType >
static bool **GetProjVector** (const BoundType &bound, const MatType &data, const arma::Col< size_t > &points, **ProjVector** &projVector, double &midValue)
Create a projection vector based on the given set of point.

39.545.1 Detailed Description

```
template<typename MetricType, typename MatType>
class mlpack::tree::SpaceSplit< MetricType, MatType >
```

Definition at line 23 of file space_split.hpp.

39.545.2 Member Function Documentation

39.545.2.1 GetProjVector() [1/2]

```
static bool GetProjVector (
    const bound::HRectBound< MetricType > & bound,
    const MatType & data,
    const arma::Col< size_t > & points,
    AxisParallelProjVector & projVector,
    double & midValue ) [static]
```

Create a projection vector based on the given set of point.

This special case will create an axis-parallel projection vector in the dimension that has the maximum width.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the tree.
<i>points</i>	Vector of indexes of points to be considered.
<i>projVector</i>	Resulting axis-parallel projection vector.
<i>midValue</i>	Mid value in the chosen projection.

Returns

Flag to determine if it is possible.

39.545.2.2 GetProjVector() [2/2]

```
static bool GetProjVector (
    const BoundType & bound,
    const MatType & data,
    const arma::Col< size_t > & points,
    ProjVector & projVector,
    double & midValue ) [static]
```

Create a projection vector based on the given set of point.

We efficiently estimate the farthest pair of points in the given set: p and q, and then consider the projection vector (q - p).

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the tree.
<i>points</i>	Vector of indexes of points to be considered.
<i>projVector</i>	Resulting projection vector.
<i>midValue</i>	Mid value in the chosen projection.

Returns

Flag to determine if it is possible.

39.546 SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType > Class Template Reference

A hybrid spill tree is a variant of binary space trees in which the children of a node can "spill over" each other, and contain shared datapoints.

Classes

- class **SpillDualTreeTraverser**
A generic dual-tree traverser for hybrid spill trees; see [spill_dual_tree_traverser.hpp](#) (p. 2683) for implementation.
- class **SpillSingleTreeTraverser**
A generic single-tree traverser for hybrid spill trees; see [spill_single_tree_traverser.hpp](#) (p. 2684) for implementation.

Public Types

- typedef HyperplaneType< MetricType >:: **BoundType** **BoundType**
The bound type.
- template<typename RuleType >
using **DefeatistDualTreeTraverser** = **SpillDualTreeTraverser**< RuleType, true >
A defeatist dual-tree traverser for hybrid spill trees.
- template<typename RuleType >
using **DefeatistSingleTreeTraverser** = **SpillSingleTreeTraverser**< RuleType, true >
A defeatist single-tree traverser for hybrid spill trees.
- template<typename RuleType >
using **DualTreeTraverser** = **SpillDualTreeTraverser**< RuleType, false >
A dual-tree traverser for hybrid spill trees.
- typedef MatType::elem_type **ElemType**
The type of element held in MatType.
- typedef MatType **Mat**
So other classes can use TreeType::Mat.
- template<typename RuleType >
using **SingleTreeTraverser** = **SpillSingleTreeTraverser**< RuleType, false >
A single-tree traverser for hybrid spill trees.

Public Member Functions

- **SpillTree** (const MatType &data, const double tau=0, const size_t maxLeafSize=20, const double rho=0.7)
Construct this as the root node of a hybrid spill tree using the given dataset.
- **SpillTree** (MatType &&data, const double tau=0, const size_t maxLeafSize=20, const double rho=0.7)
Construct this as the root node of a hybrid spill tree using the given dataset.
- **SpillTree** (**SpillTree** *parent, arma::Col< size_t > &points, const double tau=0, const size_t maxLeafSize=20, const double rho=0.7)
Construct this node as a child of the given parent, including the given list of points.
- **SpillTree** (const **SpillTree** &other)
Create a hybrid spill tree by copying the other tree.

- **SpillTree** (**SpillTree** &&other)

*Move constructor for a **SpillTree** (p. 2274); possess all the members of the given tree.*
- template<typename Archive >
 SpillTree (Archive &ar, const typename **std::enable_if_t**< Archive::is_loading::value > *=0)

*Initialize the tree from a **boost::serialization** (p. 251) archive.*
- **~SpillTree** ()

Deletes this node, deallocating the memory for the children and calling their destructors in turn.
- const **BoundType** & **Bound** () const

Return the bound object for this node.
- **BoundType** & **Bound** ()

Return the bound object for this node.
- void **Center** (arma::vec ¢er)

Store the center of the bounding region in the given vector.
- **SpillTree** & **Child** (const size_t child) const

Return the specified child (0 will be left, 1 will be right).
- **SpillTree** *& **ChildPtr** (const size_t child)
- const MatType & **Dataset** () const

Get the dataset which the tree is built on.
- size_t **Descendant** (const size_t index) const

Return the index (with reference to the dataset) of a particular descendant of this node.
- **ElemType** **FurthestDescendantDistance** () const

Return the furthest possible descendant distance.
- **ElemType** **FurthestPointDistance** () const

Return the furthest distance to a point held in this node.
- template<typename VecType >
 size_t **GetFurthestChild** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > *=0)

Return the index of the furthest child node to the given query point (this is an efficient estimation based on the splitting hyperplane, the node returned is not necessarily the furthest).
- size_t **GetFurthestChild** (const **SpillTree** &queryNode)

Return the index of the furthest child node to the given query node (this is an efficient estimation based on the splitting hyperplane, the node returned is not necessarily the furthest).
- template<typename VecType >
 size_t **GetNearestChild** (const VecType &point, typename **std::enable_if_t**< **IsVector**< VecType >::value > *=0)

Return the index of the nearest child node to the given query point (this is an efficient estimation based on the splitting hyperplane, the node returned is not necessarily the nearest).
- size_t **GetNearestChild** (const **SpillTree** &queryNode)

Return the index of the nearest child node to the given query node (this is an efficient estimation based on the splitting hyperplane, the node returned is not necessarily the nearest).
- const HyperplaneType< MetricType > & **Hyperplane** () const

Get the Hyperplane instance.
- bool **IsLeaf** () const

Return whether or not this node is a leaf (true if it has no children).
- **SpillTree** * **Left** () const

Gets the left child of this node.
- **SpillTree** *& **Left** ()

Modify the left child of this node.
- **ElemType** **MaxDistance** (const **SpillTree** &other) const

- Return the maximum distance to another node.*

 - `template<typename VecType >`
ElemType MaxDistance (const VecType &point, typename **std::enable_if_t< IsVector< VecType >::value >*=0**) const

Return the maximum distance to another point.
- `MetricType Metric` () const
- Get the metric that the tree uses.*

 - **ElemType MinDistance** (const **SpillTree** &other) const

Return the minimum distance to another node.
- `template<typename VecType >`
ElemType MinDistance (const VecType &point, typename **std::enable_if_t< IsVector< VecType >::value >*=0**) const
- Return the minimum distance to another point.*

 - **ElemType MinimumBoundDistance** () const

Return the minimum distance from the center of the node to any bound edge.
- `size_t NumChildren` () const
- Return the number of children in this node.*

 - `size_t NumDescendants` () const

Return the number of descendants of this node.
- `size_t NumPoints` () const
- Return the number of points in this node (0 if not a leaf).*

 - `bool Overlap` () const

Distinguish overlapping nodes from non-overlapping nodes.
- **SpillTree * Parent** () const
- Gets the parent of this node.*

 - **SpillTree *& Parent** ()

Modify the parent of this node.
- **ElemType ParentDistance** () const
- Return the distance from the center of this node to the center of the parent node.*

 - **ElemType & ParentDistance** ()

Modify the distance from the center of this node to the center of the parent node.
- `size_t Point` (const `size_t` index) const
- Return the index (with reference to the dataset) of a particular point in this node.*

 - **math::RangeType< ElemType > RangeDistance** (const **SpillTree** &other) const

Return the minimum and maximum distance to another node.
- `template<typename VecType >`
math::RangeType< ElemType > RangeDistance (const VecType &point, typename **std::enable_if_t< IsVector< VecType >::value >*=0**) const
- Return the minimum and maximum distance to another point.*

 - **SpillTree * Right** () const

Gets the right child of this node.
- **SpillTree *& Right** ()
- Modify the right child of this node.*

 - `template<typename Archive >`
void serialize (Archive &ar, const unsigned int version)

Serialize the tree.
- `const StatisticType & Stat` () const
- Return the statistic object for this node.*

 - `StatisticType & Stat` ()

Return the statistic object for this node.

Static Public Member Functions

- static bool **HasSelfChildren** ()
Returns false: this tree type does not have self children.

Protected Member Functions

- **SpillTree** ()
A default constructor.

39.546.1 Detailed Description

```
template<typename MetricType, typename StatisticType = EmptyStatistic, typename MatType = arma::mat, template< typename  
HyperplaneMetricType > class HyperplaneType = AxisOrthogonalHyperplane, template< typename SplitMetricType, typename SplitType  
MatType > class SplitType = MidpointSpaceSplit>  
class mlpack::tree::SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >
```

A hybrid spill tree is a variant of binary space trees in which the children of a node can "spill over" each other, and contain shared datapoints.

Two new separating planes lplane and rplane are defined, both of which are parallel to the original decision boundary and at a distance tau from it. The region between lplane and rplane is called "overlapping buffer".

For each node, we first split the points considering the overlapping buffer. If either of its children contains more than rho fraction of the total points we undo the overlapping splitting. Instead a conventional partition is used. In this way, we can ensure that each split reduces the number of points of a node by at least a constant factor.

This particular tree does not allow growth, so you cannot add or delete nodes from it. If you need to add or delete a node, the better procedure is to rebuild the tree entirely.

Three runtime parameters are required in the constructor:

- maxLeafSize: Max leaf size to be used.
- tau: Overlapping size.
- rho: Balance threshold.

For more information on spill trees, see

```

  pages = {825--832}  
}
```

Template Parameters

<i>MetricType</i>	The metric used for tree-building.
<i>StatisticType</i>	Extra data contained in the node. See statistic.hpp (p. 2688) for the necessary skeleton interface.
<i>MatType</i>	The dataset class.
<i>HyperplaneType</i>	The splitting hyperplane class.
<i>SplitType</i>	The class that partitions the dataset/points at a particular node into two parts. Its definition decides the way this split is done.

Definition at line 73 of file `spill_tree.hpp`.

39.546.2 Member Typedef Documentation

39.546.2.1 BoundType

```
typedef HyperplaneType<MetricType>:: BoundType BoundType
```

The bound type.

Definition at line 81 of file `spill_tree.hpp`.

39.546.2.2 DefeatistDualTreeTraverser

```
using DefeatistDualTreeTraverser = SpillDualTreeTraverser<RuleType, true>
```

A defeatist dual-tree traverser for hybrid spill trees.

Definition at line 146 of file `spill_tree.hpp`.

39.546.2.3 DefeatistSingleTreeTraverser

```
using DefeatistSingleTreeTraverser = SpillSingleTreeTraverser<RuleType, true>
```

A defeatist single-tree traverser for hybrid spill trees.

Definition at line 138 of file `spill_tree.hpp`.

39.546.2.4 **DualTreeTraverser**

```
using DualTreeTraverser = SpillDualTreeTraverser<RuleType, false>
```

A dual-tree traverser for hybrid spill trees.

Definition at line 142 of file `spill_tree.hpp`.

39.546.2.5 **ElemType**

```
typedef MatType::elem_type ElemType
```

The type of element held in `MatType`.

Definition at line 79 of file `spill_tree.hpp`.

39.546.2.6 **Mat**

```
typedef MatType Mat
```

So other classes can use `TreeType::Mat`.

Definition at line 77 of file `spill_tree.hpp`.

39.546.2.7 **SingleTreeTraverser**

```
using SingleTreeTraverser = SpillSingleTreeTraverser<RuleType, false>
```

A single-tree traverser for hybrid spill trees.

Definition at line 134 of file `spill_tree.hpp`.

39.546.3 **Constructor & Destructor Documentation**

39.546.3.1 **SpillTree()** [1/7]

```
SpillTree (  
    const MatType & data,  
    const double tau = 0,  
    const size_t maxLeafSize = 20,  
    const double rho = 0.7 )
```

Construct this as the root node of a hybrid spill tree using the given dataset.

The dataset will not be modified during the building procedure (unlike **BinarySpaceTree** (p. 1998)).

Parameters

<i>data</i>	Dataset to create tree from.
<i>tau</i>	Overlapping size.
<i>maxLeafSize</i>	Size of each leaf in the tree.
<i>rho</i>	Balance threshold.

39.546.3.2 `SpillTree()` [2/7]

```
SpillTree (
    MatType && data,
    const double tau = 0,
    const size_t maxLeafSize = 20,
    const double rho = 0.7 )
```

Construct this as the root node of a hybrid spill tree using the given dataset.

This will take ownership of the data matrix; if you don't want this, consider using the constructor that takes a const reference to a dataset.

Parameters

<i>data</i>	Dataset to create tree from.
<i>tau</i>	Overlapping size.
<i>maxLeafSize</i>	Size of each leaf in the tree.
<i>rho</i>	Balance threshold.

39.546.3.3 `SpillTree()` [3/7]

```
SpillTree (
    SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType > * parent,
    arma::Col< size_t > & points,
    const double tau = 0,
    const size_t maxLeafSize = 20,
    const double rho = 0.7 )
```

Construct this node as a child of the given parent, including the given list of points.

This is used for recursive tree-building by the other constructors which don't specify point indices.

Parameters

<i>parent</i>	Parent of this node.
---------------	----------------------

Parameters

<i>points</i>	Vector of indexes of points to be included in this node.
<i>tau</i>	Overlapping size.
<i>maxLeafSize</i>	Size of each leaf in the tree.
<i>rho</i>	Balance threshold.

39.546.3.4 SpillTree() [4 / 7]

```
SpillTree (
    const SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType > &
    other )
```

Create a hybrid spill tree by copying the other tree.

Be careful! This can take a long time and use a lot of memory.

Parameters

<i>other</i>	tree to be replicated.
--------------	------------------------

39.546.3.5 SpillTree() [5 / 7]

```
SpillTree (
    SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType > && other
)
```

Move constructor for a **SpillTree** (p. 2274); possess all the members of the given tree.

Parameters

<i>other</i>	tree to be moved.
--------------	-------------------

39.546.3.6 SpillTree() [6 / 7]

```
SpillTree (
    Archive & ar,
    const typename std::enable_if_t< Archive::is_loading::value > * = 0 )
```

Initialize the tree from a **boost::serialization** (p. 251) archive.

Parameters

<i>ar</i>	Archive to load tree from. Must be an iarchive, not an oarchive.
-----------	--

39.546.3.7 ~SpillTree()

`~ SpillTree ()`

Deletes this node, deallocating the memory for the children and calling their destructors in turn.

This will invalidate any pointers or references to any nodes which are children of this one.

39.546.3.8 SpillTree() [7/7]

`SpillTree () [protected]`

A default constructor.

This is meant to only be used with **boost::serialization** (p. 251), which is allowed with the friend declaration below. This does not return a valid tree! The method must be protected, so that the serialization shim can work with the default constructor.

Referenced by `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Center()`.

39.546.4 Member Function Documentation

39.546.4.1 Bound() [1/2]

`const BoundType& Bound () const [inline]`

Return the bound object for this node.

Definition at line 230 of file `spill_tree.hpp`.

Referenced by `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::MaxDistance()`, `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::MinDistance()`, and `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::RangeDistance()`.

39.546.4.2 Bound() [2/2]

```
BoundType& Bound ( ) [inline]
```

Return the bound object for this node.

Definition at line 232 of file spill_tree.hpp.

39.546.4.3 Center()

```
void Center (
    arma::vec & center ) [inline]
```

Store the center of the bounding region in the given vector.

Definition at line 424 of file spill_tree.hpp.

References SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::SpillTree().

39.546.4.4 Child()

```
SpillTree& Child (
    const size_t child ) const
```

Return the specified child (0 will be left, 1 will be right).

If the index is greater than 1, this will return the right child.

Parameters

<i>child</i>	Index of child to return.
--------------	---------------------------

Referenced by SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::ParentDistance().

39.546.4.5 ChildPtr()

```
SpillTree*& ChildPtr (
    const size_t child ) [inline]
```

Definition at line 343 of file spill_tree.hpp.

References SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Descendant(), SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::NumDescendants(), SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::NumPoints(), and SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Point().

39.546.4.6 Dataset()

```
const MatType& Dataset ( ) const [inline]
```

Get the dataset which the tree is built on.

Definition at line 258 of file spill_tree.hpp.

39.546.4.7 Descendant()

```
size_t Descendant (
    const size_t index ) const
```

Return the index (with reference to the dataset) of a particular descendant of this node.

The index should be greater than zero but less than the number of descendants.

Parameters

<i>index</i>	Index of the descendant.
--------------	--------------------------

Referenced by SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::ChildPtr().

39.546.4.8 FurthestDescendantDistance()

```
ElemType FurthestDescendantDistance ( ) const
```

Return the furthest possible descendant distance.

This returns the maximum distance from the centroid to the edge of the bound and not the empirical quantity which is the actual furthest descendant distance. So the actual furthest descendant distance may be less than what this method returns (but it will never be greater than this).

Referenced by SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Metric().

39.546.4.9 FurthestPointDistance()

```
ElemType FurthestPointDistance ( ) const
```

Return the furthest distance to a point held in this node.

If this is not a leaf node, then the distance is 0 because the node holds no points.

Referenced by `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Metric()`.

39.546.4.10 GetFurthestChild() [1/2]

```
size_t GetFurthestChild (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 )
```

Return the index of the furthest child node to the given query point (this is an efficient estimation based on the splitting hyperplane, the node returned is not necessarily the furthest).

If this is a leaf node, it will return **NumChildren()** (p. 2289) (invalid index).

Referenced by `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Metric()`.

39.546.4.11 GetFurthestChild() [2/2]

```
size_t GetFurthestChild (
    const SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType > &
    queryNode )
```

Return the index of the furthest child node to the given query node (this is an efficient estimation based on the splitting hyperplane, the node returned is not necessarily the furthest).

If it can't decide it will return **NumChildren()** (p. 2289) (invalid index).

39.546.4.12 GetNearestChild() [1/2]

```
size_t GetNearestChild (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 )
```

Return the index of the nearest child node to the given query point (this is an efficient estimation based on the splitting hyperplane, the node returned is not necessarily the nearest).

If this is a leaf node, it will return **NumChildren()** (p. 2289) (invalid index).

Referenced by `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Metric()`.

39.546.4.13 GetNearestChild() [2/2]

```
size_t GetNearestChild (
    const SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType > &
    queryNode )
```

Return the index of the nearest child node to the given query node (this is an efficient estimation based on the splitting hyperplane, the node returned is not necessarily the nearest).

If it can't decide it will return **NumChildren()** (p. 2289) (invalid index).

39.546.4.14 HasSelfChildren()

```
static bool HasSelfChildren ( ) [inline], [static]
```

Returns false: this tree type does not have self children.

Definition at line 421 of file spill_tree.hpp.

39.546.4.15 Hyperplane()

```
const HyperplaneType<MetricType>& Hyperplane ( ) const [inline]
```

Get the Hyperplane instance.

Definition at line 264 of file spill_tree.hpp.

39.546.4.16 IsLeaf()

```
bool IsLeaf ( ) const
```

Return whether or not this node is a leaf (true if it has no children).

Referenced by SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Stat().

39.546.4.17 Left() [1/2]

```
SpillTree* Left ( ) const [inline]
```

Gets the left child of this node.

Definition at line 243 of file spill_tree.hpp.

39.546.4.18 Left() [2/2]

```
SpillTree*& Left ( ) [inline]
```

Modify the left child of this node.

Definition at line 245 of file spill_tree.hpp.

39.546.4.19 MaxDistance() [1/2]

```
ElemType MaxDistance (
    const SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType > &
    other ) const [inline]
```

Return the maximum distance to another node.

Definition at line 382 of file spill_tree.hpp.

References `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Bound()`.

39.546.4.20 MaxDistance() [2/2]

```
ElemType MaxDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Return the maximum distance to another point.

Definition at line 404 of file spill_tree.hpp.

39.546.4.21 Metric()

```
MetricType Metric ( ) const [inline]
```

Get the metric that the tree uses.

Definition at line 267 of file spill_tree.hpp.

References `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::FurthestDescendantDistance()`, `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::FurthestPointDistance()`, `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::GetFurthestChild()`, `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::GetNearestChild()`, `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::MinimumBoundDistance()`, and `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::NumChildren()`.

39.546.4.22 MinDistance() [1/2]

```
ElemType MinDistance (
    const SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType > &
    other ) const [inline]
```

Return the minimum distance to another node.

Definition at line 376 of file spill_tree.hpp.

References SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Bound().

39.546.4.23 MinDistance() [2/2]

```
ElemType MinDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Return the minimum distance to another point.

Definition at line 395 of file spill_tree.hpp.

39.546.4.24 MinimumBoundDistance()

```
ElemType MinimumBoundDistance ( ) const
```

Return the minimum distance from the center of the node to any bound edge.

Referenced by SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Metric().

39.546.4.25 NumChildren()

```
size_t NumChildren ( ) const
```

Return the number of children in this node.

Referenced by SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Metric().

39.546.4.26 NumDescendants()

```
size_t NumDescendants ( ) const
```

Return the number of descendants of this node.

For a non-leaf spill tree, this is the number of points at the descendant leaves. For a leaf, this is the number of points in the leaf.

Referenced by `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::ChildPtr()`.

39.546.4.27 NumPoints()

```
size_t NumPoints ( ) const
```

Return the number of points in this node (0 if not a leaf).

Referenced by `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::ChildPtr()`.

39.546.4.28 Overlap()

```
bool Overlap ( ) const [inline]
```

Distinguish overlapping nodes from non-overlapping nodes.

Definition at line 261 of file `spill_tree.hpp`.

39.546.4.29 Parent() [1/2]

```
SpillTree* Parent ( ) const [inline]
```

Gets the parent of this node.

Definition at line 253 of file `spill_tree.hpp`.

39.546.4.30 Parent() [2/2]

```
SpillTree* Parent ( ) [inline]
```

Modify the parent of this node.

Definition at line 255 of file spill_tree.hpp.

39.546.4.31 ParentDistance() [1/2]

```
ElemType ParentDistance ( ) const [inline]
```

Return the distance from the center of this node to the center of the parent node.

Definition at line 330 of file spill_tree.hpp.

39.546.4.32 ParentDistance() [2/2]

```
ElemType& ParentDistance ( ) [inline]
```

Modify the distance from the center of this node to the center of the parent node.

Definition at line 333 of file spill_tree.hpp.

References SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Child().

39.546.4.33 Point()

```
size_t Point (
    const size_t index ) const
```

Return the index (with reference to the dataset) of a particular point in this node.

This will happily return invalid indices if the given index is greater than the number of points in this node (obtained with **NumPoints()** (p. 2290)) – be careful.

Parameters

<i>index</i>	Index of point for which a dataset index is wanted.
--------------	---

Referenced by `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::ChildPtr()`.

39.546.4.34 `RangeDistance()` [1/2]

```
math::RangeType< ElemType> RangeDistance (
    const SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType > &
    other ) const [inline]
```

Return the minimum and maximum distance to another node.

Definition at line 388 of file `spill_tree.hpp`.

References `SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType >::Bound()`.

39.546.4.35 `RangeDistance()` [2/2]

```
math::RangeType< ElemType> RangeDistance (
    const VecType & point,
    typename std::enable_if_t< IsVector< VecType >::value > * = 0 ) const [inline]
```

Return the minimum and maximum distance to another point.

Definition at line 414 of file `spill_tree.hpp`.

39.546.4.36 `Right()` [1/2]

```
SpillTree* Right ( ) const [inline]
```

Gets the right child of this node.

Definition at line 248 of file `spill_tree.hpp`.

39.546.4.37 `Right()` [2/2]

```
SpillTree& Right ( ) [inline]
```

Modify the right child of this node.

Definition at line 250 of file `spill_tree.hpp`.

39.546.4.38 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int version )
```

Serialize the tree.

39.546.4.39 Stat() [1/2]

```
const StatisticType& Stat ( ) const [inline]
```

Return the statistic object for this node.

Definition at line 235 of file spill_tree.hpp.

39.546.4.40 Stat() [2/2]

```
StatisticType& Stat ( ) [inline]
```

Return the statistic object for this node.

Definition at line 237 of file spill_tree.hpp.

Modify the base case associated with the last node combination.
- TreeType * **LastQueryNode** () const
Get the last query node.
- TreeType *& **LastQueryNode** ()
Modify the last query node.
- TreeType * **LastReferenceNode** () const
Get the last reference node.
- TreeType *& **LastReferenceNode** ()
Modify the last reference node.
- double **LastScore** () const
Get the score associated with the last query and reference nodes.
- double & **LastScore** ()
Modify the score associated with the last query and reference nodes.

39.549.1 Detailed Description

```
template<typename TreeType>
class mlpack::tree::TraversalInfo< TreeType >
```

The **TraversalInfo** (p. 2299) class holds traversal information which is used in dual-tree (and single-tree) traversals.

A traversal should be updating the members of this class before `Score()` is called. This class should be held as a member of the `RuleType` class and the interface to it should be through a **TraversalInfo()** (p. 2300) method.

The information held by this class is the last node combination visited before the current node combination was recursed into, and the score resulting from when `Score()` was called on that combination. However, this information is identical for a query node and a reference node in a particular node combination, so traversals only need to update the **TraversalInfo** (p. 2299) object in a query node (and the algorithms should only use the **TraversalInfo** (p. 2299) object from a query node).

In general, this auxiliary traversal information is used to try and make a prune without needing to call `BaseCase()` or calculate the distance between nodes. Using this information you can place bounds on the distance between the two nodes quickly.

If the traversal is not updating the members of this class correctly, a likely result is a null pointer dereference. Dual-tree algorithms should assume that the members are set properly and should not need to check for null pointers.

There is one exception, which is the root node combination; the score can be set to 0 and the query and reference nodes can just be set to the root nodes; no algorithm should be able to prune the root combination anyway.

Definition at line 50 of file `traversal_info.hpp`.

39.549.2 Constructor & Destructor Documentation

39.549.2.1 TraversalInfo()

```
TraversalInfo ( ) [inline]
```

39.550 TreeTraits< TreeType > Class Template Reference

The **TreeTraits** (p. 2302) class provides compile-time information on the characteristics of a given tree type.

Static Public Attributes

- static const bool **BinaryTree** = false
This is true if the tree always has only two children.
- static const bool **FirstPointIsCentroid** = false
This is true if the first point of each node is the centroid of its bound.
- static const bool **HasDuplicatedPoints** = false
This is true if a point can be included in more than one node.
- static const bool **HasOverlappingChildren** = true
This is true if the subspaces represented by the children of a node can overlap.
- static const bool **HasSelfChildren** = false
This is true if the points contained in the first child of a node (Child(0)) are also contained in that node.
- static const bool **RearrangesDataset** = false
This is true if the tree rearranges points in the dataset when it is built.
- static const bool **UniqueNumDescendants** = true
This is true if the NumDescendants() method doesn't include duplicated points.

39.550.1 Detailed Description

```
template<typename TreeType>
class mlpack::tree::TreeTraits< TreeType >
```

The **TreeTraits** (p. 2302) class provides compile-time information on the characteristics of a given tree type.

These include traits such as whether or not a node knows the distance to its parent node, or whether or not the subspaces represented by children can overlap.

These traits can be used for static compile-time optimization:

```
// This if statement will be optimized out at compile time!
if (TreeTraits<TreeType>::HasOverlappingChildren == false)
{
    // Do a simpler computation because no children overlap.
}
else
{
    // Do the full, complex calculation.
}
```

The traits can also be used in conjunction with SFINAE to write specialized versions of functions:

```
template<typename TreeType>
void Compute(TreeType& node,
             std::enable_if_t<
                 TreeTraits<TreeType>::RearrangesDataset>*)
{
    // Computation where special dataset-rearranging tree constructor is
    // called.
}

template<typename TreeType>
void Compute(TreeType& node,
             std::enable_if_t<
                 !TreeTraits<TreeType>::RearrangesDataset>*)
{
    // Computation where normal tree constructor is called.
}
```

In those two examples, the **std::enable_if_t<>** (p. 476) class takes a boolean template parameter which allows that function to be called when the boolean is true.

Each trait must be a static const value and not a function; only const values can be used as template parameters (or constexprs can be used too). By default (the unspecialized implementation of **TreeTraits** (p. 2302)), each parameter is set to make as few assumptions about the tree as possible; so, even if **TreeTraits** (p. 2302) is not specialized for a particular tree type, tree-based algorithms should still work.

When you write your own tree, you must specialize the **TreeTraits** (p. 2302) class to your tree type and set the corresponding values appropriately. See **mlpack/core/tree/binary_space_tree/traits.hpp** (p. 2622) for an example.

Definition at line 77 of file **tree_traits.hpp**.

39.550.2 Member Data Documentation

39.550.2.1 BinaryTree

```
const bool BinaryTree = false [static]
```

This is true if the tree always has only two children.

Definition at line 110 of file tree_traits.hpp.

39.550.2.2 FirstPointIsCentroid

```
const bool FirstPointIsCentroid = false [static]
```

This is true if the first point of each node is the centroid of its bound.

Definition at line 94 of file tree_traits.hpp.

39.550.2.3 HasDuplicatedPoints

```
const bool HasDuplicatedPoints = false [static]
```

This is true if a point can be included in more than one node.

Definition at line 89 of file tree_traits.hpp.

39.550.2.4 HasOverlappingChildren

```
const bool HasOverlappingChildren = true [static]
```

This is true if the subspaces represented by the children of a node can overlap.

Definition at line 84 of file tree_traits.hpp.

39.550.2.5 HasSelfChildren

```
const bool HasSelfChildren = false [static]
```

This is true if the points contained in the first child of a node (Child(0)) are also contained in that node.

Definition at line 100 of file tree_traits.hpp.

39.550.2.6 **RearrangesDataset**

```
const bool RearrangesDataset = false [static]
```

This is true if the tree rearranges points in the dataset when it is built.

Definition at line 105 of file `tree_traits.hpp`.

39.550.2.7 **UniqueNumDescendants**

```
const bool UniqueNumDescendants = true [static]
```

This is true if the `NumDescendants()` method doesn't include duplicated points.

Definition at line 116 of file `tree_traits.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/ tree_traits.hpp`

39.551 **TreeTraits**< **BinarySpaceTree**< **MetricType**, **StatisticType**, **MatType**, **bound::BallBound**, **SplitType** > > Class Template Reference

This is a specialization of the `TreeType` class to the `BallTree` tree type.

Static Public Attributes

- static const bool **BinaryTree** = true
- static const bool **FirstPointIsCentroid** = false
- static const bool **HasDuplicatedPoints** = false
- static const bool **HasOverlappingChildren** = true
- static const bool **HasSelfChildren** = false
- static const bool **RearrangesDataset** = true
- static const bool **UniqueNumDescendants** = true

39.551.1 Detailed Description

```
template<typename MetricType, typename StatisticType, typename MatType, template< typename SplitBoundType, typename SplitType>
class SplitType> class SplitType>
class mlpack::tree::TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, bound::BallBound, SplitType > >
```

This is a specialization of the `TreeType` class to the `BallTree` tree type.

The only difference with general **BinarySpaceTree** (p. 1998) is that `BallTree` can have overlapping children. See `mlpack/core/tree/tree_traits.hpp` (p. 2690) for more information.

39.553 TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, bound::HollowBallBound, SplitType > > Class Template Reference ↩

This is a specialization of the `TreeType` class to an arbitrary tree with `HollowBallBound` (currently only the vantage point tree is supported).

Static Public Attributes

- static const bool **BinaryTree** = true
- static const bool **FirstPointIsCentroid** = false
- static const bool **HasDuplicatedPoints** = false
- static const bool **HasOverlappingChildren** = true
- static const bool **HasSelfChildren** = false
- static const bool **RearrangesDataset** = true
- static const bool **UniqueNumDescendants** = true

39.553.1 Detailed Description

```
template<typename MetricType, typename StatisticType, typename MatType, template< typename SplitBoundType, typename Split↩  
MatType > class SplitType>  
class mlpack::tree::TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, bound::HollowBallBound, SplitType > >
```

This is a specialization of the `TreeType` class to an arbitrary tree with `HollowBallBound` (currently only the vantage point tree is supported).

The only difference with general **BinarySpaceTree** (p. 1998) is that the tree can have overlapping children.

Definition at line 211 of file traits.hpp.

39.553.2 Member Data Documentation

39.553.2.1 BinaryTree

```
const bool BinaryTree = true [static]
```

Definition at line 220 of file traits.hpp.

39.553.2.2 FirstPointIsCentroid

```
const bool FirstPointIsCentroid = false [static]
```

Definition at line 217 of file traits.hpp.

39.553.2.3 HasDuplicatedPoints

```
const bool HasDuplicatedPoints = false [static]
```

Definition at line 216 of file traits.hpp.

39.553.2.4 HasOverlappingChildren

```
const bool HasOverlappingChildren = true [static]
```

Definition at line 215 of file traits.hpp.

39.553.2.5 HasSelfChildren

```
const bool HasSelfChildren = false [static]
```

Definition at line 218 of file traits.hpp.

39.553.2.6 RearrangesDataset

```
const bool RearrangesDataset = true [static]
```

Definition at line 219 of file traits.hpp.

39.553.2.7 UniqueNumDescendants

```
const bool UniqueNumDescendants = true [static]
```

Definition at line 221 of file traits.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/ **traits.hpp**

39.554 TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, RPTreeMaxSplit > > Class Template Reference

This is a specialization of the TreeType class to the max-split random projection tree.

Static Public Attributes

- static const bool **BinaryTree** = true
This is always a binary tree.
- static const bool **FirstPointIsCentroid** = false
There is no guarantee that the first point in a node is its centroid.
- static const bool **HasDuplicatedPoints** = false
The tree has not got duplicated points.
- static const bool **HasOverlappingChildren** = true
Children of a random projection tree node may overlap.
- static const bool **HasSelfChildren** = false
Points are not contained at multiple levels of the binary space tree.
- static const bool **RearrangesDataset** = true
Points are rearranged during building of the tree.
- static const bool **UniqueNumDescendants** = true
Binary space trees don't have duplicated points, so NumDescendants() represents the number of unique descendant points.

39.554.1 Detailed Description

```
template<typename MetricType, typename StatisticType, typename MatType, template< typename BoundMetricType, typename... >
class BoundType>
class mlpack::tree::TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, RPTreeMaxSplit > >
```

This is a specialization of the `TreeType` class to the max-split random projection tree.

The only difference with general **BinarySpaceTree** (p. 1998) is that the tree can have overlapping children.

Definition at line 85 of file `traits.hpp`.

39.554.2 Member Data Documentation

39.554.2.1 BinaryTree

```
const bool BinaryTree = true [static]
```

This is always a binary tree.

Definition at line 117 of file `traits.hpp`.

39.554.2.2 FirstPointIsCentroid

```
const bool FirstPointIsCentroid = false [static]
```

There is no guarantee that the first point in a node is its centroid.

Definition at line 102 of file `traits.hpp`.

39.554.2.3 HasDuplicatedPoints

```
const bool HasDuplicatedPoints = false [static]
```

The tree has not got duplicated points.

Definition at line 97 of file `traits.hpp`.

39.554.2.4 HasOverlappingChildren

```
const bool HasOverlappingChildren = true [static]
```

Children of a random projection tree node may overlap.

Definition at line 92 of file traits.hpp.

39.554.2.5 HasSelfChildren

```
const bool HasSelfChildren = false [static]
```

Points are not contained at multiple levels of the binary space tree.

Definition at line 107 of file traits.hpp.

39.554.2.6 RearrangesDataset

```
const bool RearrangesDataset = true [static]
```

Points are rearranged during building of the tree.

Definition at line 112 of file traits.hpp.

39.554.2.7 UniqueNumDescendants

```
const bool UniqueNumDescendants = true [static]
```

Binary space trees don't have duplicated points, so NumDescendants() represents the number of unique descendant points.

Definition at line 123 of file traits.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/ **traits.hpp**

39.555 TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, RPTreeMeanSplit > > Class Template Reference

This is a specialization of the TreeType class to the mean-split random projection tree.

Static Public Attributes

- static const bool **BinaryTree** = true
This is always a binary tree.
- static const bool **FirstPointIsCentroid** = false
There is no guarantee that the first point in a node is its centroid.
- static const bool **HasDuplicatedPoints** = false
The tree has not got duplicated points.
- static const bool **HasOverlappingChildren** = true
Children of a random projection tree node may overlap.
- static const bool **HasSelfChildren** = false
Points are not contained at multiple levels of the binary space tree.
- static const bool **RearrangesDataset** = true
Points are rearranged during building of the tree.
- static const bool **UniqueNumDescendants** = true
Binary space trees don't have duplicated points, so NumDescendants() represents the number of unique descendant points.

39.555.1 Detailed Description

```
template<typename MetricType, typename StatisticType, typename MatType, template< typename BoundMetricType, typename... >
class BoundType>
class mlpack::tree::TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, RPTreeMeanSplit > >
```

This is a specialization of the `TreeType` class to the mean-split random projection tree.

The only difference with general **BinarySpaceTree** (p. 1998) is that the tree can have overlapping children.

Definition at line 135 of file `traits.hpp`.

39.555.2 Member Data Documentation

39.555.2.1 BinaryTree

```
const bool BinaryTree = true [static]
```

This is always a binary tree.

Definition at line 167 of file `traits.hpp`.

39.555.2.2 FirstPointIsCentroid

```
const bool FirstPointIsCentroid = false [static]
```

There is no guarantee that the first point in a node is its centroid.

Definition at line 152 of file traits.hpp.

39.555.2.3 HasDuplicatedPoints

```
const bool HasDuplicatedPoints = false [static]
```

The tree has not got duplicated points.

Definition at line 147 of file traits.hpp.

39.555.2.4 HasOverlappingChildren

```
const bool HasOverlappingChildren = true [static]
```

Children of a random projection tree node may overlap.

Definition at line 142 of file traits.hpp.

39.555.2.5 HasSelfChildren

```
const bool HasSelfChildren = false [static]
```

Points are not contained at multiple levels of the binary space tree.

Definition at line 157 of file traits.hpp.

39.555.2.6 RearrangesDataset

```
const bool RearrangesDataset = true [static]
```

Points are rearranged during building of the tree.

Definition at line 162 of file traits.hpp.

39.555.2.7 UniqueNumDescendants

```
const bool UniqueNumDescendants = true [static]
```

Binary space trees don't have duplicated points, so NumDescendants() represents the number of unique descendant points.

Definition at line 173 of file traits.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/ **traits.hpp**

39.556 TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > > Class Template Reference

This is a specialization of the **TreeTraits** (p. 2302) class to the **BinarySpaceTree** (p. 1998) tree type.

Static Public Attributes

- static const bool **BinaryTree** = true
This is always a binary tree.
- static const bool **FirstPointIsCentroid** = false
There is no guarantee that the first point in a node is its centroid.
- static const bool **HasDuplicatedPoints** = false
Each binary space tree node doesn't share points with any other node.
- static const bool **HasOverlappingChildren** = false
Each binary space tree node has two children which represent non-overlapping subsets of the space which the node represents.
- static const bool **HasSelfChildren** = false
Points are not contained at multiple levels of the binary space tree.
- static const bool **RearrangesDataset** = true
Points are rearranged during building of the tree.
- static const bool **UniqueNumDescendants** = true
Binary space trees don't have duplicated points, so NumDescendants() represents the number of unique descendant points.

39.556.1 Detailed Description

```
template<typename MetricType, typename StatisticType, typename MatType, template< typename BoundMetricType, typename... >
class BoundType, template< typename SplitBoundType, typename SplitMatType > class SplitType>
class mlpack::tree::TreeTraits< BinarySpaceTree< MetricType, StatisticType, MatType, BoundType, SplitType > >
```

This is a specialization of the **TreeTraits** (p. 2302) class to the **BinarySpaceTree** (p. 1998) tree type.

It defines characteristics of the binary space tree, and is used to help write tree-independent (but still optimized) tree-based algorithms. See **mlpack/core/tree/tree_traits.hpp** (p. 2690) for more information.

Definition at line 33 of file traits.hpp.

39.556.2 Member Data Documentation

39.556.2.1 BinaryTree

```
const bool BinaryTree = true [static]
```

This is always a binary tree.

Definition at line 67 of file traits.hpp.

39.556.2.2 FirstPointIsCentroid

```
const bool FirstPointIsCentroid = false [static]
```

There is no guarantee that the first point in a node is its centroid.

Definition at line 52 of file traits.hpp.

39.556.2.3 HasDuplicatedPoints

```
const bool HasDuplicatedPoints = false [static]
```

Each binary space tree node doesn't share points with any other node.

Definition at line 47 of file traits.hpp.

39.556.2.4 HasOverlappingChildren

```
const bool HasOverlappingChildren = false [static]
```

Each binary space tree node has two children which represent non-overlapping subsets of the space which the node represents.

Therefore, children are not overlapping.

Definition at line 42 of file traits.hpp.

39.556.2.5 HasSelfChildren

```
const bool HasSelfChildren = false [static]
```

Points are not contained at multiple levels of the binary space tree.

Definition at line 57 of file traits.hpp.

39.556.2.6 RearrangesDataset

```
const bool RearrangesDataset = true [static]
```

Points are rearranged during building of the tree.

Definition at line 62 of file traits.hpp.

39.556.2.7 UniqueNumDescendants

```
const bool UniqueNumDescendants = true [static]
```

Binary space trees don't have duplicated points, so NumDescendants() represents the number of unique descendant points.

Definition at line 73 of file traits.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/ **traits.hpp**

39.557 TreeTraits< CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > > Class Template Reference

The specialization of the **TreeTraits** (p. 2302) class for the **CoverTree** (p. 2040) tree type.

Static Public Attributes

- static const bool **BinaryTree** = false
The cover tree is not necessarily a binary tree.
- static const bool **FirstPointIsCentroid** = true
Each cover tree node contains only one point, and that point is its centroid.
- static const bool **HasDuplicatedPoints** = true
Cover trees do have self-children, so points can be included in more than one node.
- static const bool **HasOverlappingChildren** = true
The cover tree (or, this implementation of it) does not require that children represent non-overlapping subsets of the parent node.
- static const bool **HasSelfChildren** = true
Cover trees do have self-children.
- static const bool **RearrangesDataset** = false
Points are not rearranged when the tree is built.
- static const bool **UniqueNumDescendants** = true
NumDescendants() represents the number of unique descendant points.

39.557.1 Detailed Description

```
template<typename MetricType, typename StatisticType, typename MatType, typename RootPointPolicy>
class mlpack::tree::TreeTraits< CoverTree< MetricType, StatisticType, MatType, RootPointPolicy > >
```

The specialization of the **TreeTraits** (p. 2302) class for the **CoverTree** (p. 2040) tree type.

It defines characteristics of the cover tree, and is used to help write tree-independent (but still optimized) tree-based algorithms. See **mlpack/core/tree/tree_traits.hpp** (p. 2690) for more information.

Definition at line 31 of file traits.hpp.

39.557.2 Member Data Documentation

39.557.2.1 BinaryTree

```
const bool BinaryTree = false [static]
```

The cover tree is not necessarily a binary tree.

Definition at line 65 of file traits.hpp.

39.557.2.2 FirstPointIsCentroid

```
const bool FirstPointIsCentroid = true [static]
```

Each cover tree node contains only one point, and that point is its centroid.

Definition at line 50 of file traits.hpp.

39.557.2.3 HasDuplicatedPoints

```
const bool HasDuplicatedPoints = true [static]
```

Cover trees do have self-children, so points can be included in more than one node.

Definition at line 44 of file traits.hpp.

39.557.2.4 HasOverlappingChildren

```
const bool HasOverlappingChildren = true [static]
```

The cover tree (or, this implementation of it) does not require that children represent non-overlapping subsets of the parent node.

Definition at line 38 of file traits.hpp.

39.557.2.5 HasSelfChildren

```
const bool HasSelfChildren = true [static]
```

Cover trees do have self-children.

Definition at line 55 of file traits.hpp.

39.557.2.6 RearrangesDataset

```
const bool RearrangesDataset = false [static]
```

Points are not rearranged when the tree is built.

Definition at line 60 of file traits.hpp.

39.557.2.7 UniqueNumDescendants

```
const bool UniqueNumDescendants = true [static]
```

NumDescendants() represents the number of unique descendant points.

Definition at line 70 of file traits.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/cover_tree/ **traits.hpp**

39.558 TreeTraits< Octree< MetricType, StatisticType, MatType > > Class Template Reference

This is a specialization of the **TreeTraits** (p. 2302) class to the **Octree** (p. 2167) tree type.

Static Public Attributes

- static const bool **BinaryTree** = false
This is not necessarily a binary tree.
- static const bool **FirstPointIsCentroid** = false
There is no guarantee that the first point in a node is its centroid.
- static const bool **HasDuplicatedPoints** = false
Points are not shared across nodes in the octree.
- static const bool **HasOverlappingChildren** = false
No octree nodes will overlap.
- static const bool **HasSelfChildren** = false
Points are not contained at multiple levels of the octree.
- static const bool **RearrangesDataset** = true
Points are rearranged during building of the tree.
- static const bool **UniqueNumDescendants** = true
NumDescendants() represents the number of unique descendant points.

39.558.1 Detailed Description

```
template<typename MetricType, typename StatisticType, typename MatType>
class mlpack::tree::TreeTraits< Octree< MetricType, StatisticType, MatType > >
```

This is a specialization of the **TreeTraits** (p. 2302) class to the **Octree** (p. 2167) tree type.

It defines characteristics of the octree, and is used to help write tree-independent (but still optimized) tree-based algorithms. See **mlpack/core/tree/tree_traits.hpp** (p. 2690) for more information.

Definition at line 29 of file traits.hpp.

39.558.2 Member Data Documentation

39.558.2.1 BinaryTree

```
const bool BinaryTree = false [static]
```

This is not necessarily a binary tree.

Definition at line 60 of file traits.hpp.

39.558.2.2 FirstPointIsCentroid

```
const bool FirstPointIsCentroid = false [static]
```

There is no guarantee that the first point in a node is its centroid.

Definition at line 45 of file traits.hpp.

39.558.2.3 HasDuplicatedPoints

```
const bool HasDuplicatedPoints = false [static]
```

Points are not shared across nodes in the octree.

Definition at line 40 of file traits.hpp.

39.558.2.4 HasOverlappingChildren

```
const bool HasOverlappingChildren = false [static]
```

No octree nodes will overlap.

Definition at line 35 of file traits.hpp.

39.558.2.5 HasSelfChildren

```
const bool HasSelfChildren = false [static]
```

Points are not contained at multiple levels of the octree.

Definition at line 50 of file traits.hpp.

39.558.2.6 RearrangesDataset

```
const bool RearrangesDataset = true [static]
```

Points are rearranged during building of the tree.

Definition at line 55 of file traits.hpp.

39.558.2.7 UniqueNumDescendants

```
const bool UniqueNumDescendants = true [static]
```

NumDescendants() represents the number of unique descendant points.

Definition at line 65 of file traits.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/octree/ **traits.hpp**

39.559 TreeTraits< RectangleTree< MetricType, StatisticType, MatType, RPlusTreeSplit< SplitPolicyType, SweepType >, DescentType, AuxiliaryInformationType > > Class Template Reference

Since the R+/R++ tree can not have overlapping children, we should define traits for the R+/R++ tree.

Static Public Attributes

- static const bool **BinaryTree** = false
This tree is not necessarily a binary tree.
- static const bool **FirstPointIsCentroid** = false
There is no guarantee that the first point in a node is its centroid.
- static const bool **HasDuplicatedPoints** = false
An R-tree node doesn't share points with another node.
- static const bool **HasOverlappingChildren** = false
The R+/R++ tree can't have overlapping children.
- static const bool **HasSelfChildren** = false
Points are not contained at multiple levels of the R-tree.
- static const bool **RearrangesDataset** = false
Points are rearranged during building of the tree.
- static const bool **UniqueNumDescendants** = true
Rectangle trees don't have duplicated points, so NumDescendants() represents the number of unique descendant points.

39.559.1 Detailed Description

```
template<typename MetricType, typename StatisticType, typename MatType, typename SplitPolicyType, template< typename > class
SweepType, typename DescentType, template< typename > class AuxiliaryInformationType>
class mpack::tree::TreeTraits< RectangleTree< MetricType, StatisticType, MatType, RPlusTreeSplit< SplitPolicyType, SweepType >,
DescentType, AuxiliaryInformationType > >
```

Since the R+/R++ tree can not have overlapping children, we should define traits for the R+/R++ tree.

Definition at line 86 of file traits.hpp.

39.559.2 Member Data Documentation

39.559.2.1 BinaryTree

```
const bool BinaryTree = false [static]
```

This tree is not necessarily a binary tree.

Definition at line 125 of file traits.hpp.

39.559.2.2 FirstPointIsCentroid

```
const bool FirstPointIsCentroid = false [static]
```

There is no guarantee that the first point in a node is its centroid.

Definition at line 108 of file traits.hpp.

39.559.2.3 HasDuplicatedPoints

```
const bool HasDuplicatedPoints = false [static]
```

An R-tree node doesn't share points with another node.

Definition at line 103 of file traits.hpp.

39.559.2.4 HasOverlappingChildren

```
const bool HasOverlappingChildren = false [static]
```

The R+/R++ tree can't have overlapping children.

Definition at line 98 of file traits.hpp.

39.559.2.5 HasSelfChildren

```
const bool HasSelfChildren = false [static]
```

Points are not contained at multiple levels of the R-tree.

Definition at line 113 of file traits.hpp.

39.559.2.6 RearrangesDataset

```
const bool RearrangesDataset = false [static]
```

Points are rearranged during building of the tree.

THIS MAY NOT BE TRUE. IT'S HARD TO DYNAMICALLY INSERT POINTS AND REARRANGE THE MATRIX

Definition at line 120 of file traits.hpp.

39.559.2.7 UniqueNumDescendants

```
const bool UniqueNumDescendants = true [static]
```

Rectangle trees don't have duplicated points, so NumDescendants() represents the number of unique descendant points.

Definition at line 131 of file traits.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ **traits.hpp**

39.560 TreeTraits< RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType > > Class Template Reference

This is a specialization of the TreeType class to the **RectangleTree** (p. 2207) tree type.

Static Public Attributes

- static const bool **BinaryTree** = false
This tree is not necessarily a binary tree.
- static const bool **FirstPointIsCentroid** = false
There is no guarantee that the first point in a node is its centroid.
- static const bool **HasDuplicatedPoints** = false
An R-tree node doesn't share points with another node.
- static const bool **HasOverlappingChildren** = true
An R-tree can have overlapping children.
- static const bool **HasSelfChildren** = false
Points are not contained at multiple levels of the R-tree.
- static const bool **RearrangesDataset** = false
Points are rearranged during building of the tree.
- static const bool **UniqueNumDescendants** = true
Rectangle trees don't have duplicated points, so NumDescendants() represents the number of unique descendant points.

39.560.1 Detailed Description

```
template<typename MetricType, typename StatisticType, typename MatType, typename SplitType, typename DescentType, template<
typename > class AuxiliaryInformationType>
class mlpack::tree::TreeTraits< RectangleTree< MetricType, StatisticType, MatType, SplitType, DescentType, AuxiliaryInformationType
> >
```

This is a specialization of the TreeType class to the **RectangleTree** (p. 2207) tree type.

It defines characteristics of the rectangle type trees, and is used to help write tree-independent (but still optimized) tree-based algorithms. See **mlpack/core/tree/tree_traits.hpp** (p. 2690) for more information.

Definition at line 32 of file traits.hpp.

39.560.2 Member Data Documentation

39.560.2.1 BinaryTree

```
const bool BinaryTree = false [static]
```

This tree is not necessarily a binary tree.

Definition at line 66 of file traits.hpp.

39.560.2.2 FirstPointIsCentroid

```
const bool FirstPointIsCentroid = false [static]
```

There is no guarantee that the first point in a node is its centroid.

Definition at line 49 of file traits.hpp.

39.560.2.3 HasDuplicatedPoints

```
const bool HasDuplicatedPoints = false [static]
```

An R-tree node doesn't share points with another node.

Definition at line 44 of file traits.hpp.

39.560.2.4 HasOverlappingChildren

```
const bool HasOverlappingChildren = true [static]
```

An R-tree can have overlapping children.

Definition at line 39 of file traits.hpp.

39.560.2.5 HasSelfChildren

```
const bool HasSelfChildren = false [static]
```

Points are not contained at multiple levels of the R-tree.

Definition at line 54 of file traits.hpp.

39.560.2.6 RearrangesDataset

```
const bool RearrangesDataset = false [static]
```

Points are rearranged during building of the tree.

THIS MAY NOT BE TRUE. IT'S HARD TO DYNAMICALLY INSERT POINTS AND REARRANGE THE MATRIX

Definition at line 61 of file traits.hpp.

39.560.2.7 UniqueNumDescendants

```
const bool UniqueNumDescendants = true [static]
```

Rectangle trees don't have duplicated points, so NumDescendants() represents the number of unique descendant points.

Definition at line 72 of file traits.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ **traits.hpp**

39.561 TreeTraits< SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType > > Class Template Reference

This is a specialization of the TreeType class to the **SpillTree** (p. 2274) tree type.

Static Public Attributes

- static const bool **BinaryTree** = true
This is always a binary tree.
- static const bool **FirstPointIsCentroid** = false
There is no guarantee that the first point in a node is its centroid.
- static const bool **HasOverlappingChildren** = true
Each spill tree node has two children which can share points.
- static const bool **HasSelfChildren** = false
Points are not contained at multiple levels of the spill tree.
- static const bool **RearrangesDataset** = false
Points are not rearranged during building of the tree.
- static const bool **UniqueNumDescendants** = false
Spill trees have duplicated points, so NumDescendants() could count a given point twice.

39.561.1 Detailed Description

```
template<typename MetricType, typename StatisticType, typename MatType, template< typename HyperplaneMetricType > class
HyperplaneType, template< typename SplitMetricType, typename SplitMatType > class SplitType>
class mpack::tree::TreeTraits< SpillTree< MetricType, StatisticType, MatType, HyperplaneType, SplitType > >
```

This is a specialization of the TreeType class to the **SpillTree** (p. 2274) tree type.

It defines characteristics of the spill tree, and is used to help write tree-independent (but still optimized) tree-based algorithms. See **mlpack/core/tree/tree_traits.hpp** (p. 2690) for more information.

Definition at line 33 of file traits.hpp.

39.561.2 Member Data Documentation

39.561.2.1 BinaryTree

```
const bool BinaryTree = true [static]
```

This is always a binary tree.

Definition at line 61 of file traits.hpp.

39.561.2.2 FirstPointIsCentroid

```
const bool FirstPointIsCentroid = false [static]
```

There is no guarantee that the first point in a node is its centroid.

Definition at line 46 of file traits.hpp.

39.561.2.3 HasOverlappingChildren

```
const bool HasOverlappingChildren = true [static]
```

Each spill tree node has two children which can share points.

Therefore, children can be overlapping.

Definition at line 41 of file traits.hpp.

39.561.2.4 HasSelfChildren

```
const bool HasSelfChildren = false [static]
```

Points are not contained at multiple levels of the spill tree.

Definition at line 51 of file traits.hpp.

39.561.2.5 RearrangesDataset

```
const bool RearrangesDataset = false [static]
```

Points are not rearranged during building of the tree.

Definition at line 56 of file traits.hpp.

39.561.2.6 UniqueNumDescendants

```
const bool UniqueNumDescendants = false [static]
```

Spill trees have duplicated points, so NumDescendants() could count a given point twice.

Definition at line 67 of file traits.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/spill_tree/ **traits.hpp**

39.562 UBTreeSplit< **BoundType**, **MatType** > **Class Template Reference**

Split a node into two parts according to the median address of points contained in the node.

39.562.1 Detailed Description

```
template<typename BoundType, typename MatType = arma::mat>
class mlpack::tree::UBTreeSplit< BoundType, MatType >
```

Split a node into two parts according to the median address of points contained in the node.

The class reorders the dataset such that points with lower addresses belong to the left subtree and points with high addresses belong to the right subtree.

Definition at line 29 of file ub_tree_split.hpp.

The documentation for this class was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/ **ub_tree_split.hpp**

39.563 VantagePointSplit< **BoundType**, **MatType**, **MaxNumSamples** > **Class Template Reference**

The class splits a binary space partitioning tree node according to the median distance to the vantage point.

Classes

- struct **SplitInfo**
A struct that contains an information about the split.

Public Types

- typedef MatType::elem_type **ElemType**
The matrix element type.
- typedef BoundType::MetricType **MetricType**
The bounding shape type.

Static Public Member Functions

- template<typename VecType >
static bool **AssignToLeftNode** (const VecType &point, const **SplitInfo** &splitInfo)
Indicates that a point should be assigned to the left subtree.
- static size_t **PerformSplit** (MatType &data, const size_t begin, const size_t count, const **SplitInfo** &splitInfo)
Perform the split process according to the information about the split.
- static size_t **PerformSplit** (MatType &data, const size_t begin, const size_t count, const **SplitInfo** &splitInfo, std::vector< size_t > &oldFromNew)
Perform the split process according to the information about the split and return the list of changed indices.
- static bool **SplitNode** (const BoundType &bound, MatType &data, const size_t begin, const size_t count, **SplitInfo** &splitInfo)
Split the node according to the distance to a vantage point.

39.563.1 Detailed Description

```
template<typename BoundType, typename MatType = arma::mat, size_t MaxNumSamples = 100>
class mlpack::tree::VantagePointSplit< BoundType, MatType, MaxNumSamples >
```

The class splits a binary space partitioning tree node according to the median distance to the vantage point.

Thus points that are closer to the vantage point belong to the left subtree and points that are farther from the vantage point belong to the right subtree.

Definition at line 32 of file vantage_point_split.hpp.

39.563.2 Member Typedef Documentation

39.563.2.1 ElemType

```
typedef MatType::elem_type ElemType
```

The matrix element type.

Definition at line 36 of file vantage_point_split.hpp.

39.563.2.2 MetricType

```
typedef BoundType::MetricType MetricType
```

The bounding shape type.

Definition at line 38 of file `vantage_point_split.hpp`.

39.563.3 Member Function Documentation

39.563.3.1 AssignToLeftNode()

```
static bool AssignToLeftNode (
    const VecType & point,
    const SplitInfo & splitInfo ) [inline], [static]
```

Indicates that a point should be assigned to the left subtree.

This method returns true if a point should be assigned to the left subtree, i.e., if the distance from the point to the vantage point is less then the median value. Otherwise it returns false.

Parameters

<i>point</i>	The point that is being assigned.
<i>splitInfo</i>	An information about the split.

Definition at line 138 of file `vantage_point_split.hpp`.

References `VantagePointSplit< BoundType, MatType, MaxNumSamples >::SplitInfo::metric`, `VantagePointSplit< BoundType, MatType, MaxNumSamples >::SplitInfo::mu`, and `VantagePointSplit< BoundType, MatType, MaxNumSamples >::SplitInfo::vantagePoint`.

39.563.3.2 PerformSplit() [1/2]

```
static size_t PerformSplit (
    MatType & data,
    const size_t begin,
    const size_t count,
    const SplitInfo & splitInfo ) [inline], [static]
```

Perform the split process according to the information about the split.

This will order the dataset such that points that belong to the left subtree are on the left of the split column, and points from the right subtree are on the right side of the split column.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	The information about the split.

Definition at line 93 of file `vantage_point_split.hpp`.

39.563.3.3 PerformSplit() [2/2]

```
static size_t PerformSplit (
    MatType & data,
    const size_t begin,
    const size_t count,
    const SplitInfo & splitInfo,
    std::vector< size_t > & oldFromNew ) [inline], [static]
```

Perform the split process according to the information about the split and return the list of changed indices.

This will order the dataset such that points that belong to the left subtree are on the left of the split column, and points from the right subtree are on the right side of the split column.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	The information about the split.
<i>oldFromNew</i>	Vector which will be filled with the old positions for each new point.

Definition at line 118 of file `vantage_point_split.hpp`.

39.563.3.4 SplitNode()

```
static bool SplitNode (
    const BoundType & bound,
    MatType & data,
    const size_t begin,
```

```
const size_t count,  
    SplitInfo & splitInfo ) [static]
```

Split the node according to the distance to a vantage point.

Parameters

<i>bound</i>	The bound used for this node.
<i>data</i>	The dataset used by the binary space tree.
<i>begin</i>	Index of the starting point in the dataset that belongs to this node.
<i>count</i>	Number of points in this node.
<i>splitInfo</i>	An information about the split. This information contains the vantage point and the median distance to the vantage point.

Referenced by `VantagePointSplit< BoundType, MatType, MaxNumSamples >::SplitInfo::SplitInfo()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/ vantage_point_split.hpp`

39.564 VantagePointSplit< BoundType, MatType, MaxNumSamples >::SplitInfo Struct Reference

A struct that contains an information about the split.

Public Member Functions

- **SplitInfo** ()
- `template<typename VecType >`
SplitInfo (const **MetricType** & **metric**, const VecType & **vantagePoint**, **ElemType** **mu**)

Public Attributes

- const **MetricType** * **metric**
An instance of the MetricType class.
- **ElemType** **mu**
The median distance according to which the node will be split.
- `arma::Col< ElemType >` **vantagePoint**
The vantage point.

39.564.1 Detailed Description

```
template<typename BoundType, typename MatType = arma::mat, size_t MaxNumSamples = 100>
struct mlpack::tree::VantagePointSplit< BoundType, MatType, MaxNumSamples >::SplitInfo
```

A struct that contains an information about the split.

Definition at line 40 of file `vantage_point_split.hpp`.

39.564.2 Constructor & Destructor Documentation

39.564.2.1 SplitInfo() [1/2]

```
SplitInfo ( ) [inline]
```

Definition at line 49 of file vantage_point_split.hpp.

39.564.2.2 SplitInfo() [2/2]

```
SplitInfo (
    const MetricType & metric,
    const VecType & vantagePoint,
    ElemType mu ) [inline]
```

Definition at line 55 of file vantage_point_split.hpp.

References VantagePointSplit< BoundType, MatType, MaxNumSamples >::SplitNode().

39.564.3 Member Data Documentation

39.564.3.1 metric

```
const MetricType* metric
```

An instance of the MetricType class.

Definition at line 47 of file vantage_point_split.hpp.

Referenced by VantagePointSplit< BoundType, MatType, MaxNumSamples >::AssignToLeftNode().

39.564.3.2 mu

```
ElemType mu
```

The median distance according to which the node will be split.

Definition at line 45 of file vantage_point_split.hpp.

Referenced by VantagePointSplit< BoundType, MatType, MaxNumSamples >::AssignToLeftNode().

39.564.3.3 vantagePoint

```
arma::Col< ElemType> vantagePoint
```

The vantage point.

Definition at line 43 of file vantage_point_split.hpp.

Referenced by VantagePointSplit< BoundType, MatType, MaxNumSamples >::AssignToLeftNode().

The documentation for this struct was generated from the following file:

- /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/ **vantage_point_split.hpp**

39.565 XTreeAuxiliaryInformation< TreeType > Class Template Reference

The **XTreeAuxiliaryInformation** (p. 2338) class provides information specific to X trees for each node in a **Rectangle**↩
Tree (p. 2207).

Classes

- struct **SplitHistoryStruct**
The X tree requires that the tree records it's "split history".

Public Types

- typedef struct **mlpack::tree::XTreeAuxiliaryInformation::SplitHistoryStruct** **SplitHistoryStruct**
The X tree requires that the tree records it's "split history".

Public Member Functions

- **XTreeAuxiliaryInformation** ()
Default constructor.
- **XTreeAuxiliaryInformation** (const TreeType *node)
Construct this with the specified node.
- **XTreeAuxiliaryInformation** (const **XTreeAuxiliaryInformation** &other, TreeType *=NULL, bool=true)
Create an auxiliary information object by copying from another object.
- **XTreeAuxiliaryInformation** (**XTreeAuxiliaryInformation** &&other)
Create an auxiliary information object by moving from the other node.
- bool **HandleNodeInsertion** (TreeType *, TreeType *, bool)
Some tree types require to save some properties at the insertion process.
- bool **HandleNodeRemoval** (TreeType *, const size_t)
Some tree types require to save some properties at the deletion process.
- bool **HandlePointDeletion** (TreeType *, const size_t)

Some tree types require to save some properties at the deletion process.

- bool **HandlePointInsertion** (TreeType *, const size_t)

Some tree types require to save some properties at the insertion process.

- size_t **NormalNodeMaxNumChildren** () const

Return the maximum number of a normal node's children.

- size_t & **NormalNodeMaxNumChildren** ()

Modify the maximum number of a normal node's children.

- void **NullifyData** ()

Nullify the auxiliary information in order to prevent an invalid free.

- **XTreeAuxiliaryInformation** & **operator=** (const **XTreeAuxiliaryInformation** &other)

Copy the auxiliary information object.

- template<typename Archive >

void **serialize** (Archive &ar, const unsigned int)

Serialize the information.

- const **SplitHistoryStruct** & **SplitHistory** () const

Return the split history of the node associated with this object.

- **SplitHistoryStruct** & **SplitHistory** ()

Modify the split history of the node associated with this object.

- bool **UpdateAuxiliaryInfo** (TreeType *)

Some tree types require to propagate the information upward.

39.565.1 Detailed Description

```
template<typename TreeType>
class mlpack::tree::XTreeAuxiliaryInformation< TreeType >
```

The **XTreeAuxiliaryInformation** (p. 2338) class provides information specific to X trees for each node in a **RectangleTree** (p. 2207).

Definition at line 24 of file x_tree_auxiliary_information.hpp.

39.565.2 Member Typedef Documentation

39.565.2.1 SplitHistoryStruct

```
typedef struct mlpack::tree::XTreeAuxiliaryInformation::SplitHistoryStruct SplitHistoryStruct
```

The X tree requires that the tree records it's "split history".

To make this easy, we use the following structure.

39.565.3 Constructor & Destructor Documentation

39.565.3.1 XTreeAuxiliaryInformation() [1/4]

```
XTreeAuxiliaryInformation ( ) [inline]
```

Default constructor.

Definition at line 28 of file `x_tree_auxiliary_information.hpp`.

39.565.3.2 XTreeAuxiliaryInformation() [2/4]

```
XTreeAuxiliaryInformation (
    const TreeType * node ) [inline]
```

Construct this with the specified node.

Parameters

<i>node</i>	The node that stores this auxiliary information.
-------------	--

Definition at line 38 of file `x_tree_auxiliary_information.hpp`.

39.565.3.3 XTreeAuxiliaryInformation() [3/4]

```
XTreeAuxiliaryInformation (
    const XTreeAuxiliaryInformation< TreeType > & other,
    TreeType *   = NULL,
    bool   = true ) [inline]
```

Create an auxiliary information object by copying from another object.

Parameters

<i>other</i>	Another auxiliary information object from which the information will be copied.
<i>tree</i>	The node that holds the auxiliary information.
<i>deepCopy</i>	If false, the new object uses the same memory (not used here).

Definition at line 54 of file `x_tree_auxiliary_information.hpp`.

39.565.3.4 XTreeAuxiliaryInformation() [4/4]

```
XTreeAuxiliaryInformation (
    XTreeAuxiliaryInformation< TreeType > && other ) [inline]
```

Create an auxiliary information object by moving from the other node.

Parameters

<i>other</i>	The object from which the information will be moved.
--------------	--

Definition at line 79 of file x_tree_auxiliary_information.hpp.

39.565.4 Member Function Documentation

39.565.4.1 HandleNodeInsertion()

```
bool HandleNodeInsertion (
    TreeType * ,
    TreeType * ,
    bool ) [inline]
```

Some tree types require to save some properties at the insertion process.

This method allows the auxiliary information the option of manipulating the tree in order to perform the insertion process. If the auxiliary information does that, then the method should return true; if the method returns false the **RectangleTree** (p. 2207) performs its default behavior.

Parameters

<i>node</i>	The node in which the nodeToInsert is being inserted.
<i>nodeToInsert</i>	The node being inserted.
<i>insertionLevel</i>	The level of the tree at which the nodeToInsert should be inserted.

Definition at line 113 of file x_tree_auxiliary_information.hpp.

39.565.4.2 HandleNodeRemoval()

```
bool HandleNodeRemoval (
    TreeType * ,
    const size_t ) [inline]
```

Some tree types require to save some properties at the deletion process.

This method allows the auxiliary information the option of manipulating the tree in order to perform the deletion process. If the auxiliary information does that, then the method should return true; if the method returns false the **RectangleTree** (p. 2207) performs its default behavior.

Parameters

<i>node</i>	The node from which the node is being deleted.
<i>nodeIndex</i>	The local index of the node being deleted.

Definition at line 143 of file `x_tree_auxiliary_information.hpp`.

39.565.4.3 HandlePointDeletion()

```
bool HandlePointDeletion (
    TreeType * ,
    const size_t ) [inline]
```

Some tree types require to save some properties at the deletion process.

This method allows the auxiliary information the option of manipulating the tree in order to perform the deletion process. If the auxiliary information does that, then the method should return true; if the method returns false the **RectangleTree** (p. 2207) performs its default behavior.

Parameters

<i>node</i>	The node from which the point is being deleted.
<i>localIndex</i>	The local index of the point being deleted.

Definition at line 129 of file `x_tree_auxiliary_information.hpp`.

39.565.4.4 HandlePointInsertion()

```
bool HandlePointInsertion (
    TreeType * ,
    const size_t ) [inline]
```

Some tree types require to save some properties at the insertion process.

This method allows the auxiliary information the option of manipulating the tree in order to perform the insertion process. If the auxiliary information does that, then the method should return true; if the method returns false the **RectangleTree** (p. 2207) performs its default behavior.

Parameters

<i>node</i>	The node in which the point is being inserted.
<i>point</i>	The global number of the point being inserted.

Definition at line 96 of file x_tree_auxiliary_information.hpp.

39.565.4.5 NormalNodeMaxNumChildren() [1/2]

```
size_t NormalNodeMaxNumChildren ( ) const [inline]
```

Return the maximum number of a normal node's children.

Definition at line 215 of file x_tree_auxiliary_information.hpp.

Referenced by XTreeAuxiliaryInformation< TreeType >::operator=().

39.565.4.6 NormalNodeMaxNumChildren() [2/2]

```
size_t& NormalNodeMaxNumChildren ( ) [inline]
```

Modify the maximum number of a normal node's children.

Definition at line 217 of file x_tree_auxiliary_information.hpp.

39.565.4.7 NullifyData()

```
void NullifyData ( ) [inline]
```

Nullify the auxiliary information in order to prevent an invalid free.

Definition at line 162 of file x_tree_auxiliary_information.hpp.

39.565.4.8 operator=()

```
XTreeAuxiliaryInformation& operator= (
    const XTreeAuxiliaryInformation< TreeType > & other ) [inline]
```

Copy the auxiliary information object.

Parameters

<i>other</i>	The node from which the information will be copied.
--------------	---

Definition at line 66 of file `x_tree_auxiliary_information.hpp`.

References `XTreeAuxiliaryInformation< TreeType >::NormalNodeMaxNumChildren()`, and `XTreeAuxiliaryInformation< TreeType >::SplitHistory()`.

39.565.4.9 `serialize()`

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Serialize the information.

Definition at line 227 of file `x_tree_auxiliary_information.hpp`.

39.565.4.10 `SplitHistory()` [1/2]

```
const SplitHistoryStruct& SplitHistory ( ) const [inline]
```

Return the split history of the node associated with this object.

Definition at line 219 of file `x_tree_auxiliary_information.hpp`.

Referenced by `XTreeAuxiliaryInformation< TreeType >::operator=()`.

39.565.4.11 `SplitHistory()` [2/2]

```
SplitHistoryStruct& SplitHistory ( ) [inline]
```

Modify the split history of the node associated with this object.

Definition at line 221 of file `x_tree_auxiliary_information.hpp`.

39.565.4.12 `UpdateAuxiliaryInfo()`

```
bool UpdateAuxiliaryInfo (
    TreeType * ) [inline]
```

Some tree types require to propagate the information upward.

This method should return false if this is not the case. If true is returned, the update will be propagated upward.

Parameters

<i>node</i>	The node in which the auxiliary information being update.
-------------	---

Definition at line 154 of file `x_tree_auxiliary_information.hpp`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ x_tree_auxiliary_information.hpp`

39.566 XTreeAuxiliaryInformation< TreeType >::SplitHistoryStruct Struct Reference

The X tree requires that the tree records it's "split history".

Public Member Functions

- **SplitHistoryStruct** (int dim)
- **SplitHistoryStruct** (const **SplitHistoryStruct** &other)
- **SplitHistoryStruct** (**SplitHistoryStruct** &&other)
- **SplitHistoryStruct** & **operator=** (const **SplitHistoryStruct** &other)
- `template<typename Archive >`
void **serialize** (Archive &ar, const unsigned int)

Public Attributes

- `std::vector< bool >` **history**
- int **lastDimension**

39.566.1 Detailed Description

```
template<typename TreeType>
struct mlpack::tree::XTreeAuxiliaryInformation< TreeType >::SplitHistoryStruct
```

The X tree requires that the tree records it's "split history".

To make this easy, we use the following structure.

Definition at line 169 of file `x_tree_auxiliary_information.hpp`.

39.566.2 Constructor & Destructor Documentation

39.566.2.1 SplitHistoryStruct() [1/3]

```
SplitHistoryStruct (  
    int dim ) [inline]
```

Definition at line 174 of file `x_tree_auxiliary_information.hpp`.

Referenced by `XTreeAuxiliaryInformation< TreeType >::SplitHistoryStruct::serialize()`.

39.566.2.2 SplitHistoryStruct() [2/3]

```
SplitHistoryStruct (  
    const SplitHistoryStruct & other ) [inline]
```

Definition at line 180 of file `x_tree_auxiliary_information.hpp`.

39.566.2.3 SplitHistoryStruct() [3/3]

```
SplitHistoryStruct (  
    SplitHistoryStruct && other ) [inline]
```

Definition at line 192 of file `x_tree_auxiliary_information.hpp`.

39.566.3 Member Function Documentation**39.566.3.1 operator=()**

```
SplitHistoryStruct& operator= (  
    const SplitHistoryStruct & other ) [inline]
```

Definition at line 185 of file `x_tree_auxiliary_information.hpp`.

References `XTreeAuxiliaryInformation< TreeType >::SplitHistoryStruct::history`, and `XTreeAuxiliaryInformation< TreeType >::SplitHistoryStruct::lastDimension`.

39.566.3.2 serialize()

```
void serialize (
    Archive & ar,
    const unsigned int ) [inline]
```

Definition at line 200 of file `x_tree_auxiliary_information.hpp`.

References `XTreeAuxiliaryInformation< TreeType >::SplitHistoryStruct::SplitHistoryStruct()`.

39.566.4 Member Data Documentation

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ x_tree_auxiliary_information.hpp`

39.567 XTreeSplit Class Reference

A Rectangle Tree has new points inserted at the bottom.

Static Public Member Functions

- `template<typename TreeType >`
`static void SplitLeafNode (TreeType *tree, std::vector< bool > &relevels)`
Split a leaf node using the algorithm described in "The R-tree: An Efficient and Robust Access method for Points and Rectangles."*
- `template<typename TreeType >`
`static bool SplitNonLeafNode (TreeType *tree, std::vector< bool > &relevels)`
Split a non-leaf node using the "default" algorithm.

39.567.1 Detailed Description

A Rectangle Tree has new points inserted at the bottom.

When these nodes overflow, we split them, moving up the tree and splitting nodes as necessary.

Definition at line 36 of file `x_tree_split.hpp`.

39.567.2 Member Function Documentation

39.567.2.1 SplitLeafNode()

```
static void SplitLeafNode (
    TreeType * tree,
    std::vector< bool > & relevels ) [static]
```

Split a leaf node using the algorithm described in "The R*-tree: An Efficient and Robust Access method for Points and Rectangles."

" If necessary, this split will propagate upwards through the tree.

39.567.2.2 SplitNonLeafNode()

```
static bool SplitNonLeafNode (
    TreeType * tree,
    std::vector< bool > & relevels ) [static]
```

Split a non-leaf node using the "default" algorithm.

If this is a root node, the tree increases in depth.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/rectangle_tree/ x_tree_split.hpp`

39.568 `IsStdVector< T >` Struct Template Reference

Metaprogramming structure for vector detection.

Static Public Attributes

- static const bool **value** = false

39.568.1 Detailed Description

```
template<typename T>
struct mpack::util::IsStdVector< T >
```

Metaprogramming structure for vector detection.

Definition at line 23 of file `is_std_vector.hpp`.

39.568.2 Member Data Documentation

39.568.2.1 **value**

```
const bool value = false [static]
```

Definition at line 23 of file `is_std_vector.hpp`.

The documentation for this struct was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/util/ is_std_vector.hpp`

39.569 `IsStdVector< std::vector< T, A > >` Struct Template Reference

Metaprogramming structure for vector detection.

Static Public Attributes

- static const bool **value** = true

39.569.1 Detailed Description

```
template<typename T, typename A>
struct mpack::util::IsStdVector< std::vector< T, A > >
```

Metaprogramming structure for vector detection.

Definition at line 27 of file `is_std_vector.hpp`.

39.569.2 Member Data Documentation

39.569.2.1 value

```
const bool value = true [static]
```

Definition at line 27 of file `is_std_vector.hpp`.

The documentation for this struct was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/util/ is_std_vector.hpp`

39.570 NullOutputStream Class Reference

Used for **Log::Debug** (p. 1540) when not compiled with debugging symbols.

Public Member Functions

- **NullOutputStream** ()
Does nothing.
- **NullOutputStream** (const **NullOutputStream** &)

39.571 ParamData Struct Reference

This structure holds all of the information about a single parameter, including its value (which is set when **ParseCommandLine()** (p.302) is called).

Public Attributes

- char **alias**
Alias for this parameter.
- std::string **cppType**
The true name of the type, as it would be written in C++.
- std::string **desc**
Description of this parameter, if any.
- bool **input**
True if this option is an input option (otherwise, it is output).
- bool **loaded**
If this is an input parameter that needs extra loading, this indicates whether or not it has been loaded.
- std::string **name**
Name of this parameter.
- bool **noTranspose**
True if this is a matrix that should not be transposed.
- bool **persistent**
If this should be preserved across different settings (i.e.
- bool **required**
True if this option is required.
- std::string **tname**
Type information of this parameter.
- boost::any **value**
The actual value that is held.
- bool **wasPassed**
True if the option was passed to the program.

39.571.1 Detailed Description

This structure holds all of the information about a single parameter, including its value (which is set when **Parse**↔**CommandLine()** (p. 302) is called).

It does not hold any information about whether or not it was passed—that is handled elsewhere. A **ParamData** (p. 2356) struct is only useful in order to get "static" information about a parameter. Note that some parameter types have internal types but also different types that are used by boost::program_options (specifically, matrix and model types map to strings).

This structure is somewhat unwieldy and is likely to be refactored at some point in the future, but for now it does the job fine.

Definition at line 52 of file param_data.hpp.

39.571.2 Member Data Documentation

39.571.2.1 alias

```
char alias
```

Alias for this parameter.

Definition at line 63 of file param_data.hpp.

Referenced by `mlpack::bindings::cli::AddToPO()`, `CLIOption< N >::CLIOption()`, `MDOption< T >::MDOption()`, `PyOption< T >::PyOption()`, and `TestOption< N >::TestOption()`.

39.571.2.2 cppType

```
std::string cppType
```

The true name of the type, as it would be written in C++.

Definition at line 84 of file param_data.hpp.

Referenced by `CLIOption< N >::CLIOption()`, `mlpack::bindings::python::GetCythonType()`, `mlpack::bindings::tests::GetPrintableParam()`, `mlpack::bindings::python::GetPrintableParam()`, `mlpack::bindings::python::ImportDecl()`, `MDOption< T >::MDOption()`, `mlpack::bindings::python::PrintClassDefn()`, `mlpack::bindings::python::PrintDoc()`, `mlpack::bindings::python::PrintInputProcessing()`, `mlpack::bindings::python::PrintOutputProcessing()`, `PyOption< T >::PyOption()`, and `TestOption< N >::TestOption()`.

39.571.2.3 desc

```
std::string desc
```

Description of this parameter, if any.

Definition at line 58 of file param_data.hpp.

Referenced by `mlpack::bindings::cli::AddToPO()`, `CLIOption< N >::CLIOption()`, `MDOption< T >::MDOption()`, `mlpack::bindings::python::PrintDoc()`, `PyOption< T >::PyOption()`, and `TestOption< N >::TestOption()`.

39.571.2.4 input

```
bool input
```

True if this option is an input option (otherwise, it is output).

Definition at line 73 of file param_data.hpp.

Referenced by `CLIOption< N >::CLIOption()`, `mlpack::bindings::cli::EndProgram()`, `mlpack::bindings::cli::GetParam()`, `MDOption< T >::MDOption()`, `mlpack::bindings::python::PrintOutputProcessing()`, `PyOption< T >::PyOption()`, and `TestOption< N >::TestOption()`.

39.571.2.5 loaded

```
bool loaded
```

If this is an input parameter that needs extra loading, this indicates whether or not it has been loaded.

Definition at line 76 of file param_data.hpp.

Referenced by `CLIOption< N >::CLIOption()`, `mlpack::bindings::cli::GetParam()`, `MDOption< T >::MDOption()`, `PyOption< T >::PyOption()`, and `TestOption< N >::TestOption()`.

39.571.2.6 name

```
std::string name
```

Name of this parameter.

This is the name used for `HasParam()` and **`GetParam()`** (p. 290).

Definition at line 56 of file param_data.hpp.

Referenced by `mlpack::bindings::cli::AddToPO()`, `CLIOption< N >::CLIOption()`, `mlpack::bindings::cli::MapParameterName()`, `MDOption< T >::MDOption()`, `mlpack::bindings::cli::ParseCommandLine()`, `mlpack::bindings::python::PrintDefn()`, `mlpack::bindings::python::PrintDoc()`, `mlpack::bindings::python::PrintInputProcessing()`, `mlpack::bindings::python::PrintOutputProcessing()`, `PyOption< T >::PyOption()`, and `TestOption< N >::TestOption()`.

39.571.2.7 noTranspose

```
bool noTranspose
```

True if this is a matrix that should not be transposed.

Ignored if the parameter is not a matrix.

Definition at line 69 of file param_data.hpp.

Referenced by `CLIOption< N >::CLIOption()`, `mlpack::bindings::cli::GetParam()`, `MDOption< T >::MDOption()`, `PyOption< T >::PyOption()`, and `TestOption< N >::TestOption()`.

39.571.2.8 persistent

```
bool persistent
```

If this should be preserved across different settings (i.e.

if it should exist for every binding), this should be set to true.

Definition at line 79 of file param_data.hpp.

Referenced by `CLIOption< N >::CLIOption()`, `MDOption< T >::MDOption()`, `PyOption< T >::PyOption()`, and `TestOption< N >::TestOption()`.

39.571.2.9 required

```
bool required
```

True if this option is required.

Definition at line 71 of file param_data.hpp.

Referenced by `CLIOption< N >::CLIOption()`, `MDOption< T >::MDOption()`, `mlpack::bindings::cli::ParseCommandLine()`, `mlpack::bindings::python::PrintDefn()`, `mlpack::bindings::python::PrintDoc()`, `mlpack::bindings::python::PrintInputProcessing()`, `mlpack::bindings::python::PrintOutputProcessing()`, `PyOption< T >::PyOption()`, and `TestOption< N >::TestOption()`.

39.571.2.10 tname

```
std::string tname
```

Type information of this parameter.

Note that this is **TYPENAME()** (p. 2738) of the user-visible parameter type, not whatever is given by `ParameterType<>`.

Definition at line 61 of file param_data.hpp.

Referenced by `CLIOption< N >::CLIOption()`, `mlpack::bindings::cli::EndProgram()`, `MDOption< T >::MDOption()`, `mlpack::bindings::cli::ParseCommandLine()`, `PyOption< T >::PyOption()`, and `TestOption< N >::TestOption()`.

39.571.2.11 value

```
boost::any value
```

The actual value that is held.

If the user has passed a different type, this may be a tuple containing multiple values.

Definition at line 82 of file param_data.hpp.

Referenced by `CLIOption< N >::CLIOption()`, `mlpack::bindings::cli::DeleteAllocatedMemoryImpl()`, `mlpack::bindings::tests::DeleteAllocatedMemoryImpl()`, `mlpack::bindings::cli::GetAllocatedMemory()`, `mlpack::bindings::tests::GetAllocatedMemory()`, `mlpack::bindings::python::GetParam()`, `mlpack::bindings::tests::GetParam()`, `mlpack::bindings::markdown::GetParam()`, `mlpack::bindings::cli::GetParam()`, `mlpack::bindings::python::GetPrintableParam()`, `mlpack::bindings::tests::GetPrintableParam()`, `mlpack::bindings::cli::GetRawParam()`, `MDOption< T >::MDOption()`, `mlpack::bindings::cli::ParseCommandLine()`, `PyOption< T >::PyOption()`, `mlpack::bindings::cli::SetParam()`, and `TestOption< N >::TestOption()`.

39.571.2.12 wasPassed

```
bool wasPassed
```

True if the option was passed to the program.

Note that `wasPassed` may be set by either **`ParseCommandLine()`** (p. 302) or `SetPassed()`.

Definition at line 66 of file param_data.hpp.

Referenced by `CLIOption< N >::CLIOption()`, `MDOption< T >::MDOption()`, `mlpack::bindings::cli::ParseCommandLine()`, `PyOption< T >::PyOption()`, `mlpack::bindings::cli::SetParam()`, and `TestOption< N >::TestOption()`.

The documentation for this struct was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/util/ param_data.hpp`

39.572 PrefixedOutputStream Class Reference

Allows us to output to an ostream with a prefix at the beginning of each line, in the same way we would output to cout or cerr.

Public Member Functions

- **PrefixOutputStream** (std::ostream & **destination**, const char *prefix, bool **ignoreInput**=false, bool fatal=false, bool **backtrace**=true)
*Set up the **PrefixOutputStream** (p. 2361).*
- **PrefixOutputStream** & **operator**<< (bool val)
Write a bool to the stream.
- **PrefixOutputStream** & **operator**<< (short val)
Write a short to the stream.
- **PrefixOutputStream** & **operator**<< (unsigned short val)
Write an unsigned short to the stream.
- **PrefixOutputStream** & **operator**<< (int val)
Write an int to the stream.
- **PrefixOutputStream** & **operator**<< (unsigned int val)
Write an unsigned int to the stream.
- **PrefixOutputStream** & **operator**<< (long val)
Write a long to the stream.
- **PrefixOutputStream** & **operator**<< (unsigned long val)
Write an unsigned long to the stream.
- **PrefixOutputStream** & **operator**<< (float val)
Write a float to the stream.
- **PrefixOutputStream** & **operator**<< (double val)
Write a double to the stream.
- **PrefixOutputStream** & **operator**<< (long double val)
Write a long double to the stream.
- **PrefixOutputStream** & **operator**<< (void *val)
Write a void pointer to the stream.
- **PrefixOutputStream** & **operator**<< (const char *str)
Write a character array to the stream.
- **PrefixOutputStream** & **operator**<< (std::string &str)
Write a string to the stream.
- **PrefixOutputStream** & **operator**<< (std::streambuf *sb)
Write a streambuf to the stream.
- **PrefixOutputStream** & **operator**<< (std::ostream &(*pf)(std::ostream &))
Write an ostream manipulator function to the stream.
- **PrefixOutputStream** & **operator**<< (std::ios &(*pf)(std::ios &))
Write an ios manipulator function to the stream.
- **PrefixOutputStream** & **operator**<< (std::ios_base &(*pf)(std::ios_base &))
Write an ios_base manipulator function to the stream.
- template<typename T >
PrefixOutputStream & **operator**<< (const T &s)
Write anything else to the stream.

Public Attributes

- bool **backtrace**
If true, on a fatal error, a backtrace will be printed if HAS_BFD_DL is defined.
- std::ostream & **destination**
The output stream that all data is to be sent to; example: std::cout.
- bool **ignoreInput**
Discards input, prints nothing if true.

39.572.1 Detailed Description

Allows us to output to an ostream with a prefix at the beginning of each line, in the same way we would output to cout or cerr.

The prefix is specified in the constructor (as well as the destination ostream). A newline must be passed to the stream, and then the prefix will be prepended to the next line. For example,

```
PrefixedOutputStream ostr(std::cout, "[TEST] ");
ostr << "Hello world I like " << 7.5;
ostr << "...Continue" << std::endl;
ostr << "After the CR\n" << std::endl;
```

would give, on std::cout,

```
[TEST] Hello world I like 7.5...Continue
[TEST] After the CR
[TEST]
```

These objects are used for the **mlpack::Log** (p. 1538) levels (DEBUG, INFO, WARN, and FATAL).

Definition at line 46 of file prefixedostream.hpp.

39.572.2 Constructor & Destructor Documentation

39.572.2.1 PrefixedOutputStream()

```
PrefixedOutputStream (  
    std::ostream & destination,  
    const char * prefix,  
    bool ignoreInput = false,  
    bool fatal = false,  
    bool backtrace = true ) [inline]
```

Set up the **PrefixedOutputStream** (p. 2361).

Parameters

<i>destination</i>	ostream which receives output from this object.
<i>prefix</i>	The prefix to prepend to each line.
<i>ignoreInput</i>	If true, the stream will not be printed.
<i>fatal</i>	If true, a <code>std::runtime_error</code> exception is thrown after printing a newline.
<i>backtrace</i>	If true, attempt to print a backtrace (will only be done if <code>HAS_BFD_DL</code> is defined).

Definition at line 60 of file `prefixedostream.hpp`.

39.572.3 Member Function Documentation

39.572.3.1 `operator<<()` [1/18]

```
PrefixedOutputStream& operator<< (  
    bool val )
```

Write a bool to the stream.

Referenced by `PrefixedOutputStream::PrefixedOutputStream()`.

39.572.3.2 `operator<<()` [2/18]

```
PrefixedOutputStream& operator<< (  
    short val )
```

Write a short to the stream.

39.572.3.3 `operator<<()` [3/18]

```
PrefixedOutputStream& operator<< (  
    unsigned short val )
```

Write an unsigned short to the stream.

39.572.3.4 operator<<() [4/18]

```
PrefixedOutputStream& operator<< (  
    int val )
```

Write an int to the stream.

39.572.3.5 operator<<() [5/18]

```
PrefixedOutputStream& operator<< (  
    unsigned int val )
```

Write an unsigned int to the stream.

39.572.3.6 operator<<() [6/18]

```
PrefixedOutputStream& operator<< (  
    long val )
```

Write a long to the stream.

39.572.3.7 operator<<() [7/18]

```
PrefixedOutputStream& operator<< (  
    unsigned long val )
```

Write an unsigned long to the stream.

39.572.3.8 operator<<() [8/18]

```
PrefixedOutputStream& operator<< (  
    float val )
```

Write a float to the stream.

39.572.3.9 `operator<<()` [9/18]

```
PrefixOutputStream& operator<< (  
    double val )
```

Write a double to the stream.

39.572.3.10 `operator<<()` [10/18]

```
PrefixOutputStream& operator<< (  
    long double val )
```

Write a long double to the stream.

39.572.3.11 `operator<<()` [11/18]

```
PrefixOutputStream& operator<< (  
    void * val )
```

Write a void pointer to the stream.

39.572.3.12 `operator<<()` [12/18]

```
PrefixOutputStream& operator<< (  
    const char * str )
```

Write a character array to the stream.

39.572.3.13 `operator<<()` [13/18]

```
PrefixOutputStream& operator<< (  
    std::string & str )
```

Write a string to the stream.

39.572.3.14 `operator<<()` [14/18]

```
PrefixedOutputStream& operator<< (  
    std::streambuf * sb )
```

Write a streambuf to the stream.

39.572.3.15 `operator<<()` [15/18]

```
PrefixedOutputStream& operator<< (  
    std::ostream &(*) (std::ostream &) pf )
```

Write an ostream manipulator function to the stream.

39.572.3.16 `operator<<()` [16/18]

```
PrefixedOutputStream& operator<< (  
    std::ios &(*) (std::ios &) pf )
```

Write an ios manipulator function to the stream.

39.572.3.17 `operator<<()` [17/18]

```
PrefixedOutputStream& operator<< (  
    std::ios_base &(*) (std::ios_base &) pf )
```

Write an ios_base manipulator function to the stream.

39.572.3.18 `operator<<()` [18/18]

```
PrefixedOutputStream& operator<< (  
    const T & s )
```

Write anything else to the stream.

39.572.4 Member Data Documentation

39.572.4.1 `backtrace`

```
bool backtrace
```

If true, on a fatal error, a backtrace will be printed if `HAS_BFD_DL` is defined.

Definition at line 122 of file `prefixedostream.hpp`.

Referenced by `mlpack::util::DisableBacktrace()`.

39.572.4.2 `destination`

```
std::ostream& destination
```

The output stream that all data is to be sent to; example: `std::cout`.

Definition at line 115 of file `prefixedostream.hpp`.

39.572.4.3 `ignoreInput`

```
bool ignoreInput
```

Discards input, prints nothing if true.

Definition at line 118 of file `prefixedostream.hpp`.

Referenced by `mlpack::util::DisableVerbose()`, `mlpack::util::EnableVerbose()`, and `mlpack::bindings::cli::ParseCommandLine()`.

The documentation for this class was generated from the following file:

- `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/util/ prefixedostream.hpp`

39.573 ProgramDoc Class Reference

A static object whose constructor registers program documentation with the **CLI** (p. 1117) class.

Public Member Functions

- **ProgramDoc** (const std::string & **programName**, const std::string & **shortDocumentation**, const std::function< std::string()> & **documentation**, const std::vector< std::pair< std::string, std::string >> & **seeAlso**)
Construct a **ProgramDoc** (p. 2368) object.
- **ProgramDoc** ()
Construct an empty **ProgramDoc** (p. 2368) object.

Public Attributes

- `std::function< std::string()>` **documentation**
Documentation for what the program does.
- `std::string` **programName**
The name of the program.
- `std::vector< std::pair< std::string, std::string > >` **seeAlso**
Set of see also information.
- `std::string` **shortDocumentation**
The short documentation for the program.

39.573.1 Detailed Description

A static object whose constructor registers program documentation with the **CLI** (p. 1117) class.

This should not be used outside of **CLI** (p. 1117) itself, and you should use the **PROGRAM_INFO()** (p. 2733) macro to declare these objects. Only one **ProgramDoc** (p. 2368) object should ever exist.

See also

core/util/cli.hpp (p. 2694), **mlpack::CLI** (p. 1117)

Definition at line 26 of file `program_doc.hpp`.

39.573.2 Constructor & Destructor Documentation

39.573.2.1 ProgramDoc() [1/2]

```
ProgramDoc (
    const std::string & programName,
    const std::string & shortDocumentation,
    const std::function< std::string()> & documentation,
    const std::vector< std::pair< std::string, std::string >> & seeAlso )
```

Construct a **ProgramDoc** (p. 2368) object.

When constructed, it will register itself with **CLI** (p. 1117), and when the user calls `--help` (or whatever the option is named for the given binding type), the given function that returns a `std::string` will be returned.

Parameters

<i>programName</i>	Short string representing the name of the program.
<i>shortDocumentation</i>	A short two-sentence description of the program, what it does, and what it is useful for.
<i>documentation</i>	Long string containing documentation on how to use the program and what it is. No newline characters are necessary; this is taken care of by CLI (p. 1117) later.
Generated by Doxygen <i>seeAlso</i>	A set of pairs of strings with useful "see also" information; each pair is <code><description, url></code> .

39.573.2.2 ProgramDoc() [2/2]

ProgramDoc ()

Construct an empty **ProgramDoc** (p. 2368) object.

(This is not meant to be used!)

39.573.3 Member Data Documentation

40.22 /home/barak/src/git/debian-src/mlpack/doc/tutorials/det/det.txt File Reference

Tutorial for how to perform density estimation with Density Estimation Trees (DET).

Functions

- $V(t)$ is the volume of the node t and \tilde{V}
- see subsection cli_alt_reg_tut Alternate DET **regularization** The usual regularized error $R_\alpha(t)$ of a node t is given by

Variables

- f is the **set** of leaves in the subtree rooted at t For the purposes of density **estimation**
- this option is not available in DET right **now**
- f is the **set** of leaves in the subtree rooted at t For the purposes of density there is a different form of **regularization**
- f is the **set** of leaves in the subtree rooted at t For the purposes of density there is a different form of we penalize the sum of the inverse of the volumes of the leaves With this very small volume nodes are discouraged unless the data actually warrants it **Thus**

40.22.1 Detailed Description

Tutorial for how to perform density estimation with Density Estimation Trees (DET).

Author

Parikshit Ram

40.22.2 Function Documentation

40.22.2.1 `$V()`

```
f f $V (
      t )
```

Definition at line 351 of file det.txt.

40.22.2.2 `alpha()`

```
see subsection cli_alt_reg_tut Alternate DET regularization The usual regularized error f $R_{\leftarrow}
alpha (
      t )
```

Definition at line 344 of file det.txt.

40.22.3 Variable Documentation

40.22.3.1 `estimation`

`f` is the **set** of leaves in the subtree rooted at `f` `$t f` For the purposes of density estimation

Definition at line 354 of file det.txt.

40.22.3.2 now

this option is not available in DET right now

Definition at line 341 of file det.txt.

40.22.3.3 regularization

f is the **set** of leaves in the subtree rooted at f $\$t f$ For the purposes of density there is a different form of we penalize the sum of the inverse of the volumes of the leaves With this regularization

Definition at line 354 of file det.txt.

40.22.3.4 Thus

f is the **set** of leaves in the subtree rooted at f $\$t f$ For the purposes of density there is a different form of we penalize the sum of the inverse of the volumes of the leaves With this very small volume nodes are discouraged unless the data actually warrants it Thus

Definition at line 354 of file det.txt.

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::cli**

Functions

- template<typename T >
void **DefaultParam** (const util::ParamData &data, const void *, void *output)
Return the default value of an option.
- template<typename T >
std::string **DefaultParamImpl** (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_<_type< T >>::type !=0, const typename boost::disable_if< util::IsStdVector< T >>::type !=0, const typename boost::disable_if< data::HasSerialize< T >>::type !=0, const typename boost::disable_if< std::is_same< T, std::string >>::type !=0, const typename boost::disable_if< std::is_same< T, std::tuple< **mlpack::data::DatasetInfo**, arma::mat >>>::type !=0)
Return the default value of an option.
- template<typename T >
std::string **DefaultParamImpl** (const util::ParamData &data, const typename boost::enable_if< util::IsStdVector< T >>::type !=0)
Return the default value of a vector option.

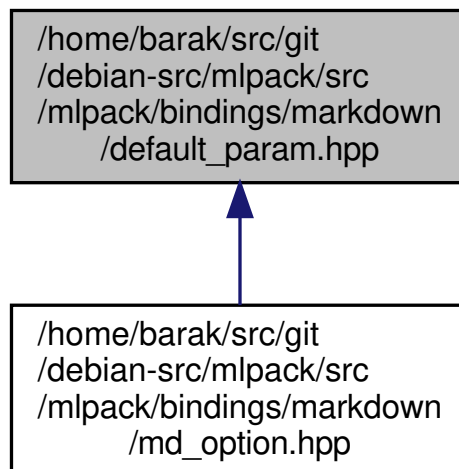

- `template<typename T >`
`std::string DefaultParamImpl (const util::ParamData &data, const typename boost::enable_if< std::is_same<`
`T, std::string >>::type *=0)`
Return the default value of a string option.
- `template<typename T >`
`std::string DefaultParamImpl (const util::ParamData &data, const typename boost::enable_if_c< arma::is_↵`
`arma_type< T >::value||std::is_same< T, std::tuple< mlpack::data::DatasetInfo, arma::mat >>::value >↵`
`::type *=0)`
Return the default value of a matrix option, a tuple option, a serializable option, or a string option (this returns the default filename, or " if the default is no file).
- `template<typename T >`
`std::string DefaultParamImpl (const util::ParamData &data, const typename boost::disable_if< arma::is_arma↵`
`_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)`
Return the default value of a model option (this returns the default filename, or " if the default is no file).

40.128 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/markdown/default_↵ param.hpp File Reference

Include dependency graph for default_param.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 - .hpp
- **mlpack::bindings**
- **mlpack::bindings::markdown**

Functions

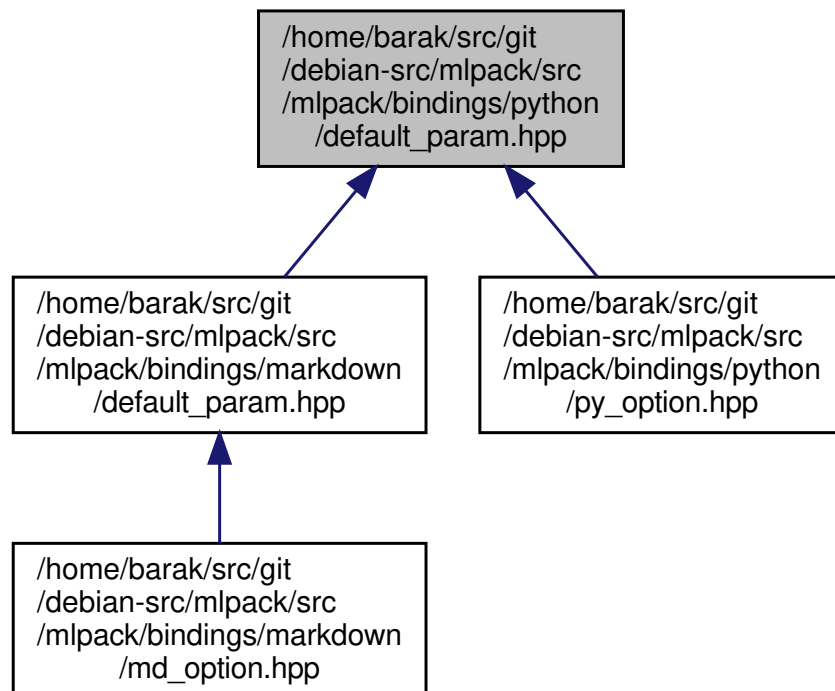

- `template<typename T>`
void DefaultParam (const util::ParamData &data, const void *, void *output)
Print the default value of a parameter into the output string.

40.129 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/python/default_param.hpp File Reference

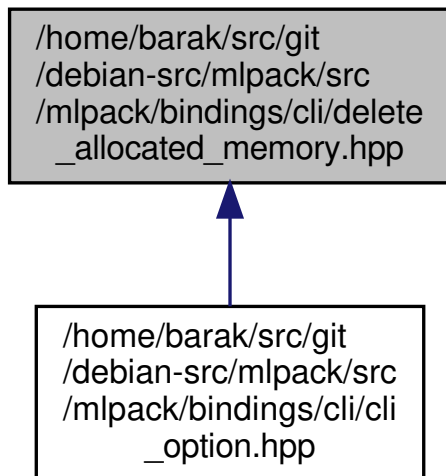

Include dependency graph for default_param.hpp:

This graph shows which files directly or indirectly include this file:

This graph shows which files directly or indirectly include this file:

- template<typename T >
void **GetAllocatedMemory** (const util::ParamData &d, const void *, void *output)

40.135 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/get_param.hpp File Reference

Include dependency graph for get_param.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .*.hpp*
- **mlpack::bindings**
- **mlpack::bindings::cli**

Functions

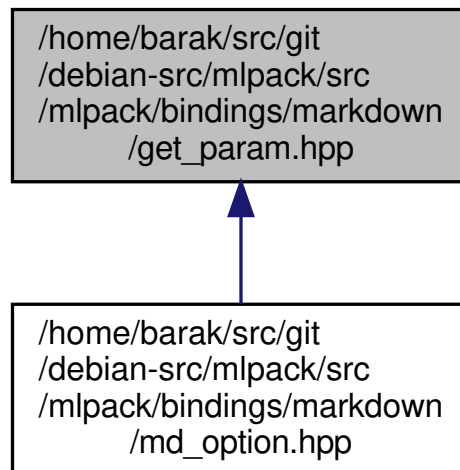

- `template<typename T >`
`T & GetParam (util::ParamData &d, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0,`
`const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if<`
`std::is_same< T, std::tuple< mlpack::data::DatasetInfo, arma::mat >>>::type *=0)`
This overload is called when nothing special needs to happen to the name of the parameter.
- `template<typename T >`
`T & GetParam (util::ParamData &d, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)`
Return a matrix parameter.
- `template<typename T >`
`T & GetParam (util::ParamData &d, const typename boost::enable_if< std::is_same< T, std::tuple< mlpack::data::DatasetInfo, arma::mat >>>::type *=0)`
Return a matrix/dataset info parameter.
- `template<typename T >`
`T * & GetParam (util::ParamData &d, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0,`
`const typename boost::enable_if< data::HasSerialize< T >>::type *=0)`
Return a serializable object.
- `template<typename T >`
`void GetParam (const util::ParamData &d, const void *, void *output)`
Return a parameter casted to the given type.

40.136 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/markdown/get_param.hpp File Reference

Include dependency graph for get_param.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::markdown**

Functions

- `template<typename T >`
 void **GetParam** (const util::ParamData &d, const void *, void *output)

All Markdown binding types are exactly what is held in the ParamData, so no special handling is necessary.

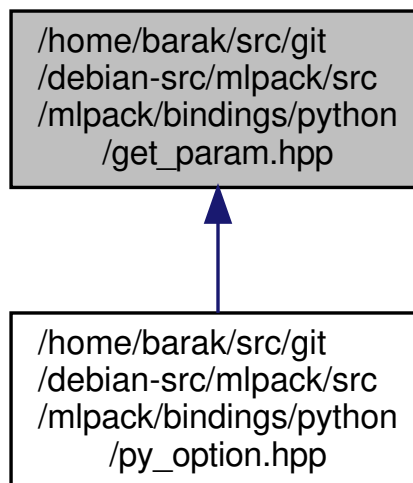

40.137 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/python/get_param.hpp

File Reference

Include dependency graph for get_param.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::python**

Functions

- `template<typename T >`
 void **GetParam** (const util::ParamData &d, const void *, void *output)

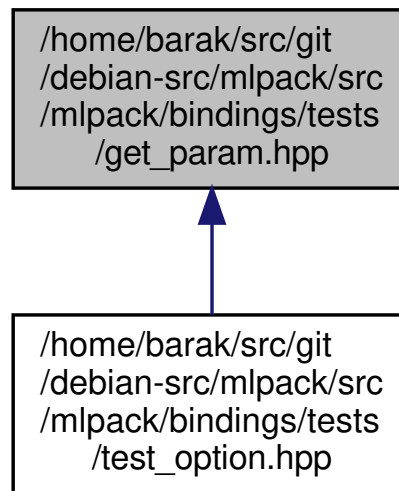

All Python binding types are exactly what is held in the ParamData, so no special handling is necessary.

40.138 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/tests/get_param.hpp File Reference

Include dependency graph for get_param.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::tests**

Functions

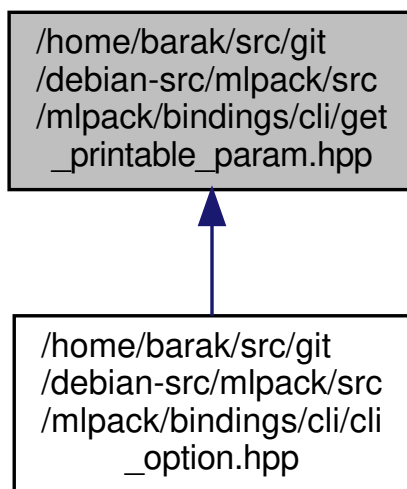

- `template<typename T >`
 T & **GetParam** (util::ParamData &d)
 This overload is called when nothing special needs to happen to the name of the parameter.
- `template<typename T >`
 void **GetParam** (const util::ParamData &d, const void *, void *output)
 Return a parameter casted to the given type.

40.139 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/get_printable_param.hpp File Reference

Include dependency graph for get_printable_param.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::cli**

Functions

- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`
Print an option.

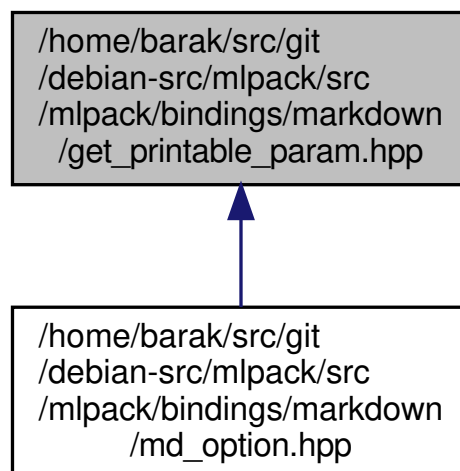

- Print a vector option, with spaces between it.*

_param.hpp File Reference

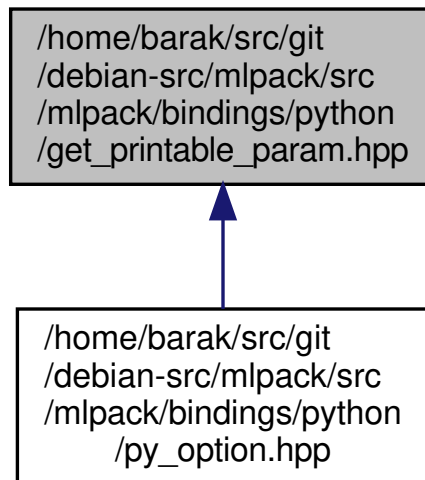

Include dependency graph for get_printable_param.hpp:

This graph shows which files directly or indirectly include this file:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::python**

Functions

- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::disable_if< arma::is_↵`
`arma_type< T >>::type !=0, const typename boost::disable_if< util::IsStdVector< T >>::type !=0, const type-`
`name boost::disable_if< data::HasSerialize< T >>::type !=0, const typename boost::disable_if< std::is_same<`
`T, std::tuple< data::DatasetInfo, arma::mat >>>::type !=0)`
Print an option of a simple type.
- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::enable_if< util::IsStd↵`
`Vector< T >>::type !=0)`
Print a vector option, with spaces between it.
- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::enable_if< arma::is_↵`
`arma_type< T >>::type !=0)`
Print a matrix option (this prints its size).
- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::disable_if< arma::is_↵`
`arma_type< T >>::type !=0, const typename boost::enable_if< data::HasSerialize< T >>::type !=0)`
Print a serializable class option (this prints the class name).
- `template<typename T >`
`std::string GetPrintableParam (const util::ParamData &data, const typename boost::enable_if< std::is_same<`
`T, std::tuple< data::DatasetInfo, arma::mat >>>::type !=0)`

Print a combination DatasetInfo/matrix parameter.

- `template<typename T >`
`void GetPrintableParam (const util::ParamData &data, const void *, void *output)`

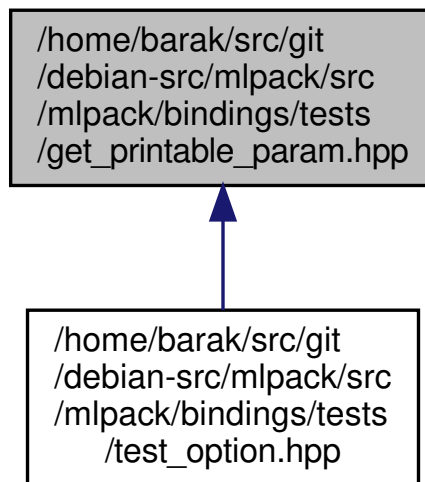

Print an option into a std::string.

40.142 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/tests/get_printable_param.hpp File Reference

Include dependency graph for `get_printable_param.hpp`:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
`.hpp`
- **mlpack::bindings**
- **mlpack::bindings::tests**

Functions

- `template<typename T >`
`std::string GetPrintableParam` (const util::ParamData &data, const typename boost::disable_if< arma::is_↵
`arma_type< T >>::type !=0, const typename boost::disable_if< util::IsStdVector< T >>::type !=0, const type-`
`name boost::disable_if< data::HasSerialize< T >>::type !=0, const typename boost::disable_if< std::is_same<`
`T, std::tuple< data::DatasetInfo, arma::mat >>>::type !=0)`

Print an option.

- `template<typename T >`
`std::string GetPrintableParam` (const util::ParamData &data, const typename boost::enable_if< util::IsStd↵
`Vector< T >>::type !=0)`

Print a vector option, with spaces between it.

- `template<typename T >`
`std::string GetPrintableParam` (const util::ParamData &data, const typename boost::enable_if< arma::is_↵
`arma_type< T >>::type !=0)`

Print a matrix option (this just prints the filename).

- `template<typename T >`
`std::string GetPrintableParam` (const util::ParamData &data, const typename boost::disable_if< arma::is_↵
`arma_type< T >>::type !=0, const typename boost::enable_if< data::HasSerialize< T >>::type !=0)`

Print a serializable class option (this just prints the filename).

- `template<typename T >`
`std::string GetPrintableParam` (const util::ParamData &data, const typename boost::enable_if< std::is_same<
`T, std::tuple< data::DatasetInfo, arma::mat >>>::type !=0)`

Print a mapped matrix option (this just prints the filename).

- `template<typename T >`
`void GetPrintableParam` (const util::ParamData &data, const void *, void *output)

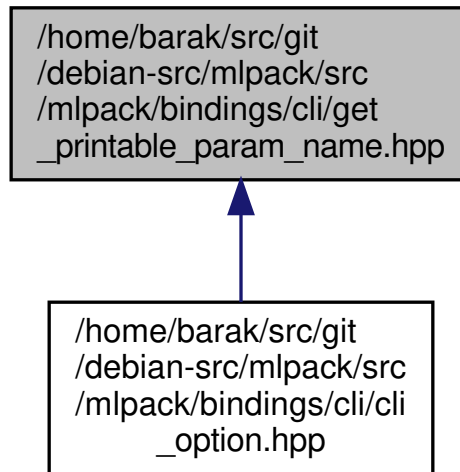

Print an option into a std::string.

40.143 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/get_printable_↵ param_name.hpp File Reference

Include dependency graph for get_printable_param_name.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::cli**

Functions

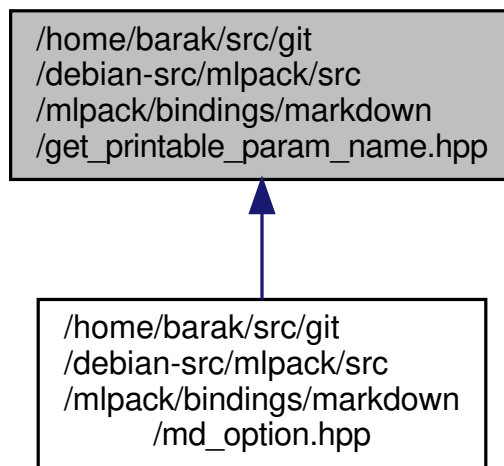

- template<typename T >
std::string **GetPrintableParamName** (const util::ParamData &data, const typename boost::disable_if< arma↵
::is_arma_type< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const
typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)
 Get the parameter name for a type that has no special handling.
- template<typename T >
std::string **GetPrintableParamName** (const util::ParamData &data, const typename boost::enable_if< arma↵
::is_arma_type< T >>::type *=0)
 Get the parameter name for a matrix type (where the user has to pass the file that holds the matrix).
- template<typename T >
std::string **GetPrintableParamName** (const util::ParamData &data, const typename boost::disable_if< arma↵
::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)
 Get the parameter name for a serializable model type (where the user has to pass the file that holds the matrix).
- template<typename T >
std::string **GetPrintableParamName** (const util::ParamData &data, const typename boost::enable_if< std::is↵
_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)
 Get the parameter name for a mapped matrix type (where the user has to pass the file that holds the matrix).
- template<typename T >
void **GetPrintableParamName** (const util::ParamData &d, const void *, void *output)
 Get the parameter's name as seen by the user.

40.144 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/markdown/get_printable_param_name.hpp File Reference

Include dependency graph for get_printable_param_name.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::markdown**

Functions

- template<typename T >
std::string **GetPrintableParamName** (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)
 Get the parameter name for a type that has no special handling.
- template<typename T >
std::string **GetPrintableParamName** (const util::ParamData &data, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)

Get the parameter name for a matrix type (where the user has to pass the file that holds the matrix).

- `template<typename T >`
`std::string GetPrintableParamName (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)`

Get the parameter name for a serializable model type (where the user has to pass the file that holds the matrix).

- `template<typename T >`
`std::string GetPrintableParamName (const util::ParamData &data, const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`

Get the parameter name for a mapped matrix type (where the user has to pass the file that holds the matrix).

- `template<typename T >`
`void GetPrintableParamName (const util::ParamData &d, const void *, void *output)`

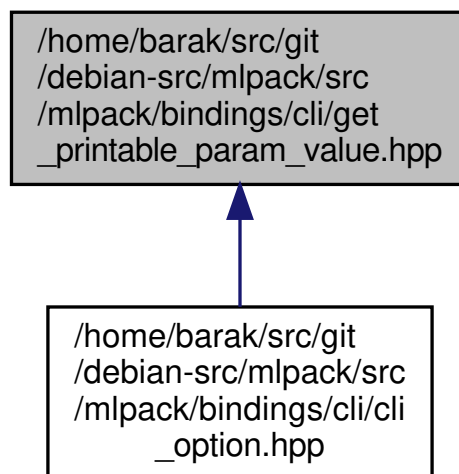

Get the parameter's name as seen by the user.

40.145 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/get_printable_param_value.hpp File Reference

Include dependency graph for `get_printable_param_value.hpp`:

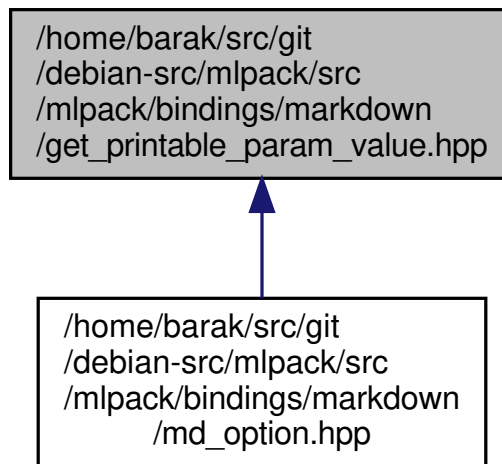

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
`.hpp`
- **mlpack::bindings**
- **mlpack::bindings::cli**

This graph shows which files directly or indirectly include this file:

Namespaces

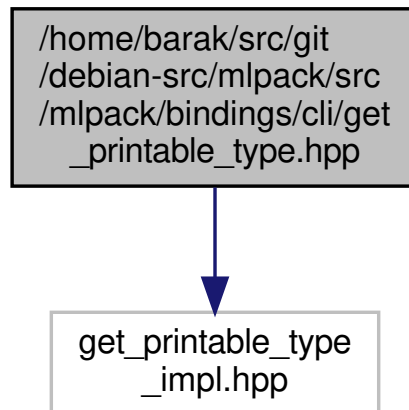

- **mlpack**
 .*.hpp*
- **mlpack::bindings**
- **mlpack::bindings::markdown**

Functions

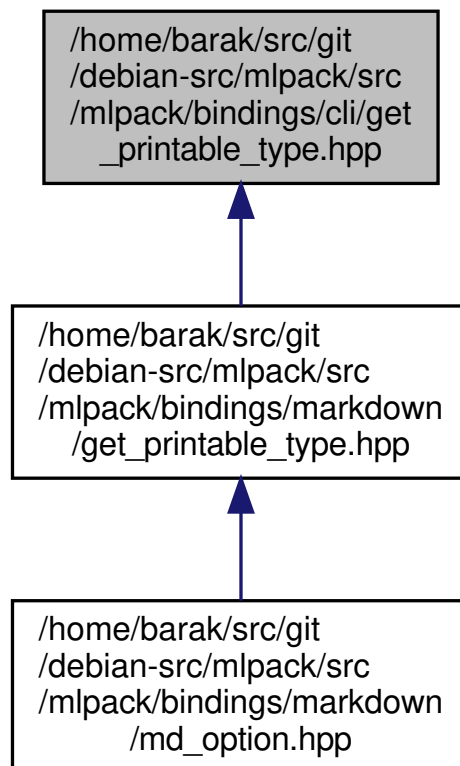

- `template<typename T >`
`std::string GetPrintableParamValue (const util::ParamData &data, const std::string &value, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`
Get the parameter name for a type that has no special handling.
- `template<typename T >`
`std::string GetPrintableParamValue (const util::ParamData &data, const std::string &value, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)`
Get the parameter name for a matrix type (where the user has to pass the file that holds the matrix).
- `template<typename T >`
`std::string GetPrintableParamValue (const util::ParamData &data, const std::string &value, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)`
Get the parameter name for a serializable model type (where the user has to pass the file that holds the matrix).
- `template<typename T >`
`std::string GetPrintableParamValue (const util::ParamData &data, const std::string &value, const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)`
Get the parameter name for a mapped matrix type (where the user has to pass the file that holds the matrix).
- `template<typename T >`
`void GetPrintableParamValue (const util::ParamData &d, const void *input, void *output)`
Get the parameter's name as seen by the user.

40.147 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/get_printable_type.hpp File Reference

40.150 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/get_raw_param.hpp

File Reference

Include dependency graph for get_raw_param.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .*.hpp*
- **mlpack::bindings**
- **mlpack::bindings::cli**

Functions

- `template<typename T >`
T & GetRawParam (util::ParamData &d, const typename boost::disable_if< arma::is_arma_type< T >>::type
 *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if<
 std::is_same< T, std::tuple< **mlpack::data::DatasetInfo**, arma::mat >>>::type *=0)
This overload is called when nothing special needs to happen to the name of the parameter.
- `template<typename T >`
T & GetRawParam (util::ParamData &d, const typename boost::enable_if_c< arma::is_arma_type< T ><←
 ::value||std::is_same< T, std::tuple< **mlpack::data::DatasetInfo**, arma::mat >>::value >>::type *=0)
Return a matrix parameter.
- `template<typename T >`
T *& GetRawParam (util::ParamData &d, const typename boost::disable_if< arma::is_arma_type< T >>::type
 *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)
Return the name of a model parameter.
- `template<typename T >`
void GetRawParam (const util::ParamData &d, const void *, void *output)
Return a parameter casted to the given type.

40.150.1 Detailed Description

Author

Ryan Curtin

Use template metaprogramming to get the right type of parameter, but without any processing.

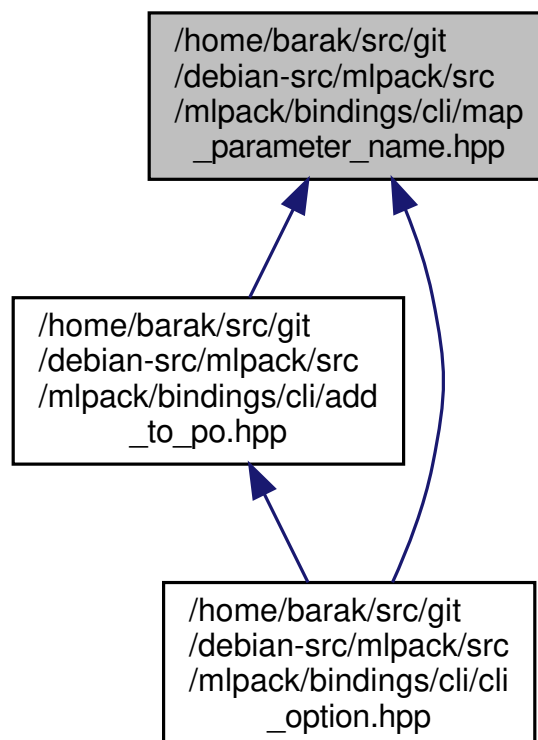

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.151 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/map_parameter_name.hpp File Reference

Include dependency graph for map_parameter_name.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::cli**

Functions

- `template<typename T >`
`std::string MapParameterName (const std::string &identifier, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< mlpack::data::DatasetInfo, arma::mat >>>::type *=0)`
If needed, map the parameter name to the name that is used by boost::program_options.
- `template<typename T >`
`std::string MapParameterName (const std::string &identifier, const typename boost::enable_if_c< arma::is_arma_type< T >::value||std::is_same< T, std::tuple< mlpack::data::DatasetInfo, arma::mat >>>::value||data::HasSerialize< T >::value >::type *=0)`
Map the parameter name to the name that is used by boost::program_options.
- `template<typename T >`
`void MapParameterName (const util::ParamData &d, const void *, void *output)`
Map the parameter name to the name seen by boost::program_options.

40.151.1 Detailed Description

Author

Ryan Curtin

Map a parameter name to what it seen by boost::program_options using template metaprogramming.

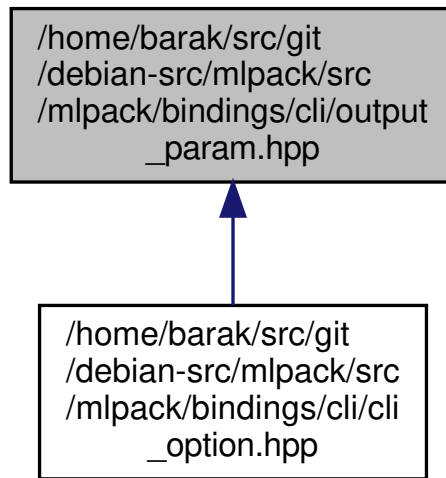

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.152 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/output_param.hpp File Reference

Include dependency graph for output_param.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::cli**

Functions

- template<typename T >
void **OutputParam** (const util::ParamData &data, const void *, void *)
 Output an option.
- template<typename T >
void **OutputParamImpl** (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>::type *=0
 Output an option (print to stdout).
- template<typename T >
void **OutputParamImpl** (const util::ParamData &data, const typename boost::enable_if< util::IsStdVector< T >>::type *=0)
 Output a vector option (print to stdout).
- template<typename T >
void **OutputParamImpl** (const util::ParamData &data, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)
 Output a matrix option (this saves it to the given file).
- template<typename T >
void **OutputParamImpl** (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)
 Output a serializable class option (this saves it to the given file).

- `template<typename T >`
`void OutputParamImpl (const util::ParamData &data, const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>::type !=0)`
Output a mapped dataset.

40.152.1 Detailed Description

Author

Ryan Curtin

Output a parameter of different types using template metaprogramming.

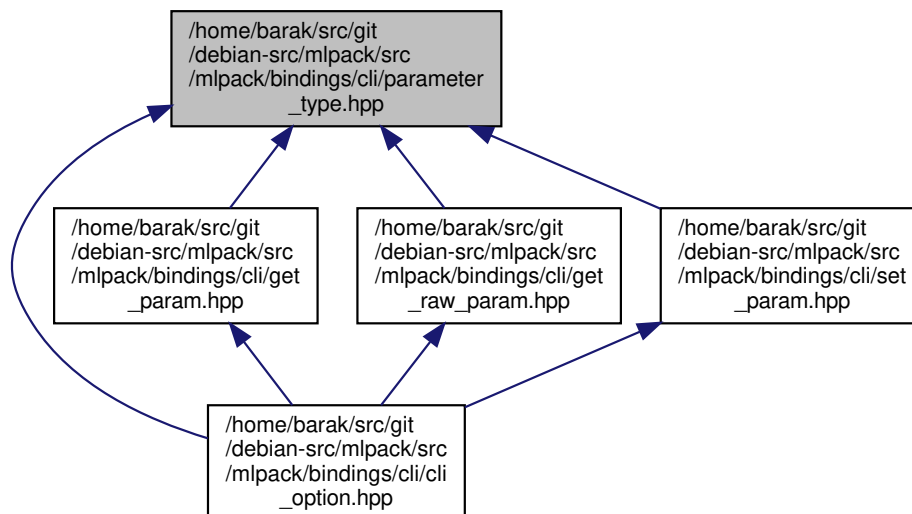

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.153 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/parameter_type.hpp File Reference

Include dependency graph for parameter_type.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- struct **ParameterType**< **T** >
Utility struct to return the type that boost::program_options should accept for a given input type.
- struct **ParameterType**< **arma::Col**< **eT** > >
For vector types, boost::program_options will accept a std::string, not an arma::Col<eT> (since it is not clear how to specify a vector on the command-line).
- struct **ParameterType**< **arma::Mat**< **eT** > >
For matrix types, boost::program_options will accept a std::string, not an arma::mat (since it is not clear how to specify a matrix on the command-line).
- struct **ParameterType**< **arma::Row**< **eT** > >
For row vector types, boost::program_options will accept a std::string, not an arma::Row<eT> (since it is not clear how to specify a vector on the command-line).
- struct **ParameterType**< **std::tuple**< **mlpack::data::DatasetMapper**< **PolicyType**, **std::string** >, **arma::Mat**< **eT** > > >
For matrix+dataset info types, we should accept a std::string.
- struct **ParameterTypeDeducer**< **HasSerialize**, **T** >
- struct **ParameterTypeDeducer**< **true**, **T** >

Namespaces

- **mlpack**
.hpp
- **mlpack::bindings**
- **mlpack::bindings::cli**

40.153.1 Detailed Description

Author

Ryan Curtin

Template metaprogramming structures to find the type (as seen by boost::program_options) of a particular option type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.154 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/parse_command_line.hpp File Reference

Include dependency graph for parse_command_line.hpp:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::cli**

Functions

- **PARAM_FLAG** ("help", "Default help info.", "h")
- **PARAM_FLAG** ("verbose", "Display informational messages and the full list of " "parameters and timers at the end of execution.", "v")
- **PARAM_FLAG** ("version", "Display the version of mlpack.", "V")
- **PARAM_STRING_IN** ("info", "Print help on a specific option.", "", "")
- void **ParseCommandLine** (int argc, char **argv)

*Parse the command line, setting all of the options inside of the **CLI** (p. 1117) object to their appropriate given values.*

40.154.1 Detailed Description

Author

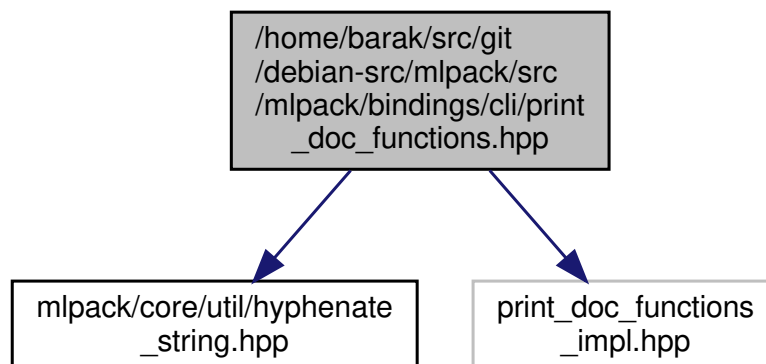

Ryan Curtin
Matthew Amidon

Parse the command line options.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.155 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/print_doc_functions.hpp File Reference

Include dependency graph for print_doc_functions.hpp:

Namespaces

- **mlpack**
.hpp
- **mlpack::bindings**
- **mlpack::bindings::cli**

Functions

- `std::string GetBindingName (const std::string &bindingName)`
Given the name of a binding, print its command-line name (this returns "mlpack_<bindingName>").
- `template<typename T >`
`bool IgnoreCheck (const T &)`
Return whether or not a runtime check on parameters should be ignored.
- `std::string ParamString (const std::string ¶mName)`
Print what a user would type to invoke the given option name.
- `std::string PrintDataset (const std::string &dataset)`
Print a dataset type parameter (add .csv and return).
- `std::string PrintDefault (const std::string ¶mName)`
Given a parameter name, print its corresponding default value.
- `std::string PrintImport (const std::string &bindingName)`
*Print any imports for **CLI** (p. 1117) (there are none, so this returns an empty string).*
- `std::string PrintModel (const std::string &model)`
Print a model type parameter (add .bin and return).
- `std::string PrintOutputOptionInfo ()`
Print any special information about output options.
- `std::string PrintType (const util::ParamData ¶m)`
Print the type of a parameter that a user would specify from the command-line.
- `std::string PrintTypeDocs ()`
Print documentation for each of the types.
- `template<typename T >`
`std::string PrintValue (const T &value, bool quotes)`
Given a parameter type, print the corresponding value.
- `std::string ProcessOptions ()`
Base case for recursion.
- `template<typename T , typename... Args>`
`std::string ProcessOptions (const std::string ¶mName, const T &value, Args... args)`
Print an option for a command-line argument.
- `template<typename... Args>`
`std::string ProgramCall (const std::string &programName, Args... args)`
Given a program name and arguments for it, print what its invocation would be.
- `std::string ProgramCall (const std::string &programName)`
Given a program name, print a program call invocation assuming that all options are specified.

40.156 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/markdown/print_doc_↵ functions.hpp File Reference

Include dependency graph for print_doc_functions.hpp:

Namespaces

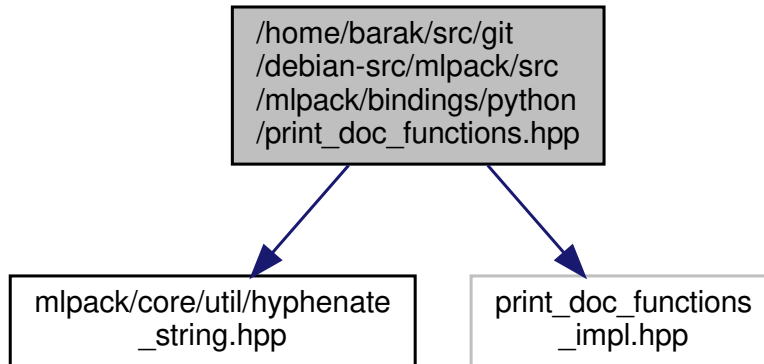

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::markdown**

Functions

- std::string **GetBindingName** (const std::string &bindingName)
 *Given the name of the binding, print the name for the current language (as given by **BindingInfo** (p. 984)).*
- template<typename T >
 bool **IgnoreCheck** (const T &t)
 Return whether or not a runtime check on parameters should be ignored.
- std::string **ParamString** (const std::string ¶mName)
 Print what a user would type to invoke the given option name.
- std::string **ParamType** (const util::ParamData &d)
 Print the user-encountered type of an option.
- std::string **PrintDataset** (const std::string &dataset)
 Print a dataset type parameter (add .csv and return).
- std::string **PrintDefault** (const std::string ¶mName)
 Print the default value of an option, unless it is required (in which case Markdown italicized '—' is printed).
- std::string **PrintImport** (const std::string &bindingName)
 Print any imports that need to be done before using the binding.
- std::string **PrintLanguage** (const std::string &language)
 Print the name of the given language.
- std::string **PrintModel** (const std::string &model)
 Print a model type parameter (add .bin and return).
- std::string **PrintOutputOptionInfo** (const std::string &language)
 Print any special information about output options.
- std::string **PrintTypeDocs** ()
 Print details about the different types for a language.
- template<typename T >
 std::string **PrintValue** (const T &value, bool quotes)
 Given a parameter type, print the corresponding value.
- template<typename... Args>
 std::string **ProgramCall** (const std::string &programName, Args... args)
 Given a program name and arguments for it, print what its invocation would be.
- std::string **ProgramCall** (const std::string &programName)
 Given a program name, print a call assuming that all arguments are specified.

40.157 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/python/print_doc_functions.hpp File Reference

Include dependency graph for print_doc_functions.hpp:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::python**

Functions

- **std::string GetBindingName** (const std::string &bindingName)
 Given the name of a binding, print its Python name.
- **bool IgnoreCheck** (const std::string ¶mName)
 Print whether or not we should ignore a check on the given parameter.
- **bool IgnoreCheck** (const std::vector< std::string > &constraints)
 Print whether or not we should ignore a check on the given set of constraints.
- **bool IgnoreCheck** (const std::vector< std::pair< std::string, bool >> &constraints, const std::string ¶mName)
 Print whether or not we should ignore a check on the given set of constraints.
- **std::string ParamString** (const std::string ¶mName)
 Given the parameter name, determine what it would actually be when passed to the command line.
- **std::string PrintDataset** (const std::string &datasetName)
 Given the name of a matrix, print it.
- **std::string PrintDefault** (const std::string ¶mName)
 Given a parameter name, print its corresponding default value.
- **std::string PrintImport** (const std::string &bindingName)
 Print any import information for the Python binding.
- **std::string PrintInputOptions** ()

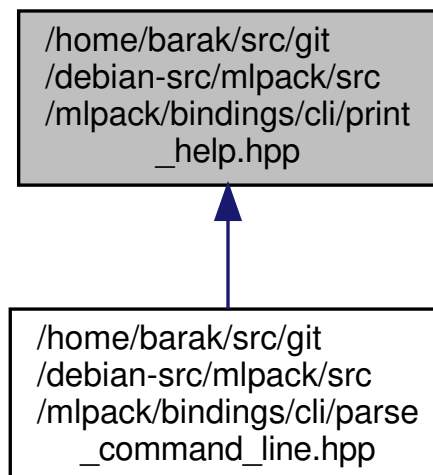

- `template<typename T , typename... Args>`
`std::string PrintInputOptions (const std::string ¶mName, const T &value, Args... args)`
Print an input option.
- `std::string PrintModel (const std::string &modelName)`
Given the name of a model, print it.
- `std::string PrintOutputOptionInfo ()`
Print any special information about output options.
- `std::string PrintOutputOptions ()`
- `template<typename T , typename... Args>`
`std::string PrintOutputOptions (const std::string ¶mName, const T &value, Args... args)`
- `template<typename T >`
`std::string PrintValue (const T &value, bool quotes)`
Given a parameter type, print the corresponding value.
- `template<>`
`std::string PrintValue (const bool &value, bool quotes)`
- `template<typename... Args>`
`std::string ProgramCall (const std::string &programName, Args... args)`
Given a name of a binding and a variable number of arguments (and their contents), print the corresponding function call.
- `std::string ProgramCall (const std::string &programName)`
Given the name of a binding, print a program call assuming that all options are specified.

40.158 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/print_help.hpp File Reference

Include dependency graph for `print_help.hpp`:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::cli**

Functions

- void **PrintHelp** (const std::string ¶m="")
 Print the help for the given parameter.

40.158.1 Detailed Description

Author

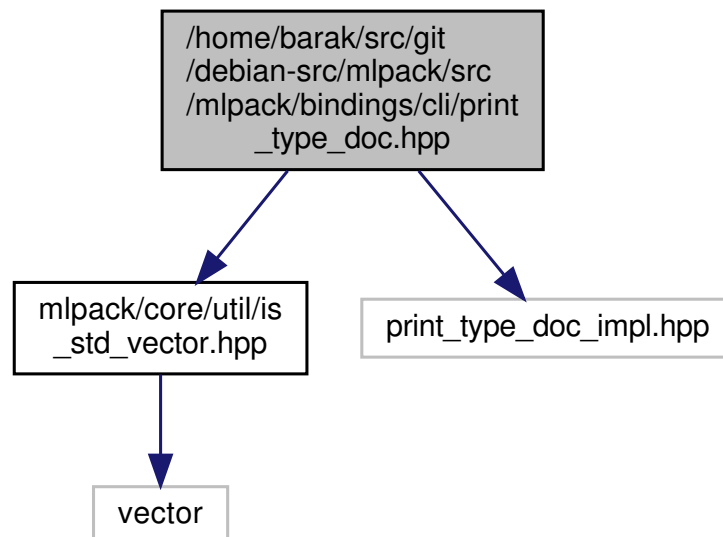

Ryan Curtin

Print help for a command-line program.

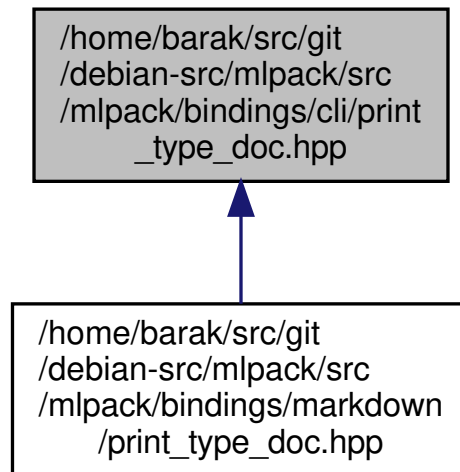

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.159 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/print_type_doc.hpp File Reference

Include dependency graph for print_type_doc.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::cli**

Functions

- template<typename T >
std::string **PrintTypeDoc** (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)

 Return a string representing the command-line type of an option.
- template<typename T >
std::string **PrintTypeDoc** (const util::ParamData &data, const typename std::enable_if< util::IsStdVector< T ><::value >::type *=0)

 Return a string representing the command-line type of a vector.
- template<typename T >
std::string **PrintTypeDoc** (const util::ParamData &data, const typename std::enable_if< arma::is_arma_type< T ><::value >::type *=0)

 Return a string representing the command-line type of a matrix option.
- template<typename T >
std::string **PrintTypeDoc** (const util::ParamData &data, const typename std::enable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::value >::type *=0)

 Return a string representing the command-line type of a matrix tuple option.
- template<typename T >
std::string **PrintTypeDoc** (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)

- `template<typename T>`
`void PrintTypeDoc (const util::ParamData &data, const void *, void *output)`
Print the command-line type of an option into a string.

Include dependency graph for print_type_doc.hpp:

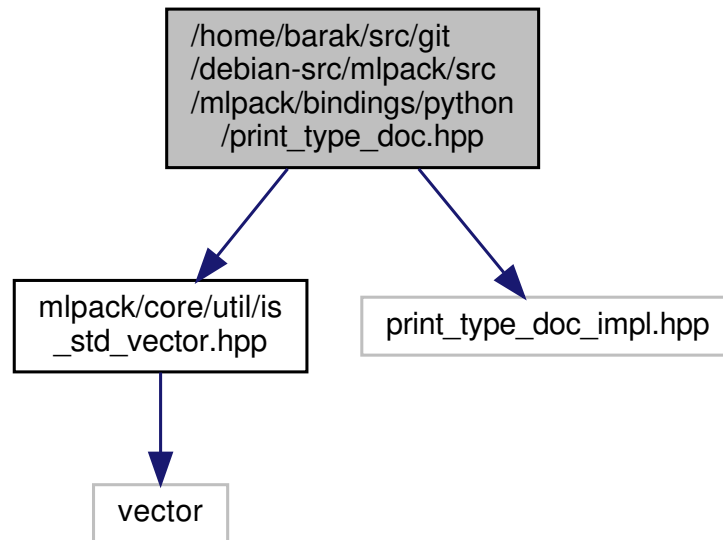

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::markdown**

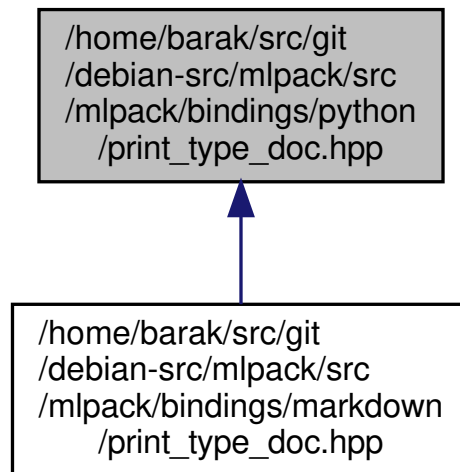

- `template<typename T>`
`std::string PrintTypeDoc (const util::ParamData &data)`
Print the type of a parameter into the output string.

40.161 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/python/print_type_↔ doc.hpp File Reference

Include dependency graph for print_type_doc.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

Functions

- template<typename T >
 std::string **PrintTypeDoc** (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)

 Return a string representing the command-line type of an option.
- template<typename T >
 std::string **PrintTypeDoc** (const util::ParamData &data, const typename std::enable_if< util::IsStdVector< T >>::value >::type *=0)

 Return a string representing the command-line type of a vector.
- template<typename T >
 std::string **PrintTypeDoc** (const util::ParamData &data, const typename std::enable_if< arma::is_arma_type< T >>::value >::type *=0)

 Return a string representing the command-line type of a matrix option.
- template<typename T >
 std::string **PrintTypeDoc** (const util::ParamData &data, const typename std::enable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::value >::type *=0)

 Return a string representing the command-line type of a matrix tuple option.
- template<typename T >
 std::string **PrintTypeDoc** (const util::ParamData &data, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)

 Return a string representing the command-line type of a model.
- template<typename T >
 void **PrintTypeDoc** (const util::ParamData &data, const void *, void *output)

 Print the command-line type of an option into a string.

40.162 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/set_param.hpp File Reference

Include dependency graph for set_param.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::cli**

Functions

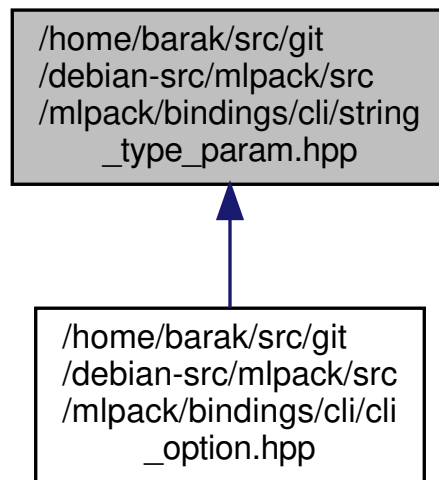

- `template<typename T >`
`void SetParam (util::ParamData &d, const boost::any &value, const typename boost::disable_if< arma::is_↵`
`arma_type< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const`
`typename boost::disable_if< std::is_same< T, std::tuple< mlpack::data::DatasetInfo, arma::mat >>>::type`
`*=0, const typename boost::disable_if< std::is_same< T, bool >>::type *=0)`
This overload is called when nothing special needs to happen to the name of the parameter.
- `template<typename T >`
`void SetParam (util::ParamData &d, const boost::any &, const typename boost::enable_if< std::is_same< T,`
`bool >>::type *=0)`
This overload is called to set a boolean.
- `template<typename T >`
`void SetParam (util::ParamData &d, const boost::any &value, const typename std::enable_if< arma::is_arma↵`
`_type< T >::value||std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>::value >::type *=0)`
Set a matrix parameter, a matrix/dataset info parameter, or a serializable object.
- `template<typename T >`
`void SetParam (util::ParamData &d, const boost::any &value, const typename boost::disable_if< arma::is_↵`
`arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)`
Set a serializable object.
- `template<typename T >`
`void SetParam (const util::ParamData &d, const void *input, void *)`
Return a parameter casted to the given type.

40.163 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/cli/string_type_param.hpp File Reference

Include dependency graph for string_type_param.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::cli**

Functions

- `template<typename T >`
 void **StringTypeParam** (const util::ParamData &, const void *, void *output)
 Return a string containing the type of a parameter.
- `template<>`
 void **StringTypeParam**< **bool** > (const util::ParamData &, const void *, void *output)
 Return "bool".
- `template<>`
 void **StringTypeParam**< **double** > (const util::ParamData &, const void *, void *output)

- `template<>`
`void StringTypeParam< int > (const util::ParamData &, const void *, void *output)`
Return "int".
- `template<>`
`void StringTypeParam< std::string > (const util::ParamData &, const void *, void *output)`
Return "string".
- `template<>`
`void StringTypeParam< std::tuple< mlpack::data::DatasetInfo, arma::mat > > (const util::ParamData &, const void *, void *output)`
Return "string";.
- `template<typename T >`
`std::string StringTypeParamImpl (const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0)`
Return a string containing the type of the parameter.
- `template<typename T >`
`std::string StringTypeParamImpl (const typename boost::enable_if< util::IsStdVector< T >>::type *=0)`
Return a string containing the type of the parameter, for vector options.
- `template<typename T >`
`std::string StringTypeParamImpl (const typename boost::enable_if< data::HasSerialize< T >>::type *=0)`
Return a string containing the type of the parameter,.

Include dependency graph for binding_info.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **BindingInfo**

The ***BindingInfo*** (p. 984) class is used by the Markdown documentation generator to store multiple *ProgramDoc* objects, indexed by both the binding name (i.e.

Namespaces

- mlpack**
.hpp
- mlpack::bindings**
- mlpack::bindings::markdown**

40.164.1 Detailed Description

Author

Ryan Curtin

This file defines the `BindingInfo` singleton class that is used specifically for the Markdown bindings to map from a binding name (i.e. "knn") to multiple `ProgramDoc` objects, which are then used to generate the documentation.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.165 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/markdown/get_binding_name.hpp File Reference

Include dependency graph for `get_binding_name.hpp`:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::markdown**

Functions

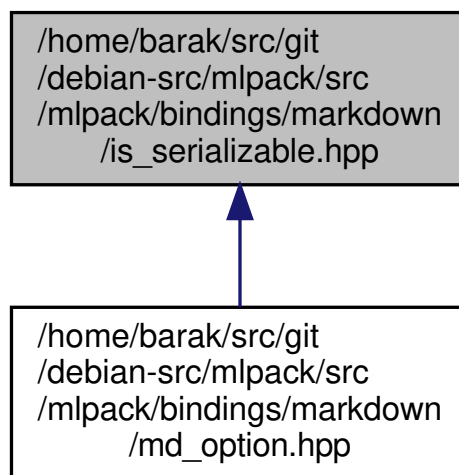

- std::string **GetBindingName** (const std::string &language, const std::string &name)
 Given a language name and a binding name, return the name of that binding for that language.

40.166 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/markdown/is_serializable.hpp File Reference

Include dependency graph for is_serializable.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::markdown**

Functions

- template<typename T >
bool **IsSerializable** (const typename boost::disable_if< data::HasSerialize< T >>::type *=0)
Return false, because the type is not serializable.
- template<typename T >
bool **IsSerializable** (const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)
Return false, because even though the type is serializable, it is an Armadillo type not an mlpack model.
- template<typename T >
bool **IsSerializable** (const typename boost::enable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0)
Return true, because the type is serializable.
- template<typename T >
void **IsSerializable** (const util::ParamData &, const void *, void *output)
Return whether or not the type is serializable.

40.166.1 Detailed Description

Author

Ryan Curtin

Return a bool noting whether or not a parameter is serializable.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.167 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/markdown/md_option.hpp File Reference

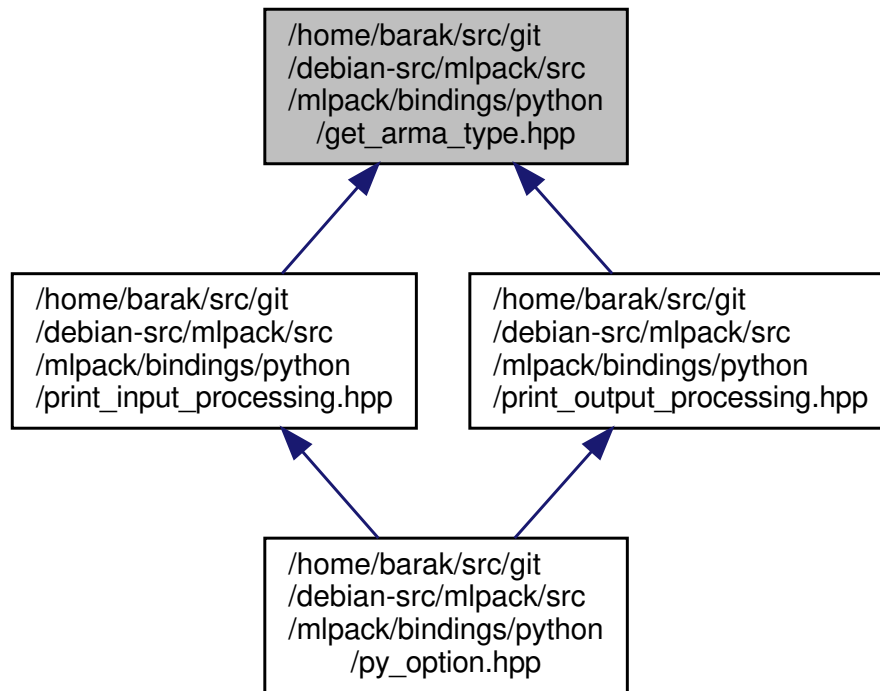

Include dependency graph for md_option.hpp:

Classes

- class **MDOption**< T >
The Markdown option class.

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::python**

Functions

- `template<typename T >
std::string GetArmaType ()`
 This is used for arma::Mat<> types; it will return "mat" for matrices, "row" for row vectors, and "col" for column vectors.

40.170.1 Detailed Description

Author

Ryan Curtin

Return "mat", "col", or "row" depending on the type of the given Armadillo object. This is so that the correct overload of `arma_numpy.numpy_to_<type>()` can be called.

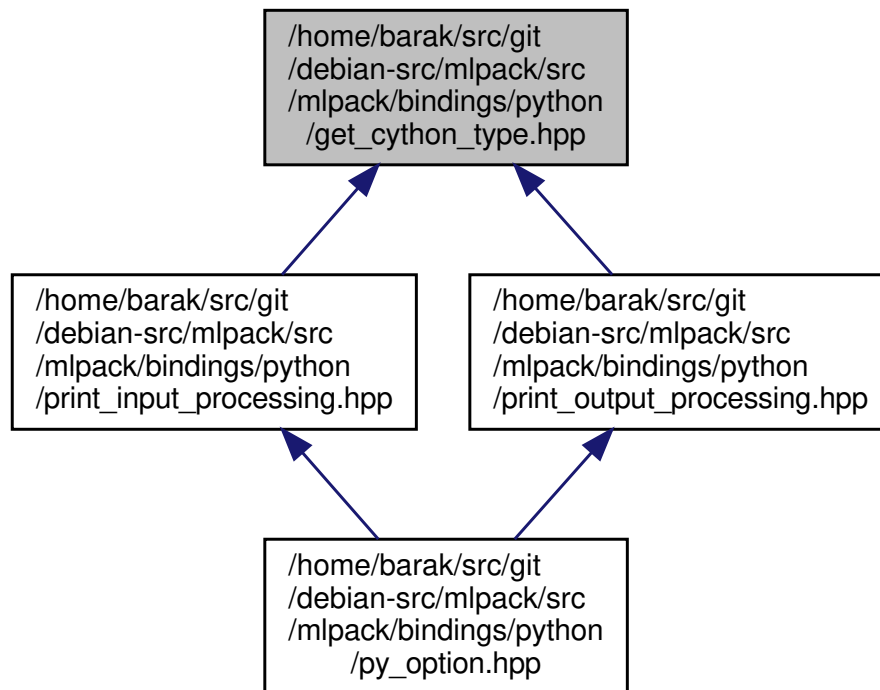

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.171 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/python/get_cython_type.hpp File Reference

Include dependency graph for get_cython_type.hpp:

This graph shows which files directly or indirectly include this file:

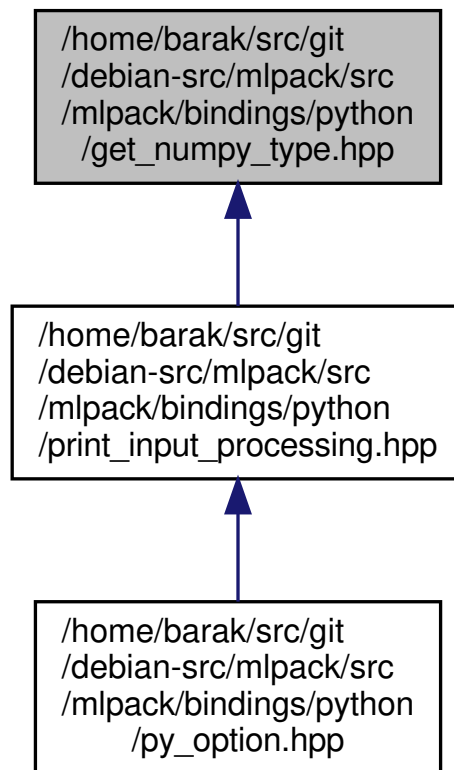

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::python**

Functions

- `template<typename T>`
`std::string GetCythonType (const util::ParamData &, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0)`

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::python**

Functions

- `template<typename T >`
 `std::string GetNumpyType ()`
- `template<>`
 `std::string GetNumpyType< double > ()`
- `template<>`
 `std::string GetNumpyType< size_t > ()`

40.172.1 Detailed Description

Author

Ryan Curtin

Given a C++ type, return the Python numpy dtype associated with that type.

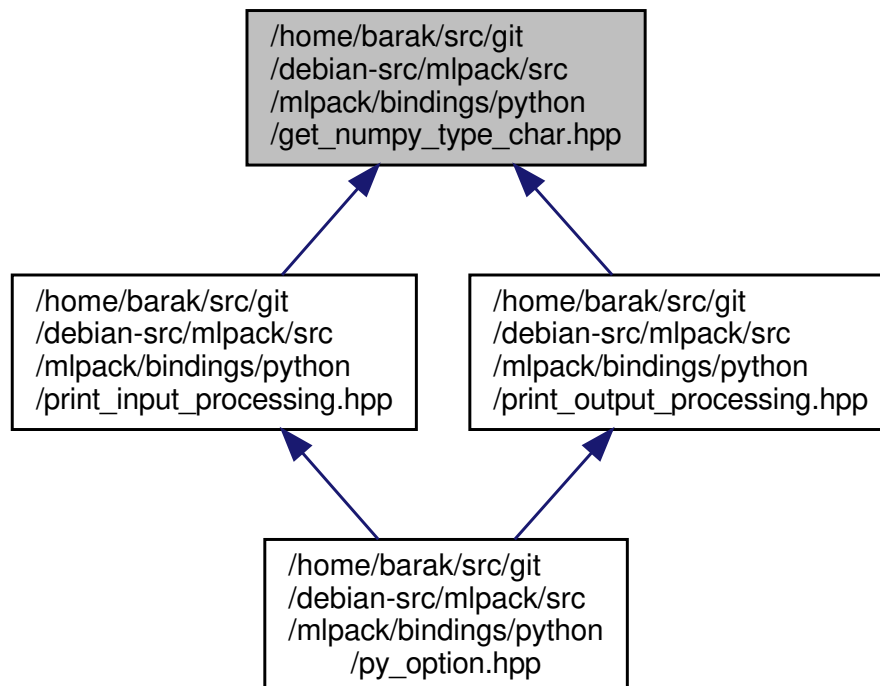

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.173 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/python/get_numpy_type_char.hpp File Reference

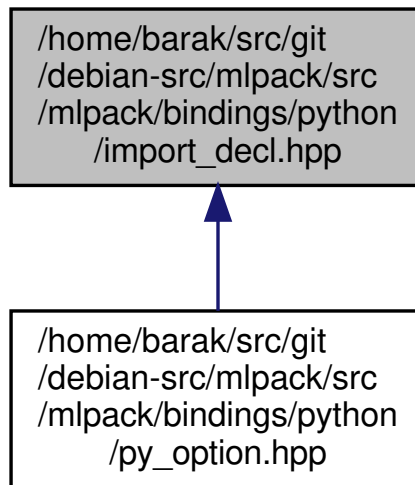

Include dependency graph for get_numpy_type_char.hpp:

This graph shows which files directly or indirectly include this file:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::python**

Functions

- template<typename T >
void **ImportDecl** (const util::ParamData &d, const size_t indent, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)
For a serializable type, print a cppclass definition.
- template<typename T >
void **ImportDecl** (const util::ParamData &, const size_t, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)
For a non-serializable type, print nothing.
- template<typename T >
void **ImportDecl** (const util::ParamData &, const size_t, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)
For a matrix type, print nothing.
- template<typename T >
void **ImportDecl** (const util::ParamData &d, const void *indent, void *)
Print the cppclass definition for a serializable model; print nothing for a non-serializable type.

40.174.1 Detailed Description

Author

Ryan Curtin

For a serializable model, print the class import.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.175 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/python/mlpack/arma_util.hpp File Reference

Include dependency graph for arma_util.hpp:

Functions

- `template<typename T >`
`T::elem_type * GetMemory (T &m)`
Return the matrix's allocated memory pointer, unless the matrix is using its internal preallocated memory, in which case we copy that and return a pointer to the memory we just made.
- `template<typename T >`
`size_t GetMemState (T &t)`
Get the memory state of the given Armadillo object.
- `template<typename T >`
`void SetMemState (T &t, int state)`
Set the memory state of the given Armadillo object.

40.175.1 Detailed Description

Author

Ryan Curtin

Utility function for Cython to set the memory state of an Armadillo object.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.175.2 Function Documentation

40.175.2.1 GetMemory()

```
T::elem_type* GetMemory (
    T & m ) [inline]
```

Return the matrix's allocated memory pointer, unless the matrix is using its internal preallocated memory, in which case we copy that and return a pointer to the memory we just made.

Definition at line 47 of file arma_util.hpp.

40.175.2.2 GetMemState()

```
size_t GetMemState (
    T & t )
```

Get the memory state of the given Armadillo object.

Definition at line 31 of file arma_util.hpp.

40.175.2.3 SetMemState()

```
void SetMemState (
    T & t,
    int state )
```

Set the memory state of the given Armadillo object.

Definition at line 22 of file arma_util.hpp.

40.176 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/python/mlpack/cli_↵
util.hpp File Reference

Include dependency graph for cli_util.hpp:

Namespaces

- **mlpack**
 .hpp
- **mlpack::util**

Functions

- void **DisableBacktrace** ()
 Disable backtraces.
- void **DisableVerbose** ()
 Turn verbose output off.
- void **EnableTimers** ()
 Enable timing.
- void **EnableVerbose** ()
 Turn verbose output on.
- template<typename T >
 T * **GetParamPtr** (const std::string ¶mName)
 Return a pointer.
- template<typename T >
 T & **GetParamWithInfo** (const std::string ¶mName)
 Return the matrix part of a matrix + dataset info parameter.
- void **ResetTimers** ()
 Reset the status of all timers.
- template<typename T >
 void **SetParam** (const std::string &identifier, T &value)
 Set the parameter to the given value.
- template<typename T >
 void **SetParamPtr** (const std::string &identifier, T *value, const bool copy)
 Set the parameter to the given value, given that the type is a pointer.
- template<typename T >
 void **SetParamWithInfo** (const std::string &identifier, T &matrix, const bool *dims)
 Set the parameter (which is a matrix/DatasetInfo tuple) to the given value.

40.176.1 Detailed Description

Author

Ryan Curtin

Simple function to work around Cython's lack of support for lvalue references.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

void **TestArmadilloSerialization** (MatType &x)

40.179 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/python/print_class_↵ defn.hpp File Reference

Include dependency graph for print_class_defn.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::python**

Functions

- template<typename T >
void **PrintClassDefn** (const util::ParamData &, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0)

Non-serializable models don't require any special definitions, so this prints nothing.
- template<typename T >
void **PrintClassDefn** (const util::ParamData &, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)

Matrices don't require any special definitions, so this prints nothing.
- template<typename T >
void **PrintClassDefn** (const util::ParamData &d, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)

Serializable models require a special class definition.
- template<typename T >
void **PrintClassDefn** (const util::ParamData &d, const void *, void *)

Print the class definition to stdout.

40.179.1 Detailed Description

Author

Ryan Curtin

Print the class definition for generating a .pyx binding.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

- **mlpack::bindings::python**

Functions

- `template<typename T >`
`void PrintDefn (const util::ParamData &d, const void *, void *)`
Print the definition for a Python binding parameter to stdout.

40.180.1 Detailed Description

Author

Ryan Curtin

Print the definition of a Python parameter.

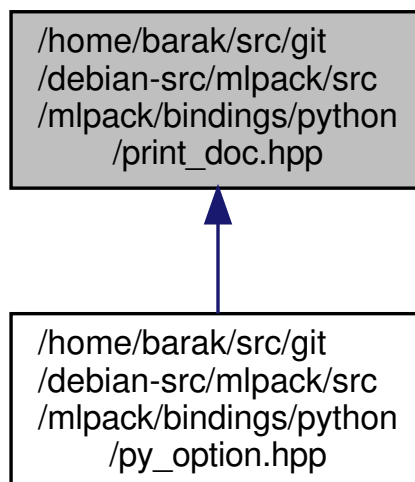

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.181 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/python/print_doc.hpp File Reference

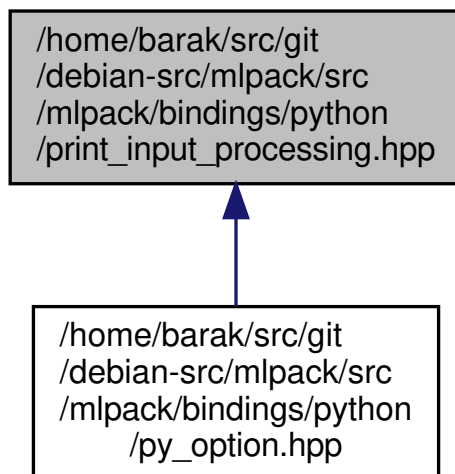

Include dependency graph for `print_doc.hpp`:

This graph shows which files directly or indirectly include this file:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::python**

Functions

- `template<typename T >`
void PrintInputProcessing (const util::ParamData &d, const size_t indent, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)
Print input processing for a standard option type.
- `template<typename T >`
void PrintInputProcessing (const util::ParamData &d, const size_t indent, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0, const typename boost::enable_if< util::IsStdVector< T >>::type *=0)
Print input processing for a vector type.
- `template<typename T >`
void PrintInputProcessing (const util::ParamData &d, const size_t indent, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)
Print input processing for a matrix type.
- `template<typename T >`
void PrintInputProcessing (const util::ParamData &d, const size_t indent, const typename boost::disable_if< util::IsStdVector< T >>::type *=0, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)
Print input processing for a serializable type.

Namespaces

- **mlpack**
 .hpp
- **mlpack::bindings**
- **mlpack::bindings::python**

Functions

- template<typename T >
void **PrintOutputProcessing** (const util::ParamData &d, const size_t indent, const bool onlyOutput, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::disable_if< data::HasSerialize< T >>::type *=0, const typename boost::disable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)

 Print output processing for a regular parameter type.
- template<typename T >
void **PrintOutputProcessing** (const util::ParamData &d, const size_t indent, const bool onlyOutput, const typename boost::enable_if< arma::is_arma_type< T >>::type *=0)

 Print output processing for a matrix type.
- template<typename T >
void **PrintOutputProcessing** (const util::ParamData &d, const size_t indent, const bool onlyOutput, const typename boost::enable_if< std::is_same< T, std::tuple< data::DatasetInfo, arma::mat >>>::type *=0)

 Print output processing for a dataset info / matrix combination.
- template<typename T >
void **PrintOutputProcessing** (const util::ParamData &d, const size_t indent, const bool onlyOutput, const typename boost::disable_if< arma::is_arma_type< T >>::type *=0, const typename boost::enable_if< data::HasSerialize< T >>::type *=0)

 Print output processing for a serializable model.
- template<typename T >
void **PrintOutputProcessing** (const util::ParamData &d, const void *input, void *)

 Given parameter information and the current number of spaces for indentation, print the code to process the output to cout.

40.183.1 Detailed Description

Author

Ryan Curtin

Print the output processing in a Python binding .pyx file for a given parameter.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.184 /home/barak/src/git/debian-src/mlpack/src/mlpack/bindings/python/print_pyx.hpp

File Reference

40.193.1 Detailed Description

Author

Kirill Mishchenko

Tools for extracting meta information about machine learning algorithms.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.194 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/metrics/accuracy.hpp File Reference

Include dependency graph for accuracy.hpp:

Classes

- class **Accuracy**

The **Accuracy** (p. 1127) is a metric of performance for classification algorithms that is equal to a proportion of correctly labeled test items among all ones for given test items.

Namespaces

- **mlpack**
 .hpp
- **mlpack::cv**

40.194.1 Detailed Description

Author

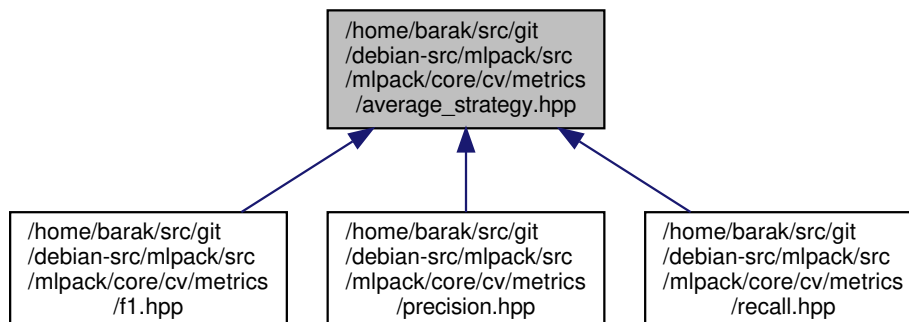

Kirill Mishchenko

The accuracy metric.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.195 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/metrics/average_strategy.hpp File Reference

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::cv**

Enumerations

- enum **AverageStrategy** {
 Binary,
 Micro,
 Macro }

This enum declares possible strategies for averaging that can be used in some metrics like precision, recall, and F1.

40.195.1 Detailed Description

Author

Kirill Mishchenko

Strategies for averaging.

40.196 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/metrics/f1.hpp File Reference

Include dependency graph for f1.hpp:

Classes

- class **F1** < **AS**, **PositiveClass** >

F1 (p. 1132) is a metric of performance for classification algorithms that for binary classification is equal to $2 * precision * recall / (precision + recall)$.

Namespaces

- **mlpack**
 .hpp
- **mlpack::cv**

40.196.1 Detailed Description

Author

Kirill Mishchenko

The F1 metric.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.197 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/metrics/facilities.hpp File Reference

Include dependency graph for facilities.hpp:

Namespaces

- **mlpack**
 .hpp
- **mlpack::cv**

Functions

- `template<typename DataType >`
 void **AssertSizes** (const DataType &data, const arma::Row< size_t > &labels, const std::string &caller↵
 Description)
 Assert there is the same number of the given data points and labels.

40.197.1 Detailed Description

Author

Kirill Mishchenko

Functionality that is used more than in one metric.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.198 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/metrics/mse.hpp File Reference

Include dependency graph for mse.hpp:

Classes

- class **MSE**

The MeanSquaredError is a metric of performance for regression algorithms that is equal to the mean squared error between predicted values and ground truth (correct) values for given test items.

Namespaces

- **mlpack**
 .hpp
- **mlpack::cv**

40.198.1 Detailed Description

Author

Kirill Mishchenko

The mean squared error (MSE).

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.199 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/metrics/precision.hpp File Reference

Include dependency graph for precision.hpp:

Classes

- class **Precision**< **AS**, **PositiveClass** >

Precision (p. 1145) is a metric of performance for classification algorithms that for binary classification is equal to $tp / (tp + fp)$, where tp and fp are the numbers of true positives and false positives respectively.

Namespaces

- **mlpack**
 .hpp
- **mlpack::cv**

40.199.1 Detailed Description

Author

Kirill Mishchenko

The precision metric.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.200 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/metrics/recall.hpp File Reference

Include dependency graph for recall.hpp:

Classes

- class **Recall**< **AS**, **PositiveClass** >

Recall (p. 1147) is a metric of performance for classification algorithms that for binary classification is equal to $tp / (tp + fn)$, where tp and fn are the numbers of true positives and false negatives respectively.

Namespaces

- **mlpack**
 .hpp
- **mlpack::cv**

40.200.1 Detailed Description

Author

Kirill Mishchenko

The recall metric.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.201 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/cv/simple_cv.hpp File Reference

Include dependency graph for simple_cv.hpp:

Classes

- class **SimpleCV**< **MLAlgorithm**, **Metric**, **MatType**, **PredictionsType**, **WeightsType** >

SimpleCV (p. 1151) splits data into two sets - training and validation sets - and then runs training on the training set and evaluates performance on the validation set.

Namespaces

- **mlpack**
 .hpp
- **mlpack::cv**

40.204 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/dataset_mapper.hpp File Reference

Include dependency graph for dataset_mapper.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **DatasetMapper**< **PolicyType**, **InputType** >
Auxiliary information for a dataset, including mappings to/from strings (or other types) and the datatype of each dimension.

Namespaces

- **mlpack**
.hpp
- **mlpack::data**
Functions to load and save matrices and models.

Typedefs

- using **DatasetInfo** = DatasetMapper< data::IncrementPolicy >

40.204.1 Detailed Description

Author

Ryan Curtin
 Keon Kim

Defines the DatasetMapper class, which holds information about a dataset. This is useful when the dataset contains categorical non-numeric features that needs to be mapped to categorical numeric features.

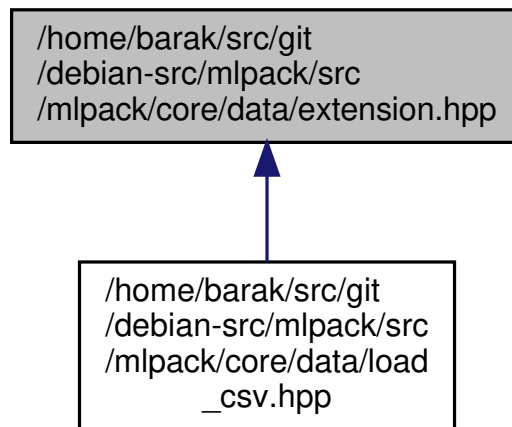

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.205 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/extension.hpp File Reference

Include dependency graph for extension.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::data**
 Functions to load and save matrices and models.

Functions

- std::string **Extension** (const std::string &filename)

40.205.1 Detailed Description

Author

Ryan Curtin

Given a filename, extract its extension. This is used by **data::Load()** (p. 379) and **data::Save()** (p. 386).

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.206 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/format.hpp File Reference

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::data**

Functions to load and save matrices and models.

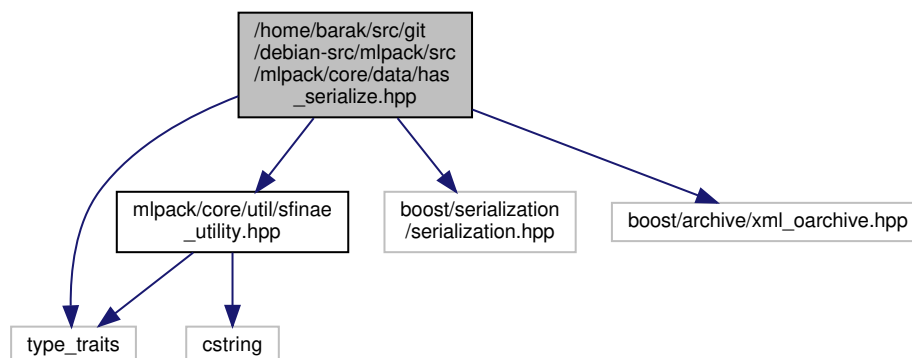

Enumerations

- enum **format** {
 autodetect,
 text,
 xml,
 binary }

*Define the formats we can read through **boost::serialization** (p. 251).*

40.207 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/has_serialize.hpp File Reference

Include dependency graph for has_serialize.hpp:

This graph shows which files directly or indirectly include this file:

40.211 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/imputation_methods/median_imputation.hpp File Reference

Include dependency graph for median_imputation.hpp:

Classes

- class **MedianImputation**< **T** >
This is a class implementation of simple median imputation.

Namespaces

- **mlpack**
.hpp
- **mlpack::data**
Functions to load and save matrices and models.

40.211.1 Detailed Description

Author

Keon Kim

Definition and Implementation of the MedianImputation class.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.212 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/imputer.hpp File Reference

Include dependency graph for imputer.hpp:

- `template<typename T>`
`bool IsNaNInf (T &val, const std::string &token)`

40.213.1 Detailed Description

Ryan Curtin

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.214 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/load.hpp File Reference

- **mlpack**
 .hpp
- **mlpack::data**

Generated by Doxygen

Functions

- `template<typename eT >`
`bool Load` (const std::string &filename, arma::Mat< eT > &matrix, const bool fatal=false, const bool transpose=true)
Loads a matrix from file, guessing the filetype from the extension.
- `template<typename eT >`
`bool Load` (const std::string &filename, arma::Col< eT > &vec, const bool fatal=false)
Don't document these with doxygen; these declarations aren't helpful to users.
- `template<typename eT >`
`bool Load` (const std::string &filename, arma::Row< eT > &rowvec, const bool fatal=false)
Load a row vector from a file, guessing the filetype from the extension.
- `template<typename eT, typename PolicyType >`
`bool Load` (const std::string &filename, arma::Mat< eT > &matrix, DatasetMapper< PolicyType > &info, const bool fatal=false, const bool transpose=true)
*Loads a matrix from a file, guessing the filetype from the extension and mapping categorical features with a **DatasetMapper** (p. 1172) object.*
- `template<typename T >`
`bool Load` (const std::string &filename, const std::string &name, T &t, const bool fatal=false, format f=format::autodetect)
Don't document these with doxygen; they aren't helpful for users to know about.

40.214.1 Detailed Description

Author

Ryan Curtin

Load an Armadillo matrix from file. This is necessary because Armadillo does not transpose matrices on input, and it allows us to give better error output.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.215 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/load_arff.hpp File Reference

Include dependency graph for load_arff.hpp:

Namespaces

- **mlpack**
 .hpp
- **mlpack::data**
 Functions to load and save matrices and models.

Functions

- template<typename eT >
 void **LoadARFF** (const std::string &filename, arma::Mat< eT > &matrix)
 A utility function to load an ARFF dataset as numeric features (that is, as an Armadillo matrix without any modification).
- template<typename eT, typename PolicyType >
 void **LoadARFF** (const std::string &filename, arma::Mat< eT > &matrix, DatasetMapper< PolicyType > &info)
 A utility function to load an ARFF dataset as numeric and categorical features, using the DatasetInfo structure for mapping.

40.215.1 Detailed Description

Author

Ryan Curtin

Load an ARFF dataset.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.216 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/load_csv.hpp File Reference

Include dependency graph for load_csv.hpp:

Classes

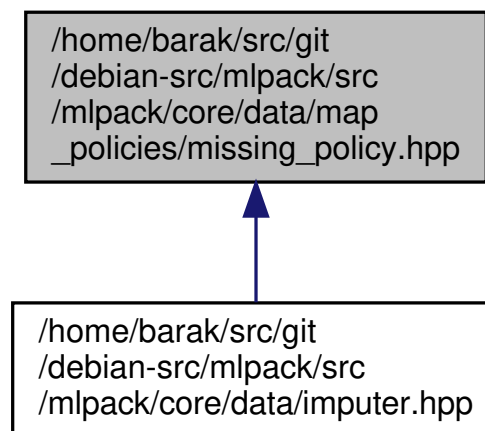

- class **LoadCSV**
 Load the csv file. This class use boost::spirit to implement the parser, please refer to following link <http://theboostcpplibraries.com/boost.spirit> for quick review.

40.219 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/map_policies/missing_policy.hpp File Reference

Include dependency graph for missing_policy.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **MissingPolicy**

MissingPolicy (p. 1193) is used as a helper class for *DatasetMapper* (p. 1172).

Namespaces

- **mlpack**
 .hpp
- **mlpack::data**

Functions to load and save matrices and models.

40.219.1 Detailed Description

Author

Keon Kim

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

Author

Keon Kim

Missing map policy for dataset info.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.220 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/normalize_labels.hpp File Reference

Include dependency graph for normalize_labels.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::data**

Functions to load and save matrices and models.

Functions

- template<typename eT , typename RowType >
 void **NormalizeLabels** (const RowType &labelsIn, arma::Row< size_t > &labels, arma::Col< eT > &mapping)
Given a set of labels of a particular datatype, convert them to unsigned labels in the range [0, n) where n is the number of different labels.
- template<typename eT >
 void **RevertLabels** (const arma::Row< size_t > &labels, const arma::Col< eT > &mapping, arma::Row< eT > &labelsOut)
Given a set of labels that have been mapped to the range [0, n), map them back to the original labels given by the 'mapping' vector.

40.220.1 Detailed Description

Author

Ryan Curtin

Often labels are not given as {0, 1, 2, ...} but instead {1, 2, ...} or even {-1, 1} or otherwise. The purpose of this function is to normalize labels to {0, 1, 2, ...} and provide a mapping back to those labels.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.221 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/one_hot_encoding.hpp File Reference

Include dependency graph for one_hot_encoding.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- mlpack**
 .hpp
- mlpack::data**
Functions to load and save matrices and models.

Functions

- `template<typename eT , typename RowType >`
`void OneHotEncoding (const RowType &labelsIn, arma::Mat< eT > &output)`

Given a set of labels of a particular datatype, convert them to binary vector.

40.221.1 Detailed Description

Author

Jeffin Sam

One hot encoding functions. The purpose of this function is to convert categorical variables to binary vectors.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpac. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.222 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/save.hpp File Reference

Include dependency graph for save.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::data**

Functions to load and save matrices and models.

Functions

- `template<typename eT >`
`bool Save (const std::string &filename, const arma::Mat< eT > &matrix, const bool fatal=false, bool transpose=true)`
Saves a matrix to file, guessing the filetype from the extension.
- `template<typename T >`
`bool Save (const std::string &filename, const std::string &name, T &t, const bool fatal=false, format f=format_↵::autodetect)`
Saves a model to file, guessing the filetype from the extension, or, optionally, saving the specified format.

40.222.1 Detailed Description

Author

Ryan Curtin

Save an Armadillo matrix to file. This is necessary because Armadillo does not transpose matrices upon saving, and it allows us to give better error output.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.↵org/licenses/BSD-3-Clause> for more information.

40.223 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/data/serialization_template_↵_version.hpp File Reference

This graph shows which files directly or indirectly include this file:

Macros

- `#define BOOST_TEMPLATE_CLASS_VERSION(SIGNATURE, T, N)`
*Use this like **BOOST_CLASS_VERSION**() (p. 2953), but for templated classes.*

40.223.1 Detailed Description

Author

Ryan Curtin

A better version of the **BOOST_CLASS_VERSION**() (p. 2953) macro that supports templated classes.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.↵org/licenses/BSD-3-Clause> for more information.

Functions

- `template<typename T , typename U >`
`void Split (const arma::Mat< T > &input, const arma::Row< U > &inputLabel, arma::Mat< T > &trainData, arma::Mat< T > &testData, arma::Row< U > &trainLabel, arma::Row< U > &testLabel, const double testRatio)`
Given an input dataset and labels, split into a training set and test set.
- `template<typename T >`
`void Split (const arma::Mat< T > &input, arma::Mat< T > &trainData, arma::Mat< T > &testData, const double testRatio)`
Given an input dataset, split into a training set and test set.
- `template<typename T , typename U >`
`std::tuple< arma::Mat< T >, arma::Mat< T >, arma::Row< U >, arma::Row< U > > Split (const arma::Mat< T > &input, const arma::Row< U > &inputLabel, const double testRatio)`
Given an input dataset and labels, split into a training set and test set.
- `template<typename T >`
`std::tuple< arma::Mat< T >, arma::Mat< T > > Split (const arma::Mat< T > &input, const double testRatio)`
Given an input dataset, split into a training set and test set.

40.224.1 Detailed Description

Author

Tham Ngap Wei, Keon Kim

Defines **Split()** (p. 389), a utility function to split a dataset into a training set and a test set.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.225 `/home/barak/src/git/debian-src/mlpack/src/mlpack/core/dists/diagonal_gaussian_distribution.hpp` File Reference

Include dependency graph for `diagonal_gaussian_distribution.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **DiagonalGaussianDistribution**
A single multivariate Gaussian distribution with diagonal covariance.

Namespaces

- mlpack**
.hpp
- mlpack::distribution**
Probability distributions.

40.225.1 Detailed Description

Author

Kim SangYeon

Implementation of the Gaussian distribution with diagonal covariance.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.226 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/dists/discrete_distribution.hpp File Reference

Include dependency graph for discrete_distribution.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **DiscreteDistribution**
A discrete distribution where the only observations are discrete observations.

Namespaces

- **mlpack**
 .hpp
- **mlpack::distribution**
 Probability distributions.

40.227.1 Detailed Description

Author

Yannis Mentekidis
 Rohan Raj

Implementation of a Gamma distribution of multidimensional data that fits gamma parameters (alpha, beta) to data. The fitting is done independently for each dataset dimension (row), based on the assumption each dimension is fully independent.

Based on "Estimating a Gamma Distribution" by Thomas P. Minka: research.microsoft.com/~minka/papers/minka-gamma.pdf

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.228 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/dists/gaussian_distribution.hpp File Reference

Include dependency graph for gaussian_distribution.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **GaussianDistribution**
 A single multivariate Gaussian distribution.

Namespaces

- **mlpack**
 .hpp
- **mlpack::distribution**
 Probability distributions.

40.228.1 Detailed Description

Author

Ryan Curtin
Michael Fox

Implementation of the Gaussian distribution.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.229 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/dists/laplace_distribution.hpp File Reference

This graph shows which files directly or indirectly include this file:

Classes

- class **LaplaceDistribution**
 The multivariate Laplace distribution centered at 0 has pdf.

Namespaces

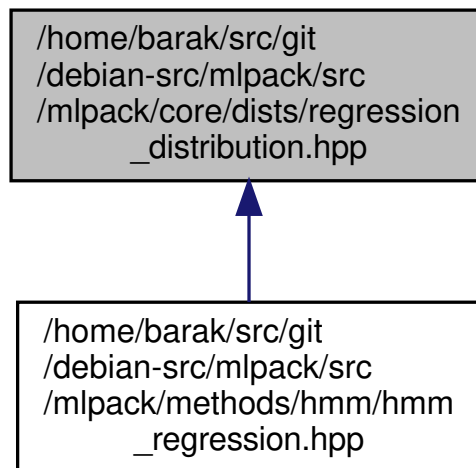

- **mlpack**
 .hpp
- **mlpack::distribution**
 Probability distributions.

40.230 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/dists/regression_distribution.hpp File Reference

Include dependency graph for regression_distribution.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RegressionDistribution**

A class that represents a univariate conditionally Gaussian distribution.

Namespaces

- **mlpack**
.hpp
- **mlpack::distribution**
Probability distributions.

40.230.1 Detailed Description

Author

Michael Fox

Implementation of conditional Gaussian distribution for HMM regression (HMMR).

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.231 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/hpt/cv_function.hpp File Reference

Include dependency graph for cv_function.hpp:

Classes

- class **CVFunction**< **CVType**, **MLAlgorithm**, **TotalArgs**, **BoundArgs** >

This wrapper serves for adapting the interface of the cross-validation classes to the one that can be utilized by the mlpack optimizers.

Namespaces

- **mlpack**
 .hpp
- **mlpack::hpt**

40.231.1 Detailed Description

Author

Kirill Mishchenko

A cross-validation wrapper for optimizers.

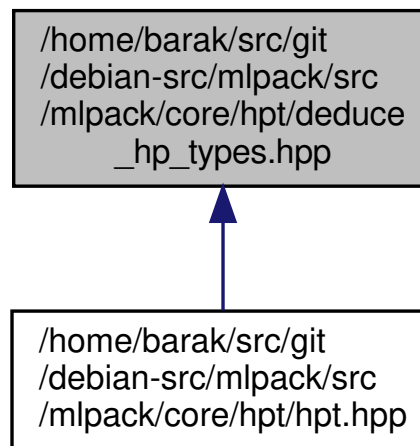

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.232 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/hpt/deduce_hp_types.hpp File Reference

Include dependency graph for deduce_hp_types.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- struct **DeduceHyperParameterTypes**< Args >
A type function for deducing types of hyper-parameters from types of arguments in the Optimize method in **HyperParameterTuner** (p. 1375).
- struct **DeduceHyperParameterTypes**< Args >::ResultHolder< HPTypes >
- struct **DeduceHyperParameterTypes**< PreFixedArg< T >, Args... >
Defining **DeduceHyperParameterTypes** (p. 1365) for the case when not all argument types have been processed, and the next one is the type of an argument that should be fixed.
- struct **DeduceHyperParameterTypes**< PreFixedArg< T >, Args... >::ResultHolder< HPTypes >
- struct **DeduceHyperParameterTypes**< T, Args... >
Defining **DeduceHyperParameterTypes** (p. 1365) for the case when not all argument types have been processed, and the next one (T) is a collection type or an arithmetic type.
- struct **DeduceHyperParameterTypes**< T, Args... >::IsCollectionType< Type >
A type function to check whether Type is a collection type (for that it should define value_type).
- struct **DeduceHyperParameterTypes**< T, Args... >::ResultHolder< HPTypes >
- struct **DeduceHyperParameterTypes**< T, Args... >::ResultHPType< ArgumentType, IsArithmetic >
A type function to deduce the result hyper-parameter type for ArgumentType.
- struct **DeduceHyperParameterTypes**< T, Args... >::ResultHPType< ArithmeticType, true >
- struct **DeduceHyperParameterTypes**< T, Args... >::ResultHPType< CollectionType, false >

Namespaces

- **mlpack**
 .hpp
- **mlpack::hpt**

Typedefs

- `template<typename... Args>`
 using **TupleOfHyperParameters** = typename DeduceHyperParameterTypes< Args... >::TupleType
 *A short alias for deducing types of hyper-parameters from types of arguments in the Optimize method in **HyperParameterTuner** (p. 1375).*

40.232.1 Detailed Description

Author

Kirill Mishchenko

Tools to deduce types of hyper-parameters from types of arguments in the Optimize method in HyperParameterTuner.

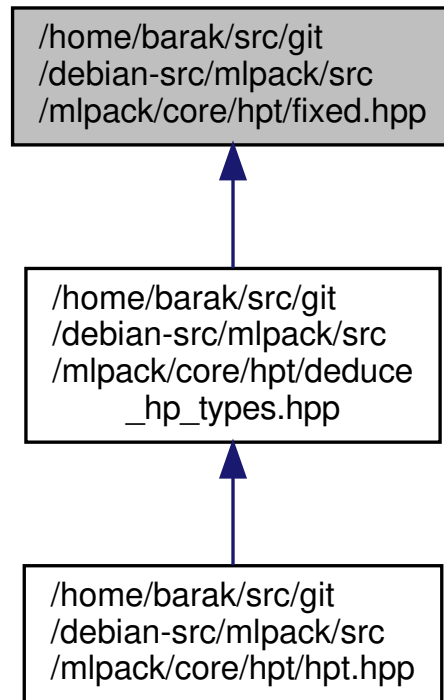

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.233 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/hpt/fixed.hpp File Reference

Include dependency graph for fixed.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- struct **FixedArg**< T, I >
A struct for storing information about a fixed argument.
- class **IsPreFixedArg**< T >
*A type function for checking whether the given type is **PreFixedArg** (p. 1381).*
- struct **PreFixedArg**< T >
*A struct for marking arguments as ones that should be fixed (it can be useful for the Optimize method of **Hyper↔ParameterTuner** (p. 1375)).*
- struct **PreFixedArg**< T >
*A struct for marking arguments as ones that should be fixed (it can be useful for the Optimize method of **Hyper↔ParameterTuner** (p. 1375)).*
- struct **PreFixedArg**< T & >
The specialization of the template for references.

Namespaces

- **mlpack**
.hpp
- **mlpack::hpt**

Functions

- `template<typename T>`
`PreFixedArg< T > Fixed (T &&value)`
Mark the given argument as one that should be fixed.

40.233.1 Detailed Description

Author

Kirill Mishchenko

Facilities for supporting fixed arguments.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.234 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/hpt/hpt.hpp File Reference

Include dependency graph for hpt.hpp:

Classes

- class **HyperParameterTuner**< **MLAlgorithm**, **Metric**, **CV**, **OptimizerType**, **MatType**, **PredictionsType**, **WeightsType** >
*The class **HyperParameterTuner** (p. 1375) for the given **MLAlgorithm** utilizes the provided **Optimizer** to find the values of hyper-parameters that optimize the value of the given **Metric**.*

Namespaces

- **mlpack**
`.hpp`
- **mlpack::hpt**

40.235 /home/barak/src/git/debian-src/mlpack/doc/guide/hpt.hpp File Reference

Namespaces

- **mlpack**
 .hpp
- **mlpack::hpt**

40.236 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/cauchy_kernel.hpp File Reference

Include dependency graph for `cauchy_kernel.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **CauchyKernel**
 The Cauchy kernel.
- class **KernelTraits< CauchyKernel >**
 Kernel traits for the Cauchy kernel.

Namespaces

- **mlpack**
 .hpp
- **mlpack::kernel**
 Kernel functions.

The diagram illustrates the structure of a research project titled "Research Project: Exploring the Impact of Digital Marketing on Consumer Behavior". The project is organized into a hierarchical structure with main branches and sub-topics.

Main Branches:

- Introduction**
 - Background and Significance
 - Research Objectives and Scope
 - Thesis Statement
- Literature Review**
 - Digital Marketing Strategies
 - Consumer Behavior Theories
 - Previous Research Findings
 - Research Gaps and Contributions
- Methodology**
 - Research Design
 - Sampling Method
 - Data Collection Methods
 - Measurement Instruments
 - Data Analysis Techniques
- Data Collection**
 - Survey Design and Distribution
 - Interviews and Focus Groups
 - Secondary Data Sources
 - Data Cleaning and Preparation
- Analysis**
 - Descriptive Statistics
 - Correlation Analysis
 - Regression Analysis
 - Mediation and Moderation Analysis
 - Qualitative Data Analysis
- Results**
 - Demographic Characteristics
 - Descriptive Statistics of Variables
 - Correlation Results
 - Regression Results
 - Mediation and Moderation Results
 - Qualitative Findings
- Discussion**
 - Interpretation of Results
 - Implications for Theory and Practice
 - Limitations and Future Research
- Conclusion**
 - Summary of Findings
 - Final Thoughts and Recommendations

The diagram shows a complex network of relationships between these main branches and their sub-topics, with some sub-topics further branching out into more detailed sub-topics, indicating a highly structured and comprehensive research project.

[illegible]

- class **GaussianKernel**
The standard Gaussian kernel.
- class **KernelTraits**< **GaussianKernel** >
Kernel traits for the Gaussian kernel.

- **mlpack**
.hpp
- **mlpack::kernel**
Kernel functions.

40.241 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/hyperbolic_tangent_↵
_kernel.hpp File Reference

Include dependency graph for hyperbolic_tangent_kernel.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **HyperbolicTangentKernel**
Hyperbolic tangent kernel.

Namespaces

- **mlpack**
.hpp
- **mlpack::kernel**
Kernel functions.

40.241.1 Detailed Description

Author

Ajinkya Kale kaleajinkya@gmail.com

Implementation of the hyperbolic tangent kernel.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.242 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/kernel_traits.hpp File Reference

This graph shows which files directly or indirectly include this file:

Classes

- class **KernelTraits**< **KernelType** >
This is a template class that can provide information about various kernels.

Namespaces

- **mlpack**
.hpp
- **mlpack::kernel**
Kernel functions.

40.242.1 Detailed Description

Author

Ryan Curtin

This provides the KernelTraits class, a template class to get information about various kernels.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.243 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/laplacian_kernel.hpp File Reference

Include dependency graph for laplacian_kernel.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **KernelTraits**< **LaplacianKernel** >
Kernel traits of the Laplacian kernel.
- class **LaplacianKernel**
The standard Laplacian kernel.

Namespaces

- **mlpack**
.hpp
- **mlpack::kernel**
Kernel functions.

40.243.1 Detailed Description

Author

Ajinkya Kale kaleajinkya@gmail.com

Implementation of the Laplacian kernel (LaplacianKernel).

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.244 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/linear_kernel.hpp File Reference

Include dependency graph for linear_kernel.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **LinearKernel**
The simple linear kernel (dot product).

Namespaces

- **mlpack**
.hpp
- **mlpack::kernel**
Kernel functions.

40.244.1 Detailed Description

Author

Wei Guan
James Cline
Ryan Curtin

Implementation of the linear kernel (just the standard dot product).

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.245 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/polynomial_kernel.hpp File Reference

Include dependency graph for polynomial_kernel.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::kernel**
 Kernel functions.

40.246.1 Detailed Description

Author

Ryan Curtin

Implementation of the p-spectrum string kernel, created for use with FastMKS. Instead of passing a data matrix to FastMKS which stores the kernels, pass a one-dimensional data matrix (data vector) to FastMKS which stores indices of strings; then, the actual strings are given to the PSpectrumStringKernel at construction time, and the kernel knows to map the indices to actual strings.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.247 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/spherical_kernel.hpp File Reference

Include dependency graph for spherical_kernel.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **KernelTraits< SphericalKernel >**
 Kernel traits for the spherical kernel.
- class **SphericalKernel**
 The spherical kernel, which is 1 when the distance between the two argument points is less than or equal to the bandwidth, or 0 otherwise.

Namespaces

- **mlpack**
.hpp
- **mlpack::kernel**
Kernel functions.

40.247.1 Detailed Description

Author

Neil Slagle

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.248 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/kernels/triangular_kernel.hpp File Reference

Include dependency graph for triangular_kernel.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **KernelTraits< TriangularKernel >**
Kernel traits for the triangular kernel.
- class **TriangularKernel**
The trivially simple triangular kernel, defined by.

Namespaces

- **mlpack**
.hpp
- **mlpack::kernel**
Kernel functions.

40.248.1 Detailed Description

Author

Ryan Curtin

Definition and implementation of the trivially simple triangular kernel.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.249 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/math/ccov.hpp File Reference

Include dependency graph for ccov.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
.hpp
- **mlpack::math**
Miscellaneous math routines.

Functions

- `template<typename eT >`
`arma::Mat< eT > ColumnCovariance (const arma::Mat< eT > &A, const size_t norm_type=0)`
- `template<typename T >`
`arma::Mat< std::complex< T > > ColumnCovariance (const arma::Mat< std::complex< T > > &A, const size_t norm_type=0)`

40.249.1 Detailed Description

Author

Ryan Curtin
 Conrad Sanderson

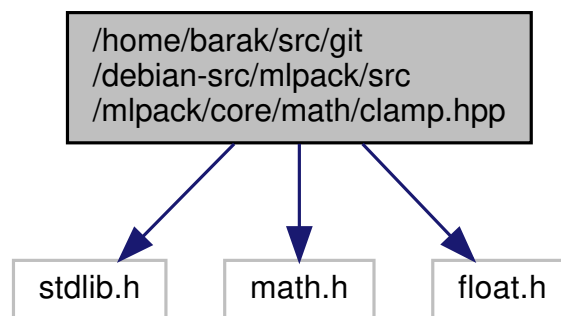

`ColumnCovariance(X)` is same as `cov(trans(X))` but without the cost of computing `trans(X)`

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.250 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/math/clamp.hpp File Reference

Miscellaneous math clamping routines.

Include dependency graph for `clamp.hpp`:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::math**
 Miscellaneous math routines.

Functions

- double **ClampNonNegative** (const double d)
 Forces a number to be non-negative, turning negative numbers into zero.
- double **ClampNonPositive** (const double d)
 Forces a number to be non-positive, turning positive numbers into zero.
- double **ClampRange** (double value, const double rangeMin, const double rangeMax)
 Clamp a number between a particular range.

40.250.1 Detailed Description

Miscellaneous math clamping routines.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.251 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/math/columns_to_blocks.hpp File Reference

Include dependency graph for columns_to_blocks.hpp:

Classes

- class **ColumnsToBlocks**
 Transform the columns of the given matrix into a block format.

Namespaces

- **mlpack**
 .hpp
- **mlpack::math**
 Miscellaneous math routines.

Functions

- void **Center** (const arma::mat &x, arma::mat &xCentered)
Creates a centered matrix, where centering is done by subtracting the sum over the columns (a column vector) from each column of the matrix.
- void **Orthogonalize** (const arma::mat &x, arma::mat &W)
Orthogonalize x and return the result in W, using eigendecomposition.
- void **Orthogonalize** (arma::mat &x)
Orthogonalize x in-place.
- void **RandVector** (arma::vec &v)
Overwrites a dimension-N vector to a random vector on the unit sphere in R^N .
- void **RemoveRows** (const arma::mat &input, const std::vector< size_t > &rowsToRemove, arma::mat &output)
Remove a certain set of rows in a matrix while copying to a second matrix.
- template<typename T >
T **Sign** (const T x)
Signum function.
- void **Smat** (const arma::vec &input, arma::mat &output)
The inverse of Svec.
- void **Svec** (const arma::mat &input, arma::vec &output)
Upper triangular representation of a symmetric matrix, scaled such that, $\text{dot}(\text{Svec}(A), \text{Svec}(B)) == \text{dot}(A, B)$ for symmetric A, B .
- void **Svec** (const arma::sp_mat &input, arma::sp_vec &output)
- size_t **SvecIndex** (size_t i, size_t j, size_t n)
*Return the index such that $A[i,j] == \text{factr}(i, j) * \text{svec}(A)[\text{pos}(i, j)]$, where $\text{factr}(i, j) = \sqrt{2}$ if $i \neq j$ and 1 otherwise.*
- void **SymKronId** (const arma::mat &A, arma::mat &op)
If A is a symmetric matrix, then SymKronId returns an operator Op such that.
- void **VectorPower** (arma::vec &vec, const double power)
Auxiliary function to raise vector elements to a specific power.
- void **WhitenUsingEig** (const arma::mat &x, arma::mat &xWhitened, arma::mat &whiteningMatrix)
Whitens a matrix using the eigendecomposition of the covariance matrix.
- void **WhitenUsingSVD** (const arma::mat &x, arma::mat &xWhitened, arma::mat &whiteningMatrix)
Whitens a matrix using the singular value decomposition of the covariance matrix.

40.252.1 Detailed Description

Author

Nishant Mehta

Linear algebra utilities.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.253 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/math/log_add.hpp File Reference

Include dependency graph for log_add.hpp:

Namespaces

- **mlpack**
 .hpp
- **mlpack::math**
 Miscellaneous math routines.

Functions

- template<typename T >
 T::elem_type **AccuLog** (const T &x)
 Sum a vector of log values.
- template<typename T >
 T **LogAdd** (T x, T y)
 Internal log-addition.

40.253.1 Detailed Description

Author

Arash Abghari

Functions for logarithmic addition.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.254 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/math/make_alias.hpp File Reference

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
.hpp
- **mlpack::math**
Miscellaneous math routines.

Functions

- `template<typename ElemType >`
`void ClearAlias (arma::Mat< ElemType > &mat)`
Clear an alias so that no data is overwritten.
- `template<typename ElemType >`
`void ClearAlias (arma::SpMat< ElemType > &)`
Clear an alias for a sparse matrix.
- `template<typename ElemType >`
`arma::Cube< ElemType > MakeAlias (arma::Cube< ElemType > &input, const bool strict=true)`
Make an alias of a dense cube.
- `template<typename ElemType >`
`arma::Mat< ElemType > MakeAlias (arma::Mat< ElemType > &input, const bool strict=true)`
Make an alias of a dense matrix.
- `template<typename ElemType >`
`arma::Row< ElemType > MakeAlias (arma::Row< ElemType > &input, const bool strict=true)`
Make an alias of a dense row.
- `template<typename ElemType >`
`arma::Col< ElemType > MakeAlias (arma::Col< ElemType > &input, const bool strict=true)`
Make an alias of a dense column.
- `template<typename ElemType >`
`arma::SpMat< ElemType > MakeAlias (const arma::SpMat< ElemType > &input, const bool=true)`
Make a copy of a sparse matrix (an alias is not possible).
- `template<typename ElemType >`
`arma::SpRow< ElemType > MakeAlias (const arma::SpRow< ElemType > &input, const bool=true)`
Make a copy of a sparse row (an alias is not possible).
- `template<typename ElemType >`
`arma::SpCol< ElemType > MakeAlias (const arma::SpCol< ElemType > &input, const bool=true)`
Make a copy of a sparse column (an alias is not possible).

40.254.1 Detailed Description

Author

Ryan Curtin

Make an alias of a matrix. For sparse matrices, unfortunately no alias can be made and a copy must be incurred.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.255 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/math/random.hpp File Reference

Miscellaneous math random-related routines.

Include dependency graph for random.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::math**
 Miscellaneous math routines.

Functions

- void **FixedRandomSeed** ()
 Set the random seed to a fixed number.
- void **ObtainDistinctSamples** (const size_t loInclusive, const size_t hiExclusive, const size_t maxNumSamples, arma::uvec &distinctSamples)
 Obtains no more than maxNumSamples distinct samples.
- double **RandBernoulli** (const double input)
 Generates a 0/1 specified by the input.
- int **RandInt** (const int hiExclusive)
 Generates a uniform random integer.
- int **RandInt** (const int lo, const int hiExclusive)
 Generates a uniform random integer.
- double **RandNormal** ()
 Generates a normally distributed random number with mean 0 and variance 1.
- double **RandNormal** (const double mean, const double variance)
 Generates a normally distributed random number with specified mean and variance.
- double **Random** ()
 Generates a uniform random number between 0 and 1.
- double **Random** (const double lo, const double hi)
 Generates a uniform random number in the specified range.
- void **RandomSeed** (const size_t seed)
 Set the random seed used by the random functions (**Random()** (p. 418) and **RandInt()** (p. 417)).

Variables

- `MLPACK_EXPORT std::mt19937 randGen`
MLPACK_EXPORT is required for global variables; it exports the symbols correctly on Windows.
- `MLPACK_EXPORT std::normal_distribution randNormalDist`
- `MLPACK_EXPORT std::uniform_real_distribution randUniformDist`

40.255.1 Detailed Description

Miscellaneous math random-related routines.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.256 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/math/random_basis.hpp File Reference

Include dependency graph for `random_basis.hpp`:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
.hpp
- **mlpack::math**
Miscellaneous math routines.

Functions

- `void RandomBasis(arma::mat &basis, const size_t d)`
Create a random d-dimensional orthogonal basis, storing it in the given matrix.

40.256.1 Detailed Description

Author

Ryan Curtin

Generate a random d-dimensional basis.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.257 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/math/range.hpp File Reference

Definition of the Range class, which represents a simple range with a lower and upper bound.

Include dependency graph for range.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RangeType**< T >
Simple real-valued range.
- class **RangeType**< T >
Simple real-valued range.

Namespaces

- **mlpack**
 .hpp
- **mlpack::math**
 Miscellaneous math routines.

Typedefs

- typedef RangeType< double > **Range**
 3.0.0 TODO: break reverse-compatibility by changing **RangeType** (p. 1549) to **Range**.

40.257.1 Detailed Description

Definition of the Range class, which represents a simple range with a lower and upper bound.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.258 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/math/round.hpp File Reference

This graph shows which files directly or indirectly include this file:

40.258.1 Detailed Description

Author

Ryan Curtin

Implementation of round() for use on Visual Studio, where C99 isn't implemented.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.259 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/math/shuffle_data.hpp File Reference

Include dependency graph for shuffle_data.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::math**
 Miscellaneous math routines.

Functions

- template<typename MatType , typename LabelsType >
 void **ShuffleData** (const MatType &inputPoints, const LabelsType &inputLabels, MatType &outputPoints, LabelsType &outputLabels, const **std::enable_if_t**<!arma::is_SpMat< MatType >::value > *=0, const **std::enable_if_t**<!arma::is_Cube< MatType >::value > *=0)
 Shuffle a dataset and associated labels (or responses).
- template<typename MatType , typename LabelsType >
 void **ShuffleData** (const MatType &inputPoints, const LabelsType &inputLabels, MatType &outputPoints, LabelsType &outputLabels, const **std::enable_if_t**< arma::is_SpMat< MatType >::value > *=0, const **std::enable_if_t**<!arma::is_Cube< MatType >::value > *=0)
 Shuffle a sparse dataset and associated labels (or responses).
- template<typename MatType , typename LabelsType >
 void **ShuffleData** (const MatType &inputPoints, const LabelsType &inputLabels, MatType &outputPoints, LabelsType &outputLabels, const **std::enable_if_t**<!arma::is_SpMat< MatType >::value > *=0, const **std::enable_if_t**< arma::is_Cube< MatType >::value > *=0, const **std::enable_if_t**< arma::is_Cube< LabelsType >::value > *=0)
 Shuffle a cube-shaped dataset and associated labels (or responses) which are also cube-shaped.
- template<typename MatType , typename LabelsType , typename WeightsType >
 void **ShuffleData** (const MatType &inputPoints, const LabelsType &inputLabels, const WeightsType &inputWeights, MatType &outputPoints, LabelsType &outputLabels, WeightsType &outputWeights, const **std::enable_if_t**<!arma::is_SpMat< MatType >::value > *=0, const **std::enable_if_t**<!arma::is_Cube< MatType >::value > *=0)

Shuffle a dataset and associated labels (or responses) and weights.

- `template<typename MatType , typename LabelsType , typename WeightsType >`
`void ShuffleData (const MatType &inputPoints, const LabelsType &inputLabels, const WeightsType &inputWeights, MatType &outputPoints, LabelsType &outputLabels, WeightsType &outputWeights, const std::enable_if_t< arma::is_SpMat< MatType >::value > !=0, const std::enable_if_t<!arma::is_Cube< MatType >::value > !=0)`

Shuffle a sparse dataset and associated labels (or responses) and weights.

40.259.1 Detailed Description

Author

Ryan Curtin

Given data points and labels, shuffle their ordering.

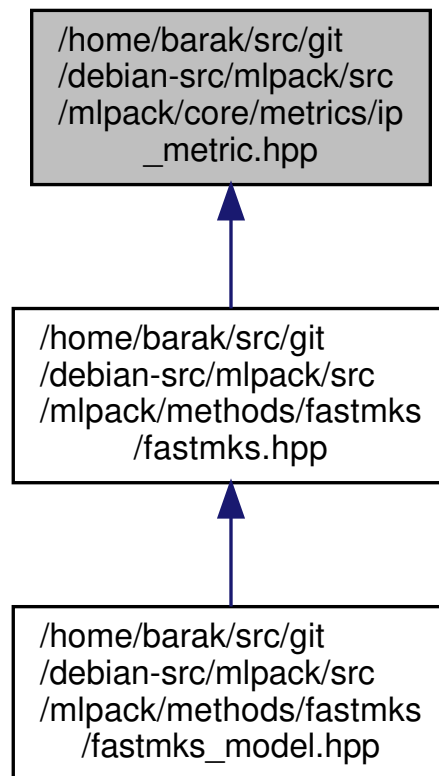

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.260 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/metrics/ip_metric.hpp File Reference

Include dependency graph for ip_metric.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **IPMetric**< **KernelType** >

The inner product metric, **IPMetric** (p. 1565), takes a given Mercer kernel (**KernelType**), and when **Evaluate()** (p. 1567) is called, returns the distance between the two points in kernel space:

Namespaces

- **mlpack**
 .hpp
- **mlpack::metric**

40.260.1 Detailed Description

Author

Ryan Curtin

Inner product induced metric. If given a kernel function, this gives the complementary metric.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.261 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/metrics/lmetric.hpp File Reference

Include dependency graph for lmetric.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **LMetric**< **TPower**, **TTakeRoot** >
The L_p metric for arbitrary integer p , with an option to take the root.

Namespaces

- **mlpack**
 .hpp
- **mlpack::metric**

Typedefs

- typedef LMetric< INT_MAX, false > **ChebyshevDistance**
The L -infinity distance.
- typedef LMetric< 2, true > **EuclideanDistance**
The Euclidean (L_2) distance.
- typedef LMetric< 1, false > **ManhattanDistance**
The Manhattan (L_1) distance.
- typedef LMetric< 2, false > **SquaredEuclideanDistance**
The squared Euclidean (L_2) distance.

Namespaces

- **mlpack**
 .hpp
- **mlpack::bound**
- **mlpack::bound::addr**

Functions

- template<typename AddressType , typename VecType >
void **AddressToPoint** (VecType &point, const AddressType &address)
Translate the address to the point.
- template<typename AddressType1 , typename AddressType2 >
int **CompareAddresses** (const AddressType1 &addr1, const AddressType2 &addr2)
Compare two addresses.
- template<typename AddressType1 , typename AddressType2 , typename AddressType3 >
bool **Contains** (const AddressType1 &address, const AddressType2 &loBound, const AddressType3 &hiBound)
Returns true if an address is contained between two other addresses.
- template<typename AddressType , typename VecType >
void **PointToAddress** (AddressType &address, const VecType &point)
Calculate the address of a point.

40.263.1 Detailed Description

Author

Mikhail Lozhnikov

This file contains a series of functions for translating points to addresses and back and functions for comparing addresses.

The notion of addresses is described in the following paper.

```

40.264 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/ballbound.hpp File Reference

Bounds that are useful for binary space partitioning trees.

Include dependency graph for ballbound.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **BallBound**< **MetricType**, **VecType** >
Ball bound encloses a set of points at a specific distance (radius) from a specific point (center).
- struct **BoundTraits**< **BallBound**< **MetricType**, **VecType** > >
*A specialization of **BoundTraits** (p. 1002) for this bound type.*

Namespaces

- **mlpack**
.hpp
- **mlpack::bound**

40.264.1 Detailed Description

Bounds that are useful for binary space partitioning trees.

Interface to a ball bound that works in arbitrary metric spaces.

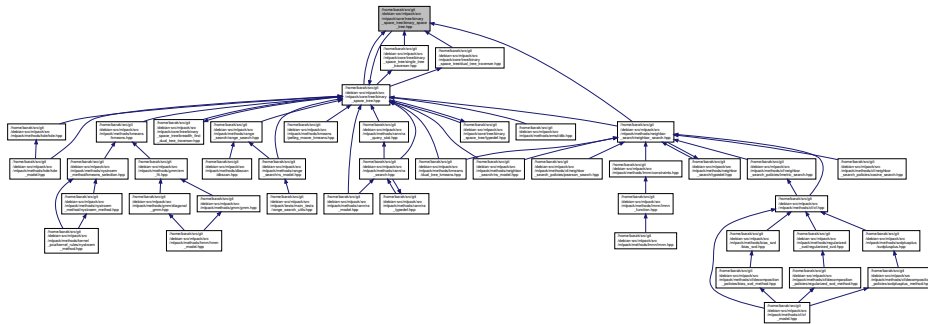

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

Trees and tree-building procedures.

40.267.1 Detailed Description

Author

Ryan Curtin

Defines the `BreadthFirstDualTreeTraverser` for the `BinarySpaceTree` tree type. This is a nested class of `BinarySpaceTree` which traverses two trees in a breadth-first manner with a given set of rules which indicate the branches which can be pruned and the order in which to recurse.

Trees and tree-building procedures.

40.280 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/binary_space_tree/traits.hpp

File Reference

Include dependency graph for traits.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **TreeTraits**< **BinarySpaceTree**< **MetricType**, **StatisticType**, **MatType**, bound::BallBound, SplitType > >

This is a specialization of the TreeType class to the BallTree tree type.

- class **TreeTraits**< **BinarySpaceTree**< **MetricType**, **StatisticType**, **MatType**, bound::CellBound, SplitType > >

This is a specialization of the TreeType class to the UBTree tree type.

- class **TreeTraits**< **BinarySpaceTree**< **MetricType**, **StatisticType**, **MatType**, bound::HollowBallBound, SplitType > >

This is a specialization of the TreeType class to an arbitrary tree with HollowBallBound (currently only the vantage point tree is supported).

- class **TreeTraits**< **BinarySpaceTree**< **MetricType**, **StatisticType**, **MatType**, BoundType, RPTreeMaxSplit > >

This is a specialization of the TreeType class to the max-split random projection tree.

- class **TreeTraits**< **BinarySpaceTree**< **MetricType**, **StatisticType**, **MatType**, BoundType, RPTreeMeanSplit > >

This is a specialization of the TreeType class to the mean-split random projection tree.

- class **TreeTraits**< **BinarySpaceTree**< **MetricType**, **StatisticType**, **MatType**, BoundType, SplitType > >

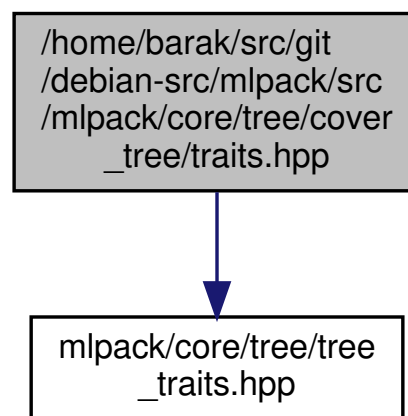

This is a specialization of the TreeTraits (p. 2302) class to the BinarySpaceTree (p. 1998) tree type.

Namespaces

- mlpack**
 .hpp

Trees and tree-building procedures.

Typedefs

- `template<typename MetricType , typename StatisticType , typename MatType >`
`using BallTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::BallBound, MidpointSplit >`
A midpoint-split ball tree.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using KDTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::HRectBound, MidpointSplit >`
The standard midpoint-split kd-tree.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using MaxRPTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::HRectBound, RPTreeMaxSplit >`
A max-split random projection tree.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using MeanSplitBallTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::BallBound, MeanSplit >`
A mean-split ball tree.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using MeanSplitKDTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::HRectBound, MeanSplit >`
A mean-split kd-tree.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using RPTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::HRectBound, RPTreeMeanSplit >`
A mean-split random projection tree.
- `template<typename MetricType , typename StatisticType , typename MatType >`
`using UBTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::CellBound, UBTreeSplit >`
The Universal B-tree.

- `template<typename MetricType , typename StatisticType , typename MatType >`
`using VPTree = BinarySpaceTree< MetricType, StatisticType, MatType, bound::HollowBallBound, VPTreeSplit >`
- `template<typename BoundType , typename MatType = arma::mat>`
`using VPTreeSplit = VantagePointSplit< BoundType, MatType, 100 >`

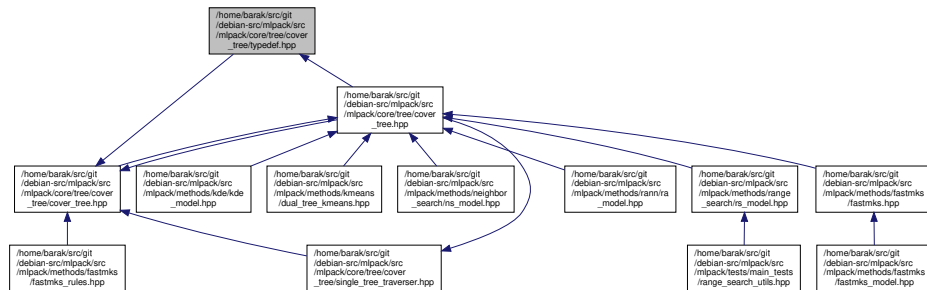

The vantage point tree (which is also called the metric tree).

40.286 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/cover_tree/typedef.hpp File Reference

Include dependency graph for typedef.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
`.hpp`
- **mlpack::tree**
Trees and tree-building procedures.

Typedefs

- `template<typename MetricType , typename StatisticType , typename MatType >`
`using StandardCoverTree = CoverTree< MetricType, StatisticType, MatType, FirstPointIsRoot >`
The standard cover tree, as detailed in the original cover tree paper:

- `template<typename MetricType , typename StatisticType , typename MatType >`
`using RPlusPlusTree = RectangleTree< MetricType, StatisticType, MatType, RPlusTreeSplit< RPlusPlusTree<`
`SplitPolicy, MinimalSplitsNumberSweep >, RPlusPlusTreeDescentHeuristic, RPlusPlusTreeAuxiliaryInformation`
`>`

The R++ tree, a variant of the R+ tree with maximum bounding rectangles.

- `template<typename MetricType , typename StatisticType , typename MatType >`
`using RPlusTree = RectangleTree< MetricType, StatisticType, MatType, RPlusTreeSplit< RPlusTreeSplitPolicy,`
`MinimalCoverageSweep >, RPlusTreeDescentHeuristic, NoAuxiliaryInformation >`

The R+ tree, a variant of the R tree that avoids overlapping rectangles.

- `template<typename MetricType , typename StatisticType , typename MatType >`
`using RStarTree = RectangleTree< MetricType, StatisticType, MatType, RStarTreeSplit, RStarTreeDescent<`
`Heuristic, NoAuxiliaryInformation >`

The R-tree, a more recent variant of the R tree.*

- `template<typename MetricType , typename StatisticType , typename MatType >`
`using RTree = RectangleTree< MetricType, StatisticType, MatType, RTreeSplit, RTreeDescentHeuristic, No<`
`AuxiliaryInformation >`

An implementation of the R tree that satisfies the TreeType policy API.

- `template<typename MetricType , typename StatisticType , typename MatType >`
`using XTree = RectangleTree< MetricType, StatisticType, MatType, XTreeSplit, RTreeDescentHeuristic, XTree<`
`AuxiliaryInformation >`

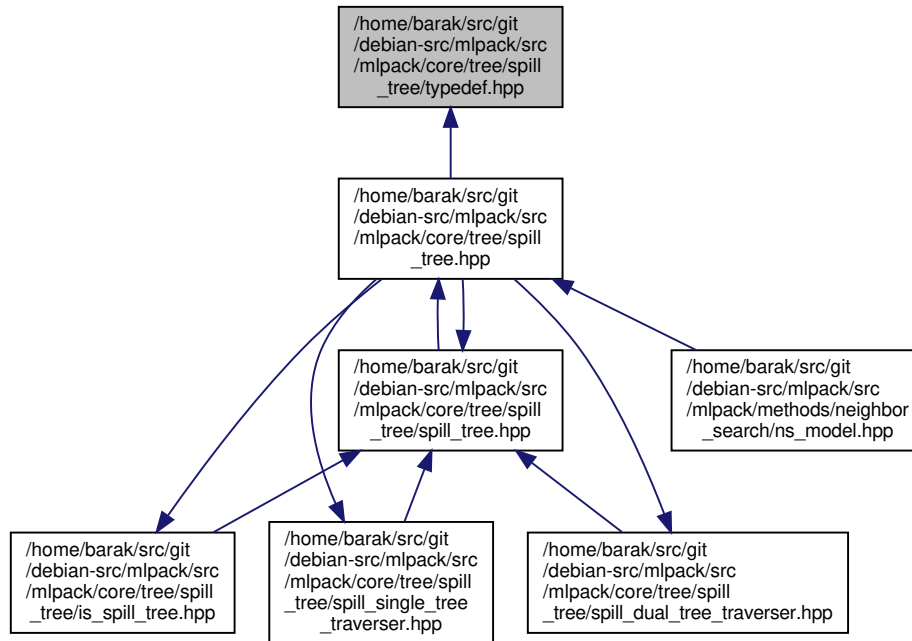

The X-tree, a variant of the R tree with supernodes.

40.288 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/spill_tree/typedef.hpp File Reference

Classes

- struct **BoundTraits**< **CellBound**< **MetricType**, **ElemType** > >
- class **CellBound**< **MetricType**, **ElemType** >

The *CellBound* (p. 1006) class describes a bound that consists of a number of hyperrectangles.

Namespaces

- **mlpack**
- **mlpack::bound**

40.295.1 Detailed Description

Author

Mikhail Lozhnikov

Definition of the CellBound class. The class describes a bound that consists of a number of hyperrectangles. These hyperrectangles do not overlap each other. The bound is limited by an outer hyperrectangle and two addresses, the lower address and the high address. Thus, the bound contains all points included between the lower and the high addresses.

The notion of addresses is described in the following paper.

*A generic single-tree traverser for hybrid spill trees; see **spill_single_tree_traverser.hpp** (p. 2684) for implementation.*

Namespaces

- **mlpack**
.hpp
- **mlpack::tree**

Trees and tree-building procedures.

40.336.1 Detailed Description

Author

Ryan Curtin
Marcos Pivadori

A nested class of SpillTree which traverses the entire tree with a given set of rules which indicate the branches which can be pruned and the order in which to recurse. This traverser is a depth-first traverser. The Defeatist template parameter determines if the traversers must do defeatist search on overlapping nodes.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

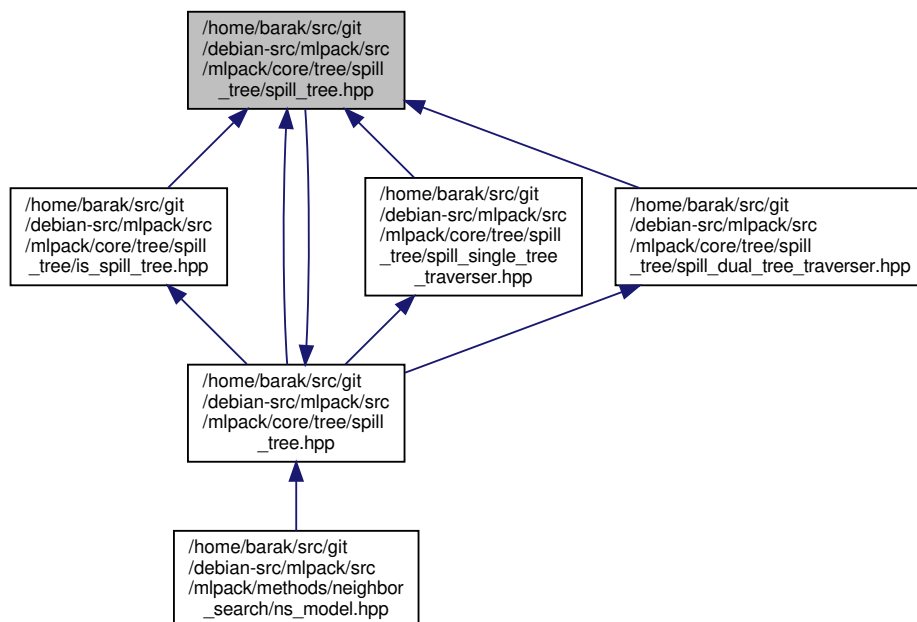

40.337 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/spill_tree/spill_tree.hpp

File Reference

Include dependency graph for spill_tree.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **SpillTree**< **MetricType**, **StatisticType**, **MatType**, **HyperplaneType**, **SplitType** >
A hybrid spill tree is a variant of binary space trees in which the children of a node can "spill over" each other, and contain shared datapoints.
- class **SpillTree**< **MetricType**, **StatisticType**, **MatType**, **HyperplaneType**, **SplitType** >::**SpillDualTree**↔
Traverser< **MetricType**, **StatisticType**, **MatType**, **HyperplaneType**, **SplitType** >
A generic dual-tree traverser for hybrid spill trees; see [spill_dual_tree_traverser.hpp](#) (p. 2683) for implementation.
- class **SpillTree**< **MetricType**, **StatisticType**, **MatType**, **HyperplaneType**, **SplitType** >::**SpillSingleTree**↔
Traverser< **MetricType**, **StatisticType**, **MatType**, **HyperplaneType**, **SplitType** >
A generic single-tree traverser for hybrid spill trees; see [spill_single_tree_traverser.hpp](#) (p. 2684) for implementation.

Namespaces

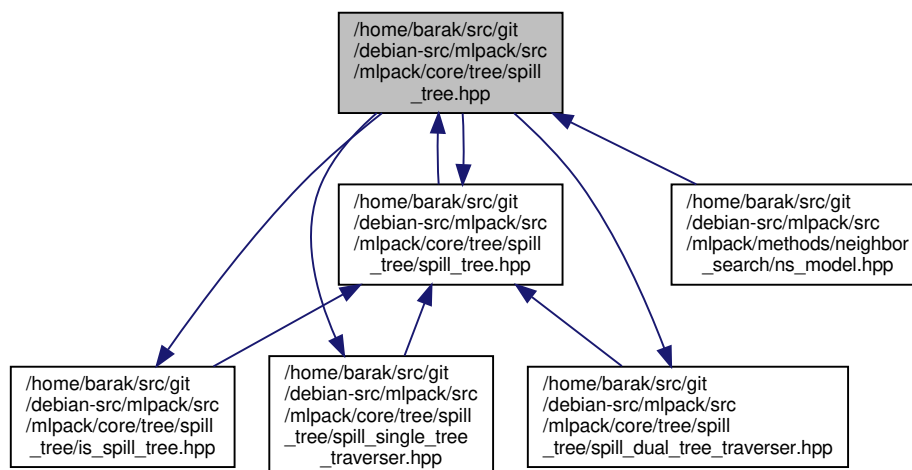

- mlpack**
.hpp
- mlpack::tree**
Trees and tree-building procedures.

40.338 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/spill_tree.hpp File Reference

Include dependency graph for spill_tree.hpp:

This graph shows which files directly or indirectly include this file:

40.339 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/statistic.hpp File Reference

Definition of the policy type for the statistic class.

This graph shows which files directly or indirectly include this file:

Classes

- class **EmptyStatistic**

Empty statistic if you are not interested in storing statistics in your tree.

Namespaces

- **mlpack**

.hpp

- **mlpack::tree**

Trees and tree-building procedures.

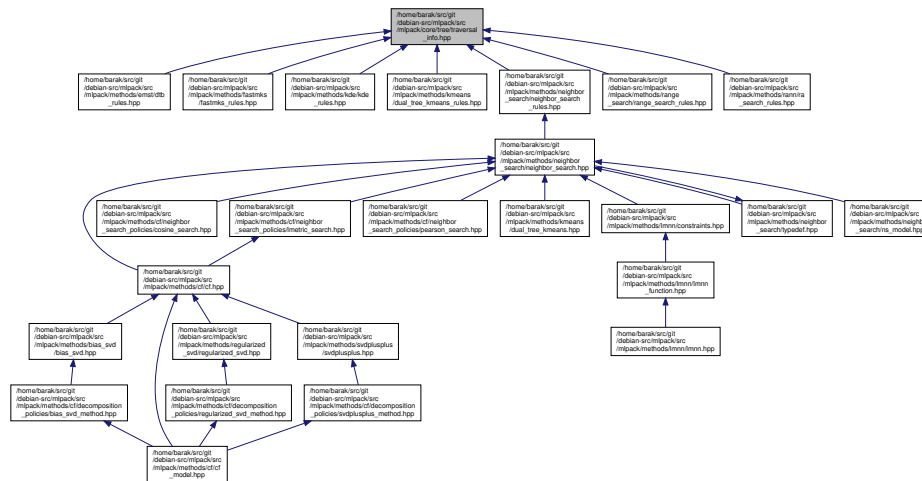

40.339.1 Detailed Description

Definition of the policy type for the statistic class.

You should define your own statistic that looks like EmptyStatistic.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.340 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/traversal_info.hpp File Reference

Classes

The **TraversalInfo** (p. 2299) class holds traversal information which is used in dual-tree (and single-tree) traversals.

- **mlpack**
.hpp
- **mlpack::tree**
Trees and tree-building procedures.

Author

This class will hold the traversal information for dual-tree traversals. A dual-tree traversal should be updating the members of this class before `Score()` is called.

40.341 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/tree/tree_traits.hpp File Reference

This graph shows which files directly or indirectly include this file:

Classes

- class **TreeTraits**< **TreeType** >

The **TreeTraits** (p. 2302) class provides compile-time information on the characteristics of a given tree type.

Namespaces

- **mlpack**
 .hpp
- **mlpack::tree**

Trees and tree-building procedures.

40.341.1 Detailed Description

Author

Ryan Curtin

This file implements the basic, unspecialized TreeTraits class, which provides information about tree types. If you create a tree class, you should specialize this class with the characteristics of your tree.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.342 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/util/arma_config.hpp File Reference

This is an autogenerated file which contains the configuration of Armadillo at the time mlpack was built.

This graph shows which files directly or indirectly include this file:

Macros

- #define **MLPACK_ARMA_NO64BIT_WORD**
- #define **MLPACK_ARMA_USE_OPENMP**

40.342.1 Detailed Description

This is an autogenerated file which contains the configuration of Armadillo at the time mlpack was built.

If you modify anything in here by hand, your warranty is void, your house may catch fire, and we're not going to call the police when your program segfaults so hard that robbers come to your house and take everything you own. If you do decide, against better judgment, to modify anything at all in this file, and you are reporting a bug, be absolutely certain to mention that you've done something stupid in this file first.

In short: don't touch this file.

40.342.2 Macro Definition Documentation

40.342.2.1 MLPACK_ARMA_NO64BIT_WORD

```
#define MLPACK_ARMA_NO64BIT_WORD
```

Definition at line 18 of file arma_config.hpp.

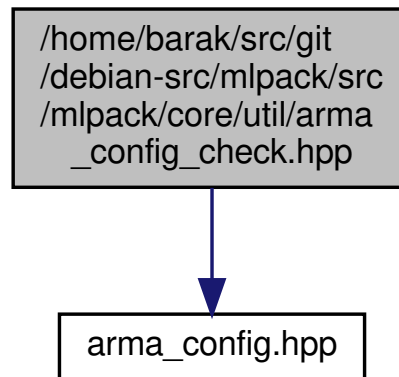

40.342.2.2 MLPACK_ARMA_USE_OPENMP

```
#define MLPACK_ARMA_USE_OPENMP
```

Definition at line 20 of file arma_config.hpp.

40.343 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/util/arma_config_check.hpp File Reference

Include dependency graph for arma_config_check.hpp:

This graph shows which files directly or indirectly include this file:

40.343.1 Detailed Description

Author

Ryan Curtin

Using the contents of **arma_config.hpp** (p.2690), try to catch the condition where the user has included mlpack with ARMA_64BIT_WORD enabled but mlpack was compiled without ARMA_64BIT_WORD enabled. This should help prevent a long, drawn-out debugging process where nobody can figure out why the stack is getting mangled.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

Include dependency graph for nullostream.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **NullOutputStream**
Used for **Log::Debug** (p. 1540) when not compiled with debugging symbols.

Namespaces

- **mlpack**
.hpp
- **mlpack::util**

40.353.1 Detailed Description

Author

Ryan Curtin
Matthew Amidon

Definition of the `NullOutputStream` class.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.354 /home/barak/src/git/debian-src/mlpack/src/mlpack/core/util/param.hpp File Reference

Classes

- class **DatasetMapper**< **PolicyType**, **InputType** >
Auxiliary information for a dataset, including mappings to/from strings (or other types) and the datatype of each dimension.

Namespaces

- **mlpack**
.hpp
- **mlpack::data**
Functions to load and save matrices and models.

Macros

- #define **PARAM_COL**(ID, DESC, ALIAS, REQ, TRANS, IN)
- #define **PARAM_COL_IN**(ID, DESC, ALIAS) **PARAM_COL**(ID, DESC, ALIAS, false, true, true)
Define a vector input parameter (type arma::vec).
- #define **PARAM_COL_IN_REQ**(ID, DESC, ALIAS) **PARAM_COL**(ID, DESC, ALIAS, true, true, true)
Define a required vector input parameter (type arma::vec).
- #define **PARAM_COL_OUT**(ID, DESC, ALIAS) **PARAM_COL**(ID, DESC, ALIAS, false, true, false)
Define a vector output parameter (type arma::vec).
- #define **PARAM_DOUBLE_IN**(ID, DESC, ALIAS, DEF) **PARAM_IN**(double, ID, DESC, ALIAS, DEF, false)
Define a double input parameter.
- #define **PARAM_DOUBLE_IN_REQ**(ID, DESC, ALIAS) **PARAM_IN**(double, ID, DESC, ALIAS, 0.0, true)
Define a required double parameter.
- #define **PARAM_DOUBLE_OUT**(ID, DESC) **PARAM_OUT**(double, ID, DESC, "", 0.0, false)
Define a double output parameter.
- #define **PARAM_FLAG**(ID, DESC, ALIAS) **PARAM_IN**(bool, ID, DESC, ALIAS, false, false);
Define a flag parameter.
- #define **PARAM_IN**(T, ID, DESC, ALIAS, DEF, REQ)
Define an input parameter.
- #define **PARAM_INT_IN**(ID, DESC, ALIAS, DEF) **PARAM_IN**(int, ID, DESC, ALIAS, DEF, false)
Define an integer input parameter.
- #define **PARAM_INT_IN_REQ**(ID, DESC, ALIAS) **PARAM_IN**(int, ID, DESC, ALIAS, 0, true)
Define a required integer input parameter.
- #define **PARAM_INT_OUT**(ID, DESC) **PARAM_OUT**(int, ID, DESC, "", 0, false)
Define an integer output parameter.
- #define **PARAM_MATRIX**(ID, DESC, ALIAS, REQ, TRANS, IN)
- #define **PARAM_MATRIX_AND_INFO_IN**(ID, DESC, ALIAS) **PARAM_IN**(**TUPLE_TYPE**, ID, DESC, ALIAS, **TUPLE_TYPE**(), false)
- #define **PARAM_MATRIX_IN**(ID, DESC, ALIAS) **PARAM_MATRIX**(ID, DESC, ALIAS, false, true, true)
Define a matrix input parameter.

- **#define PARAM_MATRIX_IN_REQ**(ID, DESC, ALIAS) **PARAM_MATRIX**(ID, DESC, ALIAS, true, true, true)
Define a required matrix input parameter.
- **#define PARAM_MATRIX_OUT**(ID, DESC, ALIAS) **PARAM_MATRIX**(ID, DESC, ALIAS, false, true, false)
Define a matrix output parameter.
- **#define PARAM_MODEL**(TYPE, ID, DESC, ALIAS, REQ, IN)
- **#define PARAM_MODEL_IN**(TYPE, ID, DESC, ALIAS) **PARAM_MODEL**(TYPE, ID, DESC, ALIAS, false, true)
Define an input model.
- **#define PARAM_MODEL_IN_REQ**(TYPE, ID, DESC, ALIAS) **PARAM_MODEL**(TYPE, ID, DESC, ALIAS, true, true)
Define a required input model.
- **#define PARAM_MODEL_OUT**(TYPE, ID, DESC, ALIAS) **PARAM_MODEL**(TYPE, ID, DESC, ALIAS, false, false)
Define an output model.
- **#define PARAM_OUT**(T, ID, DESC, ALIAS, DEF, REQ)
- **#define PARAM_ROW**(ID, DESC, ALIAS, REQ, TRANS, IN)
- **#define PARAM_ROW_IN**(ID, DESC, ALIAS) **PARAM_ROW**(ID, DESC, ALIAS, false, true, true)
Define a row vector input parameter (type arma::rowvec).
- **#define PARAM_ROW_OUT**(ID, DESC, ALIAS) **PARAM_ROW**(ID, DESC, ALIAS, false, true, false)
Define a row vector output parameter (type arma::rowvec).
- **#define PARAM_STRING_IN**(ID, DESC, ALIAS, DEF) **PARAM_IN**(std::string, ID, DESC, ALIAS, DEF, false)
Define a string input parameter.
- **#define PARAM_STRING_IN_REQ**(ID, DESC, ALIAS) **PARAM_IN**(std::string, ID, DESC, ALIAS, "", true)
Define a required string parameter.
- **#define PARAM_STRING_OUT**(ID, DESC, ALIAS) **PARAM_OUT**(std::string, ID, DESC, ALIAS, "", false)
Define a string output parameter.
- **#define PARAM_TMATRIX_IN**(ID, DESC, ALIAS) **PARAM_MATRIX**(ID, DESC, ALIAS, false, false, true)
Define a transposed matrix input parameter.
- **#define PARAM_TMATRIX_IN_REQ**(ID, DESC, ALIAS) **PARAM_MATRIX**(ID, DESC, ALIAS, true, false, true)
Define a required transposed matrix input parameter.
- **#define PARAM_TMATRIX_OUT**(ID, DESC, ALIAS) **PARAM_MATRIX**(ID, DESC, ALIAS, false, false, false)
Define a transposed matrix output parameter.
- **#define PARAM_UCOL**(ID, DESC, ALIAS, REQ, TRANS, IN)
- **#define PARAM_UCOL_IN**(ID, DESC, ALIAS) **PARAM_UCOL**(ID, DESC, ALIAS, false, true, true)
Define an unsigned vector input parameter (type arma::Col<size_t>).
- **#define PARAM_UCOL_OUT**(ID, DESC, ALIAS) **PARAM_UCOL**(ID, DESC, ALIAS, false, true, false)
Define an unsigned vector output parameter (type arma::Col<size_t>).
- **#define PARAM_UMATRIX**(ID, DESC, ALIAS, REQ, TRANS, IN)
- **#define PARAM_UMATRIX_IN**(ID, DESC, ALIAS) **PARAM_UMATRIX**(ID, DESC, ALIAS, false, true, true)
Define an unsigned matrix input parameter (arma::Mat<size_t>).
- **#define PARAM_UMATRIX_IN_REQ**(ID, DESC, ALIAS) **PARAM_UMATRIX**(ID, DESC, ALIAS, true, true, true)
Define a required unsigned matrix input parameter (arma::Mat<size_t>).
- **#define PARAM_UMATRIX_OUT**(ID, DESC, ALIAS) **PARAM_UMATRIX**(ID, DESC, ALIAS, false, true, false)
Define an unsigned matrix output parameter (arma::Mat<size_t>).
- **#define PARAM_UROW**(ID, DESC, ALIAS, REQ, TRANS, IN)
- **#define PARAM_UROW_IN**(ID, DESC, ALIAS) **PARAM_UROW**(ID, DESC, ALIAS, false, true, true)
Define an unsigned row vector input parameter (type arma::Row<size_t>).
- **#define PARAM_UROW_OUT**(ID, DESC, ALIAS) **PARAM_UROW**(ID, DESC, ALIAS, false, true, false)
Define an unsigned row vector output parameter (type arma::Row<size_t>).

- **#define PARAM_VECTOR_IN**(T, ID, DESC, ALIAS) **PARAM_IN**(std::vector<T>, ID, DESC, ALIAS, std::vector<T>(), false)
Define a std::vector input parameter.
- **#define PARAM_VECTOR_IN_REQ**(T, ID, DESC, ALIAS) **PARAM_IN**(std::vector<T>, ID, DESC, ALIAS, std::vector<T>(), true);
Define a required vector parameter.
- **#define PARAM_VECTOR_OUT**(T, ID, DESC, ALIAS) **PARAM_OUT**(std::vector<T>, ID, DESC, ALIAS, std::vector<T>(), false)
Define a vector output parameter.
- **#define PROGRAM_INFO**(NAME, SHORT_DESC, DESC, ...)
Document an executable.
- **#define SEE_ALSO**(DESCRIPTION, LINK) {DESCRIPTION, LINK}
Provide a link for a binding's "see also" documentation section, which is primarily (but not necessarily exclusively) used by the Markdown bindings. This link can be specified by calling SEE_ALSO("description", "link"), where "description" is the description of the link and "link" may be one of the following:
- **#define TUPLE_TYPE** std::tuple< **mlpack::data::DatasetInfo**, arma::mat>
Define an input DatasetInfo/matrix parameter.

40.354.1 Detailed Description

Author

Matthew Amidon
 Ryan Curtin

Definition of PARAM_*_IN() and PARAM_*_OUT() macros, as well as the **PROGRAM_INFO**() (p. 2733) macro, which are used to define input and output parameters of command-line programs and bindings to other languages.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.354.2 Macro Definition Documentation

40.354.2.1 PARAM_COL

```
#define PARAM_COL(  
    ID,  
    DESC,  
    ALIAS,  
    REQ,  
    TRANS,  
    IN )
```

Value:

```
static mlpack::util::Option<arma::vec> \  
  JOIN(cli_option_dummy_object_col_, __LINE_) \  
  (arma::vec(), ID, DESC, ALIAS, "arma::vec", REQ, IN, !TRANS, \  
  testName);
```

Definition at line 1140 of file param.hpp.

40.354.2.2 PARAM_COL_IN

```
#define PARAM_COL_IN(
    ID,
    DESC,
    ALIAS ) PARAM_COL(ID, DESC, ALIAS, false, true, true)
```

Define a vector input parameter (type arma::vec).

From the command line, the user can specify the file that holds the vector, using the name of the vector parameter with "_file" appended (and the same alias). So for instance, if the name of the vector parameter was "vec", the user could specify that the "vec" vector was held in vec.csv by giving the parameter:

```
--vec_file vector.csv
```

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the **PARAM_***() macros. However, not all compilers have this support—most notably, gcc < 4.3. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 535 of file param.hpp.

40.354.2.3 PARAM_COL_IN_REQ

```
#define PARAM_COL_IN_REQ(
    ID,
    DESC,
    ALIAS ) PARAM_COL(ID, DESC, ALIAS, true, true, true)
```

Define a required vector input parameter (type arma::vec).

From the command line, the user can specify the file that holds the vector, using the name of the vector parameter with "_file" appended (and the same alias). So for instance, if the name of the vector parameter was "vec", the user could specify that the "vec" vector was held in vec.csv by giving the parameter:

```
--vec_file vector.csv
```

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 561 of file `param.hpp`.

40.354.2.4 PARAM_COL_OUT

```
#define PARAM_COL_OUT(
    ID,
    DESC,
    ALIAS )  PARAM_COL(ID, DESC, ALIAS, false, true, false)
```

Define a vector output parameter (type `arma::vec`).

When the program terminates, the vector will be saved to whatever it was set to during the program. From the command-line, the user may specify the file in which to save the output vector using a string option that is the name of the matrix parameter with `"_file"` appended. So, for instance, if the name of the output vector parameter was `"vec"`, the user could specify that the `"vec"` vector should be saved in `vector.csv` by giving the parameter:

```
--vec_file vector.csv
```

The output vector will not be printed on `stdout`, like the other output option types.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 671 of file param.hpp.

40.354.2.5 PARAM_DOUBLE_IN

```
#define PARAM_DOUBLE_IN(  
    ID,  
    DESC,  
    ALIAS,  
    DEF ) PARAM_IN(double, ID, DESC, ALIAS, DEF, false)
```

Define a double input parameter.

The parameter can then be specified on the command line with `-ID=value`.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).
<i>DEF</i>	Default value of the parameter.

See also

mlpack::CLI (p. 1117), **PROGRAM_INFO()** (p. 2733)

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 170 of file param.hpp.

40.354.2.6 PARAM_DOUBLE_IN_REQ

```
#define PARAM_DOUBLE_IN_REQ(  
    ID,  
    DESC,  
    ALIAS ) PARAM_IN(double, ID, DESC, ALIAS, 0.0, true)
```

Define a required double parameter.

The parameter must then be specified on the command line with `-ID=value`.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

See also

mlpack::CLI (p. 1117), **PROGRAM_INFO()** (p. 2733)

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the **PARAM_***() macros. However, not all compilers have this support—most notably, gcc < 4.3. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 986 of file param.hpp.

40.354.2.7 PARAM_DOUBLE_OUT

```
#define PARAM_DOUBLE_OUT(  
    ID,  
    DESC )  PARAM_OUT(double, ID, DESC, "", 0.0, false)
```

Define a double output parameter.

This parameter will be printed on stdout at the end of the program; for instance, if the parameter name is "number" and the value is 5.012, the output on stdout would be of the following form:

```
number: 5.012
```

If the parameter is not set by the end of the program, a fatal runtime error will be issued.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).

See also

mlpack::CLI (p. 1117), **PROGRAM_INFO()** (p. 2733)

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the **PARAM_***() macros. However, not all compilers have this support—most notably, gcc < 4.3. In that case,

the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 198 of file param.hpp.

40.354.2.8 PARAM_FLAG

```
#define PARAM_FLAG(  
    ID,  
    DESC,  
    ALIAS )  PARAM_IN(bool, ID, DESC, ALIAS, false, false);
```

Define a flag parameter.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

See also

mlpack::CLI (p. 1117), **PROGRAM_INFO()** (p. 2733)

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the **PARAM_***() macros. However, not all compilers have this support—most notably, gcc < 4.3. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 93 of file param.hpp.

40.354.2.9 PARAM_IN

```
#define PARAM_IN(  
    T,  
    ID,  
    DESC,  
    ALIAS,  
    DEF,  
    REQ )
```

Value:

```
static mlpack::util::Option<T> \
  JOIN(JOIN(cli_option_dummy_object_in_, __LINE__), opt) \
  (DEF, ID, DESC, ALIAS, #T, REQ, true, false, testName);
```

Define an input parameter.

Don't use this function; use the other ones above that call it. Note that we are using the **LINE** macro for naming these actual parameters when **COUNTER** does not exist, which is a bit of an ugly hack... but this is the preprocessor, after all. We don't have much choice other than ugliness.

Parameters

<i>T</i>	Type of the parameter.
<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter (1-2 sentences).
<i>ALIAS</i>	Alias for this parameter (one letter).
<i>DEF</i>	Default value of the parameter.
<i>REQ</i>	Whether or not parameter is required (boolean value).

Definition at line 1118 of file param.hpp.

40.354.2.10 PARAM_INT_IN

```
#define PARAM_INT_IN(
    ID,
    DESC,
    ALIAS,
    DEF ) PARAM_IN(int, ID, DESC, ALIAS, DEF, false)
```

Define an integer input parameter.

The parameter can then be specified on the command line with `-ID=value`.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).
<i>DEF</i>	Default value of the parameter.

See also

mlpack::CLI (p. 1117), **PROGRAM_INFO()** (p. 2733)

Bug Use a forward declaration of the class. The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—

most notably, gcc < 4.3. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 118 of file param.hpp.

40.354.2.11 PARAM_INT_IN_REQ

```
#define PARAM_INT_IN_REQ(  
    ID,  
    DESC,  
    ALIAS ) PARAM_IN(int, ID, DESC, ALIAS, 0, true)
```

Define a required integer input parameter.

The parameter must then be specified on the command line with `-ID=value`.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

See also

mlpack::CLI (p. 1117), **PROGRAM_INFO()** (p. 2733)

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the **PARAM_***() macros. However, not all compilers have this support—most notably, gcc < 4.3. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 964 of file param.hpp.

40.354.2.12 PARAM_INT_OUT

```
#define PARAM_INT_OUT(  
    ID,  
    DESC ) PARAM_OUT(int, ID, DESC, "", 0, false)
```

Define an integer output parameter.

This parameter will be printed on stdout at the end of the program; for instance, if the parameter name is "number" and the value is 5, the output on stdout would be of the following form:

```
number: 5
```

If the parameter is not set by the end of the program, a fatal runtime error will be issued.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).

See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 146 of file param.hpp.

40.354.2.13 PARAM_MATRIX

```
#define PARAM_MATRIX(
    ID,
    DESC,
    ALIAS,
    REQ,
    TRANS,
    IN )
```

Value:

```
static mlpack::util::Option<arma::mat> \
  JOIN(JOIN(cli_option_dummy_object_matrix_, __LINE__), opt) \
  (arma::mat(), ID, DESC, ALIAS, "arma::mat", REQ, IN, !TRANS, \
  testName);
```

Definition at line 1128 of file param.hpp.

40.354.2.14 PARAM_MATRIX_AND_INFO_IN

```
#define PARAM_MATRIX_AND_INFO_IN(
    ID,
    DESC,
    ALIAS )  PARAM_IN( TUPLE_TYPE, ID, DESC, ALIAS,  TUPLE_TYPE(), false)
```

Definition at line 855 of file param.hpp.

40.354.2.15 PARAM_MATRIX_IN

```
#define PARAM_MATRIX_IN(  
    ID,  
    DESC,  
    ALIAS ) PARAM_MATRIX(ID, DESC, ALIAS, false, true, true)
```

Define a matrix input parameter.

From the command line, the user can specify the file that holds the matrix, using the name of the matrix parameter with "_file" appended (and the same alias). So for instance, if the name of the matrix parameter was "mat", the user could specify that the "mat" matrix was held in matrix.csv by giving the parameter

```
--mat_file matrix.csv
```

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the **PARAM_***() macros. However, not all compilers have this support—most notably, gcc < 4.3. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 278 of file param.hpp.

40.354.2.16 PARAM_MATRIX_IN_REQ

```
#define PARAM_MATRIX_IN_REQ(  
    ID,  
    DESC,  
    ALIAS ) PARAM_MATRIX(ID, DESC, ALIAS, true, true, true)
```

Define a required matrix input parameter.

From the command line, the user can specify the file that holds the matrix, using the name of the matrix parameter with "_file" appended (and the same alias). So for instance, if the name of the matrix parameter was "mat", the user could specify that the "mat" matrix was held in matrix.csv by giving the parameter

```
--mat_file matrix.csv
```

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 304 of file `param.hpp`.

40.354.2.17 `PARAM_MATRIX_OUT`

```
#define PARAM_MATRIX_OUT(  
    ID,  
    DESC,  
    ALIAS ) PARAM_MATRIX(ID, DESC, ALIAS, false, true, false)
```

Define a matrix output parameter.

When the program terminates, the matrix will be saved to whatever it was set to by `CLI::GetParam<arma::mat>(ID)` during the program. From the command-line, the user may specify the file in which to save the output matrix using a string option that is the name of the matrix parameter with `"_file"` appended. So, for instance, if the name of the output matrix parameter was `"mat"`, the user could specify that the `"mat"` matrix should be saved in `matrix.csv` by giving the parameter

```
--mat_file matrix.csv
```

The output matrix will not be printed on `stdout`, like the other output option types.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they

produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 335 of file param.hpp.

40.354.2.18 PARAM_MODEL

```
#define PARAM_MODEL(  
    TYPE,  
    ID,  
    DESC,  
    ALIAS,  
    REQ,  
    IN )
```

Value:

```
static mlpack::util::Option<TYPE*> \  
  JOIN(JOIN(cli_option_dummy_object_model_, __LINE_), opt) \  
  (nullptr, ID, DESC, ALIAS, #TYPE, REQ, IN, false, \  
   testName);
```

Definition at line 1164 of file param.hpp.

40.354.2.19 PARAM_MODEL_IN

```
#define PARAM_MODEL_IN(  
    TYPE,  
    ID,  
    DESC,  
    ALIAS )  PARAM_MODEL(TYPE, ID, DESC, ALIAS, false, true)
```

Define an input model.

From the command line, the user can specify the file that holds the model, using the name of the model parameter with "_file" appended (and the same alias). So for instance, if the name of the model parameter was "model", the user could specify that the "model" model was held in model.bin by giving the parameter

```
--model_file model.bin
```

Note that the first parameter of this model is the type (the class name) of the model to be loaded. This model type must have a `Serialize()` function; a compilation error (a very long and complex one) will result if the model type does not have the following function:

```
template<typename Archive>  
void Serialize(Archive& ar, const unsigned int version);
```

This is the **boost::serialization** (p. 251) `serialize()` function, just with a capital s for `Serialize()` (see `src/mlpack/core/data/serialization↔_shim.hpp`).

Parameters

<i>TYPE</i>	Type of the model to be loaded.
<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter.
<i>ALIAS</i>	An alias for the parameter (one letter).

Definition at line 887 of file param.hpp.

40.354.2.20 PARAM_MODEL_IN_REQ

```
#define PARAM_MODEL_IN_REQ(
    TYPE,
    ID,
    DESC,
    ALIAS )  PARAM_MODEL(TYPE, ID, DESC, ALIAS, true, true)
```

Define a required input model.

From the command line, the user can specify the file that holds the model, using the name of the model parameter with "_file" appended (and the same alias). So for instance, if the name of the model parameter was "model", the user could specify that the "model" model was held in model.bin by giving the parameter

```
--model_file model.bin
```

Note that the first parameter of this model is the type (the class name) of the model to be loaded. This model type must have a `Serialize()` function; a compilation error (a very long and complex one) will result if the model type does not have the following function:

```
template<typename Archive>
void Serialize(Archive& ar, const unsigned int version);
```

This is the **boost::serialization** (p. 251) `serialize()` function, just with a capital s for `Serialize()` (see `src/mlpack/core/data/serialization/_shim.hpp`).

Parameters

<i>TYPE</i>	Type of the model to be loaded.
<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter.
<i>ALIAS</i>	An alias for the parameter (one letter).

Definition at line 919 of file param.hpp.

40.354.2.21 PARAM_MODEL_OUT

```
#define PARAM_MODEL_OUT(
    TYPE,
    ID,
    DESC,
    ALIAS )  PARAM_MODEL(TYPE, ID, DESC, ALIAS, false, false)
```

Define an output model.

From the command line, the user can specify the file that should hold the model, using the name of the model parameter with "_file" appended (and the same alias). So for instance, if the user desires to save the model to model.bin and the parameter name is "model", they could specify

```
--model_file model.bin
```

The model will be saved at the termination of the program. If you use a parameter of this type, you must call CLI::Destroy() at the end of your program.

Parameters

<i>TYPE</i>	Type of the model to be saved.
<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter.
<i>ALIAS</i>	An alias for the parameter (one letter).

Definition at line 942 of file param.hpp.

40.354.2.22 PARAM_OUT

```
#define PARAM_OUT(
    T,
    ID,
    DESC,
    ALIAS,
    DEF,
    REQ )
```

Value:

```
static mlpack::util::Option<T> \
    JOIN(JOIN(cli_option_dummy_object_out_, __LINE__), opt) \
    (DEF, ID, DESC, ALIAS, #T, REQ, false, false, testName);
```

Definition at line 1123 of file param.hpp.

40.354.2.23 PARAM_ROW

```
#define PARAM_ROW(
    ID,
    DESC,
    ALIAS,
    REQ,
    TRANS,
    IN )
```

Value:

```
static mlpack::util::Option<arma::rowvec> \
    JOIN(cli_option_dummy_object_row_, __LINE__) \
    (arma::rowvec(), ID, DESC, ALIAS, "arma::rowvec", REQ, IN, !TRANS, \
    testName);
```

Definition at line 1152 of file param.hpp.

40.354.2.24 PARAM_ROW_IN

```
#define PARAM_ROW_IN(
    ID,
    DESC,
    ALIAS ) PARAM_ROW(ID, DESC, ALIAS, false, true, true)
```

Define a row vector input parameter (type arma::rowvec).

From the command line, the user can specify the file that holds the vector, using the name of the vector parameter with "_file" appended (and the same alias). So for instance, if the name of the vector parameter was "vec", the user could specify that the "vec" vector was held in vec.csv by giving the parameter:

```
--vec_file vector.csv
```

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the **PARAM_***() macros. However, not all compilers have this support—most notably, gcc < 4.3. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 587 of file param.hpp.

40.354.2.25 PARAM_ROW_OUT

```
#define PARAM_ROW_OUT(  
    ID,  
    DESC,  
    ALIAS )  PARAM_ROW(ID, DESC, ALIAS, false, true, false)
```

Define a row vector output parameter (type arma::rowvec).

When the program terminates, the vector will be saved to whatever it was set to during the program. From the command-line, the user may specify the file in which to save the output vector using a string option that is the name of the matrix parameter with "_file" appended. So, for instance, if the name of the output vector parameter was "vec", the user could specify that the "vec" vector should be saved in vector.csv by giving the parameter:

```
--vec_file vector.csv
```

The output vector will not be printed on stdout, like the other output option types.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the **PARAM_***() macros. However, not all compilers have this support—most notably, gcc < 4.3. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 702 of file param.hpp.

40.354.2.26 PARAM_STRING_IN

```
#define PARAM_STRING_IN(  
    ID,  
    DESC,  
    ALIAS,  
    DEF )  PARAM_IN(std::string, ID, DESC, ALIAS, DEF, false)
```

Define a string input parameter.

The parameter can then be specified on the command line with **-ID=value**. If **ALIAS** is equal to **DEF_MOD** (which is set using the **PROGRAM_INFO**() (p. 2733) macro), the parameter can be specified with just **-ID=value**.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).
<i>DEF</i>	Default value of the parameter.

See also

mlpack::CLI (p. 1117), **PROGRAM_INFO()** (p. 2733)

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the **PARAM_***() macros. However, not all compilers have this support—most notably, gcc < 4.3. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 223 of file param.hpp.

40.354.2.27 PARAM_STRING_IN_REQ

```
#define PARAM_STRING_IN_REQ(
    ID,
    DESC,
    ALIAS )  PARAM_IN(std::string, ID, DESC, ALIAS, "", true)
```

Define a required string parameter.

The parameter must then be specified on the command line with **-ID=value**.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

See also

mlpack::CLI (p. 1117), **PROGRAM_INFO()** (p. 2733)

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the **PARAM_***() macros. However, not all compilers have this support—most notably, gcc < 4.3. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 1008 of file param.hpp.

40.354.2.28 PARAM_STRING_OUT

```
#define PARAM_STRING_OUT(  
    ID,  
    DESC,  
    ALIAS )  PARAM_OUT(std::string, ID, DESC, ALIAS, "", false)
```

Define a string output parameter.

The string will be printed to stdout at the end of the program. For instance, if there was a string output parameter called "something" with value "hello", at the end of the program the output would be of the following form:

```
something: "hello"
```

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

See also

mlpack::CLI (p. 1117), **PROGRAM_INFO()** (p. 2733)

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the **PARAM_*()** macros. However, not all compilers have this support—most notably, gcc < 4.3. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 252 of file param.hpp.

40.354.2.29 PARAM_TMATRIX_IN

```
#define PARAM_TMATRIX_IN(  
    ID,  
    DESC,  
    ALIAS )  PARAM_MATRIX(ID, DESC, ALIAS, false, false, true)
```

Define a transposed matrix input parameter.

This is useful when data is desired in row-major form instead of the usual column-major form. From the command line, the user can specify the file that holds the matrix, using the name of the matrix parameter with "_file" appended (and the same alias). So for instance, if the name of the matrix parameter was "mat", the user could specify that the "mat" matrix was held in matrix.csv by giving the parameter

```
--mat_file matrix.csv
```

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 362 of file `param.hpp`.

40.354.2.30 PARAM_TMATRIX_IN_REQ

```
#define PARAM_TMATRIX_IN_REQ(  
    ID,  
    DESC,  
    ALIAS )  PARAM_MATRIX(ID, DESC, ALIAS, true, false, true)
```

Define a required transposed matrix input parameter.

This is useful when data is desired in row-major form instead of the usual column-major form. From the command line, the user can specify the file that holds the matrix, using the name of the matrix parameter with `"_file"` appended (and the same alias). So for instance, if the name of the matrix parameter was `"mat"`, the user could specify that the `"mat"` matrix was held in `matrix.csv` by giving the parameter

```
--mat_file matrix.csv
```

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 390 of file param.hpp.

40.354.2.31 PARAM_TMATRIX_OUT

```
#define PARAM_TMATRIX_OUT(  
    ID,  
    DESC,  
    ALIAS )  PARAM_MATRIX(ID, DESC, ALIAS, false, false, false)
```

Define a transposed matrix output parameter.

This is useful when data is stored in a row-major form instead of the usual column-major form. When the program terminates, the matrix will be saved to whatever it was set to by `CLI::GetParam<arma::mat>(ID)` during the program. From the command-line, the user may specify the file in which to save the output matrix using a string option that is the name of the matrix parameter with `"_file"` appended. So, for instance, if the name of the output matrix parameter was `"mat"`, the user could specify that the `"mat"` matrix should be saved in `matrix.csv` by giving the parameter

```
--mat_file matrix.csv
```

The output matrix will not be printed on stdout, like the other output option types.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

40.354.2.32 PARAM_UCOL

```
#define PARAM_UCOL(  
    ID,  
    DESC,  
    ALIAS,
```

```

    REQ,
    TRANS,
    IN )

```

Value:

```

static mlpack::util::Option<arma::Col<size_t>> \
  JOIN(cli_option_dummy_object_ucol_, __LINE__) \
  (arma::Col<size_t>(), ID, DESC, ALIAS, "arma::Col<size_t>", REQ, IN, \
  !TRANS, testName);

```

Definition at line 1146 of file param.hpp.

40.354.2.33 PARAM_UCOL_IN

```

#define PARAM_UCOL_IN(
    ID,
    DESC,
    ALIAS )  PARAM_UCOL(ID, DESC, ALIAS, false, true, true)

```

Define an unsigned vector input parameter (type `arma::Col<size_t>`).

From the command line, the user can specify the file that holds the vector, using the name of the vector parameter with `"_file"` appended (and the same alias). So for instance, if the name of the vector parameter was `"vec"`, the user could specify that the `"vec"` vector was held in `vec.csv` by giving the parameter:

```
--vec_file vector.csv
```

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*`() macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. 40.354.2.42 PARAM_VECTOR_IN

```
#define PARAM_VECTOR_IN(
    T,
    ID,
    DESC,
    ALIAS ) PARAM_IN(std::vector<T>, ID, DESC, ALIAS, std::vector<T>(), false)
```

Define a `std::vector` input parameter.

The parameter can then be specified on the command line with `-ID=value1,value2,value3`.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).
<i>DEF</i>	Default value of the parameter.

See also

mlpack::CLI (p. 1117), **PROGRAM_INFO()** (p. 2733)

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the `PARAM_*` macros. However, not all compilers have this support—most notably, `gcc < 4.3`. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 788 of file `param.hpp`.

40.354.2.43 PARAM_VECTOR_IN_REQ

```
#define PARAM_VECTOR_IN_REQ(
    T,
    ID,
    DESC,
    ALIAS ) PARAM_IN(std::vector<T>, ID, DESC, ALIAS, std::vector<T>(), true);
```

Define a required vector parameter.

The parameter must then be specified on the command line with `-ID=value1,value2,value3`.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).
<i>ALIAS</i>	An alias for the parameter (one letter).

See also

mlpack::CLI (p. 1117), **PROGRAM_INFO()** (p. 2733)

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the **PARAM_***() macros. However, not all compilers have this support—most notably, gcc < 4.3. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 1031 of file param.hpp.

40.354.2.44 PARAM_VECTOR_OUT

```
#define PARAM_VECTOR_OUT(  
    T,  
    ID,  
    DESC,  
    ALIAS )  PARAM_OUT(std::vector<T>, ID, DESC, ALIAS, std::vector<T>(), false)
```

Define a vector output parameter.

This vector will be printed on stdout at the end of the program; for instance, if the parameter name is "vector" and the vector holds the array { 1, 2, 3, 4 }, the output on stdout would be of the following form:

```
vector: 1, 2, 3, 4
```

If the parameter is not set by the end of the program, a fatal runtime error will be issued.

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).

See also

mlpack::CLI (p. 1117), **PROGRAM_INFO()** (p. 2733)

Bug The **COUNTER** variable is used in most cases to guarantee a unique global identifier for options declared using the **PARAM_***() macros. However, not all compilers have this support—most notably, gcc < 4.3. In that case, the **LINE** macro is used as an attempt to get a unique global identifier, but collisions are still possible, and they produce bizarre error messages. See <https://github.com/mlpack/mlpack/issues/100> for more information.

Definition at line 817 of file param.hpp.

40.354.2.45 PROGRAM_INFO

```
#define PROGRAM_INFO(
    NAME,
    SHORT_DESC,
    DESC,
    ... )
```

Value:

```
static mlpack::util::ProgramDoc \
cli_programdoc_dummy_object = mlpack::util::ProgramDoc(NAME, SHORT_DESC, \
[]() { return DESC; }, { __VA_ARGS__ } )
```

Document an executable.

Only one instance of this macro should be present in your program! Therefore, use it in the main.cpp (or corresponding executable) in your program.

See also

mlpack::CLI (p. 1117), **PARAM_FLAG()** (p. 2710), **PARAM_INT_IN()** (p. 2711), **PARAM_DOUBLE_IN()** (p. 2708), **PARAM_STRING_IN()** (p. 2721), **PARAM_VECTOR_IN()** (p. 2731), **PARAM_INT_OUT()** (p. 2712), **PARAM_DOUBLE_OUT()** (p. 2709), **PARAM_VECTOR_OUT()** (p. 2733), **PARAM_INT_IN_REQ()** (p. 2712), **PARAM_DOUBLE_IN_REQ()** (p. 2708), **PARAM_STRING_IN_REQ()** (p. 2722), **PARAM_VECTOR_IN_REQ()** (p. 2732), **PARAM_INT_OUT_REQ()**, **PARAM_DOUBLE_OUT_REQ()**, **PARAM_VECTOR_OUT_REQ()**, **PARAM_STRING_OUT_REQ()**.

Parameters

<i>NAME</i>	Short string representing the name of the program.
<i>SHORT_DESC</i>	Short two-sentence description of the program; it should describe what the program implements and does, and a quick overview of how it can be used and what it should be used for.
<i>DESC</i>	Long string describing what the program does and possibly a simple usage example. Newlines should not be used here; this is taken care of by CLI (however, you can explicitly specify newlines to denote new paragraphs). You can also use printing macros like <code>PRINT_PARAM_STRING()</code> , <code>PRINT_DATASET()</code> , and others.
<i>SEE_ALSOS</i>	A set of SEE_ALSO() (p. 2734) macros that are used for generating documentation. See the SEE_ALSO() (p. 2734) macro. This is a varargs argument, so you can add as many SEE_ALSO() (p. 2734)s as you like.

Definition at line 71 of file param.hpp.

40.354.2.46 SEE_ALSO

```
#define SEE_ALSO(
    DESCRIPTION,
    LINK ) {DESCRIPTION, LINK}
```

Provide a link for a binding's "see also" documentation section, which is primarily (but not necessarily exclusively) used by the Markdown bindings. This link can be specified by calling `SEE_ALSO("description", "link")`, where "description" is the description of the link and "link" may be one of the following:

- A direct URL, starting with `http://` or `https://`.
- A page anchor for documentation, referencing another binding by its CMake binding name, i.e. `"#knn"`.
- A link to a Doxygen page, using the mangled Doxygen name after a `'/`, i.e., `"@doxygen/mlpack1_1_adaboost1↔_1_AdaBoost"`.

Definition at line 45 of file `param.hpp`.

40.354.2.47 TUPLE_TYPE

```
#define TUPLE_TYPE std::tuple< mlpack::data::DatasetInfo, arma::mat>
```

Define an input `DatasetInfo`/matrix parameter.

From the command line, the user can specify the file that holds the matrix, using the name of the matrix parameter with `"_file"` appended (and the same alias). So for instance, if the name of the matrix parameter was `"matrix"`, the user could specify that the `"matrix"` matrix was held in `file.csv` by giving the parameter

```
--matrix_file file.csv
```

Then the `DatasetInfo` and matrix type could be accessed with

```
DatasetInfo d = std::move(
    CLI::GetParam<std::tuple<arma::mat, DatasetInfo>>("matrix").get<0>());
arma::mat m = std::move(
    CLI::GetParam<std::tuple<arma::mat, DatasetInfo>>("matrix").get<1>());
```

Parameters

<i>ID</i>	Name of the parameter.
<i>DESC</i>	Quick description of the parameter (1-2 sentences).
<i>ALIAS</i>	One-character string representing the alias of the parameter.

40.359.1 Detailed Description

Author

Trironk Kiatkungwanglai, Kirill Mishchenko

This file contains macro utilities for the SFINAE Paradigm. These utilities determine if classes passed in as template parameters contain members at compile time, which is useful for changing functionality depending on what operations an object is capable of performing.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.359.2 Macro Definition Documentation

40.359.2.1 HAS_ANY_METHOD_FORM

```
#define HAS_ANY_METHOD_FORM(  
    FUNC,  
    NAME )
```

Value:

```

template <typename T>
struct NAME
{
    template <typename Q = T>
    static typename
    std::enable_if<std::is_member_function_pointer<decltype(&Q::FUNC)>::value,
                  int>::type
    f(int) { return 1; }

    template <typename Q = T>
    static char f(char) { return 0; }

    static const bool value = sizeof(f<T>(0)) != sizeof(char);
};

```

Constructs a template structure, which will define a boolean static variable, to true, if the passed template parameter, has a member function with the specified name.

The check does not care about the signature or the function parameters.

Parameters

<i>FUNC</i>	the name of the function, whose existence is to be detected
<i>NAME</i>	the name of the structure that will be generated

Use this like: `NAME<ClassName>::value` to check for the existence of the function in the given class name. This can also be used in conjunction with `std::enable_if`.

Definition at line 201 of file `sfinae_utility.hpp`.

40.359.2.2 HAS_EXACT_METHOD_FORM

```

#define HAS_EXACT_METHOD_FORM(
    METHOD,
    NAME ) HAS_METHOD_FORM_BASE( SINGLE_ARG(METHOD), SINGLE_ARG(NAME), 0)

```

`HAS_EXACT_METHOD_FORM` generates a template that allows a compile time check whether a given class has a method of the requested form.

For example, for the following class

```
class A { public: ... Train(const arma::mat&, const arma::Row<size_t>&); ... };
```

and the following form of Train methods

```
template<typename Class> using TrainForm = void(Class::*)(const arma::mat&, const arma::Row<size_t>&);
```

we can check whether the class A has a Train method of the specified form:

```
HAS_METHOD_FORM(Train, HasTrain) (p. 2744); static_assert(HasTrain<A, TrainForm>::value, "value should be true");
```

The class generated by this will only return true values if the signature matches exactly.

Parameters

<i>METHOD</i>	The name of the method to check for.
<i>NAME</i>	The name of the struct to construct.
<i>MAXN</i>	The maximum number of additional arguments.

Definition at line 287 of file `sfinae_utility.hpp`.

40.359.2.3 HAS_MEM_FUNC

```
#define HAS_MEM_FUNC(
    FUNC,
    NAME )
```

Value:

```
template<typename T, typename sig, typename = std::true_type>
struct NAME : std::false_type {};

template<typename T, typename sig>
struct NAME
<
    T,
    sig,
    std::integral_constant<bool, mlpack::sfinae::SigCheck<sig, &T::FUNC>::value>
> : std::true_type {};
```

Definition at line 128 of file `sfinae_utility.hpp`.

40.359.2.4 HAS_METHOD_FORM

```
#define HAS_METHOD_FORM(
    METHOD,
    NAME ) HAS_METHOD_FORM_BASE( SINGLE_ARG(METHOD), SINGLE_ARG(NAME), 7)
```

`HAS_METHOD_FORM` generates a template that allows a compile time check for whether a given class has a method of the requested form.

For example, for the following class

```
class A { public: ... Train(const arma::mat&, const arma::Row<size_t>&, double); ... };
```

and the following form of `Train` methods

```
template<typename Class, typename...Ts> using TrainForm = void(Class::*)(const arma::mat&, const arma::Row<size_t>&, Ts...);
```

we can check whether the class `A` has a `Train` method of the specified form:

```
HAS_METHOD_FORM(Train, HasTrain) (p. 2744); static_assert(HasTrain<A, TrainForm>::value, "value should be true");
```

The class generated by this will also return true values if the given class has a method that also has extra parameters.

Parameters

<i>METHOD</i>	The name of the method to check for.
<i>NAME</i>	The name of the struct to construct.
<i>MAXN</i>	The maximum number of additional arguments.

Definition at line 253 of file sfinae_utility.hpp.

40.359.2.5 HAS_METHOD_FORM_BASE

```
#define HAS_METHOD_FORM_BASE(  
    METHOD,  
    NAME,  
    MAXN )
```

Base macro for **HAS_METHOD_FORM()** (p. 2744) and **HAS_EXACT_METHOD_FORM()** (p. 2743) macros.

Definition at line 143 of file sfinae_utility.hpp.

40.359.2.6 SINGLE_ARG

```
#define SINGLE_ARG(  
    ... ) __VA_ARGS__
```

Definition at line 220 of file sfinae_utility.hpp.

- **mlpack::amf**
 Alternating Matrix Factorization.

40.374.1 Detailed Description

Author

Ryan Curtin

A termination policy which only terminates when the maximum number of iterations is reached.

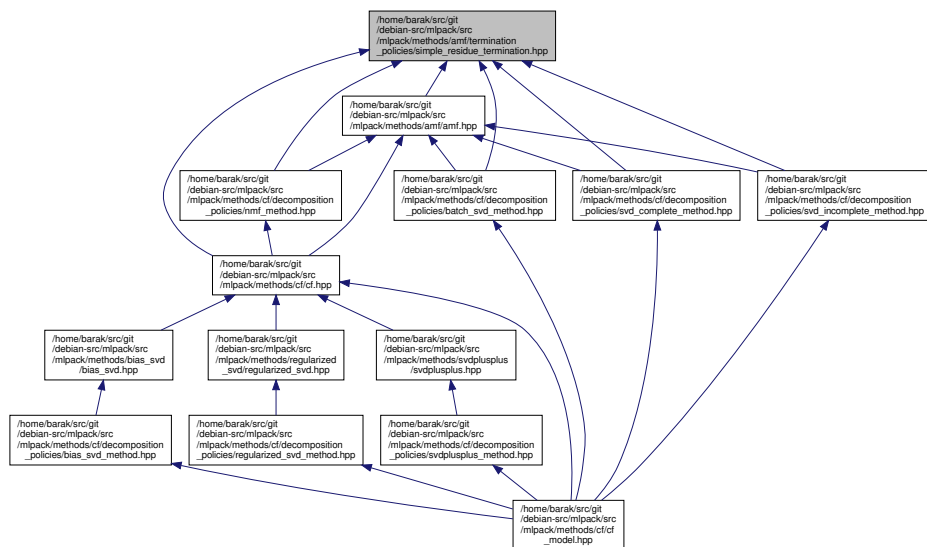

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.375 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/amf/termination_policies/simple_residue_termination.hpp File Reference

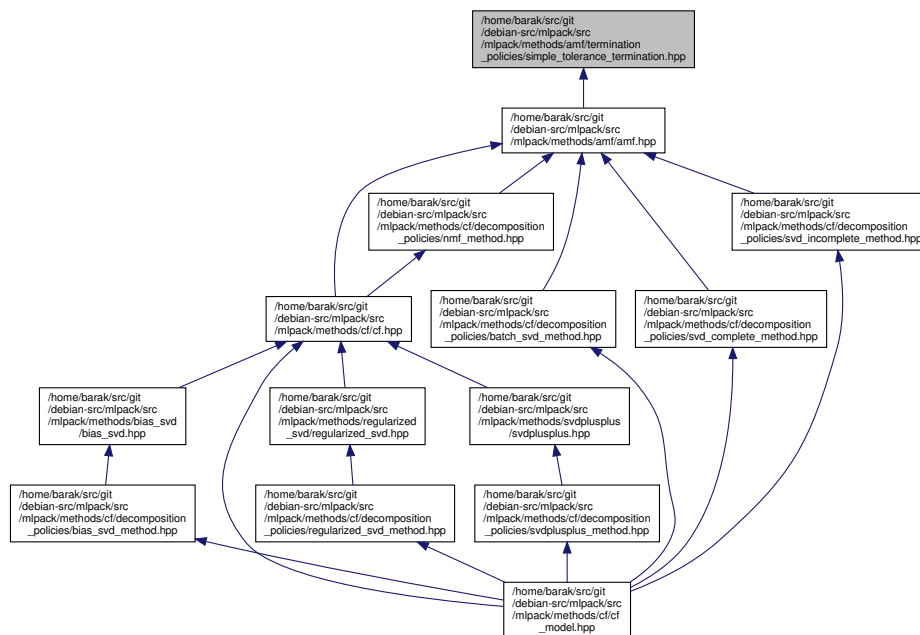

Include dependency graph for simple_residue_termination.hpp:

This graph shows which files directly or indirectly include this file:

This graph shows which files directly or indirectly include this file:

Classes

- class **SimpleToleranceTermination**< MatType >
This class implements residue tolerance termination policy.

Namespaces

- **mlpack**
.hpp
- **mlpack::amf**
Alternating Matrix Factorization.

40.376.1 Detailed Description

Author

Sumedh Ghaisas

Termination policy used in AMF (Alternating Matrix Factorization).

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.377 [/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/amf/termination_policies/validation_rmse_termination.hpp](#) File Reference

Include dependency graph for validation_rmse_termination.hpp:

Classes

- class **ValidationRMSETermination**< **MatType** >

This class implements validation termination policy based on RMSE index.

Namespaces

- **mlpack**

.hpp

- **mlpack::amf**

Alternating Matrix Factorization.

40.378 [/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/amf/update_rules/nmf_als.hpp](#) File Reference

Include dependency graph for nmf_als.hpp:

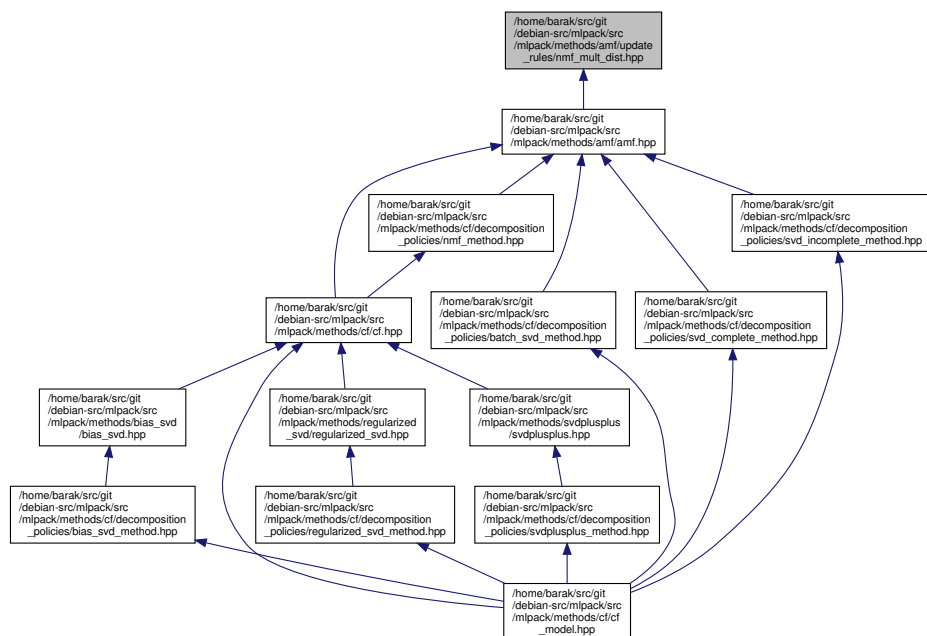

40.379 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/amf/update_rules/nmf_mult_dist.hpp File Reference

Include dependency graph for nmf_mult_dist.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **NMFMultiplicativeDistanceUpdate**
The multiplicative distance update rules for matrices W and H .

Namespaces

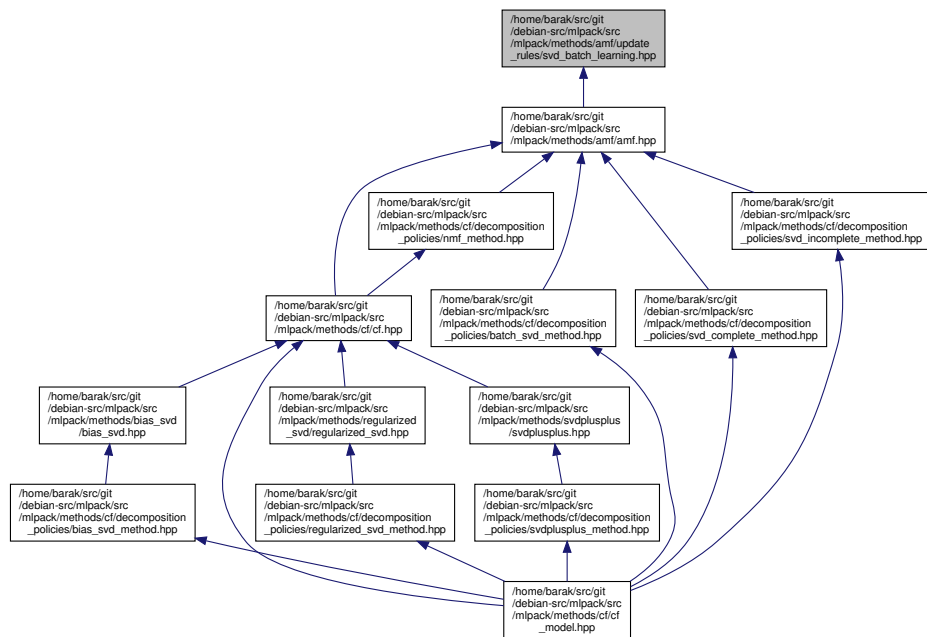

- mlpack**
.hpp
- mlpack::amf**
Alternating Matrix Factorization.

40.381 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/amf/update_rules/svd_↵
batch_learning.hpp File Reference

Include dependency graph for `svd_batch_learning.hpp`:

This graph shows which files directly or indirectly include this file:

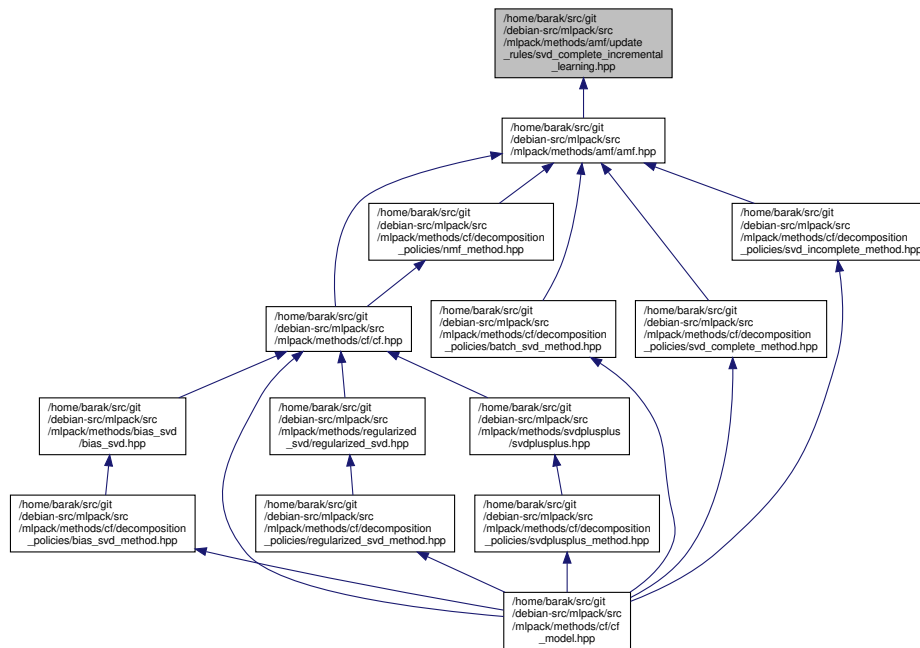

Classes

- class **SVDBatchLearning**
This class implements SVD batch learning with momentum.

Namespaces

- **mlpack**
.hpp
- **mlpack::amf**
Alternating Matrix Factorization.

This graph shows which files directly or indirectly include this file:

Classes

- class **SVDCompleteIncrementalLearning** < **MatType** >

This class computes SVD using complete incremental batch learning, as described in the following paper:

- class **SVDCompleteIncrementalLearning** < **arma::sp_mat** >

TODO : Merge this template specialized function for sparse matrix using common row_col_iterator.

Namespaces

- **mlpack**

.hpp

- **mlpack::amf**

Alternating Matrix Factorization.

40.382.1 Detailed Description

Author

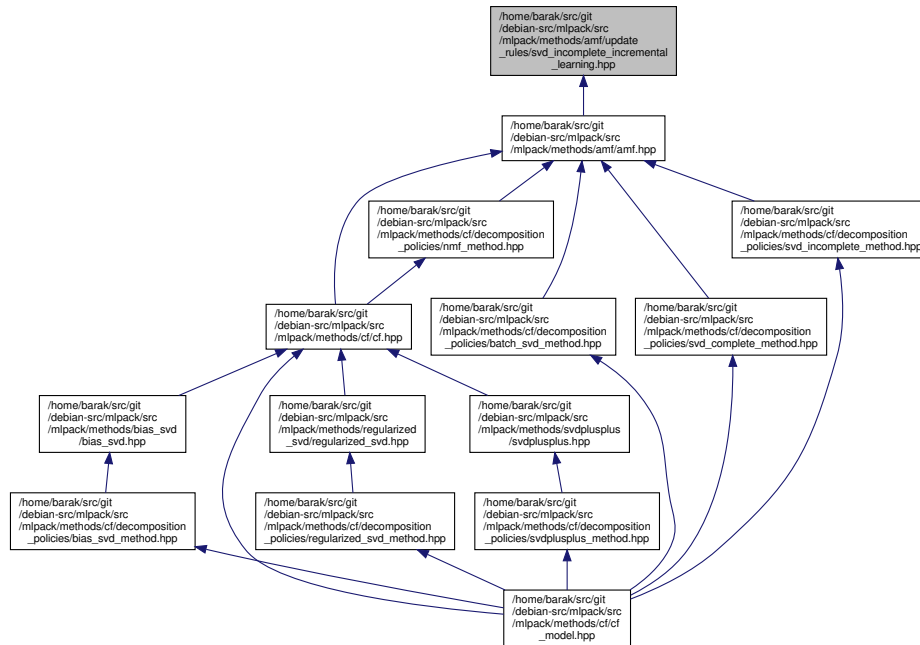

Sumedh Ghaisas

SVD factorizer used in AMF (Alternating Matrix Factorization).

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.383 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/amf/update_rules/svd_incomplete_incremental_learning.hpp File Reference

This graph shows which files directly or indirectly include this file:

Classes

- class **SVDIncompleteIncrementalLearning**

This class computes SVD using incomplete incremental batch learning, as described in the following paper:

Namespaces

- **mlpack**
 .hpp
- **mlpack::amf**
Alternating Matrix Factorization.

Functions

- template<>
 void **SVDIncompleteIncrementalLearning::HUpdate**< arma::sp_mat > (const arma::sp_mat &V, const arma::mat &W, arma::mat &H)
- template<>
 void **SVDIncompleteIncrementalLearning::WUpdate**< arma::sp_mat > (const arma::sp_mat &V, arma::mat &W, const arma::mat &H)

TODO : Merge this template specialized function for sparse matrix using common row_col_iterator.

40.383.1 Detailed Description

Author

Sumedh Ghaisas

SVD factorizer used in AMF (Alternating Matrix Factorization).

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.384 `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/activation_functions/hard_` `_sigmoid_function.hpp` File Reference

Include dependency graph for `hard_sigmoid_function.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **HardSigmoidFunction**
The hard sigmoid function, defined by.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.384.1 Detailed Description

Author

Bishwa Karki

Definition and implementation of the hard sigmoid function.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.385 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/activation_functions/identity_function.hpp File Reference

Include dependency graph for identity_function.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **IdentityFunction**
The identity function, defined by.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.385.1 Detailed Description

Author

Marcus Edel

Definition and implementation of the identity function.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.386 `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/activation_functions/logistic_function.hpp` File Reference

Include dependency graph for `logistic_function.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **LogisticFunction**
The logistic function, defined by.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.386.1 Detailed Description

Author

Marcus Edel

Definition and implementation of the logistic function.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.387 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/activation_functions/rectifier_↵ _function.hpp File Reference

Include dependency graph for rectifier_function.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RectifierFunction**
The rectifier function, defined by.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.387.1 Detailed Description

Author

Marcus Edel

Definition and implementation of the rectifier function as described by V. Nair and G. E. Hinton.

For more information, see the following paper.

```
@misc{NairHinton2010,
  author = {Vinod Nair, Geoffrey E. Hinton},
  title = {Rectified Linear Units Improve Restricted Boltzmann Machines},
  year = {2010}
}
```

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.388 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/activation_functions/softplus_↵ _function.hpp File Reference

Include dependency graph for softplus_function.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **SoftplusFunction**
The softplus function, defined by.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.388.1 Detailed Description

Author

Vivek Pal

Definition and implementation of the softplus function as described by Charles Dugas, Yoshua Bengio, François Belisle, Claude Nadeau & René Garcia.

For more information, please see the following paper:

```
@inproceedings{Dugas2001,
  author    = {Dugas, Charles and Bengio, Yoshua and Belisle, Francois and
               Nadeau, Claude and Garcia, Rene},
  title     = {Incorporating Second-Order Functional Knowledge for Better
               Option Pricing},
  booktitle = {Advances in Neural Information Processing Systems},
  year      = {2001}
}
```

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpak. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.389 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/activation_functions/softsign.
_function.hpp File Reference

Include dependency graph for softsign function.hpp:

Classes

- class **SoftsignFunction**
The softsign function, defined by.

Namespaces

- **mlpack**
 .hpp
- **mlpack::ann**
 Artificial Neural Network.

40.389.1 Detailed Description

Author

Marcus Edel

Definition and implementation of the softsign function as described by X. Glorot and Y. Bengio.

For more information, see the following paper.

```
@inproceedings{GlorotAISTATS2010,
  title={title={Understanding the difficulty of training deep feedforward
neural networks},
  author={Glorot, Xavier and Bengio, Yoshua},
  booktitle={Proceedings of AISTATS 2010},
  year={2010}
}
```

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.390 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/activation_functions/swish_↵ _function.hpp File Reference

Include dependency graph for swish_function.hpp:

Classes

- class **SwishFunction**
 The swish function, defined by.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.390.1 Detailed Description

Author

Vivek Pal

Definition and implementation of the Swish function as described by Prajit Ramachandran, Barret Zoph & Quoc V. Le

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.391 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/activation_functions/tanh_function.hpp File Reference

Include dependency graph for tanh_function.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **TanhFunction**
The tanh function, defined by.

40.393 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/add.hpp File Reference

Include dependency graph for add.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **Add**< **InputDataType**, **OutputDataType** >
Implementation of the **Add** (p. 553) module class.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.394 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/augmented/tasks/copy.hpp File Reference

Include dependency graph for copy.hpp:

Functions

- `template<typename MatType >`
`double SequencePrecision (arma::field< MatType > trueOutputs, arma::field< MatType > predOutputs, double tol=1e-4)`

Function that computes the sequences precision (number of correct sequences / number of sequences) of model's answer against ground truth answer.

40.395.1 Detailed Description

Author

Konstantin Sidorov

Definition of scoring functions for sequence prediction problems.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.396 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/augmented/tasks/sort.hpp File Reference

Include dependency graph for sort.hpp:

Classes

- class **SortTask**
Generator of instances of the sequence sort task.

Namespaces

- **mlpack**
`.hpp`
- **mlpack::ann**
Artificial Neural Network.
- **mlpack::ann::augmented**
- **mlpack::ann::augmented::tasks**

40.397.1 Detailed Description

Author

Saksham Bansal

Definition of the BRNN class, which implements bidirectional recurrent neural networks.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.398 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/convolution_rules/border_modes.hpp File Reference

This graph shows which files directly or indirectly include this file:

Classes

- class **FullConvolution**
- class **ValidConvolution**

Namespaces

- **mlpack**
 .hpp
- **mlpack::ann**
 Artificial Neural Network.

40.398.1 Detailed Description

Author

Marcus Edel

This file provides the border modes that can be used to compute different convolutions.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.400 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/convolution_rules/naive_convolution.hpp File Reference

Include dependency graph for naive_convolution.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **NaiveConvolution**< **BorderMode** >
Computes the two-dimensional convolution.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.400.1 Detailed Description

Author

Shangtong Zhang
Marcus Edel

Implementation of the convolution.

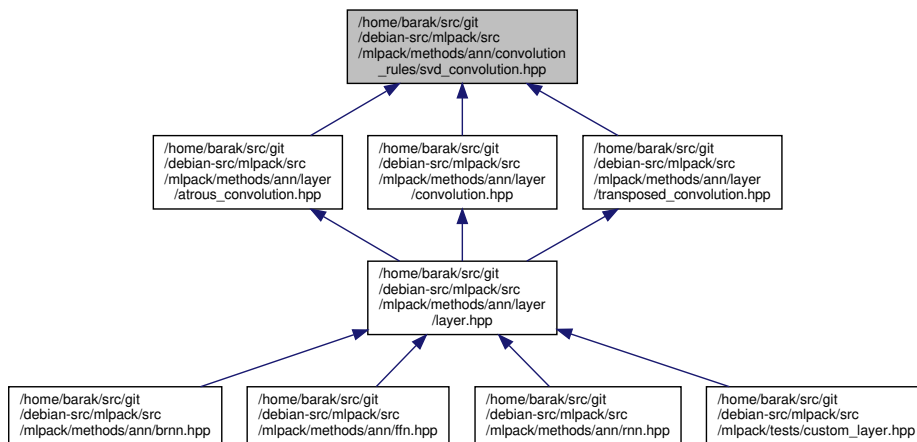

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.401 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/convolution_rules/svd_convolution.hpp File Reference

Include dependency graph for svd_convolution.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **SVDConvolution**< **BorderMode** >
Computes the two-dimensional convolution using singular value decomposition.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.401.1 Detailed Description

Author

Marcus Edel

Implementation of the convolution using the singular value decomposition to speed up the computation.

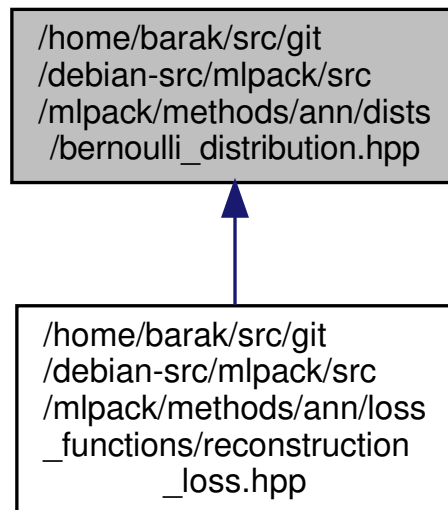

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.402 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/dists/bernoulli_distribution.hpp File Reference

Include dependency graph for bernoulli_distribution.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **BernoulliDistribution**< **DataType** >
Multiple independent Bernoulli distributions.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.402.1 Detailed Description

Author

Atharva Khandait

Definition of the Bernoulli distribution class.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.403 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/ffn.hpp File Reference

Include dependency graph for ffn.hpp:

Classes

- struct **version**< **mlpack::ann::FFN**< **OutputLayerType**, **InitializationRuleType**, **CustomLayer...** > >
- class **FFN**< **OutputLayerType**, **InitializationRuleType**, **CustomLayers** >
Implementation of a standard feed forward network.

Namespaces

- **boost**
Set the serialization version of the adaboost class.
- **boost::serialization**
- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.403.1 Detailed Description

Author

Marcus Edel
Shangtong Zhang

Definition of the FFN class, which implements feed forward neural networks.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

42

Include dependency graph for const_init.hpp:

Classes

- class **ConstInitialization**

This class is used to initialize weight matrix with constant values.

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

40.404.1 Detailed Description

Author

Sumedh Ghaisas

Initialization rule for the neural networks. This simple initialization is performed by assigning a matrix of all constant values to the weight matrix.

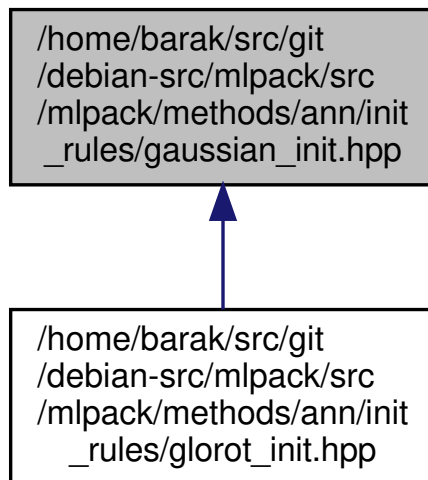

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.405 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/gaussian_init.hpp File Reference

Include dependency graph for gaussian_init.hpp:

This graph shows which files directly or indirectly include this file:

Classes

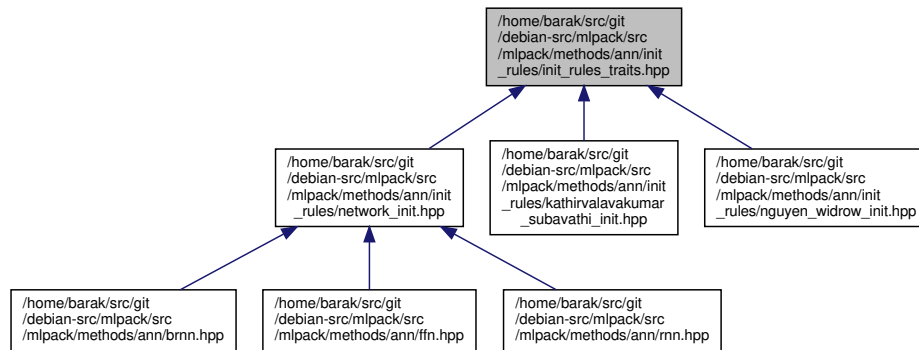

- class **GaussianInitialization**
This class is used to initialize weight matrix with a gaussian.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.408 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/init_rules_traits.hpp File Reference

This graph shows which files directly or indirectly include this file:

Classes

- class **InitTraits**< **InitRuleType** >

This is a template class that can provide information about various initialization methods.

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

40.408.1 Detailed Description

Author

Marcus Edel

This provides the InitTraits class, a template class to get information about various initialization methods.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.409 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/kathirvalavakumar_subavathi_init.hpp File Reference

Include dependency graph for kathirvalavakumar_subavathi_init.hpp:

Classes

- class **InitTraits**< **KathirvalavakumarSubavathiInitialization** >
Initialization traits of the kathirvalavakumar subavathi initialization rule.
- class **KathirvalavakumarSubavathiInitialization**
This class is used to initialize the weight matrix with the method proposed by T.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.409.1 Detailed Description

Author

Marcus Edel

Definition and implementation of the initialization method by T. Kathirvalavakumar and S. Subavathi. This initialization rule is based on sensitivity analysis using cauchy's inequality.

For more information, see the following paper.

```
@inproceedings{KathirvalavakumarJILSA2011,
  title={A New Weight Initialization Method Using Cauchy's Inequality Based
on Sensitivity Analysis},
  author={T. Kathirvalavakumar and S. Subavathi},
  booktitle={Journal of Intelligent Learning Systems and Applications,
Vol. 3 No. 4},
  year={2011}
}
```

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.410 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/lecun_normal_init.hpp File Reference

Include dependency graph for lecu_n_normal_init.hpp:

Classes

- class **LecunNormalInitialization**

This class is used to initialize weight matrix with the Lecun Normalization initialization rule.

Namespaces

- **mlpack**
 `.hpp`
- **mlpack::ann**

Artificial Neural Network.

40.410.1 Detailed Description

Author

Dakshit Agrawal
Prabhat Sharma

Initialization rule given by Lecun et. al. for neural networks and also mentioned in Self Normalizing Networks.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.412 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/nguyen_widrow_init.hpp File Reference

Include dependency graph for `nguyen_widrow_init.hpp`:

Classes

- class **InitTraits**< **NguyenWidrowInitialization** >
Initialization traits of the Nguyen-Widrow initialization rule.
- class **NguyenWidrowInitialization**
This class is used to initialize the weight matrix with the Nguyen-Widrow method.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.412.1 Detailed Description

Author

Marcus Edel

Definition and implementation of the Nguyen-Widrow method. This initialization rule initialize the weights so that the active regions of the neurons are approximately evenly distributed over the input space.

For more information, see the following paper.

```
@inproceedings{NguyenIJCNN1990,
  title={Improving the learning speed of 2-layer neural networks by choosing
  initial values of the adaptive weights},
  booktitle={Neural Networks, 1990., 1990 IJCNN International Joint
  Conference on},
  year={1990}
}
```

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.413 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/oivs_↵ init.hpp File Reference

Include dependency graph for oivs_init.hpp:

Classes

- class **OivsInitialization**< **ActivationFunction** >
This class is used to initialize the weight matrix with the oivs method.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.413.1 Detailed Description

Author

Marcus Edel

Definition and implementation of the Optimal Initial Value Setting method (OIVS). This initialization rule is based on geometrical considerations as described by H. Shimodaira.

For more information, see the following paper.

```
@inproceedings{ShimodairaICTAI1994,
  title={A weight value initialization method for improving learning
    performance of the backpropagation algorithm in neural networks},
  author={Shimodaira, H.},
  booktitle={Tools with Artificial Intelligence, 1994. Proceedings.,
    Sixth International Conference on},
  year={1994}
}
```

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.414 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/init_rules/orthogonal_init.hpp File Reference

Include dependency graph for orthogonal_init.hpp:

Classes

- class **OrthogonalInitialization**

This class is used to initialize the weight matrix with the orthogonal matrix initialization.

Namespaces

- **mlpack**
 .hpp
- **mlpack::ann**

Artificial Neural Network.

40.414.1 Detailed Description

Author

Marcus Edel

Definition and implementation of the orthogonal matrix initialization method.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.416.1 Detailed Description

Author

Dakshit Agrawal

Definition of the Alpha-Dropout class, which implements a regularizer that randomly sets units to alpha-dash to prevent them from co-adapting and makes an affine transformation so as to keep the mean and variance of outputs at their original values.

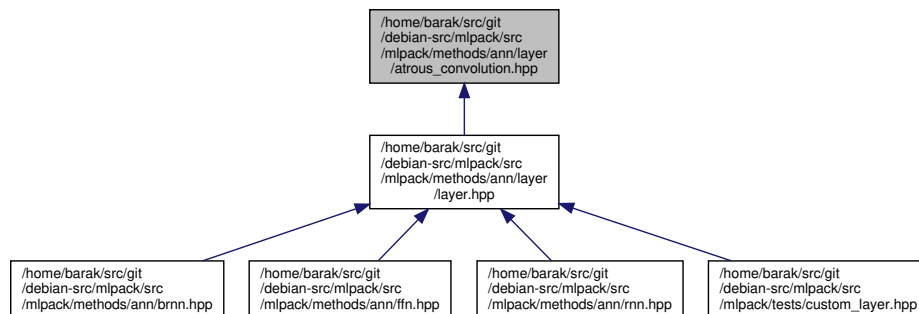

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.417 `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/atrous_convolution.hpp` File Reference

Include dependency graph for `atrous_convolution.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **AtrousConvolution**< **ForwardConvolutionRule**, **BackwardConvolutionRule**, **GradientConvolutionRule**, **InputDataType**, **OutputDataType** >

*Implementation of the Atrous **Convolution** (p. 643) class.*

Namespaces

- **mlpack**
 .hpp
- **mlpack::ann**
 Artificial Neural Network.

40.417.1 Detailed Description

Author

Aarush Gupta
Shikhar Jaiswal

Definition of the Atrous Convolution class.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.418 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/base_layer.hpp File Reference

Include dependency graph for base_layer.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **BaseLayer**< **ActivationFunction**, **InputDataType**, **OutputDataType** >
 Implementation of the base layer.

Namespaces

- **mlpack**
 .hpp
- **mlpack::ann**
 Artificial Neural Network.

Typedefs

- `template<class ActivationFunction = HardSigmoidFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat> using HardSigmoidLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType >`
 Standard HardSigmoid-Layer using the HardSigmoid activation function.
- `template<class ActivationFunction = IdentityFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat> using IdentityLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType >`
 Standard Identity-Layer using the identity activation function.
- `template<class ActivationFunction = RectifierFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat> using ReLULayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType >`
 Standard rectified linear unit non-linearity layer.
- `template<class ActivationFunction = LogisticFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat> using SigmoidLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType >`
 Standard Sigmoid-Layer using the logistic activation function.
- `template<class ActivationFunction = SoftplusFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat> using SoftPlusLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType >`
 Standard Softplus-Layer using the Softplus activation function.
- `template<class ActivationFunction = TanhFunction, typename InputDataType = arma::mat, typename OutputDataType = arma::mat> using TanHLayer = BaseLayer< ActivationFunction, InputDataType, OutputDataType >`
 Standard hyperbolic tangent layer.

40.418.1 Detailed Description

Author

Marcus Edel

Definition of the BaseLayer class, which attaches various functions to the embedding layer.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.419 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/batch_norm.hpp

File Reference

Include dependency graph for batch_norm.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **BatchNorm**< **InputDataType**, **OutputDataType** >
Declaration of the Batch Normalization layer class.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.419.1 Detailed Description

Author

Praveen Ch
Manthan-R-Sheth

Definition of the Batch Normalization layer class.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.421 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/c_relu.hpp File Reference

Include dependency graph for c_relu.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **CReLU**< **InputDataType**, **OutputDataType** >
A concatenated ReLU has two outputs, one ReLU and one negative ReLU, concatenated together.

Namespaces

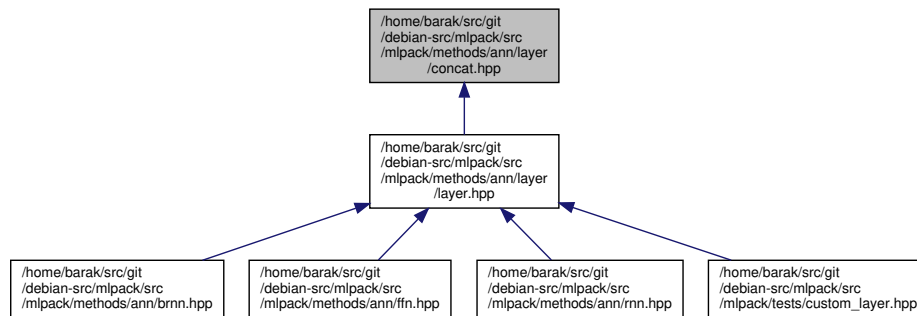

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.422 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/concat.hpp File Reference

Include dependency graph for concat.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **Concat**< **InputDataType**, **OutputDataType**, **CustomLayers** >

*Implementation of the **Concat** (p. 621) class.*

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

40.422.1 Detailed Description

Author

Marcus Edel
Mehul Kumar Nirala

Definition of the Concat class, which acts as a concatenation contain.

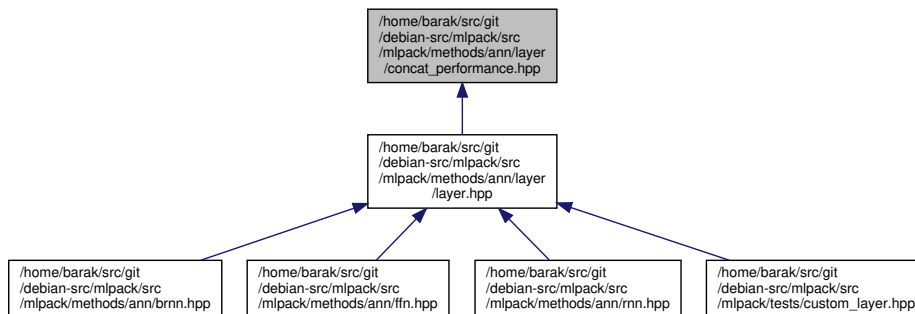

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.423 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/concat_performance.hpp File Reference

Include dependency graph for concat_performance.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **ConcatPerformance**< **OutputLayerType**, **InputDataType**, **OutputDataType** >
Implementation of the concat performance class.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.423.1 Detailed Description

Author

Marcus Edel

Definition of the ConcatPerformance class.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.425 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/constant.hpp File Reference

Include dependency graph for constant.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **Constant**< **InputDataType**, **OutputDataType** >
Implementation of the constant layer.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.425.1 Detailed Description

Author

Marcus Edel

Definition of the Constant class, which outputs a constant value given any input.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

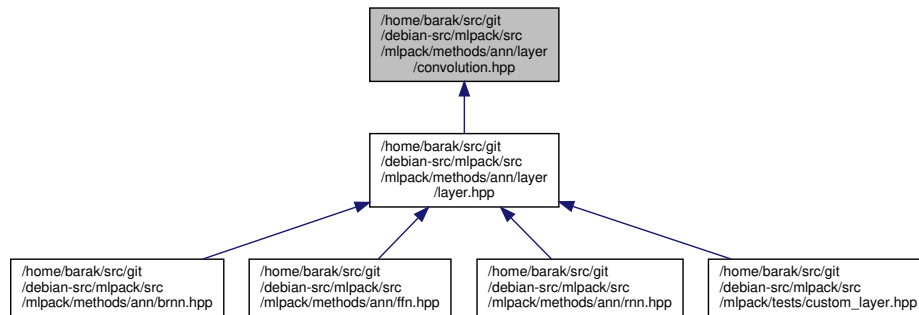

40.426 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/convolution.hpp

File Reference

Include dependency graph for convolution.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **Convolution** < **ForwardConvolutionRule**, **BackwardConvolutionRule**, **GradientConvolutionRule**, **InputDataType**, **OutputDataType** >
*Implementation of the **Convolution** (p. 643) class.*

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.426.1 Detailed Description

Author

Marcus Edel

Definition of the Convolution module class.

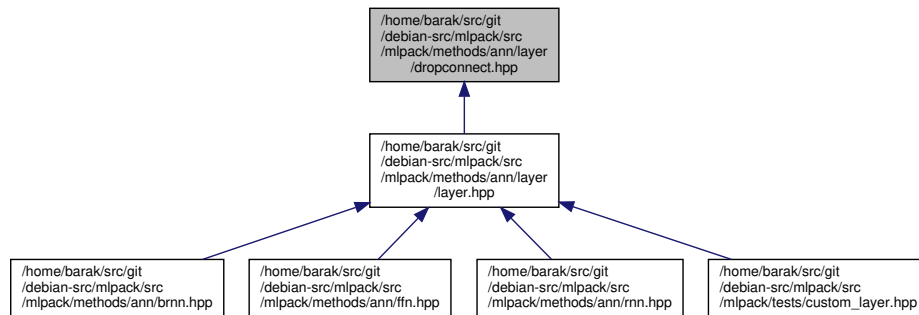

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.427 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/dropconnect.hpp File Reference

Include dependency graph for dropconnect.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **DropConnect**< **InputDataType**, **OutputDataType** >

The **DropConnect** (p. 666) layer is a regularizer that randomly with probability ratio sets the connection values to zero and scales the remaining elements by factor $1/(1 - \text{ratio})$.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.427.1 Detailed Description

Author

Palash Ahuja
Marcus Edel

Definition of the DropConnect class, which implements a regularizer that randomly sets connections to zero. Preventing units from co-adapting.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.429 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/elu.hpp File Reference

Include dependency graph for elu.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **ELU**< **InputDataType**, **OutputDataType** >
The **ELU** (p. 680) activation function, defined by.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

Typedefs

- using **SELU** = ELU< arma::mat, arma::mat >

40.429.1 Detailed Description

Author

Vivek Pal
Dakshit Agrawal

Definition of the ELU activation function as described by Djork-Arne Clevert, Thomas Unterthiner and Sepp Hochreiter.

Definition of the SELU function as introduced by Klambauer et. al. in Self Neural Networks. The SELU activation function keeps the mean and variance of the input invariant.

In short, SELU = lambda * ELU, with 'alpha' and 'lambda' fixed for normalized inputs.

Hence both ELU and SELU are implemented in the same file, with lambda = 1 for ELU function.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

Include dependency graph for fast_lstm.hpp:

```

graph TD
    A["/home/barak/src/git

40.432 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/glimpse.hpp

File Reference

Include dependency graph for glimpse.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **Glimpse**< **InputDataType**, **OutputDataType** >

The glimpse layer returns a retina-like representation (down-scaled cropped images) of increasing scale around a given location in a given image.

- class **MeanPoolingRule**

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

40.432.1 Detailed Description

Author

Marcus Edel

Definition of the GlimpseLayer class, which takes an input image and a location to extract a retina-like representation of the input image at different increasing scales.

For more information, see the following.

```

40.434 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/hard_tanh.hpp File Reference

Include dependency graph for hard_tanh.hpp:

This graph shows which files directly or indirectly include this file:

- class **HardTanH**< **InputDataType**, **OutputDataType** >
The Hard Tanh activation function, defined by.

- **mlpack**
 .hpp
- **mlpack::ann**
 Artificial Neural Network.

Author

Dhawal Arora

Definition and implementation of the HardTanH layer.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.435 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/join.hpp File Reference

Include dependency graph for join.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **Join**< **InputDataType**, **OutputDataType** >

Implementation of the **Join** (p. 753) module class.

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

40.435.1 Detailed Description

Author

Marcus Edel

Definition of the Join module.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.436 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/layer.hpp File Reference

Include dependency graph for layer.hpp:

This graph shows which files directly or indirectly include this file:

40.436.1 Detailed Description

Author

Marcus Edel

This includes various layers to construct a model.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.437 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/layer_norm.hpp File Reference

Include dependency graph for layer_norm.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **LayerNorm**< **InputDataType**, **OutputDataType** >
Declaration of the Layer Normalization class.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.437.1 Detailed Description

Author

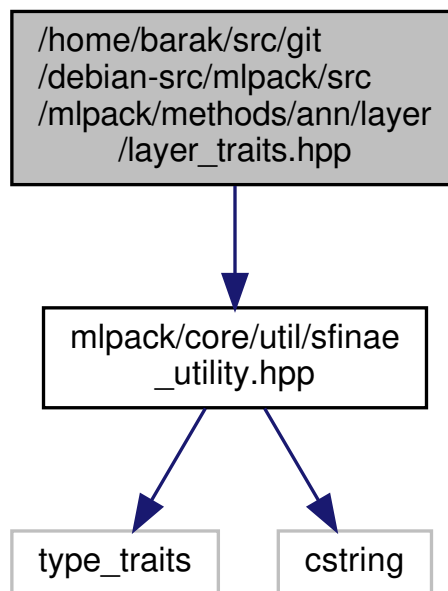

Shikhar Jaiswal

Definition of the Layer Normalization class.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.438 `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/layer_traits.hpp` File Reference

Include dependency graph for `layer_traits.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **LayerTraits**< **LayerType** >

This is a template class that can provide information about various layers.

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

Functions

- **HAS_ANY_METHOD_FORM** (Model, HasModelCheck)
- **HAS_MEM_FUNC** (Gradient, HasGradientCheck)
- **HAS_MEM_FUNC** (Deterministic, HasDeterministicCheck)
- **HAS_MEM_FUNC** (Parameters, HasParametersCheck)
- **HAS_MEM_FUNC** (Add, HasAddCheck)
- **HAS_MEM_FUNC** (Location, HasLocationCheck)
- **HAS_MEM_FUNC** (Reset, HasResetCheck)
- **HAS_MEM_FUNC** (ResetCell, HasResetCellCheck)
- **HAS_MEM_FUNC** (Reward, HasRewardCheck)
- **HAS_MEM_FUNC** (InputWidth, HasInputWidth)
- **HAS_MEM_FUNC** (InputHeight, HasInputHeight)
- **HAS_MEM_FUNC** (Rho, HasRho)
- **HAS_MEM_FUNC** (Loss, HasLoss)
- **HAS_MEM_FUNC** (Run, HasRunCheck)

40.438.1 Detailed Description

Author

Marcus Edel

This provides the LayerTraits class, a template class to get information about various layers.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.439 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/layer_types.hpp

File Reference

Include dependency graph for layer_types.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **AddMerge**< **InputDataType**, **OutputDataType**, **CustomLayers** >
Implementation of the **AddMerge** (p. 558) module class.
- class **AtrousConvolution**< **ForwardConvolutionRule**, **BackwardConvolutionRule**, **GradientConvolutionRule**, **InputDataType**, **OutputDataType** >
Implementation of the Atrous **Convolution** (p. 643) class.
- class **BatchNorm**< **InputDataType**, **OutputDataType** >
Declaration of the Batch Normalization layer class.
- class **Concat**< **InputDataType**, **OutputDataType**, **CustomLayers** >
Implementation of the **Concat** (p. 621) class.
- class **Concatenate**< **InputDataType**, **OutputDataType** >
Implementation of the **Concatenate** (p. 630) module class.
- class **ConcatPerformance**< **OutputLayerType**, **InputDataType**, **OutputDataType** >
Implementation of the concat performance class.
- class **Convolution**< **ForwardConvolutionRule**, **BackwardConvolutionRule**, **GradientConvolutionRule**, **InputDataType**, **OutputDataType** >
Implementation of the **Convolution** (p. 643) class.
- class **DropConnect**< **InputDataType**, **OutputDataType** >
The **DropConnect** (p. 666) layer is a regularizer that randomly with probability ratio sets the connection values to zero and scales the remaining elements by factor $1/(1 - \text{ratio})$.
- class **FastLSTM**< **InputDataType**, **OutputDataType** >
An implementation of a faster version of the Fast **LSTM** (p. 801) network layer.
- class **Glimpse**< **InputDataType**, **OutputDataType** >
The glimpse layer returns a retina-like representation (down-scaled cropped images) of increasing scale around a given location in a given image.
- class **GRU**< **InputDataType**, **OutputDataType** >
An implementation of a gru network layer.
- class **LayerNorm**< **InputDataType**, **OutputDataType** >

Declaration of the Layer Normalization class.

- class **Linear**< **InputDataType**, **OutputDataType** >
*Implementation of the **Linear** (p. 776) layer class.*
- class **LinearNoBias**< **InputDataType**, **OutputDataType** >
*Implementation of the **LinearNoBias** (p. 782) class.*
- class **LSTM**< **InputDataType**, **OutputDataType** >
*Implementation of the **LSTM** (p. 801) module class.*
- class **MultiplyMerge**< **InputDataType**, **OutputDataType**, **CustomLayers** >
*Implementation of the **MultiplyMerge** (p. 829) module class.*
- class **Recurrent**< **InputDataType**, **OutputDataType**, **CustomLayers** >
Implementation of the RecurrentLayer class.
- class **RecurrentAttention**< **InputDataType**, **OutputDataType** >
*This class implements the **Recurrent** (p. 886) Model for Visual Attention, using a variety of possible layer implementations.*
- class **Reparametrization**< **InputDataType**, **OutputDataType** >
*Implementation of the **Reparametrization** (p. 903) layer class.*
- class **Sequential**< **InputDataType**, **OutputDataType**, **Residual**, **CustomLayers** >
*Implementation of the **Sequential** (p. 927) class.*
- class **TransposedConvolution**< **ForwardConvolutionRule**, **BackwardConvolutionRule**, **GradientConvolutionRule**, **InputDataType**, **OutputDataType** >
*Implementation of the Transposed **Convolution** (p. 643) class.*
- class **VRClassReward**< **InputDataType**, **OutputDataType** >
Implementation of the variance reduced classification reinforcement layer.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

 Artificial Neural Network.

40.440.1 Detailed Description

Author

Dhawal Arora

Definition of LeakyReLU layer first introduced in the acoustic model, Andrew L. Maas, Awni Y. Hannun, Andrew Y. Ng, "Rectifier Nonlinearities Improve Neural Network Acoustic Models", 2014

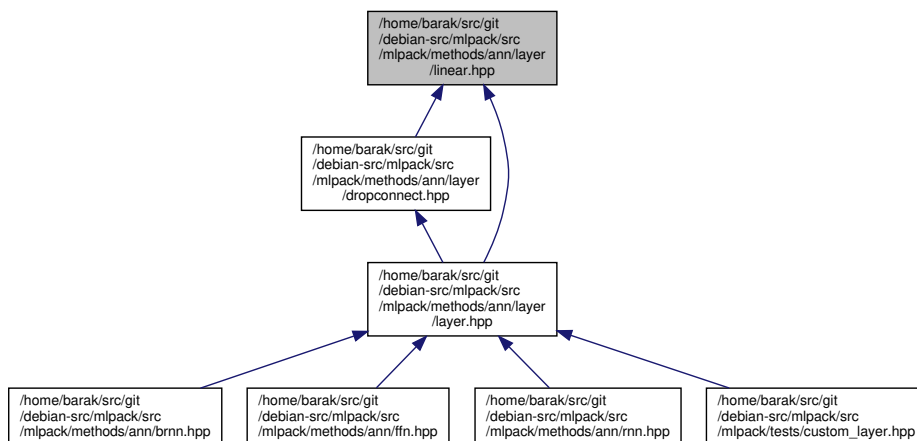

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.441 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/linear.hpp File Reference

Include dependency graph for linear.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **Lookup**< InputDataType, OutputDataType >
Implementation of the **Lookup** (p. 795) class.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

Typedefs

- `template<typename MatType = arma::mat>`
`using Embedding = Lookup< MatType, MatType >`

40.444.1 Detailed Description

Author

Marcus Edel

Definition of the Lookup class a particular convolution, where the width of the convolution is 1.

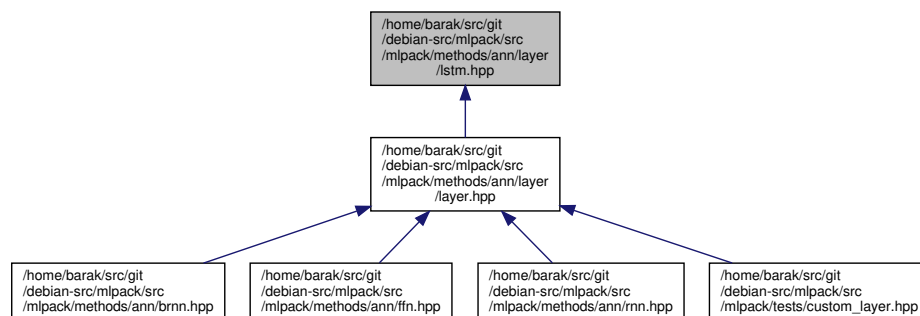

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.445 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/lstm.hpp File Reference

Include dependency graph for lstm.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **MeanPooling**< **InputDataType**, **OutputDataType** >
*Implementation of the **MeanPooling** (p. 814).*

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.447.1 Detailed Description

Author

Marcus Edel
Nilay Jain

Definition of the MeanPooling layer class.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.448 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/multiply_↵ constant.hpp File Reference

Include dependency graph for multiply_constant.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **MultiplyConstant**< **InputDataType**, **OutputDataType** >
Implementation of the multiply constant layer.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.448.1 Detailed Description

Author

Marcus Edel

Definition of the MultiplyConstantLayer class, which multiplies the input by a (non-learnable) constant.

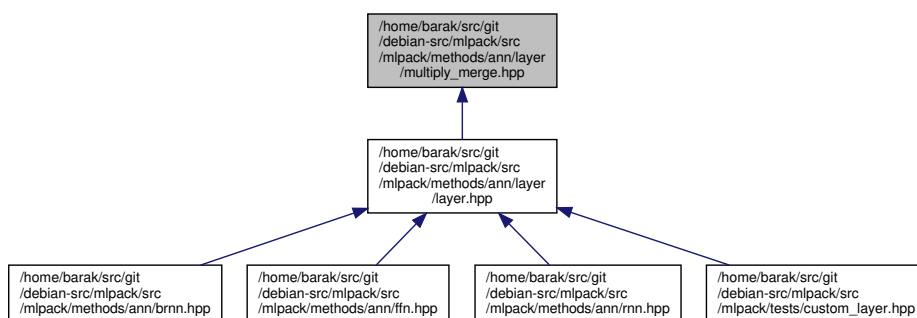

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.449 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/multiply_merge.hpp File Reference

Include dependency graph for multiply_merge.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **PReLU**< **InputDataType**, **OutputDataType** >
*The **PReLU** (p. 855) activation function, defined by (where alpha is trainable)*

Namespaces

- mlpack**
.hpp
- mlpack::ann**
Artificial Neural Network.

40.450.1 Detailed Description

Author

Prasanna Patil

Definition of PReLU layer first introduced in the, Kaiming He, Xiangyu Zhang, Shaoqing, Ren Jian Sun, "Delving Deep into Rectifiers: Surpassing Human-Level Performance on ImageNet Classification", 2014

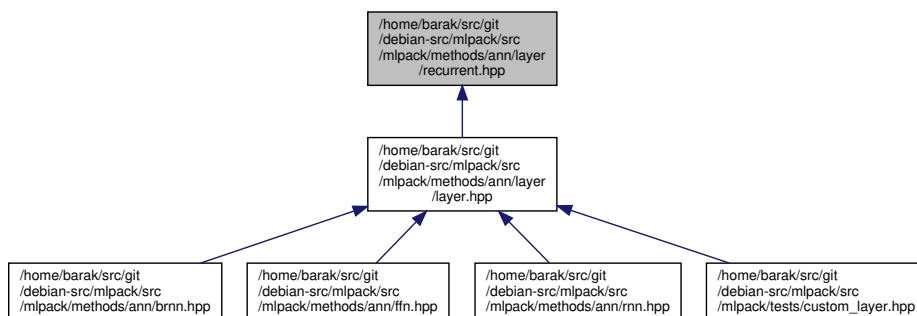

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.451 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/recurrent.hpp File Reference

Include dependency graph for recurrent.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RecurrentAttention**< **InputDataType**, **OutputDataType** >

This class implements the **Recurrent** (p. 886) Model for Visual Attention, using a variety of possible layer implementations.

Namespaces

- mlpack**
.hpp
- mlpack::ann**

Artificial Neural Network.

40.452.1 Detailed Description

Author

Marcus Edel

Definition of the RecurrentAttention class.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.453 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/reinforce_normal.hpp File Reference

Include dependency graph for reinforce_normal.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **ReinforceNormal**< **InputDataType**, **OutputDataType** >
Implementation of the reinforce normal layer.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.453.1 Detailed Description

Author

Marcus Edel

Definition of the ReinforceNormalLayer class, which implements the REINFORCE algorithm for the normal distribution.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.454 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/reparametrization.hpp File Reference

Include dependency graph for reparametrization.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **Reparametrization**< **InputDataType**, **OutputDataType** >
Implementation of the **Reparametrization** (p. 903) layer class.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.454.1 Detailed Description

Author

Atharva Khandait

Definition of the Reparametrization layer class which samples from a gaussian distribution.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.455 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/select.hpp File Reference

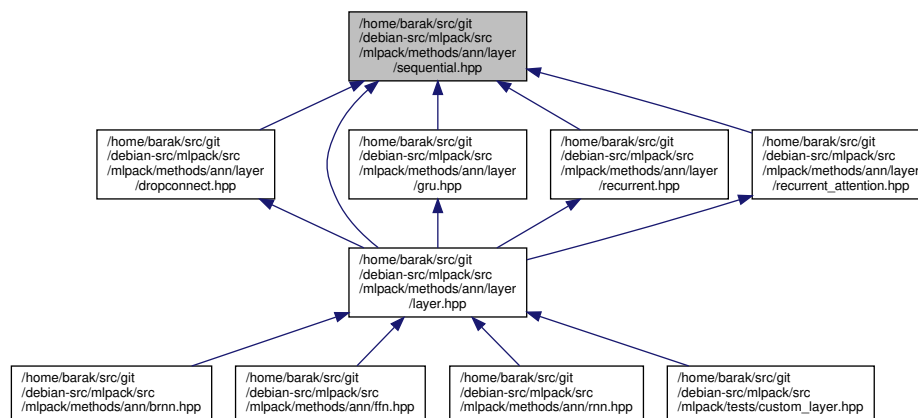

Include dependency graph for select.hpp:

This graph shows which files directly or indirectly include this file:

This graph shows which files directly or indirectly include this file:

Classes

- class **Sequential**< **InputDataType**, **OutputDataType**, **Residual**, **CustomLayers** >
Implementation of the **Sequential** (p. 927) class.

Namespaces

- mlpack**
.hpp
- mlpack::ann**
Artificial Neural Network.

Typedefs

- template<typename InputDataType = arma::mat, typename OutputDataType = arma::mat, typename... CustomLayers>
using **Residual** = Sequential< InputDataType, OutputDataType, true, CustomLayers... >

40.456.1 Detailed Description

Author

Marcus Edel

Definition of the Sequential class, which acts as a feed-forward fully connected network container.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.457 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/subview.hpp

File Reference

Include dependency graph for subview.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **Subview**< **InputDataType**, **OutputDataType** >
Implementation of the subview layer.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.457.1 Detailed Description

Author

Haritha Nair

Definition of the Subview class, which modifies the input as necessary.

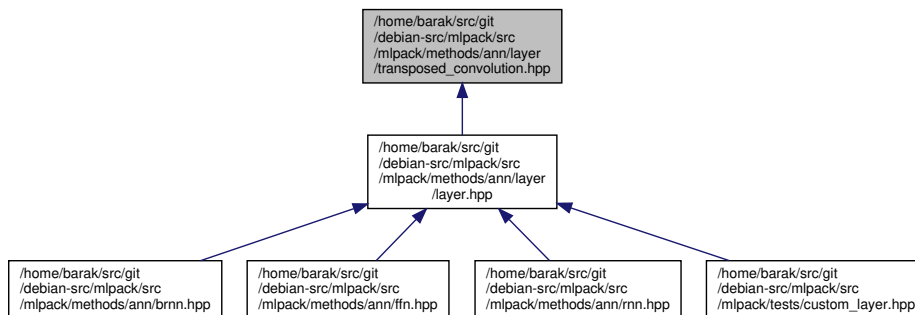

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.458 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/transposed_convolution.hpp File Reference

Include dependency graph for transposed_convolution.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **TransposedConvolution**< **ForwardConvolutionRule**, **BackwardConvolutionRule**, **GradientConvolutionRule**, **InputDataType**, **OutputDataType** >
Implementation of the Transposed **Convolution** (p. 643) class.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.458.1 Detailed Description

Author

Shikhar Jaiswal
Marcus Edel

Definition of the Transposed Convolution module class.

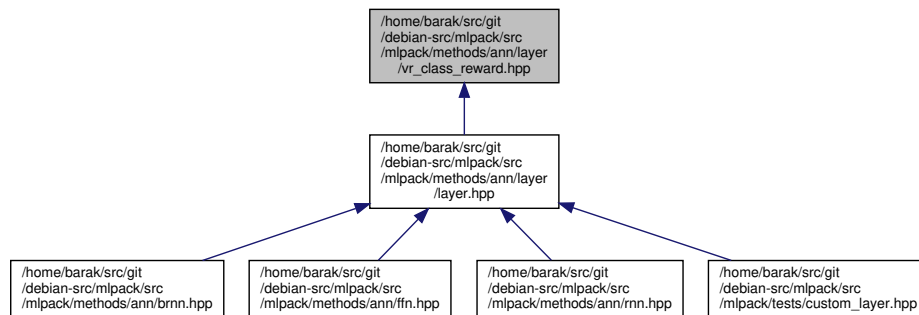

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.459 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/layer/vr_class_reward.hpp File Reference

Include dependency graph for vr_class_reward.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **VRClassReward**< **InputDataType**, **OutputDataType** >
Implementation of the variance reduced classification reinforcement layer.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.459.1 Detailed Description

Author

Marcus Edel

Definition of the VRClassReward class, which implements the variance reduced classification reinforcement layer.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

Include dependency graph for cross_entropy_error.hpp:

- class **CrossEntropyError**< InputDataType, OutputDataType >
The cross-entropy performance function measures the network's performance according to the cross-entropy between the input and target distributions.

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

Author

Konstantin Sidorov

Definition of the cross-entropy performance function.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpac. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

Include dependency graph for dice_loss.hpp:

Classes

- class **SigmoidCrossEntropyError**< **InputDataType**, **OutputDataType** >

The **SigmoidCrossEntropyError** (p. 937) performance function measures the network's performance according to the cross-entropy function between the input and target distributions.

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

40.467.1 Detailed Description

Author

Kris Singh
Shikhar Jaiswal

Definition of the cross-entropy with logit performance function.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.468 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/rbm/rbm.hpp File Reference

Include dependency graph for rbm.hpp:

Classes

- class **RBM**< **InitializationRuleType**, **DataType**, **PolicyType** >

The implementation of the **RBM** (p. 864) module.

Namespaces

- **mlpack**
 .hpp
- **mlpack::ann**
 Artificial Neural Network.

40.468.1 Detailed Description

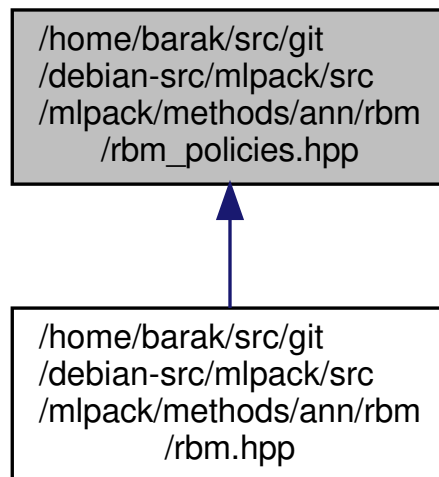

Author

Kris Singh
Shikhar Jaiswal

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.469 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/rbm/rbm_policies.hpp File Reference

This graph shows which files directly or indirectly include this file:

Classes

- class **BinaryRBM**
 For more information, see the following paper:
- class **SpikeSlabRBM**
 For more information, see the following paper:

40.470.1 Detailed Description

Author

Marcus Edel

Definition of the RNN class, which implements recurrent neural networks.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.471 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/add_visitor.hpp File Reference

Include dependency graph for add_visitor.hpp:

Classes

- class **AddVisitor**< **CustomLayers** >
AddVisitor (p. 565) exposes the *Add()* method of the given module.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.471.1 Detailed Description

Author

Marcus Edel

This file provides an abstraction for the *Add()* function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.472 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/backward_visitor.hpp File Reference

Include dependency graph for backward_visitor.hpp:

Classes

- class **BackwardVisitor**

***BackwardVisitor** (p. 587) executes the Backward() function given the input, error and delta parameter.*

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

40.472.1 Detailed Description

Author

Marcus Edel

This file provides an abstraction for the Backward() function for different layers and automatically directs any parameter to the right layer type.

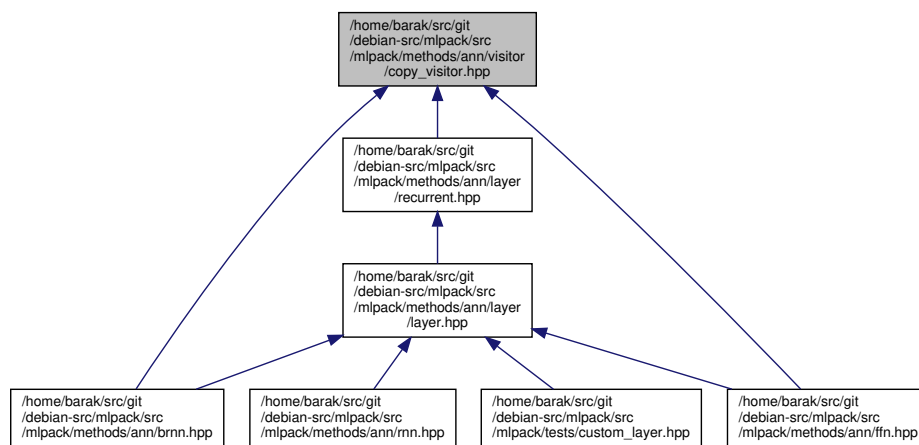

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.473 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/copy_visitor.hpp File Reference

Include dependency graph for copy_visitor.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **CopyVisitor**< **CustomLayers** >
This visitor is to support copy constructor for neural network module.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.473.1 Detailed Description

Author

Shangtong Zhang

This file provides an abstraction for copy between layers.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

Include dependency graph for delete_visitor.hpp:

- class **DeleteVisitor**

DeleteVisitor (p. 659) executes the destructor of the instantiated object.

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

Author

Marcus Edel

This file provides an abstraction for the Delete() function for different layers and automatically directs any parameter to the right layer type.

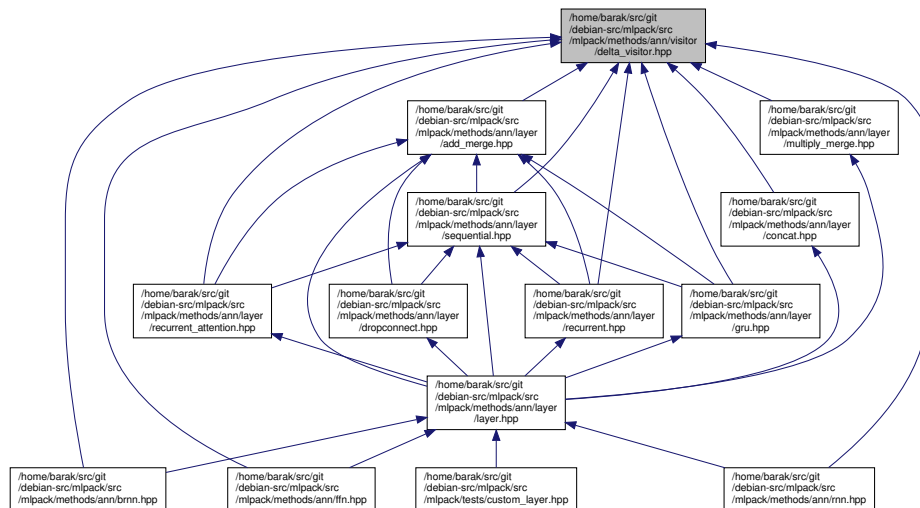

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.475 `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/delta_visitor.hpp` File Reference

Include dependency graph for `delta_visitor.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **DeltaVisitor**

***DeltaVisitor** (p. 660) exposes the delta parameter of the given module.*

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

40.475.1 Detailed Description

Author

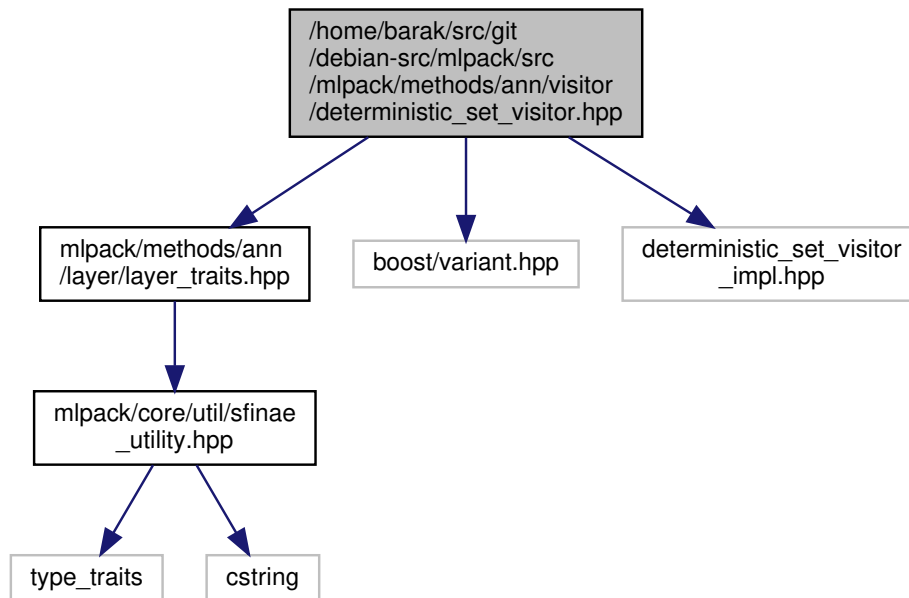

Marcus Edel

This file provides an abstraction for the Delta() function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.476 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/deterministic_set_visitor.hpp File Reference

Include dependency graph for deterministic_set_visitor.hpp:

Classes

- class **DeterministicSetVisitor**
DeterministicSetVisitor (p. 661) set the deterministic parameter given the deterministic value.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.476.1 Detailed Description

Author

Marcus Edel

This file provides an abstraction for the Deterministic() function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.477 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/forward_visitor.hpp File Reference

Include dependency graph for forward_visitor.hpp:

Classes

- class **ForwardVisitor**

ForwardVisitor (p. 713) executes the Forward() function given the input and output parameter.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**

Artificial Neural Network.

40.477.1 Detailed Description

Author

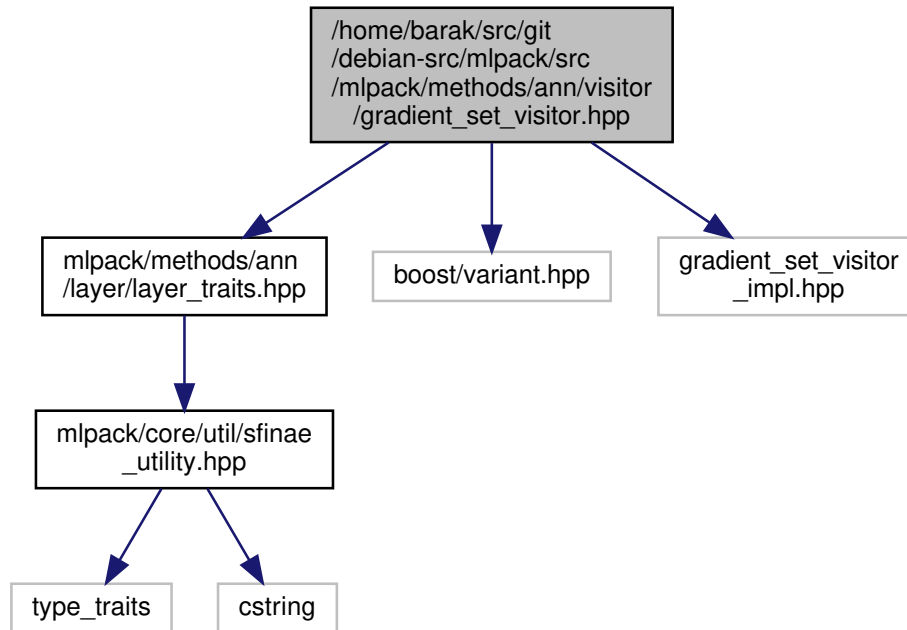

Marcus Edel

This file provides an abstraction for the Forward() function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.478 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/gradient_set_visitor.hpp File Reference

Include dependency graph for gradient_set_visitor.hpp:

Classes

- class **GradientSetVisitor**
GradientSetVisitor (p. 725) update the gradient parameter given the gradient set.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.478.1 Detailed Description

Author

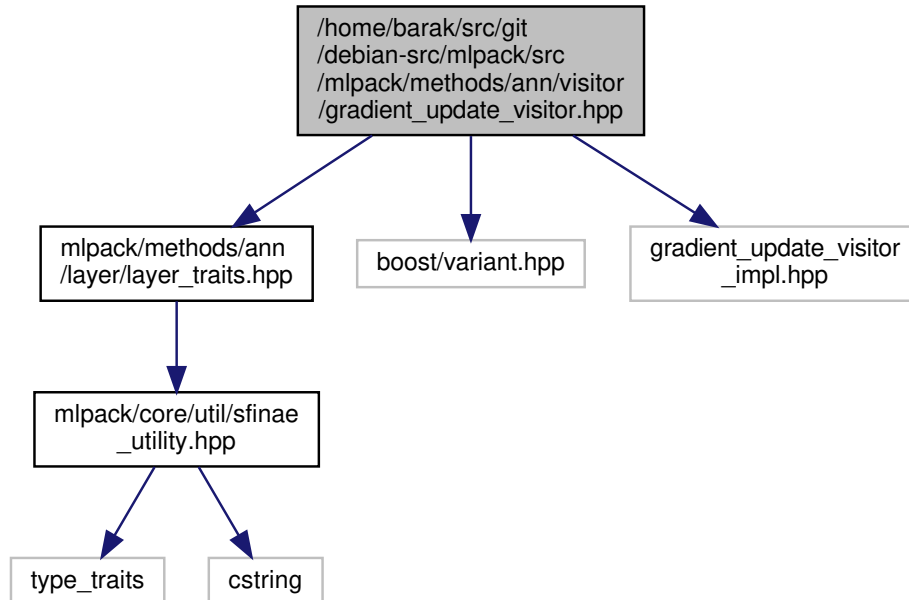

Marcus Edel

This file provides an abstraction for the `Gradient()` function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.479 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/gradient_↵ update_visitor.hpp File Reference

Include dependency graph for gradient_update_visitor.hpp:

Classes

- class **GradientUpdateVisitor**
GradientUpdateVisitor (p. 727) update the gradient parameter given the gradient set.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.479.1 Detailed Description

Author

Marcus Edel

This file provides an abstraction for the `Gradient()` function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.480 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/gradient_visitor.hpp File Reference

Include dependency graph for gradient_visitor.hpp:

Classes

- class **GradientVisitor**

SearchModeVisitor executes the Gradient() method of the given module using the input and delta parameter.

Namespaces

- **mlpack**
 .hpp
- **mlpack::ann**

Artificial Neural Network.

40.480.1 Detailed Description

Author

Marcus Edel

This file provides an abstraction for the Gradient() function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.481 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/gradient_zero_visitor.hpp File Reference

Include dependency graph for gradient_zero_visitor.hpp:

Classes

- class **GradientZeroVisitor**

Namespaces

- **mlpack**
 .hpp
- **mlpack::ann**
 Artificial Neural Network.

40.481.1 Detailed Description

Author

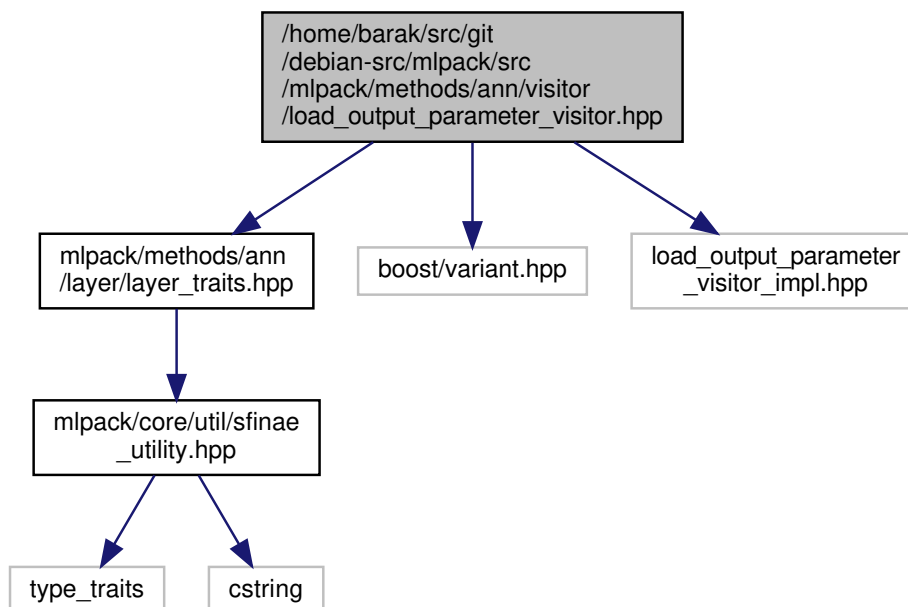

Marcus Edel

This file provides an abstraction for the Gradient() function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.482 `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/load_output_parameter_visitor.hpp` File Reference

Include dependency graph for `load_output_parameter_visitor.hpp`:

Classes

- class **LoadOutputParameterVisitor**
LoadOutputParameterVisitor (p. 788) restores the output parameter using the given parameter set.

Namespaces

- mlpack**
.hpp
- mlpack::ann**
Artificial Neural Network.

40.482.1 Detailed Description

Author

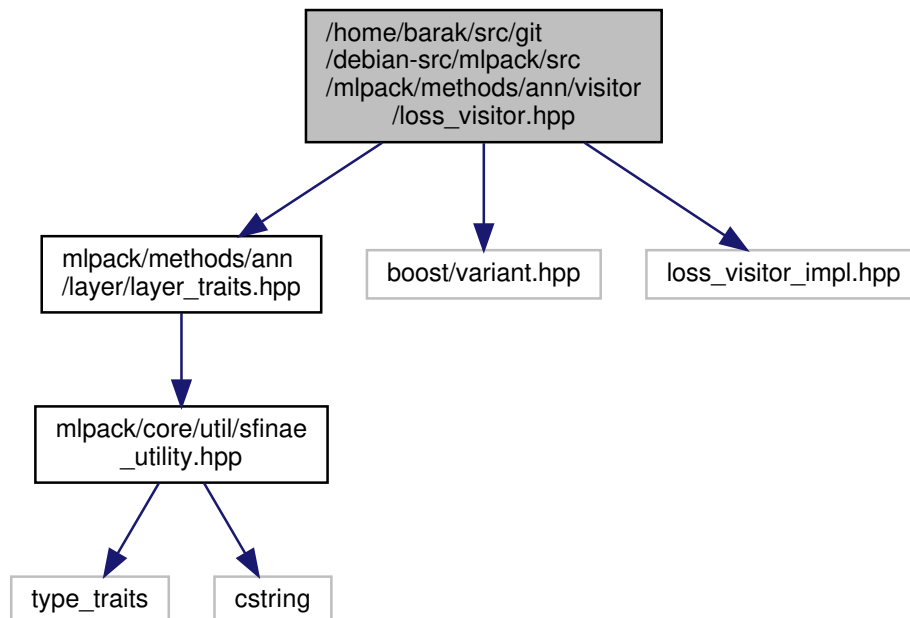

Marcus Edel

This file provides an abstraction for the OutputParameter() function for different layers and automatically directs any parameter to the right layer type.

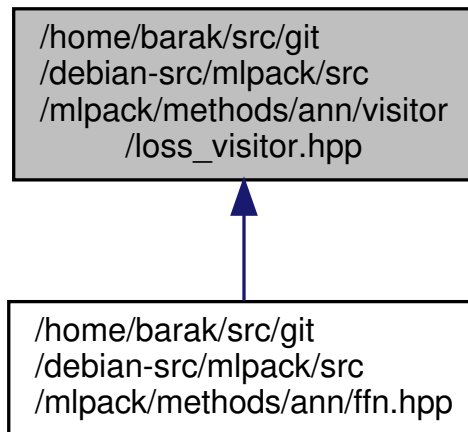

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.483 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/loss_visitor.hpp File Reference

Include dependency graph for loss_visitor.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **LossVisitor**

LossVisitor (p. 800) exposes the `Loss()` method of the given module.

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

40.483.1 Detailed Description

Author

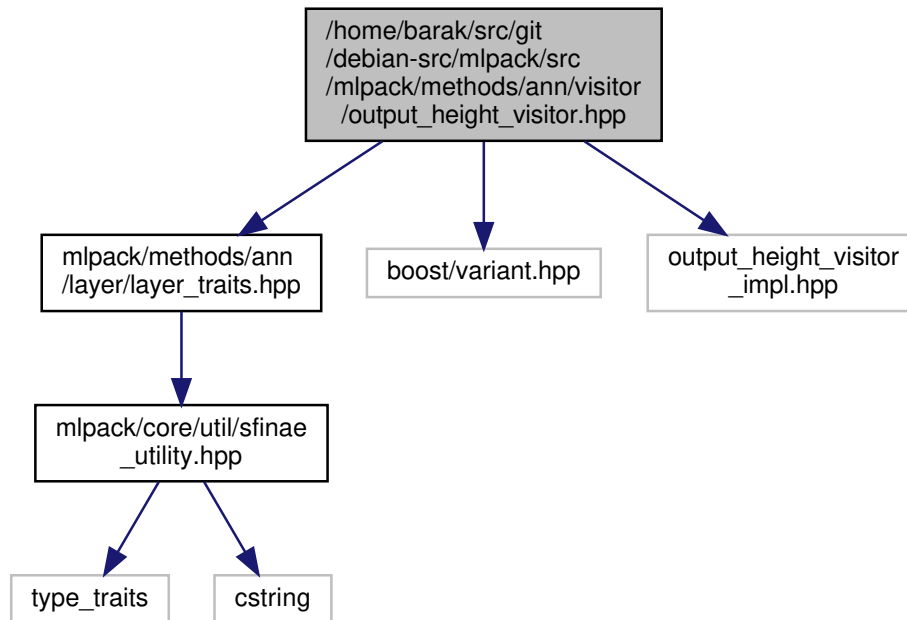

Atharva Khandait

This file provides an abstraction for the `Loss()` function for different layers and automatically directs any parameter to the right layer type.

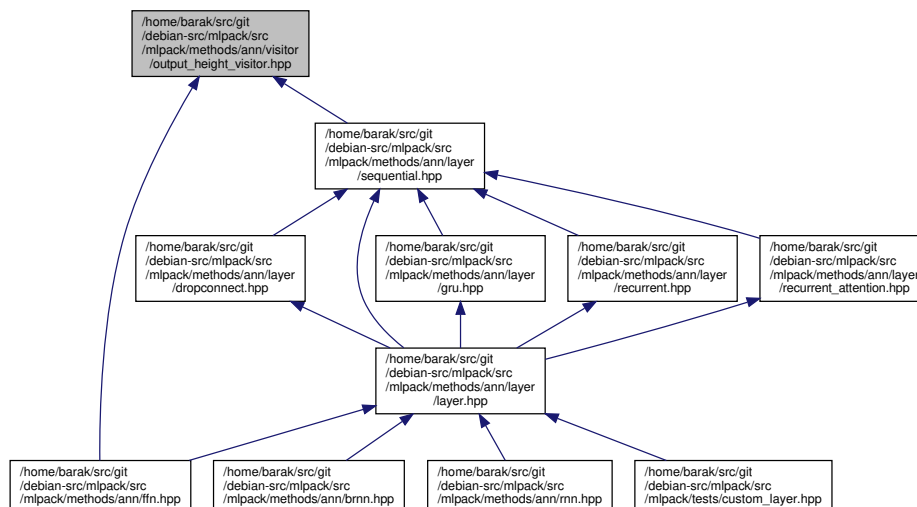

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.484 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/output_height_visitor.hpp File Reference

Include dependency graph for output_height_visitor.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **OutputHeightVisitor**

OutputHeightVisitor (p. 850) exposes the `OutputHeight()` method of the given module.

Namespaces

- **mlpack**
 .hpp
- **mlpack::ann**
 Artificial Neural Network.

40.484.1 Detailed Description

Author

Marcus Edel

This file provides an abstraction for the `OutputHeight()` function for different layers and automatically directs any parameter to the right layer type.

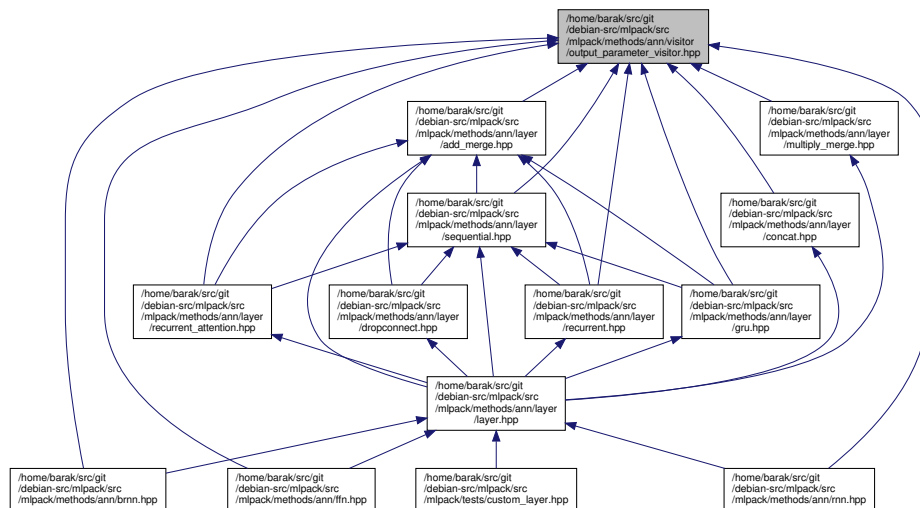

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.485 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/output_parameter_visitor.hpp File Reference

Include dependency graph for `output_parameter_visitor.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **OutputParameterVisitor**
OutputParameterVisitor (p. 851) exposes the output parameter of the given module.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.485.1 Detailed Description

Author

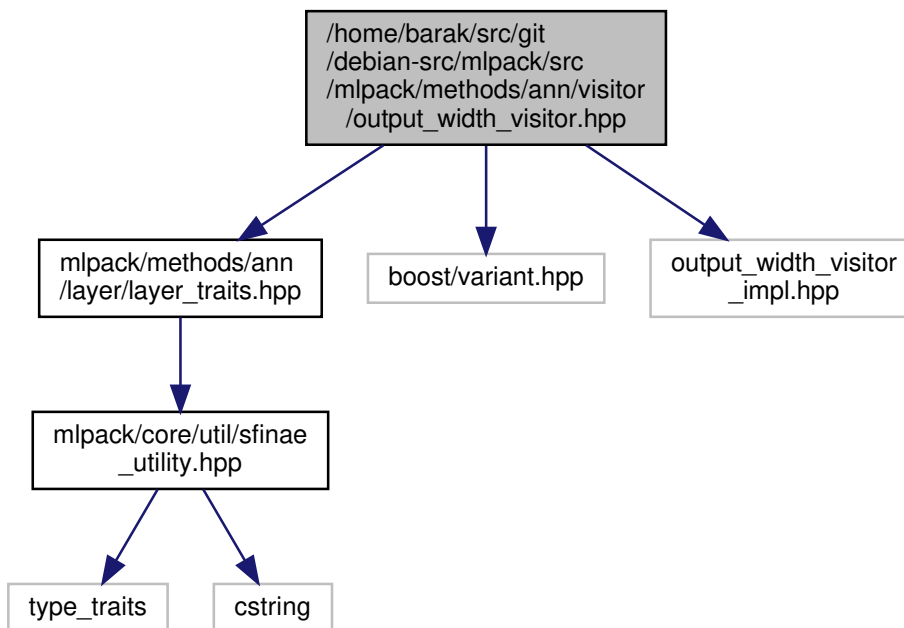

Marcus Edel

This file provides an abstraction for the OutputParameter() function for different layers and automatically directs any parameter to the right layer type.

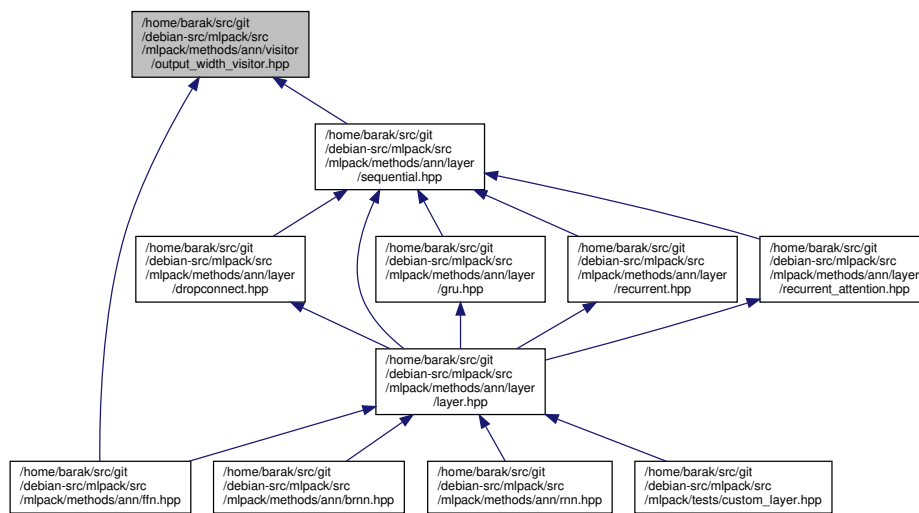

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.486 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/output_width_visitor.hpp File Reference

Include dependency graph for output_width_visitor.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **OutputWidthVisitor**

***OutputWidthVisitor** (p. 852) exposes the `OutputWidth()` method of the given module.*

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

40.486.1 Detailed Description

Author

Marcus Edel

This file provides an abstraction for the `OutputWidth()` function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.487 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/parameters_set_visitor.hpp File Reference

Include dependency graph for parameters_set_visitor.hpp:

Classes

- class **ParametersSetVisitor**
ParametersSetVisitor (p. 853) update the parameters set using the given matrix.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.487.1 Detailed Description

Author

Marcus Edel

This file provides an abstraction for the Parameters() function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.488 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/parameters_visitor.hpp File Reference

Include dependency graph for parameters_visitor.hpp:

Classes

- class **ParametersVisitor**

ParametersVisitor (p. 854) exposes the parameters set of the given module and stores the parameters set into the given matrix.

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

40.488.1 Detailed Description

Author

Marcus Edel

This file provides an abstraction for the Parameters() function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.489 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/reset_cell_visitor.hpp File Reference ↩

Include dependency graph for reset_cell_visitor.hpp:

Classes

- class **ResetCellVisitor**

ResetCellVisitor (p. 907) executes the ResetCell() function.

Namespaces

- **mlpack**
 .hpp
- **mlpack::ann**
 Artificial Neural Network.

40.489.1 Detailed Description

Author

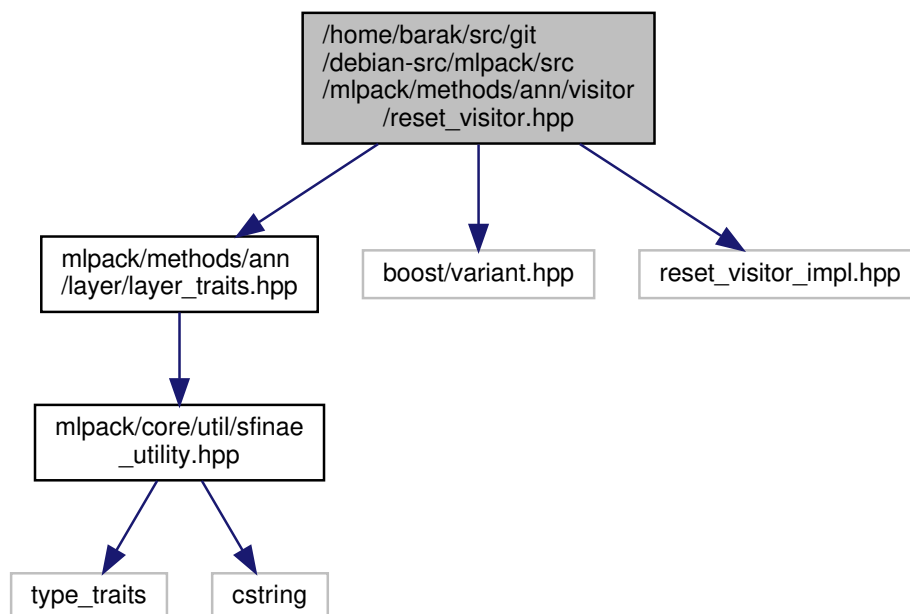

Sumedh Ghaisas

Boost static visitor abstraction for calling ResetCell function on RNN cells.

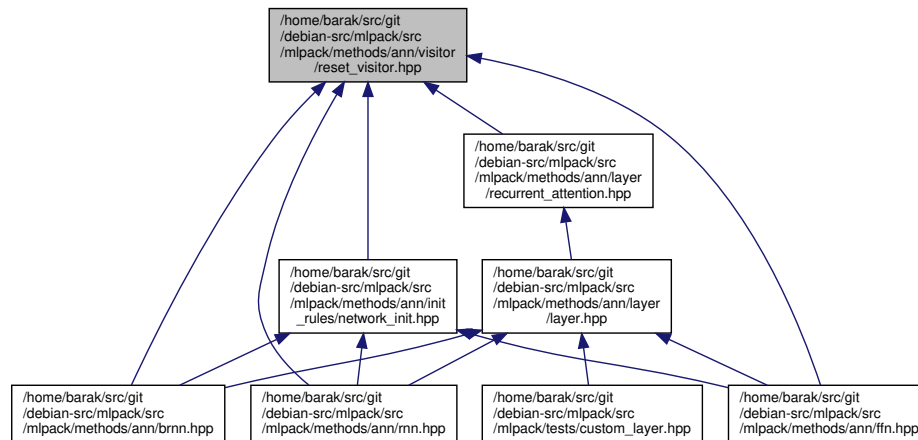

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.490 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/reset_visitor.hpp File Reference

Include dependency graph for reset_visitor.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **ResetVisitor**

***ResetVisitor** (p. 909) executes the `Reset()` function.*

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

40.490.1 Detailed Description

Author

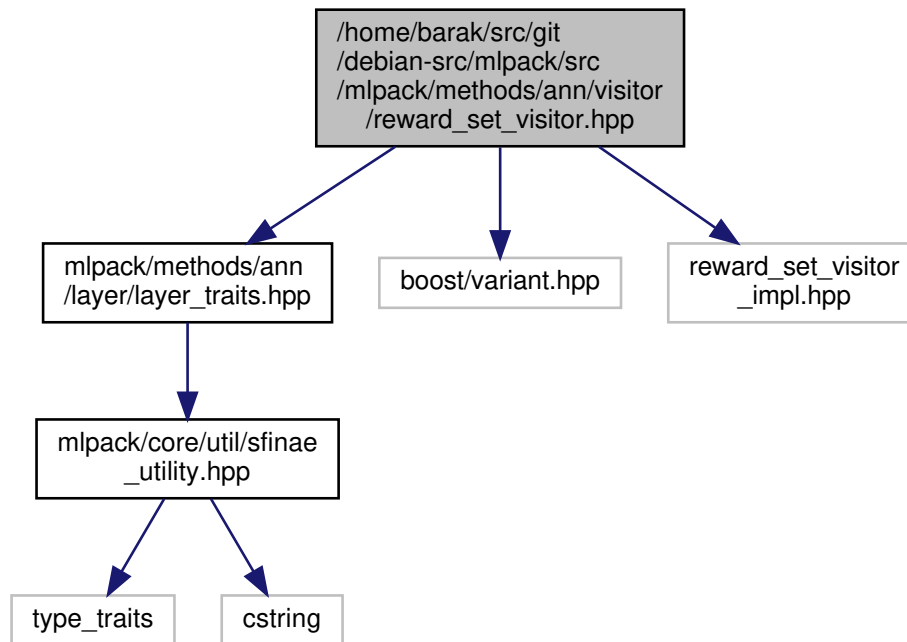

Marcus Edel

This file provides an abstraction for the `Reset()` function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.491 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/reward_set_visitor.hpp File Reference

Include dependency graph for reward_set_visitor.hpp:

Classes

- class **RewardSetVisitor**
RewardSetVisitor (p. 910) set the reward parameter given the reward value.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.491.1 Detailed Description

Author

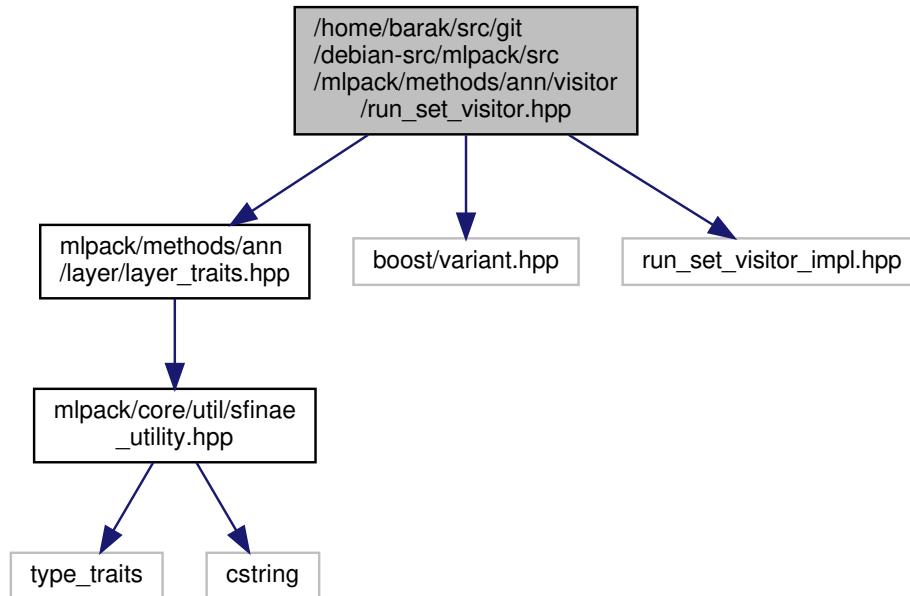

Marcus Edel

This file provides an abstraction for the `Reward()` function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.492 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/run_set_visitor.hpp File Reference

Include dependency graph for run_set_visitor.hpp:

Classes

- class **RunSetVisitor**
RunSetVisitor (p. 921) set the run parameter given the run value.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.492.1 Detailed Description

Author

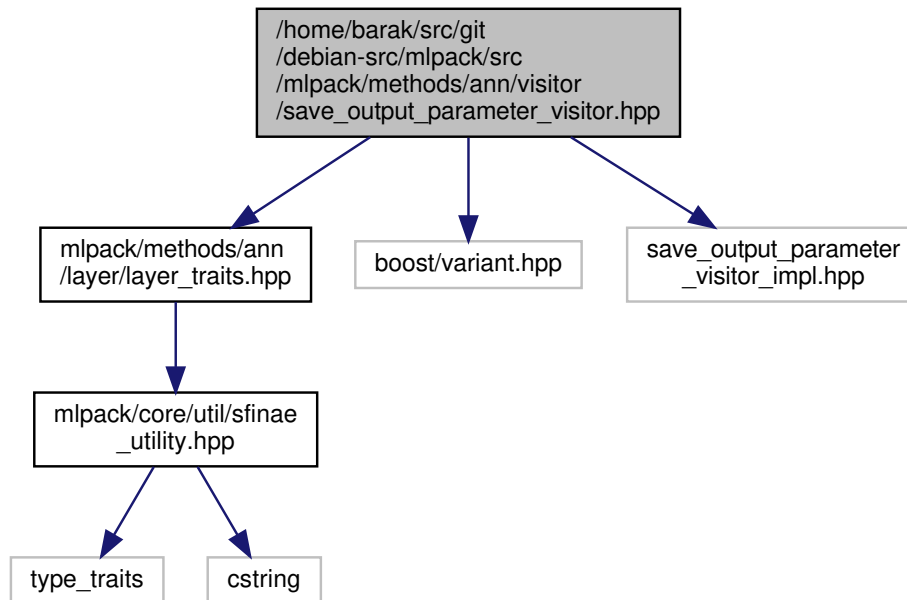

Saksham Bansal

This file provides an abstraction for the `Run()` function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.493 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/save_output_parameter_visitor.hpp File Reference

Include dependency graph for save_output_parameter_visitor.hpp:

Classes

- class **SaveOutputParameterVisitor**
SaveOutputParameterVisitor (p. 923) saves the output parameter into the given parameter set.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.493.1 Detailed Description

Author

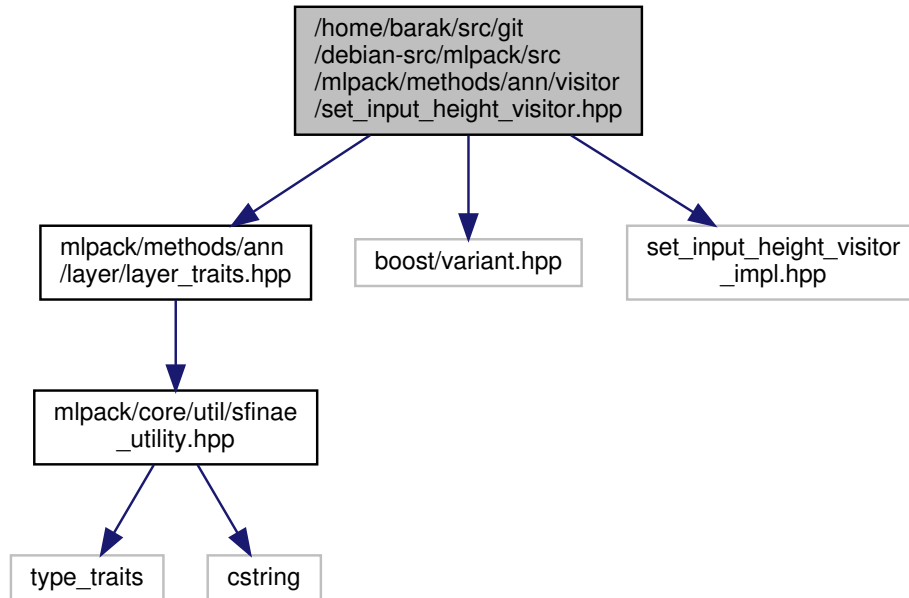

Marcus Edel

This file provides an abstraction for the `OutputParameter()` function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.494 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/set_input_height_visitor.hpp File Reference

Include dependency graph for set_input_height_visitor.hpp:

Classes

- class **SetInputHeightVisitor**
***SetInputHeightVisitor** (p. 934) updates the input height parameter with the given input height.*

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.494.1 Detailed Description

Author

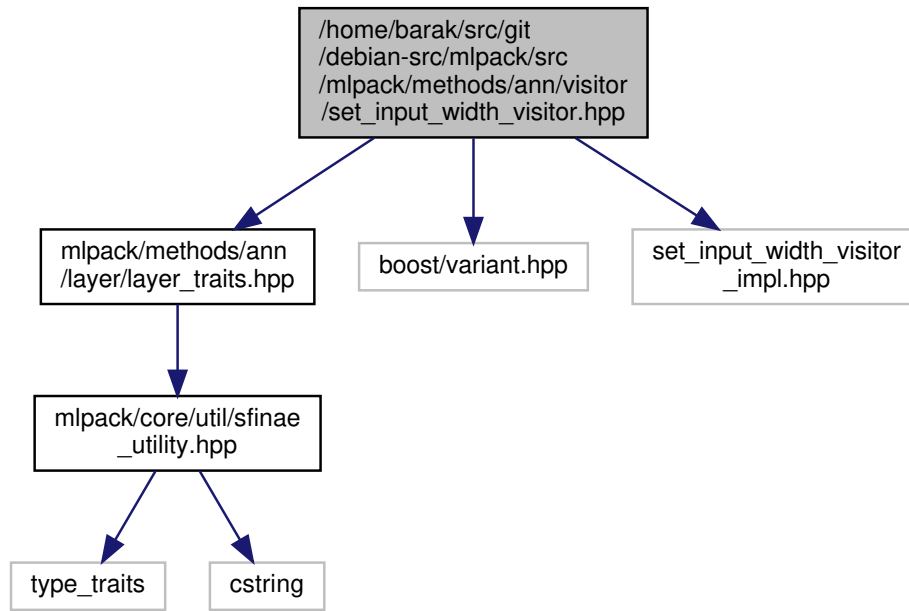

Marcus Edel

This file provides an abstraction for the `InputHeight()` function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.495 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/set_input_width_visitor.hpp File Reference

Include dependency graph for set_input_width_visitor.hpp:

Classes

- class **SetInputWidthVisitor**

SetInputWidthVisitor (p. 935) updates the input width parameter with the given input width.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.495.1 Detailed Description

Author

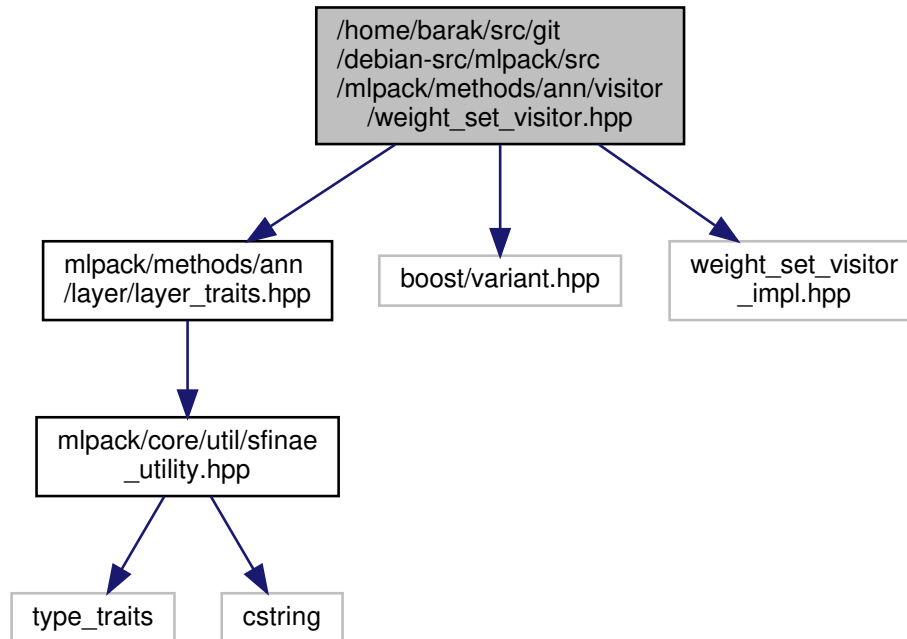

Marcus Edel

This file provides an abstraction for the `InputWidth()` function for different layers and automatically directs any parameter to the right layer type.

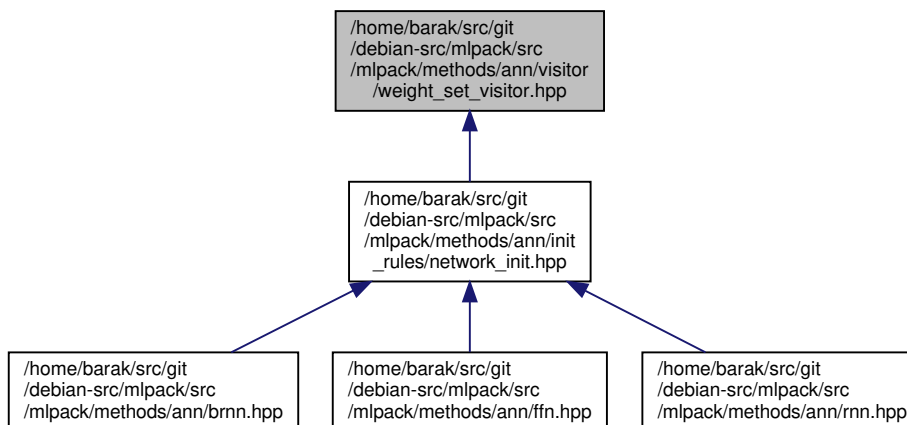

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.496 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/weight_set_visitor.hpp File Reference

Include dependency graph for weight_set_visitor.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **WeightSetVisitor**

WeightSetVisitor (p. 972) update the module parameters given the parameters set.

Namespaces

- **mlpack**
.hpp
- **mlpack::ann**
Artificial Neural Network.

40.496.1 Detailed Description

Author

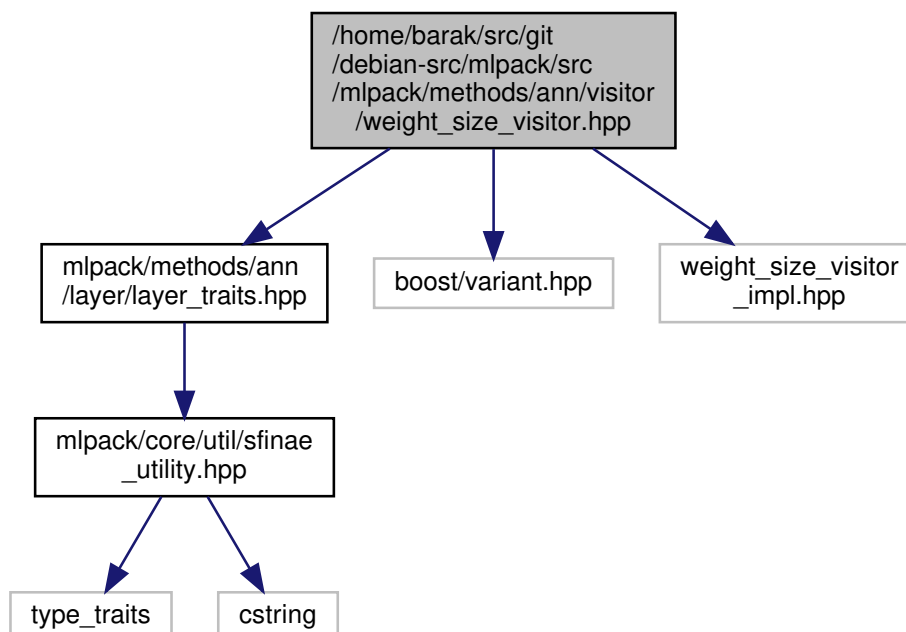

Marcus Edel

This file provides an abstraction for the `Weight()` function for different layers and automatically directs any parameter to the right layer type.

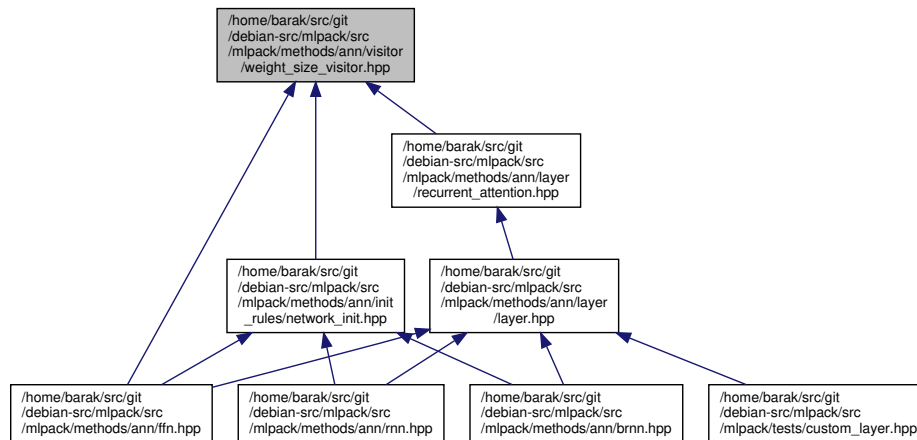

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.497 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/ann/visitor/weight_size_visitor.hpp File Reference

Include dependency graph for `weight_size_visitor.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **WeightSizeVisitor**

***WeightSizeVisitor** (p. 973) returns the number of weights of the given module.*

Namespaces

- **mlpack**

.hpp

- **mlpack::ann**

Artificial Neural Network.

40.497.1 Detailed Description

Author

Marcus Edel

This file provides an abstraction for the `WeightSize()` function for different layers and automatically directs any parameter to the right layer type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

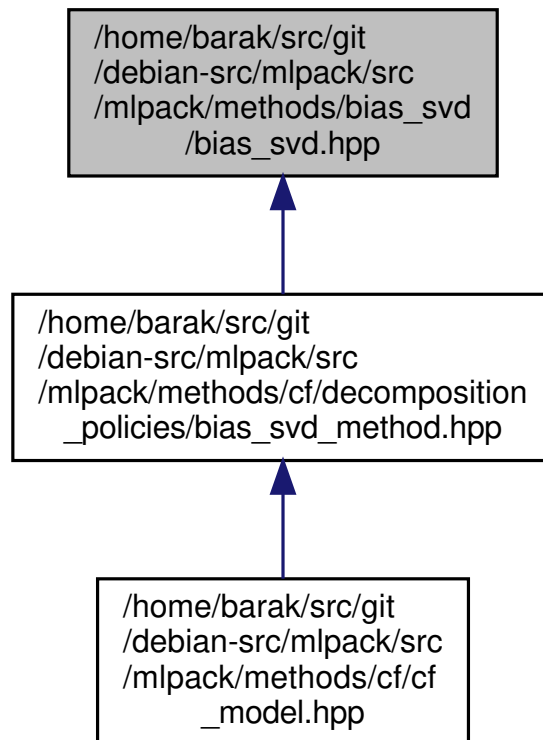

Author

40.500 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/bias_svd/bias_svd.hpp File Reference

Include dependency graph for bias_svd.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **BiasSVD**< **OptimizerType** >

Bias SVD is an improvement on Regularized SVD which is a matrix factorization techniques.

Namespaces

- **mlpack**
 .hpp
- **mlpack::svd**

40.500.1 Detailed Description

Author

Siddharth Agrawal
Wenhao Huang

An implementation of Bias SVD.

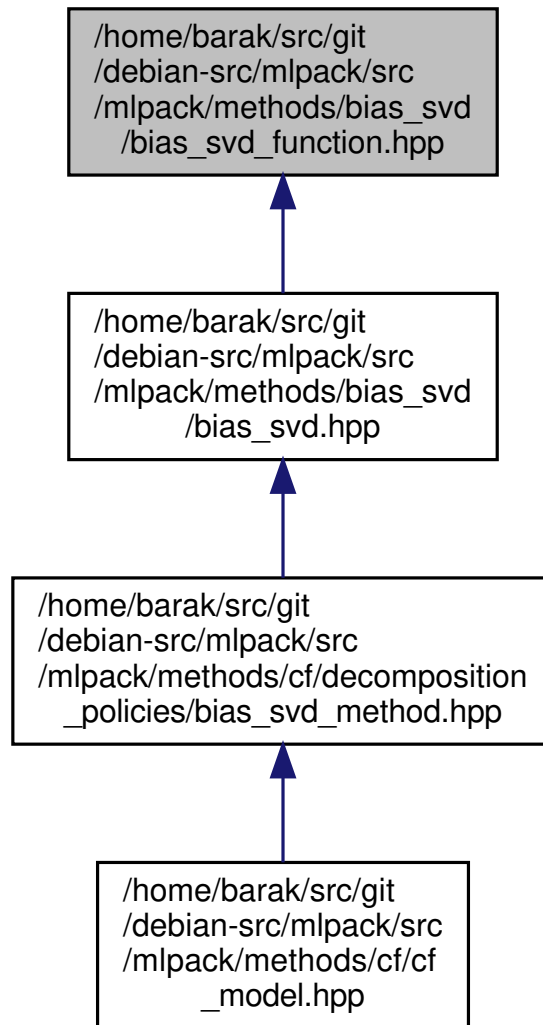

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpac. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.501 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/bias_svd/bias_svd_↵
function.hpp File Reference

Include dependency graph for bias_svd_function.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **BiasSVDFunction**< **MatType** >

*This class contains methods which are used to calculate the cost of **BiasSVD** (p. 1925)'s objective function, to calculate gradient of parameters with respect to the objective function, etc.*

Namespaces

- **ens**
- **mlpack**
 - **mlpack::svd**

Namespaces

- **mlpack**
 - .hpp
- **mlpack::svd**

40.502.1 Detailed Description

Author

Marcus Edel

An implementation of the randomized block krylov SVD method.

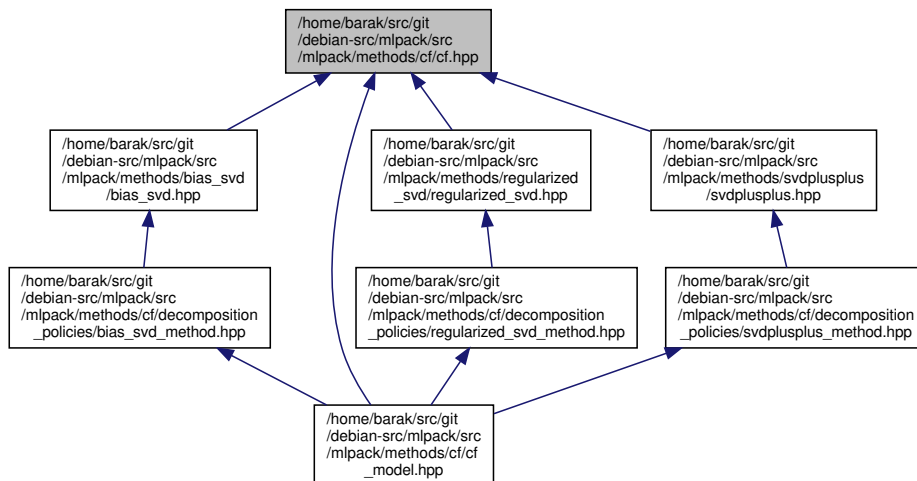

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.503 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/cf.hpp File Reference

Include dependency graph for cf.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **CFType**< **DecompositionPolicy**, **NormalizationType** >
This class implements Collaborative Filtering (CF).

Namespaces

- **mlpack**
.hpp
- **mlpack::cf**
Collaborative filtering.

40.503.1 Detailed Description

Author

Mudit Raj Gupta
Sumedh Ghaisas

Collaborative filtering.

Defines the CFType class to perform collaborative filtering on the specified data set using alternating least squares (ALS).

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.504 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/cf_model.hpp File Reference

Include dependency graph for cf_model.hpp:

Classes

- class **CFModel**
The model to save to disk.
- class **DeleteVisitor**
DeleteVisitor (p. 1058) deletes the CFType<> object which is pointed to by the variable cf in class **CFModel** (p. 1042).
- class **GetValueVisitor**
GetValueVisitor (p. 1060) returns the pointer which points to the **CFType** (p. 1045) object.
- class **PredictVisitor**< **NeighborSearchPolicy**, **InterpolationPolicy** >
PredictVisitor (p. 1077) uses the **CFType** (p. 1045) object to make predictions on the given combinations of users and items.
- class **RecommendationVisitor**< **NeighborSearchPolicy**, **InterpolationPolicy** >
RecommendationVisitor (p. 1084) uses the **CFType** (p. 1045) object to get recommendations for the given users.

Namespaces

- **mlpack**
 .hpp
- **mlpack::cf**
 Collaborative filtering.

40.504.1 Detailed Description

Author

Wenhao Huang

A serializable CF model, used by the main program.

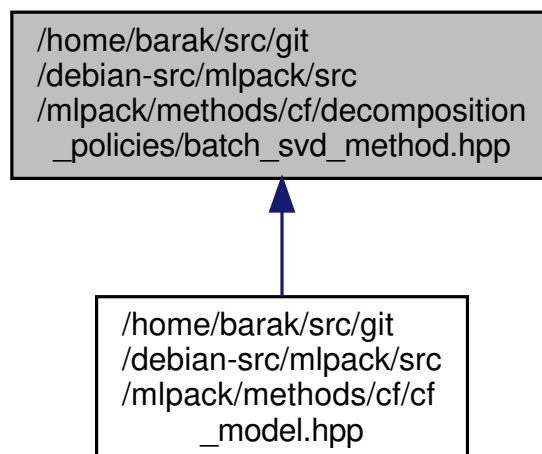

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.505 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/decomposition_policies/batch_svd_method.hpp File Reference

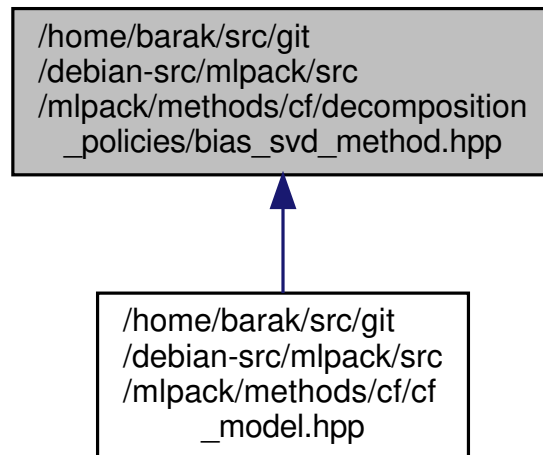

Include dependency graph for batch_svd_method.hpp:

This graph shows which files directly or indirectly include this file:

This graph shows which files directly or indirectly include this file:

Classes

- class **BiasSVDPolicy**

*Implementation of the Bias SVD policy to act as a wrapper when accessing Bias SVD from within **CFT** (p. 1045).*

Namespaces

- **mlpack**
.hpp
- **mlpack::cf**

Collaborative filtering.

40.506.1 Detailed Description

Author

Wenhao Huang

Implementation of the bias svd method for use in the Collaborative Filtering.

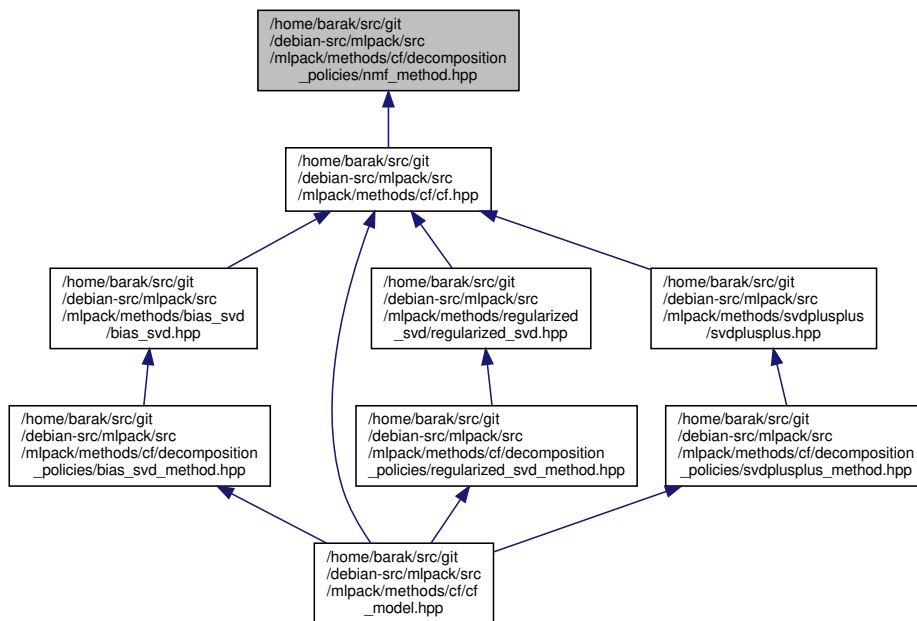

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.507 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/decomposition_policies/nmf_method.hpp File Reference

Include dependency graph for nmf_method.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **NMFPolicy**

Implementation of the NMF policy to act as a wrapper when accessing NMF from within **CFTType** (p. 1045).

Namespaces

- mlpack**
.hpp
- mlpack::cf**
Collaborative filtering.

40.507.1 Detailed Description

Author

Haritha Nair

Implementation of the exact svd method for use in Collaborative Filtering.

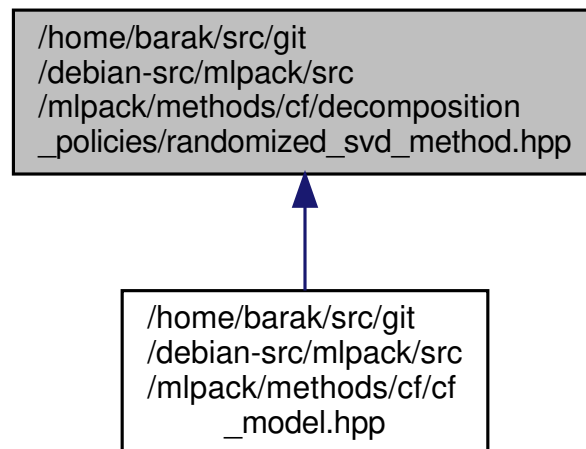

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.508 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/decomposition_policies/randomized_svd_method.hpp File Reference

Include dependency graph for randomized_svd_method.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RandomizedSVDPolicy**

*Implementation of the Randomized SVD policy to act as a wrapper when accessing Randomized SVD from within **CFT**ype (p. 1045).*

Namespaces

- **mlpack**
 .hpp
- **mlpack::cf**
 Collaborative filtering.

40.509 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/pca/decomposition_policies/randomized_svd_method.hpp File Reference

Include dependency graph for randomized_svd_method.hpp:

Classes

- class **RandomizedSVDPolicy**
 Implementation of the randomized SVD policy.

Namespaces

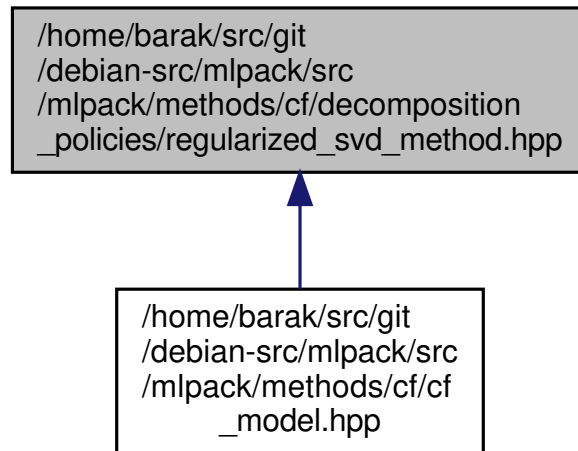

- **mlpack**
 .hpp
- **mlpack::pca**

40.510 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/decomposition_policies/regularized_svd_method.hpp File Reference

Include dependency graph for regularized_svd_method.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RegSVDPolicy**

*Implementation of the Regularized SVD policy to act as a wrapper when accessing Regularized SVD from within **CFTYPE** (p. 1045).*

Namespaces

- **mlpack**
.hpp
- **mlpack::cf**

Collaborative filtering.

40.510.1 Detailed Description

Author

Haritha Nair

Implementation of the regularized svd method for use in the Collaborative Filtering.

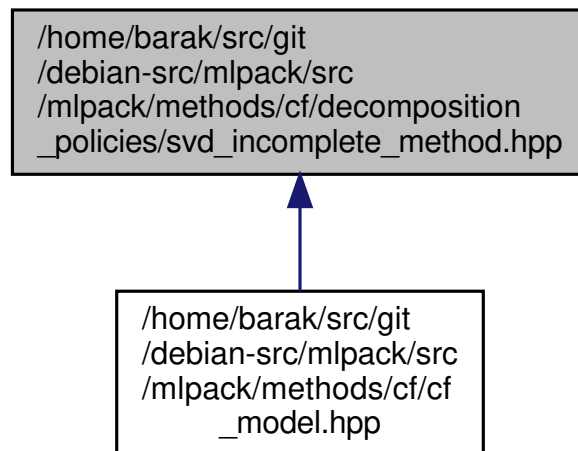

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information. ↩

40.512 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/decomposition_policies/svd_incomplete_method.hpp File Reference

Include dependency graph for svd_incomplete_method.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **SVDIncompletePolicy**

*Implementation of the SVD incomplete incremental to act as a wrapper when accessing SVD incomplete incremental from within **CFTYPE** (p. 1045).*

Namespaces

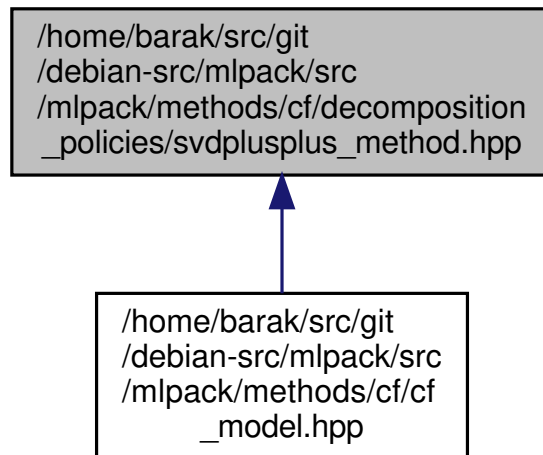

- **mlpack**
.hpp
- **mlpack::cf**
Collaborative filtering.

40.513 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/decomposition_policies/svdplusplus_method.hpp File Reference

Include dependency graph for svdplusplus_method.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **SVDPlusPlusPolicy**

*Implementation of the SVDPlusPlus policy to act as a wrapper when accessing SVDPlusPlus from within **CFTYPE** (p. 1045).*

Namespaces

- **mlpack**
.*hpp*
- **mlpack::cf**
Collaborative filtering.

40.513.1 Detailed Description

Author

Wenhao Huang

Implementation of the svdplusplus method for use in the Collaborative Filtering.

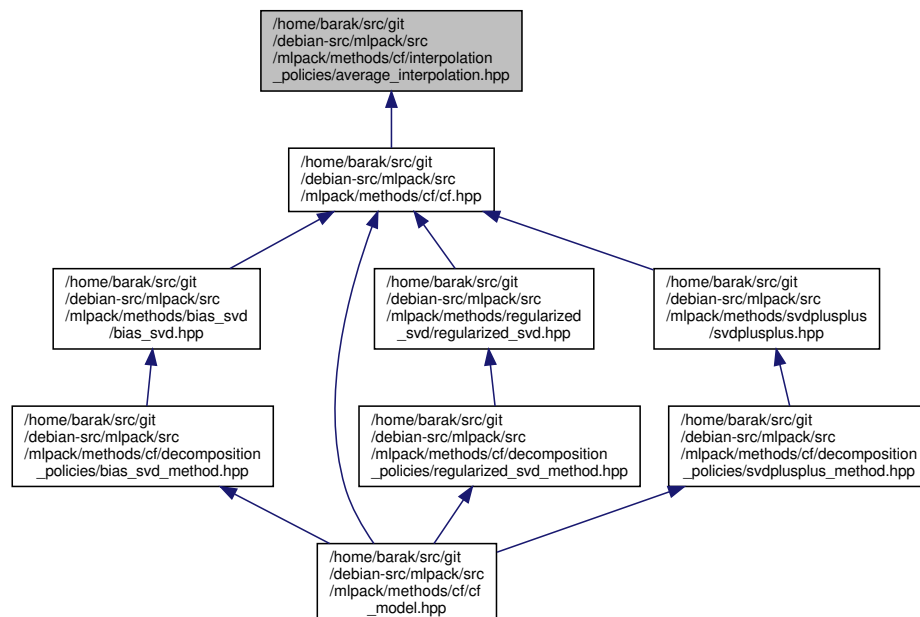

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.514 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/interpolation_policies/average_↔ _interpolation.hpp File Reference

Include dependency graph for average_interpolation.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **AverageInterpolation**

This class performs average interpolation to generate interpolation weights for neighborhood-based collaborative filtering.

Namespaces

- **mlpack**
 .hpp
- **mlpack::cf**
 Collaborative filtering.

40.514.1 Detailed Description

Author

Wenhao Huang

Definition of AverageInterpolation class.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.515 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/interpolation_policies/regression_interpolation.hpp File Reference ↩↪

Include dependency graph for regression_interpolation.hpp:

Classes

- class **RegressionInterpolation**
 Implementation of regression-based interpolation method.

Namespaces

- **mlpack**
 .hpp
- **mlpack::cf**
 Collaborative filtering.

40.517 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/neighbor_search_policies/cosine_search.hpp File Reference

Include dependency graph for cosine_search.hpp:

Classes

- class **CosineSearch**
Nearest neighbor search with cosine distance.

Namespaces

- **mlpack**
.hpp
- **mlpack::cf**
Collaborative filtering.

40.517.1 Detailed Description

Author

Wenhao Huang

Nearest neighbor search with cosine distance.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.519.1 Detailed Description

Author

Wenhao Huang

Nearest neighbor search with pearson distance.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.520 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/normalization/combined_↵
_normalization.hpp File Reference

Include dependency graph for combined_normalization.hpp:

Classes

- class **CombinedNormalization**< **NormalizationTypes** >

This normalization class performs a sequence of normalization methods on raw ratings.

Namespaces

- **mlpack**
 .hpp
- **mlpack::cf**

Collaborative filtering.

40.520.1 Detailed Description

Author

Wenhao Huang

CombinedNormalization is a class template for performing a sequence of data normalization methods which are specified by template parameter.

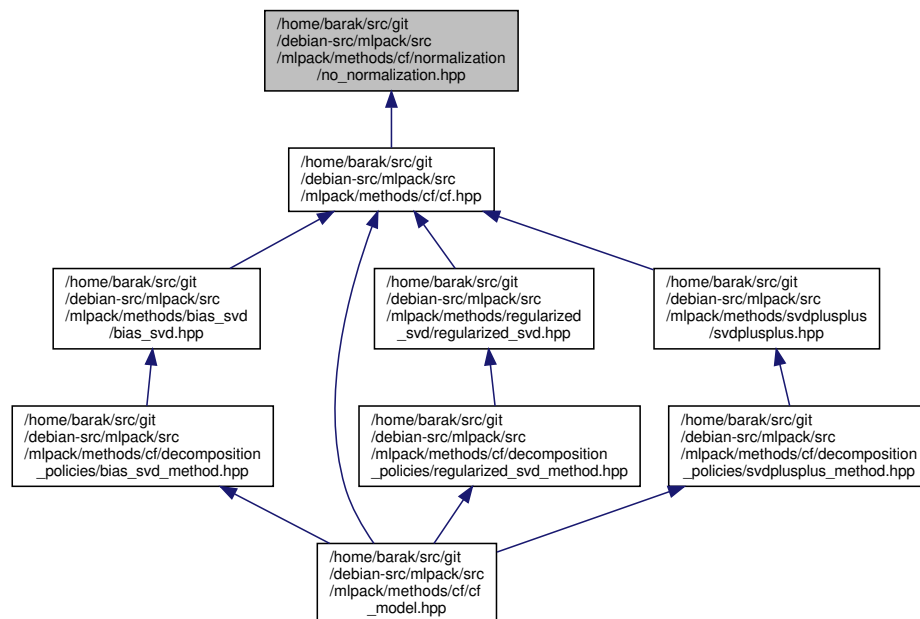

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.522 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/normalization/no_normalization.hpp File Reference

Include dependency graph for no_normalization.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **NoNormalization**
This normalization class doesn't perform any normalization.

Namespaces

- mlpack**
.hpp
- mlpack::cf**
Collaborative filtering.

- class **UserMeanNormalization**

- **mlpack**
 .hpp
- **mlpack::cf**
 Collaborative filtering.

Wenhao Huang

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.525 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/cf/normalization/z_↵
score_normalization.hpp File Reference

Namespaces

- **mlpack**
 .hpp
- **mlpack::cf**
 Collaborative filtering.

Typedefs

- typedef SVDWrapper< DummyClass > **ArmaSVDFactorizer**
 add simple typedefs

40.526.1 Detailed Description

Author

Sumedh Ghaisas

Wrapper class for SVD factorizers used for Collaborative Filtering.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.527 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/dbscan/dbscan.hpp File Reference

Include dependency graph for dbscan.hpp:

Classes

- class **DBSCAN**< RangeSearchType, PointSelectionPolicy >
 DBSCAN (p. 1197) (*Density-Based Spatial Clustering of Applications with Noise*) is a clustering technique described in the following paper:

Namespaces

- **mlpack**
 .hpp
- **mlpack::dbscan**

Namespaces

- **mlpack**
 .hpp
- **mlpack::dbscan**

40.528.1 Detailed Description

Author

Kim SangYeon

Sequentially select the next point for DBSCAN.

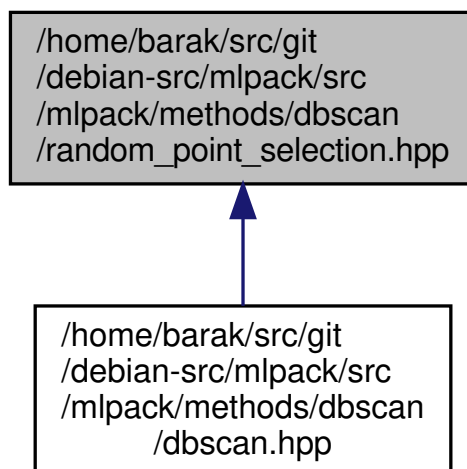

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.529 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/dbscan/random_point_selection.hpp File Reference

Include dependency graph for random_point_selection.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RandomPointSelection**

*This class can be used to randomly select the next point to use for **DBSCAN** (p. 1197).*

Namespaces

- **mlpack**
 .hpp
- **mlpack::dbscan**

40.529.1 Detailed Description

Author

Ryan Curtin

Randomly select the next point for DBSCAN.

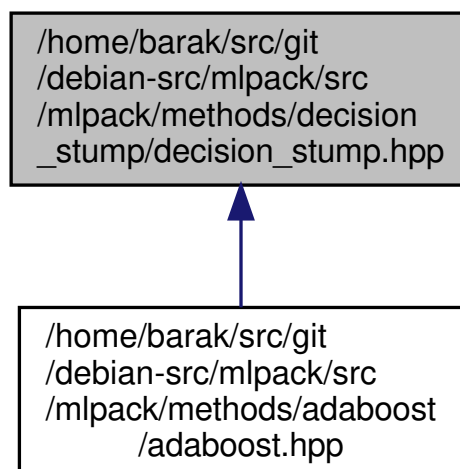

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.530 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_stump/decision_stump.hpp File Reference

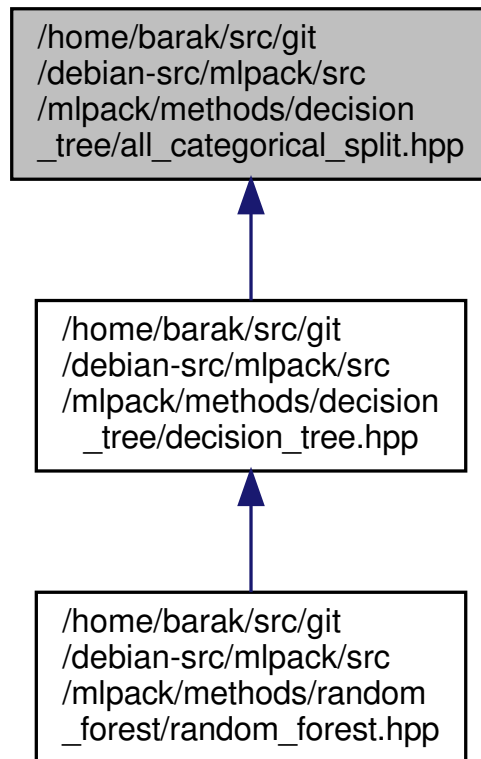

Include dependency graph for decision_stump.hpp:

This graph shows which files directly or indirectly include this file:

This graph shows which files directly or indirectly include this file:

Classes

- class **AllCategoricalSplit**< **FitnessFunction** >
*The **AllCategoricalSplit** (p. 1981) is a splitting function that will split categorical features into many children: one child for each category.*
- class **AllCategoricalSplit**< **FitnessFunction** >::**AuxiliarySplitInfo**< **ElemType** >

Namespaces

- **mlpack**
.hpp
- **mlpack::tree**
Trees and tree-building procedures.

40.531.1 Detailed Description

Author

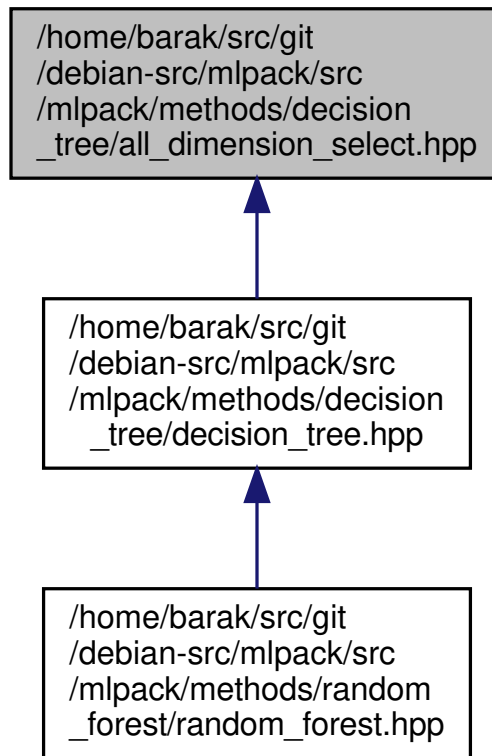

Ryan Curtin

This file defines a tree splitter that split a categorical feature into all of the possible categories.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.532 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_tree/all_↵ dimension_select.hpp File Reference

This graph shows which files directly or indirectly include this file:

Classes

- class **AllDimensionSelect**

This dimension selection policy allows any dimension to be selected for splitting.

Namespaces

- **mlpack**
 .hpp
- **mlpack::tree**

Trees and tree-building procedures.

40.532.1 Detailed Description

Author

Ryan Curtin

Selects all dimensions for a split.

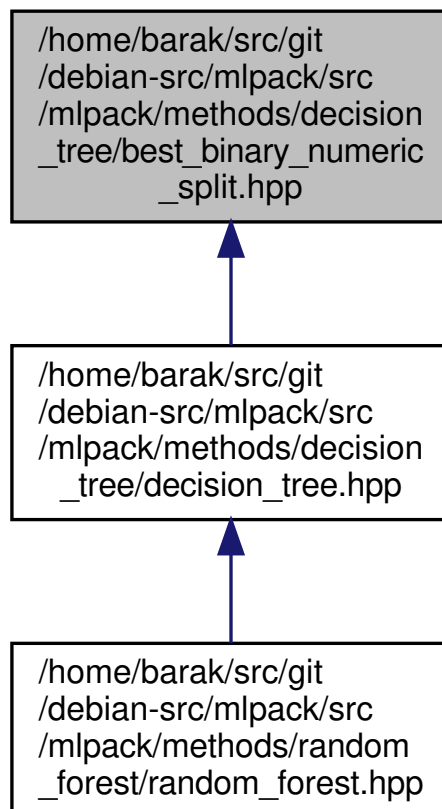

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.533 `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_tree/best_binary_numeric_split.hpp` File Reference

Include dependency graph for `best_binary_numeric_split.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **BestBinaryNumericSplit**< **FitnessFunction** >

The **BestBinaryNumericSplit** (p. 1989) is a splitting function for decision trees that will exhaustively search a numeric dimension for the best binary split.

- class **BestBinaryNumericSplit**< **FitnessFunction** >::**AuxiliarySplitInfo**< **ElemType** >

Namespaces

- **mlpack**

.hpp

- **mlpack::tree**

Trees and tree-building procedures.

40.533.1 Detailed Description

Author

Ryan Curtin

A tree splitter that finds the best binary numeric split.

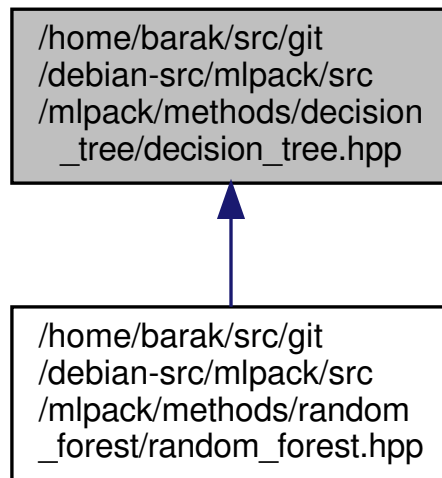

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.534 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_tree/decision_tree.hpp File Reference

Include dependency graph for decision_tree.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **DecisionTree**< **FitnessFunction**, **NumericSplitType**, **CategoricalSplitType**, **DimensionSelectionType**, **ElemType**, **NoRecursion** >

This class implements a generic decision tree learner.

Namespaces

- **mlpack**
.hpp
- **mlpack::tree**

Trees and tree-building procedures.

Typedefs

- template<typename FitnessFunction = GiniGain, template< typename > class NumericSplitType = BestBinaryNumericSplit, template< typename > class CategoricalSplitType = AllCategoricalSplit, typename DimensionSelectType = AllDimensionSelect, typename ElemType = double>
using **DecisionStump** = DecisionTree< FitnessFunction, NumericSplitType, CategoricalSplitType, DimensionSelectType, ElemType, false >

Convenience typedef for decision stumps (single level decision trees).

40.534.1 Detailed Description

Author

Ryan Curtin

A generic decision tree learner. Its behavior can be controlled via template arguments.

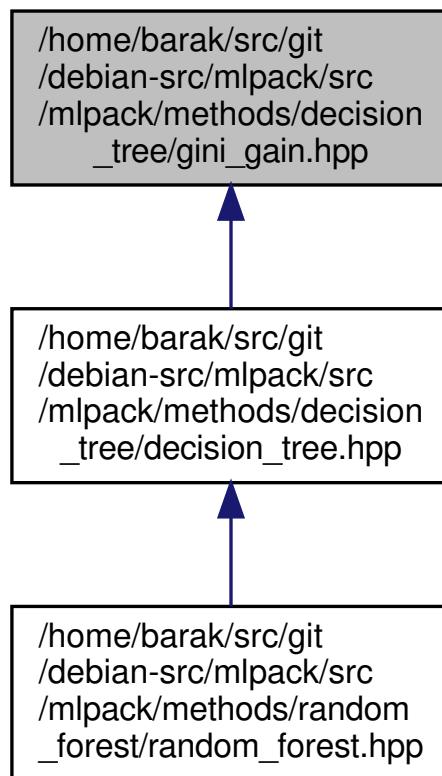

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.535 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_tree/gini_gain.hpp File Reference

Include dependency graph for gini_gain.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **GiniGain**

The Gini gain, a measure of set purity usable as a fitness function (FitnessFunction) for decision trees.

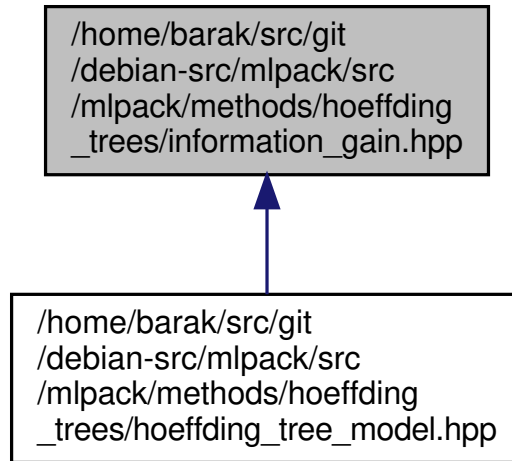

Namespaces

- **mlpack**
 .hpp
- **mlpack::tree**

Trees and tree-building procedures.

40.537 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hoeffding_trees/information_gain.hpp File Reference

This graph shows which files directly or indirectly include this file:

Classes

- class **InformationGain**

The standard information gain criterion, used for calculating gain in decision trees.

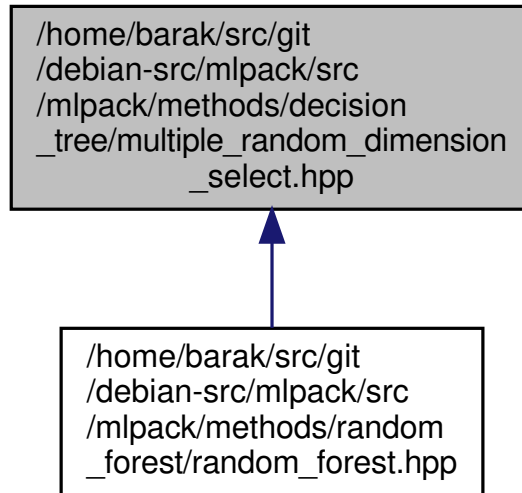

Namespaces

- **mlpack**
.hpp
- **mlpack::tree**

Trees and tree-building procedures.

40.538 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/decision_tree/multiple_random_dimension_select.hpp File Reference

This graph shows which files directly or indirectly include this file:

Classes

- class **MultipleRandomDimensionSelect**

This dimension selection policy allows the selection from a few random dimensions.

Namespaces

- **mlpack**
 .hpp
- **mlpack::tree**

Trees and tree-building procedures.

40.538.1 Detailed Description

Author

Ryan Curtin

Select a number of random dimensions to pick from.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

- class **RandomDimensionSelect**

- **mlpack**

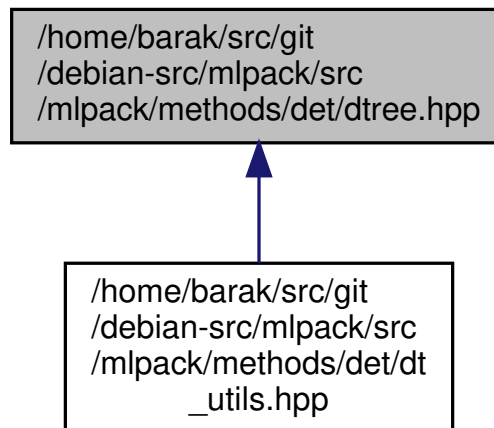

- `mlpack::tree`

40.540 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/det/dt_utils.hpp File Reference

- class **PathCacher**

Generated by Doxygen

This graph shows which files directly or indirectly include this file:

Classes

- class **DTree**< **MatType**, **TagType** >

A density estimation tree is similar to both a decision tree and a space partitioning tree (like a kd-tree).

Namespaces

- **mlpack**
 .hpp
- **mlpack::det**

Density Estimation Trees.

40.541.1 Detailed Description

Author

Parikshit Ram (pram@cc.gatech.edu)

Density Estimation Tree class

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.542 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/emst/dtb.hpp File Reference

Include dependency graph for dtb.hpp:

Classes

- class **DualTreeBoruvka**< **MetricType**, **MatType**, **TreeType** >
Performs the MST calculation using the Dual-Tree Boruvka algorithm, using any type of tree.

Namespaces

- **mlpack**
.hpp
- **mlpack::emst**
Euclidean Minimum Spanning Trees.

40.542.1 Detailed Description

Author

Bill March (march@gatech.edu)

Contains an implementation of the DualTreeBoruvka algorithm for finding a Euclidean Minimum Spanning Tree using the kd-tree data structure.

```
@inproceedings{

Classes

- class **DTBRules**< **MetricType**, **TreeType** >

Namespaces

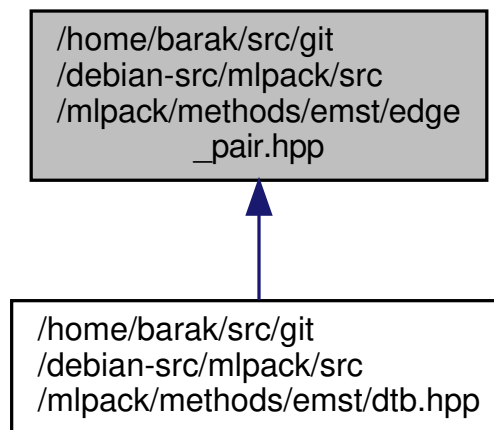

- **mlpack**
.hpp
- **mlpack::emst**
Euclidean Minimum Spanning Trees.

40.545 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/emst/edge_pair.hpp File Reference

Include dependency graph for edge_pair.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **EdgePair**
An edge pair is simply two indices and a distance.

Namespaces

- **mlpack**
.hpp
- **mlpack::emst**
Euclidean Minimum Spanning Trees.

40.545.1 Detailed Description

Author

Bill March (march@gatech.edu)

This file contains utilities necessary for all of the minimum spanning tree algorithms.

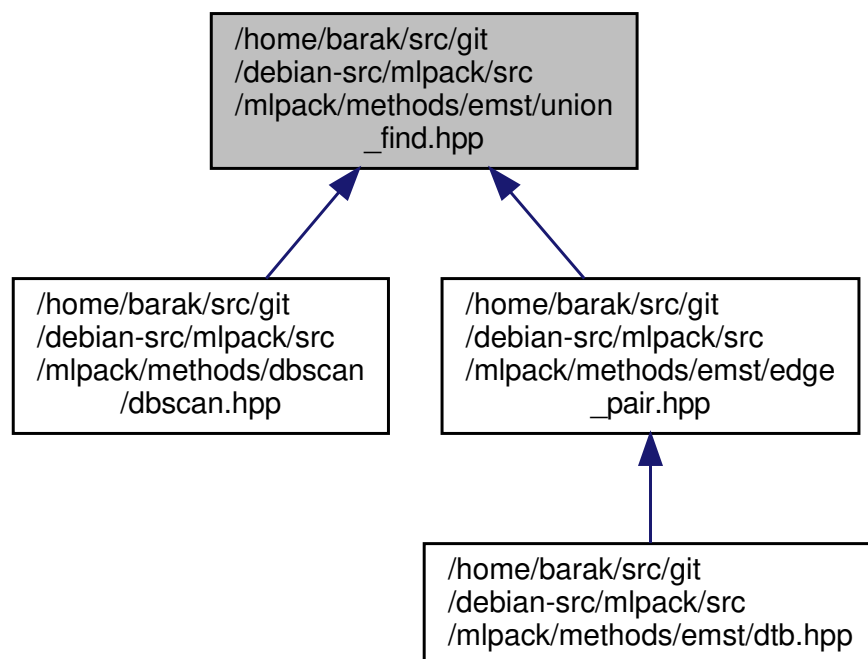

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.546 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/emst/union_find.hpp File Reference

Include dependency graph for union_find.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **UnionFind**
A Union-Find data structure.

Namespaces

- **mlpack**
.hpp
- **mlpack::emst**
Euclidean Minimum Spanning Trees.

40.546.1 Detailed Description

Author

Bill March (march@gatech.edu)

Implements a union-find data structure. This structure tracks the components of a graph. Each point in the graph is initially in its own component. Calling `unionfind.Union(x, y)` unites the components indexed by `x` and `y`. `unionfind.Find(x)` returns the index of the component containing point `x`.

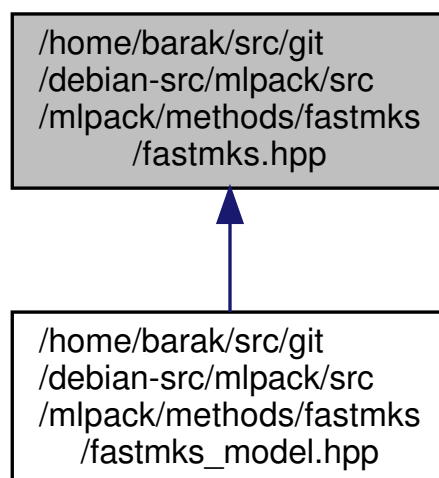

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.547 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/fastmks/fastmks.hpp File Reference

Include dependency graph for `fastmks.hpp`:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::fastmks**
 Fast max-kernel search.

40.548.1 Detailed Description

Author

Ryan Curtin

A utility struct to contain all the possible FastMKS models.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.549 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/fastmks/fastmks_↵
rules.hpp File Reference

Include dependency graph for fastmks_rules.hpp:

Classes

- class **FastMKSRules**< **KernelType**, **TreeType** >
*The **FastMKSRules** (p. 1298) class is a template helper class used by **FastMKS** (p. 1280) class when performing exact max-kernel search.*

Namespaces

- **mlpack**
 .hpp
- **mlpack::fastmks**
 Fast max-kernel search.

40.549.1 Detailed Description

Author

Ryan Curtin

Rules for the single or dual tree traversal for fast max-kernel search.

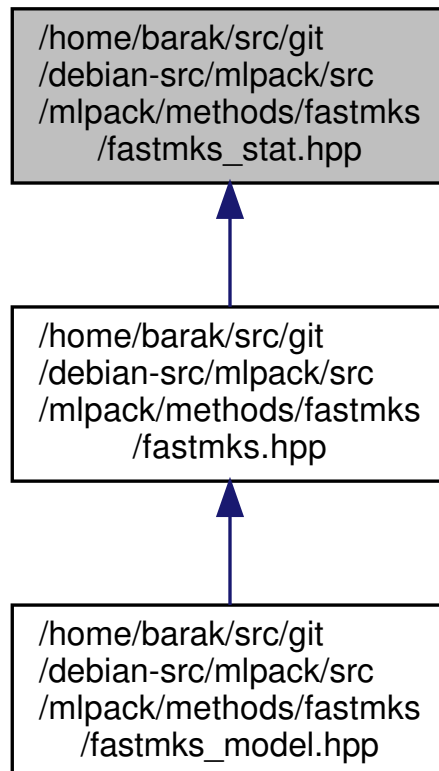

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.550 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/fastmks/fastmks_stat.hpp File Reference

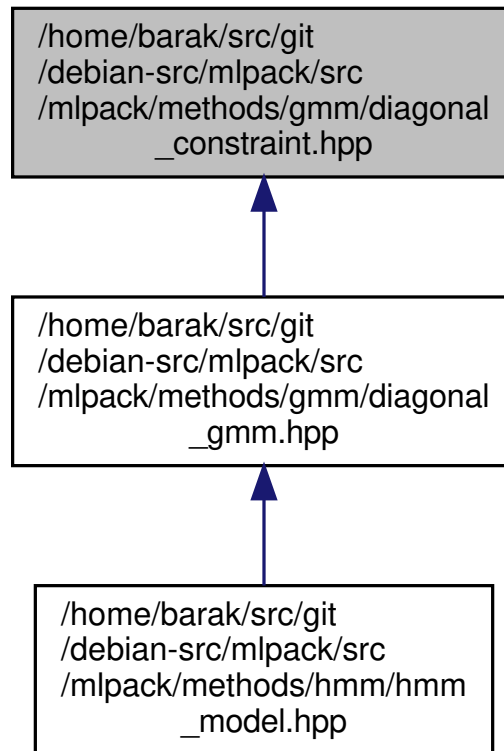

Include dependency graph for fastmks_stat.hpp:

This graph shows which files directly or indirectly include this file:

This graph shows which files directly or indirectly include this file:

Classes

- class **DiagonalConstraint**
Force a covariance matrix to be diagonal.

Namespaces

- **mlpack**
.hpp
- **mlpack::gmm**
Gaussian Mixture Models.

40.551.1 Detailed Description

Author

Ryan Curtin

Constrain a covariance matrix to be diagonal.

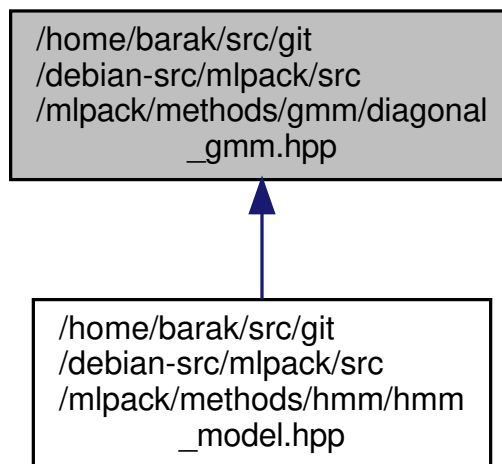

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.552 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/gmm/diagonal_gmm.hpp File Reference

Include dependency graph for diagonal_gmm.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **DiagonalGMM**
A Diagonal Gaussian Mixture Model.

Namespaces

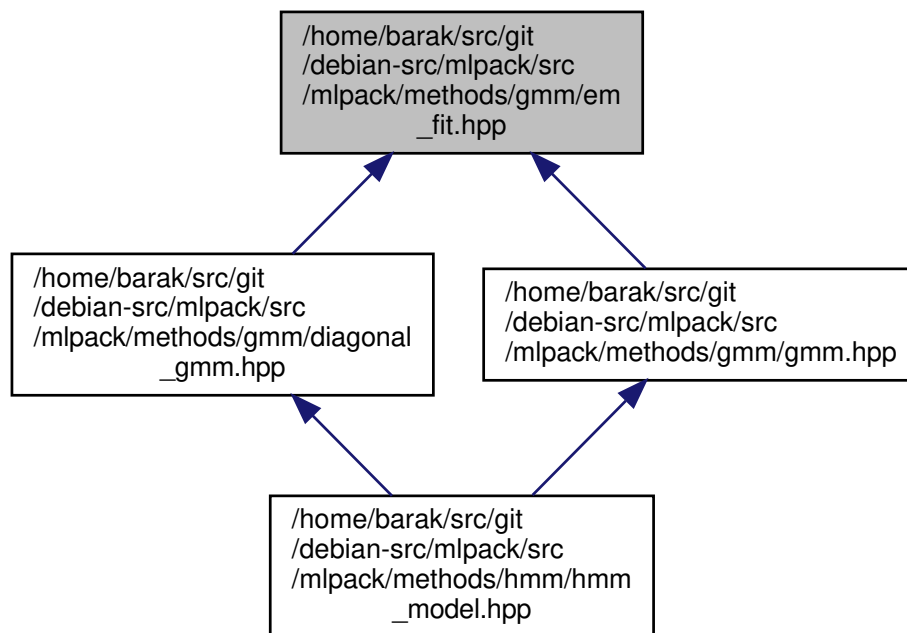

- **mlpack**
.hpp
- **mlpack::gmm**
Gaussian Mixture Models.

40.554 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/gmm/em_fit.hpp File Reference

Include dependency graph for em_fit.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **EMFit**< **InitialClusteringType**, **CovarianceConstraintPolicy**, **Distribution** >
*This class contains methods which can fit a **GMM** (p. 1323) to observations using the EM algorithm.*

Namespaces

- **mlpack**
.hpp
- **mlpack::gmm**
Gaussian Mixture Models.

40.556.1 Detailed Description

Author

Ryan Curtin

No constraint on the covariance matrix.

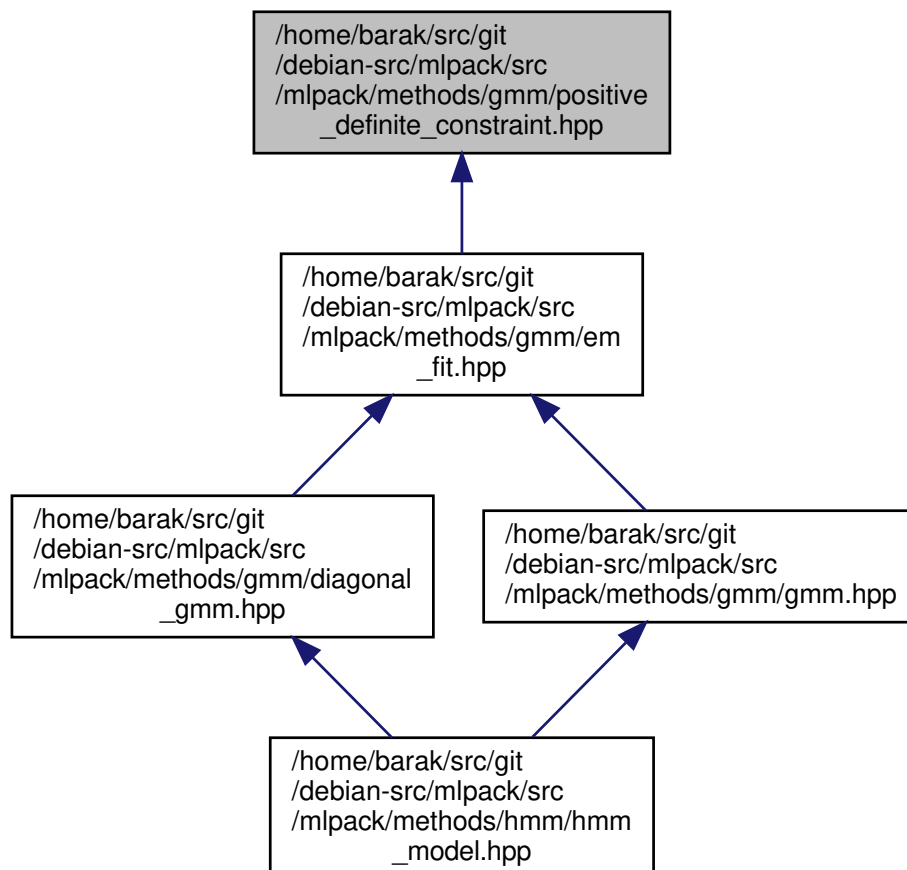

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.557 `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/gmm/positive_definite_constraint.hpp` File Reference

Include dependency graph for `positive_definite_constraint.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **PositiveDefiniteConstraint**
Given a covariance matrix, force the matrix to be positive definite.

Namespaces

- mlpack**
.hpp
- mlpack::gmm**
Gaussian Mixture Models.

40.557.1 Detailed Description

Author

Ryan Curtin

Restricts a covariance matrix to being positive definite.

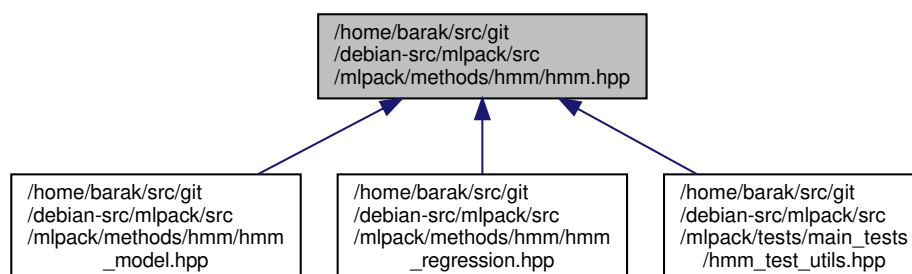

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.558 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hmm/hmm.hpp File Reference

Include dependency graph for hmm.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **HMM** < **Distribution** >

A class that represents a Hidden Markov Model with an arbitrary type of emission distribution.

Namespaces

- **mlpack**

.hpp

- **mlpack::hmm**

Hidden Markov Models.

40.558.1 Detailed Description

Author

Ryan Curtin
Tran Quoc Long
Michael Fox

Definition of HMM class.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.559 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hmm/hmm_model.hpp File Reference

Include dependency graph for hmm_model.hpp:

Classes

- class **HMMModel**

*A serializable **HMM** (p. 1335) model that also stores the type.*

Namespaces

- **mlpack**
.hpp
- **mlpack::hmm**
Hidden Markov Models.

Enumerations

- enum **HMMType** : char {
 DiscreteHMM = 0,
 GaussianHMM,
 GaussianMixtureModelHMM,
 DiagonalGaussianMixtureModelHMM,
 DiscreteHMM = 0,
 GaussianHMM,
 GaussianMixtureModelHMM,
 DiagonalGaussianMixtureModelHMM }

Functions

- **BOOST_CLASS_VERSION** (**mlpack::hmm::HMMModel**, 1)
Set the serialization version of the HMMModel class.

40.559.1 Detailed Description

Author

Ryan Curtin

A serializable HMM model that also stores the type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.559.2 Function Documentation

40.559.2.1 BOOST_CLASS_VERSION()

```
BOOST_CLASS_VERSION (
    mlpack::hmm::HMMModel ,
    1 )
```

Set the serialization version of the HMMModel class.

Referenced by `HMMModel::DiagGMMHMM()`.

Namespaces

- **mlpack**
.hpp
- **mlpack::hmm**
Hidden Markov Models.

Enumerations

- enum **HMMType** : char {
 DiscreteHMM = 0,
 GaussianHMM,
 GaussianMixtureModelHMM,
 DiagonalGaussianMixtureModelHMM,
 DiscreteHMM = 0,
 GaussianHMM,
 GaussianMixtureModelHMM,
 DiagonalGaussianMixtureModelHMM }
HMMType, to be stored on disk.

Functions

- template<typename ActionType , typename ExtraInfoType = void>
 void **LoadHMMAndPerformAction** (const std::string &modelFile, ExtraInfoType *x=NULL)
 ActionType should implement static void Apply(HMMType&).
- template<typename HMMType >
 void **SaveHMM** (HMMType &hmm, const std::string &modelFile)
 *Save an **HMM** (p. 1335) to a file.*

40.561.1 Detailed Description

Author

Ryan Curtin

Utility to read HMM type from file.

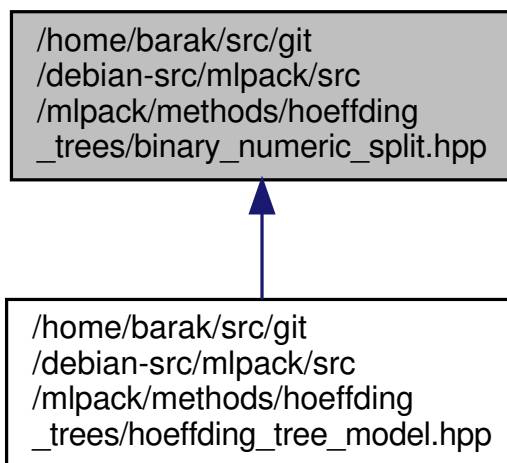

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.562 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hoeffding_trees/binary_numeric_split.hpp File Reference

Include dependency graph for binary_numeric_split.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **BinaryNumericSplit**< **FitnessFunction**, **ObservationType** >

The ***BinaryNumericSplit*** (p. 1992) class implements the numeric feature splitting strategy devised by Gama, Rocha, and Medas in the following paper:

Namespaces

- mlpack**
.*hpp*
- mlpack::tree**
Trees and tree-building procedures.

Typedefs

- template<typename **FitnessFunction** >
using **BinaryDoubleNumericSplit** = **BinaryNumericSplit**< **FitnessFunction**, double >

40.562.1 Detailed Description

Author

Ryan Curtin

An implementation of the binary-tree-based numeric splitting procedure described by Gama, Rocha, and Medas in their KDD 2003 paper.

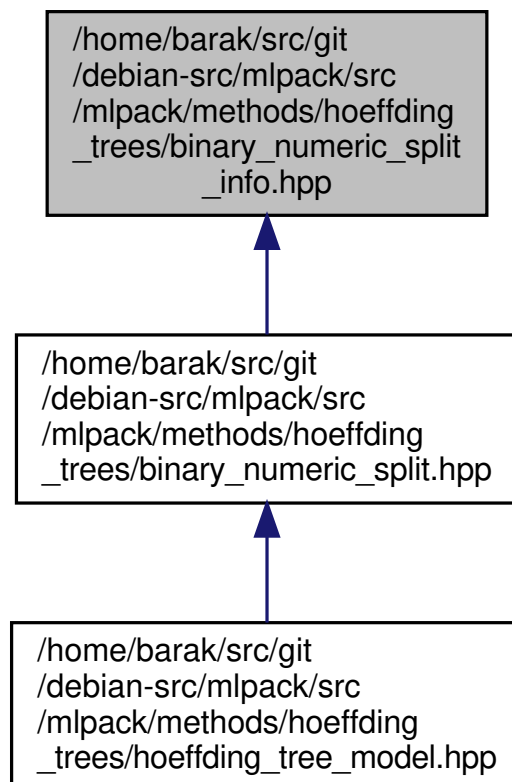

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.563 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hoeffding_trees/binary_numeric_split_info.hpp File Reference

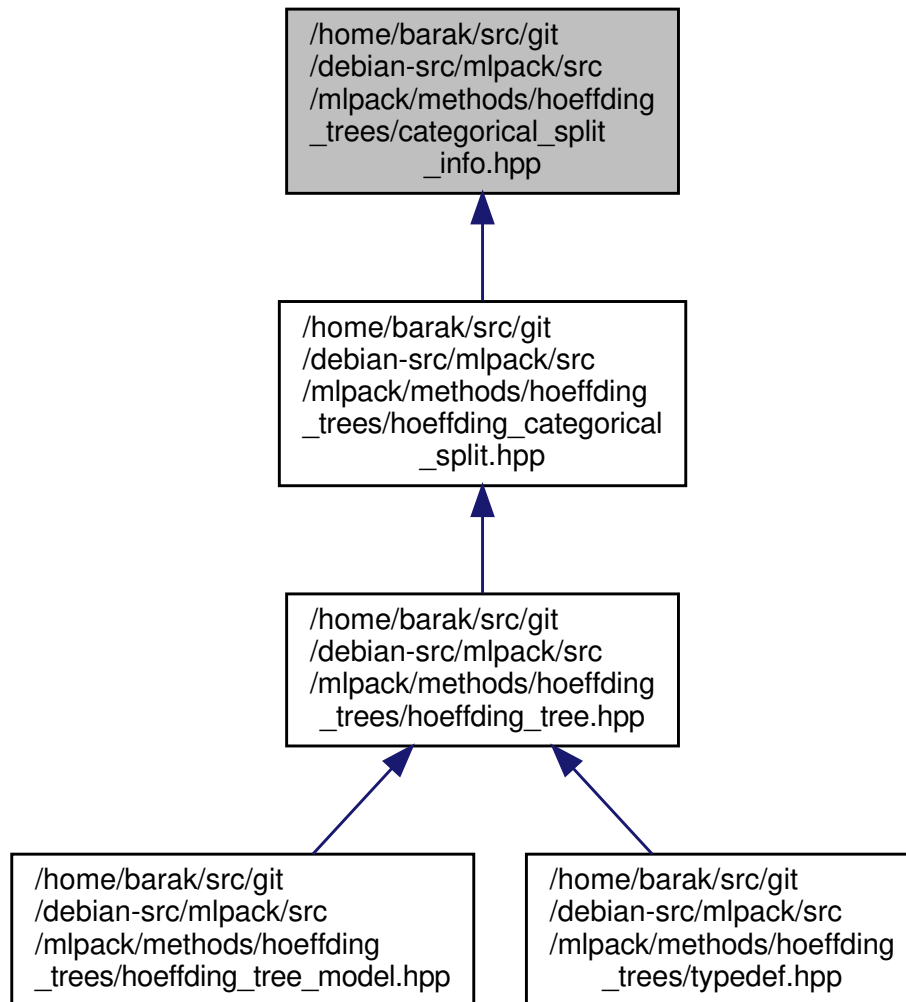

Include dependency graph for binary_numeric_split_info.hpp:

This graph shows which files directly or indirectly include this file:

This graph shows which files directly or indirectly include this file:

Classes

- class **CategoricalSplitInfo**

Namespaces

- **mlpack**
.hpp
- **mlpack::tree**
Trees and tree-building procedures.

40.564.1 Detailed Description

Author

Ryan Curtin

After a categorical split has been made, this holds information on the split.

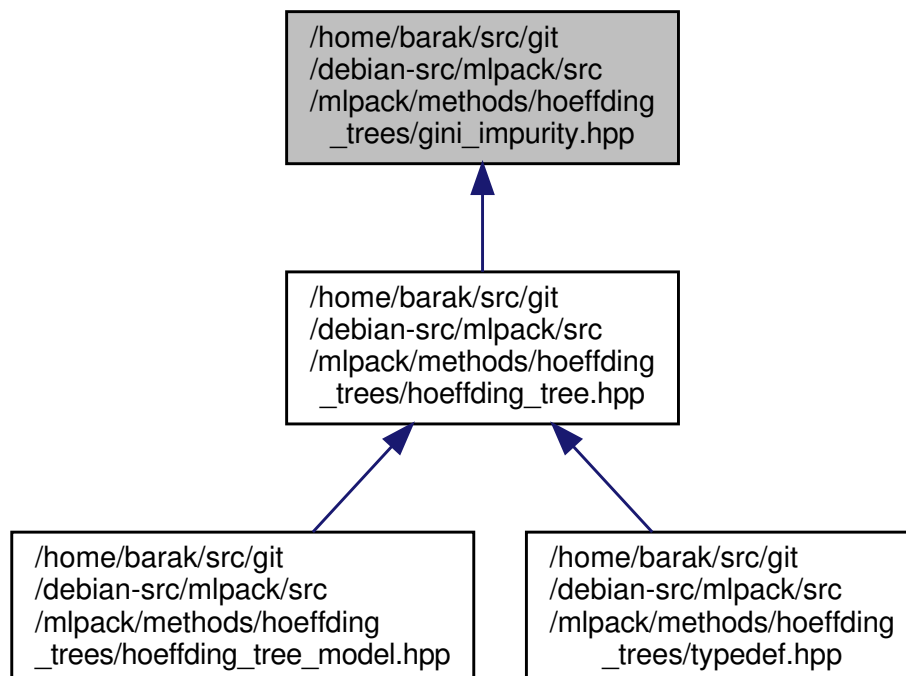

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.565 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hoeffding_trees/gini_impurity.hpp File Reference

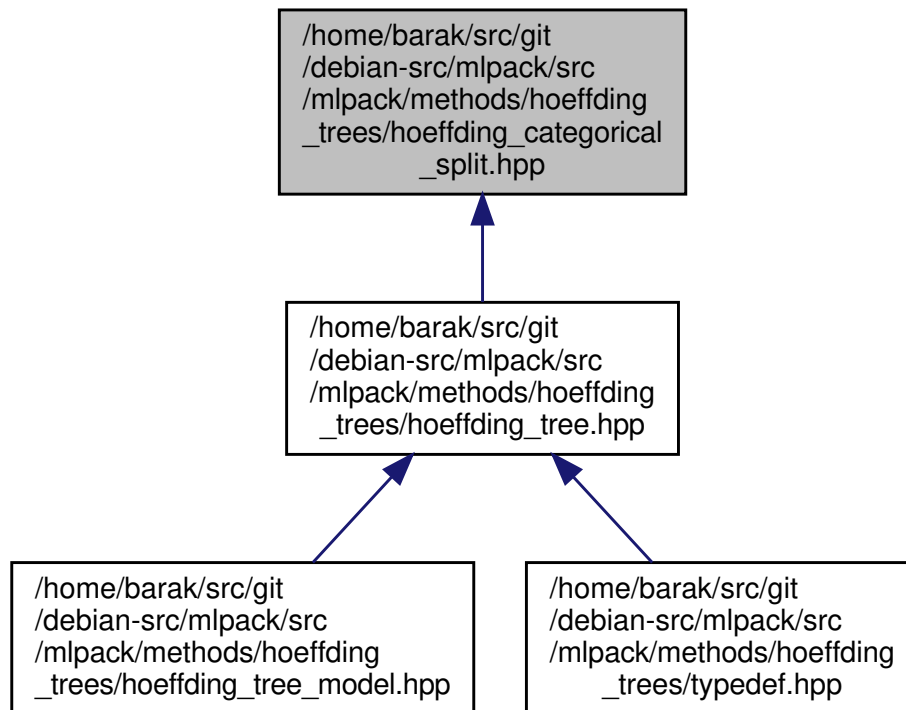

Include dependency graph for gini_impurity.hpp:

This graph shows which files directly or indirectly include this file:

This graph shows which files directly or indirectly include this file:

Classes

- class **HoeffdingCategoricalSplit**< **FitnessFunction** >

This is the standard Hoeffding-bound categorical feature proposed in the paper below:

Namespaces

- **mlpack**
 .hpp
- **mlpack::tree**

Trees and tree-building procedures.

40.566.1 Detailed Description

Author

Ryan Curtin

A class that contains the information necessary to perform a categorical split for Hoeffding trees.

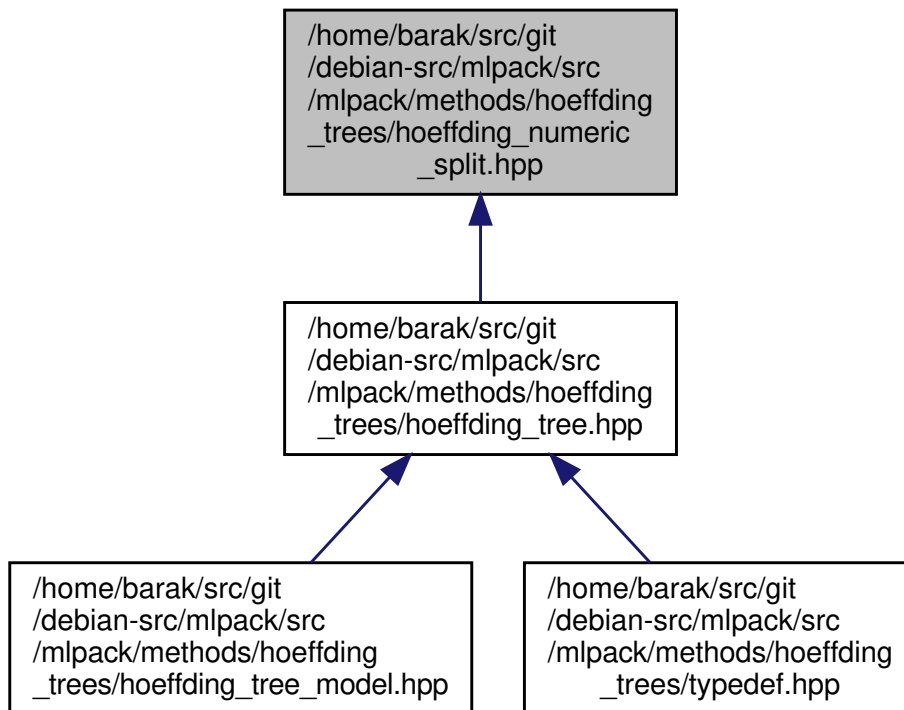

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.567 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hoeffding_trees/hoeffding_numeric_split.hpp File Reference

Include dependency graph for hoeffding_numeric_split.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **HoeffdingNumericSplit**< **FitnessFunction**, **ObservationType** >

The **HoeffdingNumericSplit** (p. 2108) class implements the numeric feature splitting strategy alluded to by Domingos and Hulten in the following paper:

Namespaces

- **mlpack**
 .hpp
- **mlpack::tree**

Trees and tree-building procedures.

Typedefs

- `template<typename FitnessFunction >`
using **HoeffdingDoubleNumericSplit** = `HoeffdingNumericSplit< FitnessFunction, double >`
Convenience typedef.

40.567.1 Detailed Description

Author

Ryan Curtin

A numeric feature split for Hoeffding trees. This is a very simple implementation based on a minor note in the paper "Mining High-Speed Data Streams" by Pedro Domingos and Geoff Hulten.

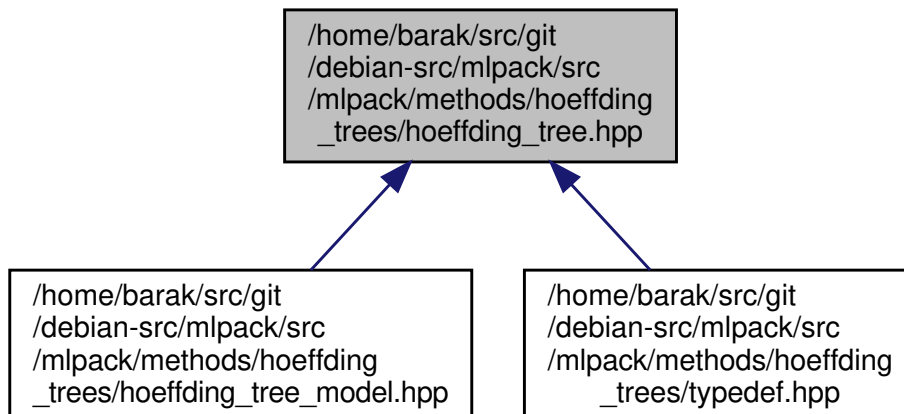

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.568 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hoeffding_trees/hoeffding_tree.hpp File Reference

Include dependency graph for `hoeffding_tree.hpp`:

This graph shows which files directly or indirectly include this file:

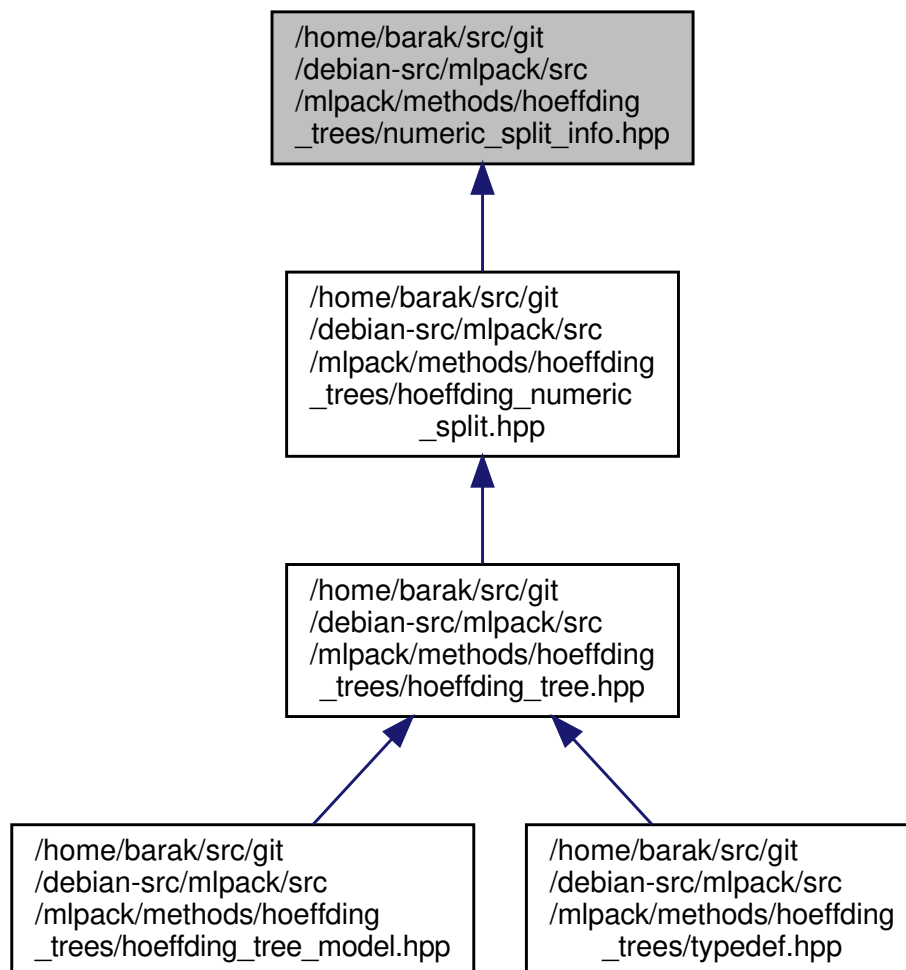

40.570 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/hoeffding_trees/numeric_split_info.hpp File Reference

Include dependency graph for numeric_split_info.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **NumericSplitInfo**< **ObservationType** >

Namespaces

- **mlpack**
 .hpp
- **mlpack::tree**
 Trees and tree-building procedures.

40.570.1 Detailed Description

Author

Ryan Curtin

After a numeric split has been made, this holds information on the split.

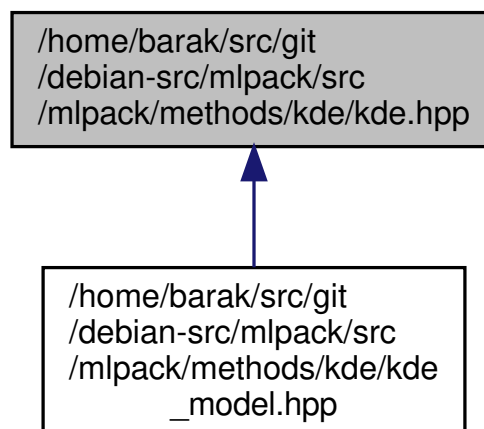

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.571 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kde/kde.hpp File Reference

Include dependency graph for kde.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **KDE**< **KernelType**, **MetricType**, **MatType**, **TreeType**, **DualTreeTraversalType**, **SingleTreeTraversalType** <→

The **KDE** (p. 1387) class is a template class for performing Kernel Density Estimations.

Namespaces

- **mlpack**

.hpp

- **mlpack::kde**

Kernel Density Estimation.

Enumerations

- enum **KDEMode** {
DUAL_TREE_MODE,
SINGLE_TREE_MODE }

KDEMode represents the ways in which KDE algorithm can be executed.

40.571.1 Detailed Description

Author

Roberto Hueso

Kernel Density Estimation.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.572 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kde/kde_model.hpp File Reference

Include dependency graph for kde_model.hpp:

Classes

- class **DeleteVisitor**
- class **DualBiKDE**

DualBiKDE (p. 1384) computes a Kernel Density Estimation on the given KDEType.
- class **DualMonoKDE**

DualMonoKDE (p. 1386) computes a Kernel Density Estimation on the given KDEType.
- class **KDEModel**
- class **KernelNormalizer**

KernelNormalizer (p. 1410) holds a set of methods to normalize estimations applying in each case the appropriate kernel normalizer function.
- class **ModeVisitor**

ModeVisitor (p. 1412) exposes the Mode() method of the KDEType.
- class **TrainVisitor**

TrainVisitor (p. 1413) trains a given KDEType using a reference set.

Namespaces

- **mlpack**

.hpp
- **mlpack::kde**

Kernel Density Estimation.

Typedefs

- `template<typename KernelType, template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType>`
`using KDEType = KDE< KernelType, metric::EuclideanDistance, arma::mat, TreeType, TreeType< metric::EuclideanDistance, kde::KDEStat, arma::mat >::template DualTreeTraverser, TreeType< metric::EuclideanDistance, kde::KDEStat, arma::mat >::template SingleTreeTraverser >`
Alias template.

40.572.1 Detailed Description

Author

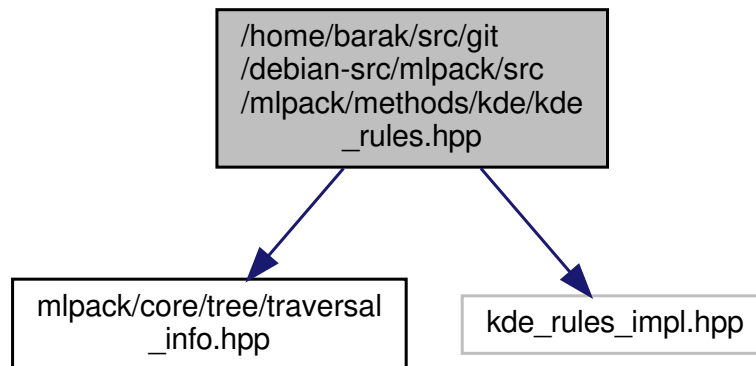

Roberto Hueso

Model for KDE. It abstracts different types of tree, kernels, etc.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.573 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kde/kde_rules.hpp File Reference

Include dependency graph for kde_rules.hpp:

Classes

- class **KDERules**< **MetricType**, **KernelType**, **TreeType** >
A dual-tree traversal Rules class for kernel density estimation.

Namespaces

- **mlpack**
.hpp
- **mlpack::kde**
Kernel Density Estimation.

40.573.1 Detailed Description

Author

Roberto Hueso

Rules for Kernel Density Estimation, so that it can be done with arbitrary tree types.

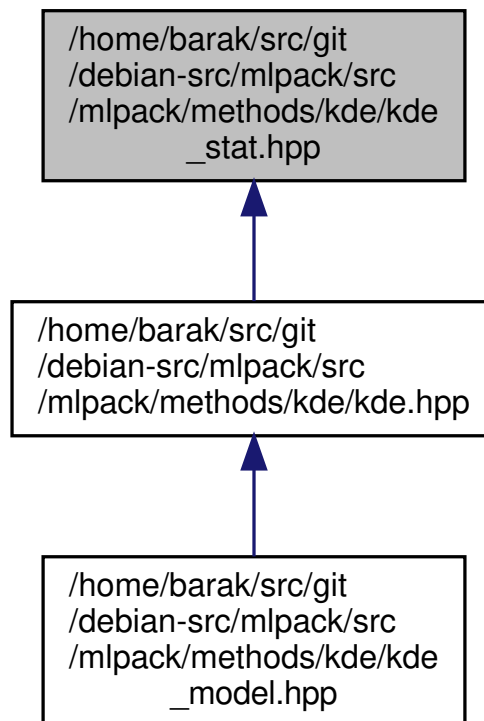

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.574 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kde/kde_stat.hpp File Reference

Include dependency graph for kde_stat.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **KDEStat**

Extra data for each node in the tree for the task of kernel density estimation.

Namespaces

- **mlpack**
 .hpp
- **mlpack::kde**

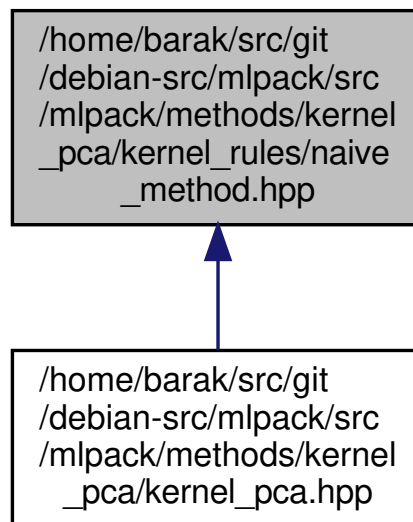

Kernel Density Estimation.

40.576 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kernel_pca/kernel_rules/naive_method.hpp File Reference

Include dependency graph for naive_method.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **NaiveKernelRule**< **KernelType** >

Namespaces

- **mlpack**
 .hpp
- **mlpack::kpca**

40.576.1 Detailed Description

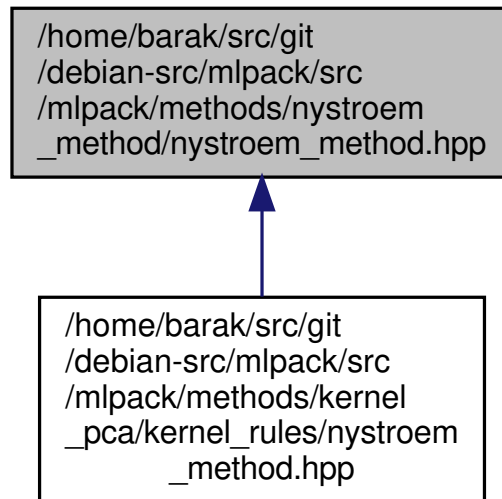

Author

Ajinkya Kale

Use the naive method to construct the kernel matrix.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

This graph shows which files directly or indirectly include this file:

Classes

- class **NystroemMethod**< **KernelType**, **PointSelectionPolicy** >

Namespaces

- **mlpack**
 .hpp
- **mlpack::kernel**
 Kernel functions.

40.579 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/allow_empty_clusters.hpp File Reference

Include dependency graph for allow_empty_clusters.hpp:

Classes

- class **AllowEmptyClusters**
 Policy which allows K-Means to create empty clusters without any error being reported.

Typedefs

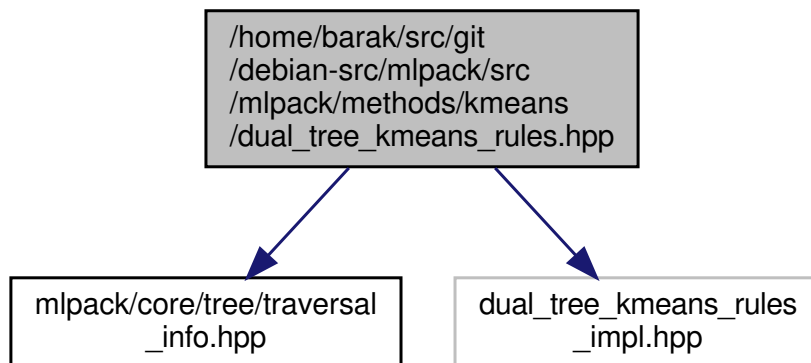

- `template<typename MetricType , typename MatType >`
`using CoverTreeDualTreeKMeans = DualTreeKMeans< MetricType, MatType, tree::StandardCoverTree >`
*A template typedef for the **DualTreeKMeans** (p. 1466) algorithm with the cover tree type.*
- `template<typename MetricType , typename MatType >`
`using DefaultDualTreeKMeans = DualTreeKMeans< MetricType, MatType >`
*A template typedef for the **DualTreeKMeans** (p. 1466) algorithm with the default tree type (a kd-tree).*

Functions

- `template<typename TreeType >`
`void HideChild (TreeType &node, const size_t child, const typename std::enable_if_t< !tree::TreeTraits< TreeType >::BinaryTree > *junk=0)`
Utility function for hiding children.
- `template<typename TreeType >`
`void HideChild (TreeType &node, const size_t child, const typename std::enable_if_t< tree::TreeTraits< TreeType >::BinaryTree > *junk=0)`
Utility function for hiding children.
- `template<typename TreeType >`
`void RestoreChildren (TreeType &node, const typename std::enable_if_t<!tree::TreeTraits< TreeType >::BinaryTree > *junk=0)`
Utility function for restoring children to a non-binary tree.
- `template<typename TreeType >`
`void RestoreChildren (TreeType &node, const typename std::enable_if_t< tree::TreeTraits< TreeType >::BinaryTree > *junk=0)`
Utility function for restoring children to a binary tree.

40.581 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/dual_tree_kmeans_rules.hpp File Reference

Include dependency graph for dual_tree_kmeans_rules.hpp:

Namespaces

- **mlpack**
.hpp
- **mlpack::kmeans**
K-Means clustering.

40.583 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/elkan_kmeans.hpp File Reference

Include dependency graph for elkan_kmeans.hpp:

Classes

- class **ElkanKMeans**< **MetricType**, **MatType** >

Namespaces

- **mlpack**
.hpp
- **mlpack::kmeans**
K-Means clustering.

40.583.1 Detailed Description

Author

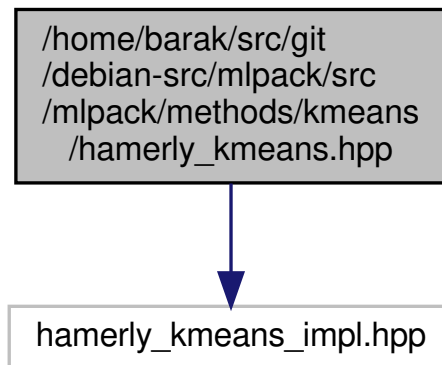

Ryan Curtin

An implementation of Elkan's algorithm for exact Lloyd iterations.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.584 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/hamerly_↵ kmeans.hpp File Reference

Include dependency graph for hamerly_kmeans.hpp:

Classes

- class **HamerlyKMeans**< **MetricType**, **MatType** >

Namespaces

- **mlpack**
 .hpp
- **mlpack::kmeans**
 K-Means clustering.

40.584.1 Detailed Description

Author

Ryan Curtin

An implementation of Greg Hamerly's algorithm for k-means clustering.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.585 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/kill_empty_clusters.hpp File Reference

Include dependency graph for kill_empty_clusters.hpp:

Classes

- class **KillEmptyClusters**
Policy which allows K-Means to "kill" empty clusters without any error being reported.

Namespaces

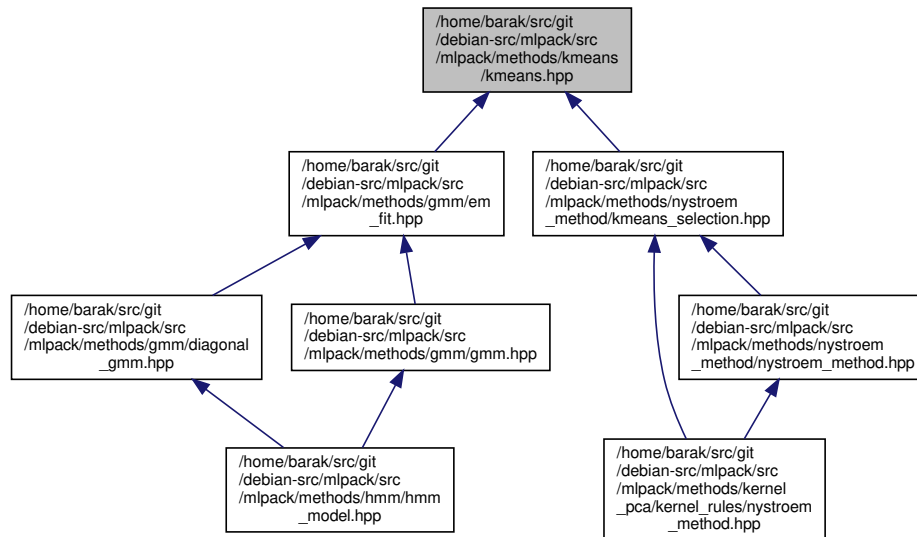

- **mlpack**
.hpp
- **mlpack::kmeans**
K-Means clustering.

40.586 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/kmeans.hpp File Reference

Include dependency graph for kmeans.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **KMeans**< **MetricType**, **InitialPartitionPolicy**, **EmptyClusterPolicy**, **LloydStepType**, **MatType** >

This class implements K-Means clustering, using a variety of possible implementations of Lloyd's algorithm.

Namespaces

- **mlpack**
.*hpp*
- **mlpack::kmeans**
K-Means clustering.

40.586.1 Detailed Description

Author

Parikshit Ram (pram@cc.gatech.edu)

K-Means clustering.

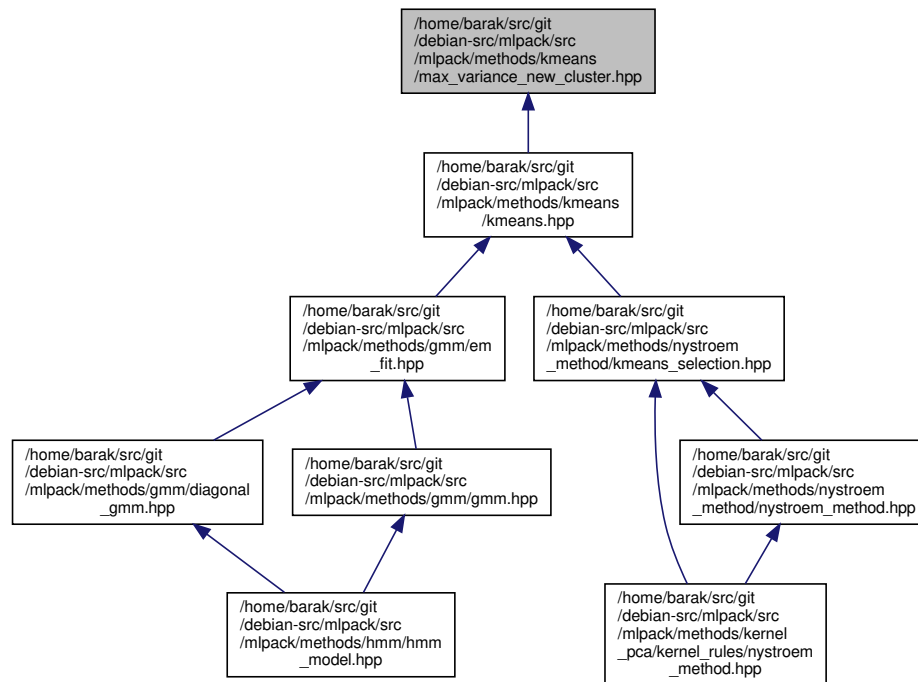

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.587 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/max_variance_new_cluster.hpp File Reference

Include dependency graph for max_variance_new_cluster.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **MaxVarianceNewCluster**

When an empty cluster is detected, this class takes the point furthest from the centroid of the cluster with maximum variance as a new cluster.

Namespaces

- mlpack**
.hpp
- mlpack::kmeans**
K-Means clustering.

40.587.1 Detailed Description

Author

Ryan Curtin

An implementation of the EmptyClusterPolicy policy class for K-Means. When an empty cluster is detected, the point furthest from the centroid of the cluster with maximum variance is taken to be a new cluster.

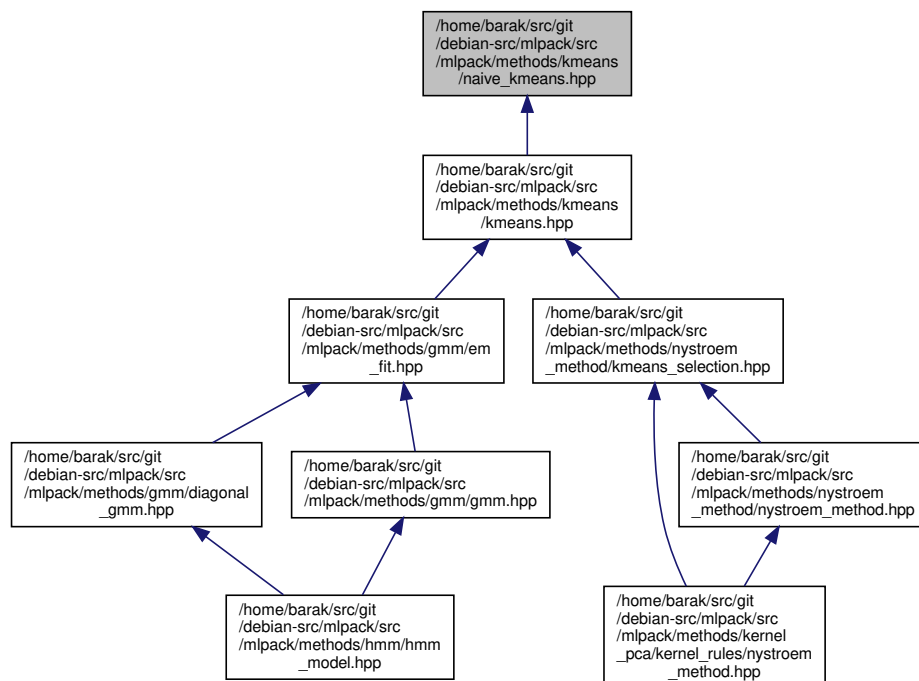

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.588 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/naive_kmeans.hpp File Reference

Include dependency graph for naive_kmeans.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **NaiveKMeans** < **MetricType**, **MatType** >

This is an implementation of a single iteration of Lloyd's algorithm for k-means.

Namespaces

- **mlpack**

.hpp

- **mlpack::kmeans**

K-Means clustering.

40.588.1 Detailed Description

Author

Ryan Curtin

An implementation of a naively-implemented step of the Lloyd algorithm for k-means clustering, using OpenMP for parallelization over multiple threads. This may still be the best choice for small datasets or datasets with very high dimensionality.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.589 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/pelleg_moore_↵
_kmeans.hpp File Reference

Include dependency graph for pelleg_moore_kmeans.hpp:

Classes

- class **PellegMooreKMeans**< **MetricType**, **MatType** >

An implementation of Pelleg-Moore's 'blacklist' algorithm for k-means clustering.

Namespaces

- **mlpack**
 .hpp
- **mlpack::kmeans**
 K-Means clustering.

40.589.1 Detailed Description

Author

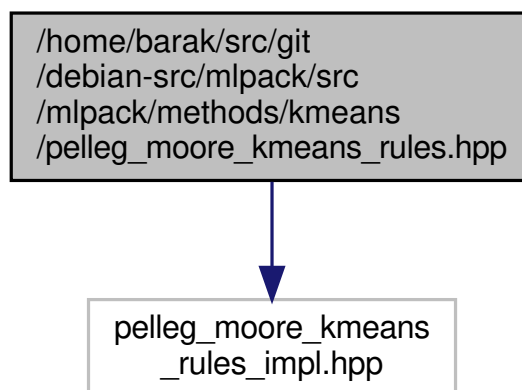

Ryan Curtin

An implementation of Pelleg-Moore's 'blacklist' algorithm for k-means clustering.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.590 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/pelleg_moore_kmeans_rules.hpp File Reference

Include dependency graph for pelleg_moore_kmeans_rules.hpp:

Classes

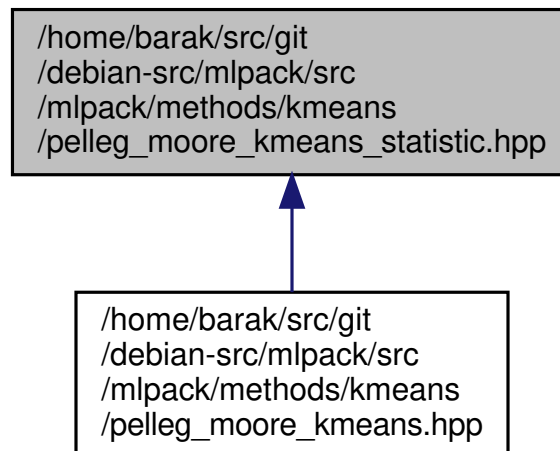

- class **PellegMooreKMeansRules**< **MetricType**, **TreeType** >
 The rules class for the single-tree Pelleg-Moore kd-tree traversal for k-means clustering.

Namespaces

- **mlpack**
 .hpp
- **mlpack::kmeans**
 K-Means clustering.

40.591 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/pelleg_moore_kmeans_statistic.hpp File Reference

This graph shows which files directly or indirectly include this file:

Classes

- class **PellegMooreKMeansStatistic**
 A statistic for trees which holds the blacklist for Pelleg-Moore k-means clustering (which represents the clusters that cannot possibly own any points in a node).

Namespaces

- **mlpack**
 .hpp
- **mlpack::kmeans**
 K-Means clustering.

40.593 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/kmeans/refined_start.hpp File Reference

Include dependency graph for refined_start.hpp:

Classes

- class **RefinedStart**
A refined approach for choosing initial points for k-means clustering.

Namespaces

- **mlpack**
.hpp
- **mlpack::kmeans**
K-Means clustering.

40.593.1 Detailed Description

Author

Ryan Curtin

An implementation of Bradley and Fayyad's "Refining Initial Points for K-Means clustering". This class is meant to provide better initial points for the k-means algorithm.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

- class **SampleInitialization**

- **mlpack**
.hpp
- **mlpack::kmeans**
K-Means clustering.

40.594.1 Detailed Description

Author

Ryan Curtin

In order to construct initial centroids, randomly sample points from the dataset. This tends to give better results than the RandomPartition strategy.

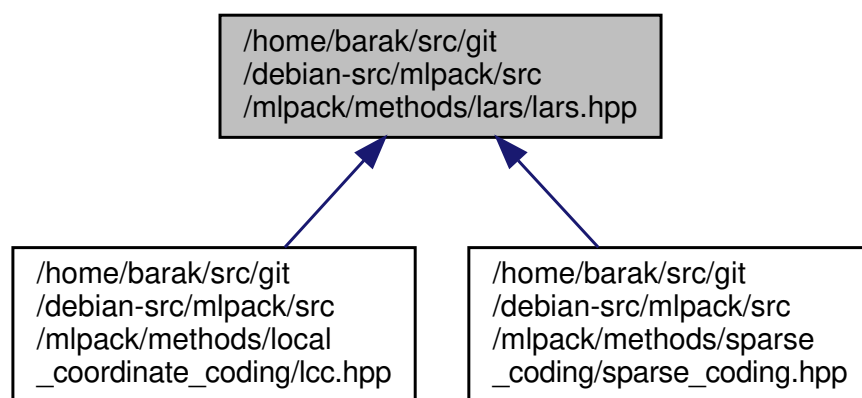

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.595 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/lars/lars.hpp File Reference

Include dependency graph for lars.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **LARS**

An implementation of **LARS** (p. 1783), a stage-wise homotopy-based algorithm for l_1 -regularized linear regression (LASSO) and l_1+l_2 regularized linear regression (Elastic Net).

Namespaces

- **mlpack**
 .hpp
- **mlpack::regression**
 Regression methods.

40.595.1 Detailed Description

Author

Nishant Mehta (niche)

Definition of the LARS class, which performs Least Angle Regression and the LASSO.

Only minor modifications of LARS are necessary to handle the constrained version of the problem:

$$\min_{\beta} 0.5 \|X\beta - y\|_2^2 + 0.5\lambda_2 \|\beta\|_2^2$$

subject to $\|\beta\|_1 \leq \tau$

Although this option currently is not implemented, it will be implemented very soon.

The Large Margin Nearest Neighbors function.

Namespaces

- **mlpack**
.hpp
- **mlpack::lmnn**
Large Margin Nearest Neighbor.

40.603.1 Detailed Description

Author

Sumedh Ghaisas
Arun Reddy

The LogisticRegression class, which implements logistic regression. This implements supports L2-regularization.

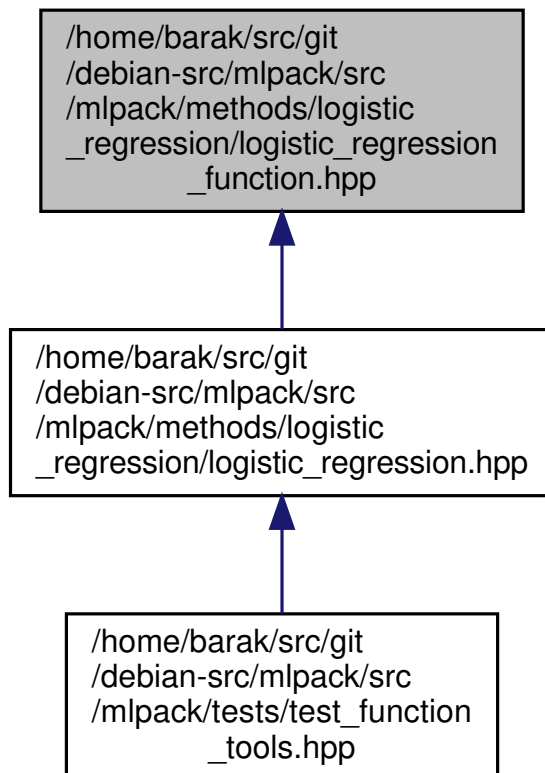

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.↵org/licenses/BSD-3-Clause> for more information.

40.604 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/logistic_regression/logistic_↵ _regression_function.hpp File Reference

Include dependency graph for logistic_regression_function.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::neighbor**

Functions

- **BOOST_TEMPLATE_CLASS_VERSION** (template< typename SortPolicy >, **mlpack::neighbor::LSHSearch**< SortPolicy >, 1)
 Set the serialization version of the LSHSearch class.

40.605.1 Detailed Description

Author

Parikshit Ram

Defines the LSHSearch class, which performs an approximate nearest neighbor search for a queries in a query set over a given dataset using Locality-sensitive hashing with 2-stable distributions.

The details of this method can be found in the following paper:

{datar2004locality, title={Locality-sensitive hashing scheme based on p-stable distributions}, author={Datar, M. and Immorlica, N. and Indyk, P. and Mirrokni, V.S.}, booktitle={Proceedings of the 12th Annual Symposium on Computational Geometry}, pages={253–262}, year={2004}, organization={ACM} }

Additionally, the class implements Multiprobe LSH, which improves approximation results during the search for approximate nearest neighbors. The Multiprobe LSH algorithm was presented in the paper:

{Lv2007multiprobe, title={Multi-probe LSH: efficient indexing for high-dimensional similarity search}, author={Lv, Qin and Josephson, William and Wang, Zhe and Charikar, Moses and Li, Kai}, booktitle={Proceedings of the 33rd international conference on Very large data bases}, year={2007}, pages={950–961} }

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.605.2 Function Documentation

40.605.2.1 BOOST_TEMPLATE_CLASS_VERSION()

```
BOOST_TEMPLATE_CLASS_VERSION (
    template< typename SortPolicy > ,
    mlpack::neighbor::LSHSearch< SortPolicy > ,
    1 )
```

Set the serialization version of the LSHSearch class.

Referenced by LSHSearch< SortPolicy >::Projections().

40.606 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/matrix_completion/matrix_completion.hpp File Reference

Include dependency graph for matrix_completion.hpp:

Classes

- class **MatrixCompletion**

This class implements the popular nuclear norm minimization heuristic for matrix completion problems.

Namespaces

- **mlpack**
.hpp
- **mlpack::matrix_completion**

40.606.1 Detailed Description

Author

Stephen Tu

A thin wrapper around nuclear norm minimization to solve low rank matrix completion problems.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

[illegible]

- class **MeanShift**< **UseKernel**, **KernelType**, **MatType** >
This class implements mean shift clustering.

- **mlpack**
.hpp
- **mlpack::meanshift**
Mean shift clustering.

Shangtong Zhang

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

The diagram illustrates the hierarchical structure of the 'Introduction' section. The root node is 'Introduction' (1.0). It branches into four main categories: 'Background' (1.1), 'Methods' (1.2), 'Results' (1.3), and 'Discussion' (1.4). Each of these categories further branches into sub-sections, which then branch into more detailed sub-sections, creating a dense tree structure. The diagram uses blue lines and boxes to represent the hierarchy.

Namespaces

- **mlpack**
 .hpp
- **mlpack::nca**
 Neighborhood Components Analysis.

40.609.1 Detailed Description

Author

Ryan Curtin

Declaration of NCA class (Neighborhood Components Analysis).

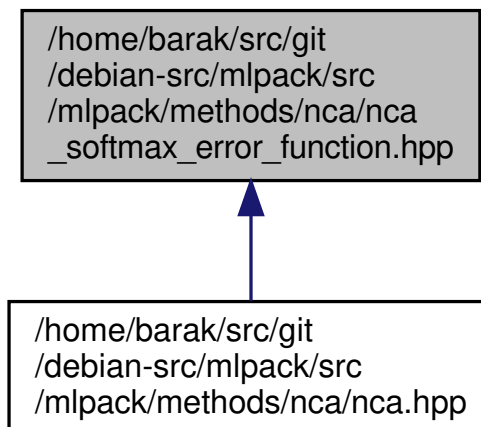

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.610 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/nca/nca_softmax_error_function.hpp File Reference

Include dependency graph for nca_softmax_error_function.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **NeighborSearch**< **SortPolicy**, **MetricType**, **MatType**, **TreeType**, **DualTreeTraversalType**, **SingleTree**↔
TraversalType >

*The **NeighborSearch** (p. 1627) class is a template class for performing distance-based neighbor searches.*

- class **TrainVisitor**< **SortPolicy** >

***TrainVisitor** (p. 1707) sets the reference set to a new reference set on the given **NSType**.*

Namespaces

- **mlpack**
.hpp
- **mlpack::neighbor**

Enumerations

- enum **NeighborSearchMode** {
 NAIVE_MODE,
 SINGLE_TREE_MODE,
 DUAL_TREE_MODE,
 GREEDY_SINGLE_TREE_MODE }

NeighborSearchMode represents the different neighbor search modes available.

40.611.1 Detailed Description

Author

Ryan Curtin

Defines the NeighborSearch class, which performs an abstract nearest-neighbor-like query on two datasets.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.612.1 Detailed Description

Author

Ryan Curtin

Defines the pruning rules and base case rules necessary to perform a tree-based search (with an arbitrary tree) for the NeighborSearch class.

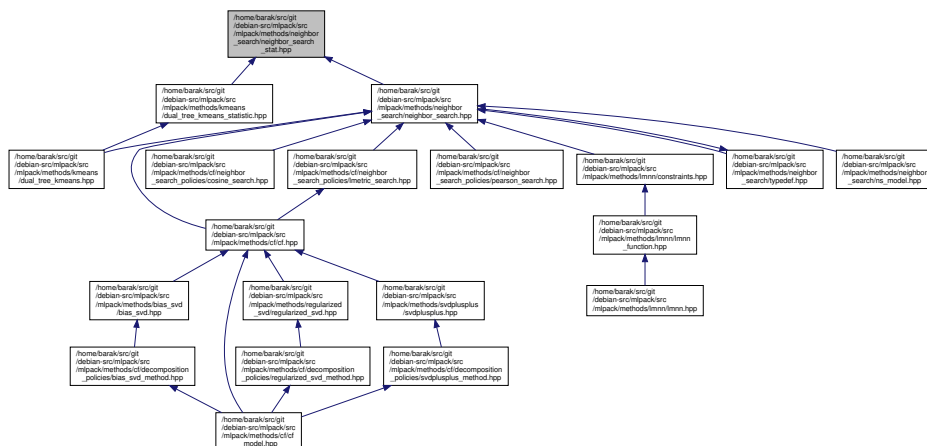

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.613 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/neighbor_search/neighbor_↵
_search_stat.hpp File Reference

Include dependency graph for neighbor_search_stat.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **NeighborSearchStat** < **SortPolicy** >

Extra data for each node in the tree.

Namespaces

- **mlpack**
 .hpp
- **mlpack::neighbor**

40.614 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/neighbor_search/ns_model.hpp File Reference

Include dependency graph for ns_model.hpp:

Classes

- class **BiSearchVisitor**< **SortPolicy** >
 BiSearchVisitor (p. 1591) executes a bichromatic neighbor search on the given *NSType*.
- class **DeleteVisitor**
 DeleteVisitor (p. 1595) deletes the given *NSType* instance.
- class **EpsilonVisitor**
 EpsilonVisitor (p. 1600) exposes the *Epsilon* method of the given *NSType*.
- class **MonoSearchVisitor**
 MonoSearchVisitor (p. 1618) executes a monochromatic neighbor search on the given *NSType*.
- class **NSModel**< **SortPolicy** >
 The *NSModel* (p. 1657) class provides an easy way to serialize a model, abstracts away the different types of trees, and also reflects the *NeighborSearch* (p. 1627) API.
- class **ReferenceSetVisitor**
 ReferenceSetVisitor (p. 1701) exposes the *referenceSet* of the given *NSType*.
- class **SearchModeVisitor**
 SearchModeVisitor (p. 1703) exposes the *SearchMode()* method of the given *NSType*.
- class **TrainVisitor**< **SortPolicy** >
 TrainVisitor (p. 1707) sets the reference set to a new reference set on the given *NSType*.

Namespaces

- **mlpack**
 .hpp
- **mlpack::neighbor**

Typedefs

- `template<typename SortPolicy , template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType> using NSType = NeighborSearch< SortPolicy, metric::EuclideanDistance, arma::mat, TreeType, TreeType< metric::EuclideanDistance, NeighborSearchStat< SortPolicy >, arma::mat >::template DualTreeTraverser >`
Alias template for euclidean neighbor search.

Functions

- **BOOST_TEMPLATE_CLASS_VERSION** (template< typename SortPolicy >, `mlpack::neighbor::NSModel< SortPolicy >`, 1)
Set the serialization version of the NSModel class.

40.614.1 Detailed Description

Author

Ryan Curtin

This is a model for nearest or furthest neighbor search. It is useful in that it provides an easy way to serialize a model, abstracts away the different types of trees, and also reflects the NeighborSearch API and automatically directs to the right tree type.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.614.2 Function Documentation

40.614.2.1 BOOST_TEMPLATE_CLASS_VERSION()

```
BOOST_TEMPLATE_CLASS_VERSION (
    template< typename SortPolicy > ,
    mlpack::neighbor::NSModel< SortPolicy > ,
    1 )
```

Set the serialization version of the NSModel class.

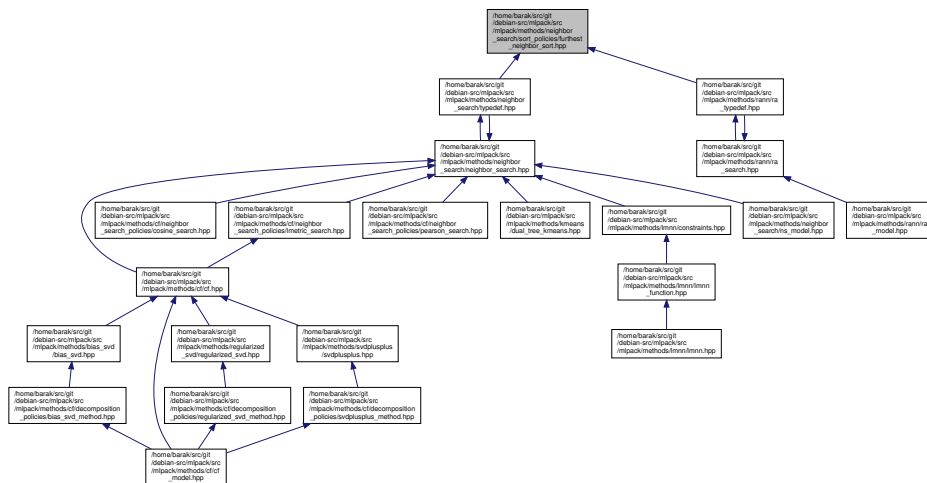

Referenced by `NSModel< SortPolicy >::RandomBasis()`.

40.615 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/neighbor_search/sort_
policies/furthest_neighbor_sort.hpp File Reference

Include dependency graph for furthest_neighbor_sort.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **FurthestNS**

*This class implements the necessary methods for the SortPolicy template parameter of the **NeighborSearch** (p. 1627) class.*

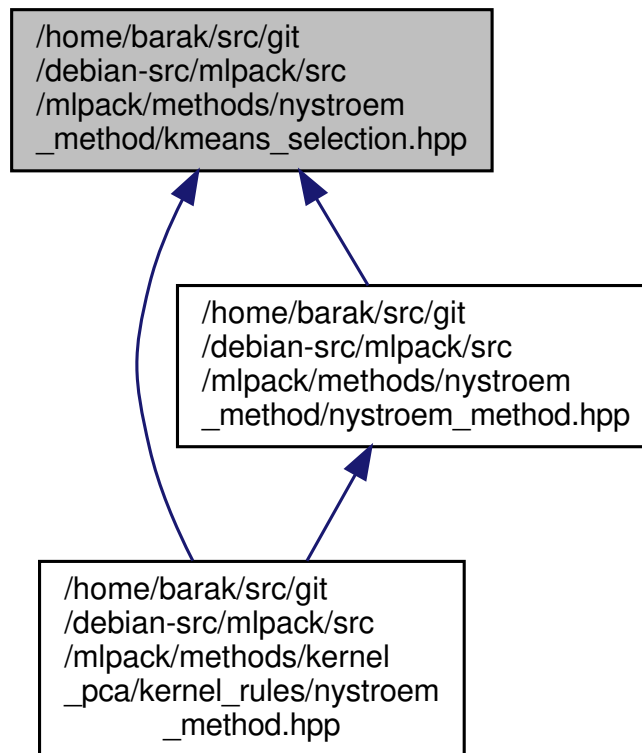

Namespaces

- **mlpack**
 .hpp
- **mlpack::neighbor**

Typedefs

- using **FurthestNeighborSort** = FurthestNS

This graph shows which files directly or indirectly include this file:

Classes

- class **KMeansSelection**< **ClusteringType**, **maxIterations** >
Implementation of the kmeans sampling scheme.

Namespaces

- **mlpack**
.hpp
- **mlpack::kernel**
Kernel functions.

40.618.1 Detailed Description

Author

Marcus Edel

Use the centroids of the K-Means clustering method for use in the Nystroem method of kernel matrix approximation.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

Include dependency graph for ordered_selection.hpp:

Classes

- class **OrderedSelection**

Namespaces

- **mlpack**
.hpp
- **mlpack::kernel**
Kernel functions.

40.619.1 Detailed Description

Author

Ryan Curtin

Select the first points of the dataset for use in the Nystroem method of kernel matrix approximation. This is mostly for testing, but might have other uses.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

_selection.hpp File Reference

Include dependency graph for random_selection.hpp:

Classes

- class **RandomSelection**

Namespaces

- **mlpack**
.hpp
- **mlpack::kernel**
Kernel functions.

40.620.1 Detailed Description

Author

Ryan Curtin

Randomly select some points (with replacement) to use for the Nystroem method. Replacement is suboptimal, but for rank \ll number of points, this is unlikely.

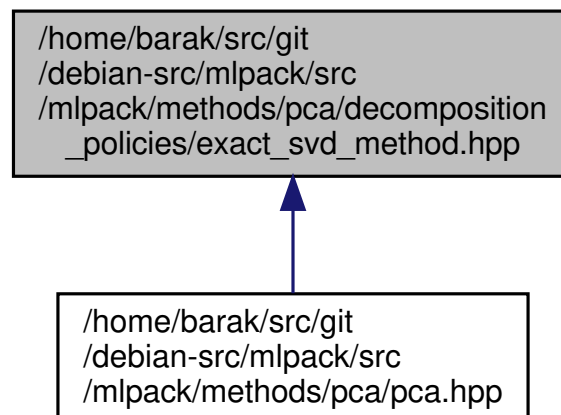

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

 .hpp
- **mlpack::tree**
 Trees and tree-building procedures.

Functions

- `template<bool UseWeights, typename MatType , typename LabelsType , typename WeightsType >`
`void Bootstrap (const MatType &dataset, const LabelsType &labels, const WeightsType &weights, MatType`
`&bootstrapDataset, LabelsType &bootstrapLabels, WeightsType &bootstrapWeights)`

Given a dataset, create another dataset via bootstrap sampling, with labels.

40.630.1 Detailed Description

Author

Ryan Curtin

Implementation of the **Bootstrap()** (p. 463) function, which creates a bootstrapped dataset from the given input dataset.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.631 `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/random_forest/random_↵` `_forest.hpp` File Reference

Include dependency graph for `random_forest.hpp`:

Classes

- class **RandomForest**< **FitnessFunction**, **DimensionSelectionType**, **NumericSplitType**, **CategoricalSplitType**, **ElemType** >

Namespaces

- **mlpack**
`.hpp`
- **mlpack::tree**
Trees and tree-building procedures.

40.631.1 Detailed Description

Author

Ryan Curtin

Definition of the RandomForest class.

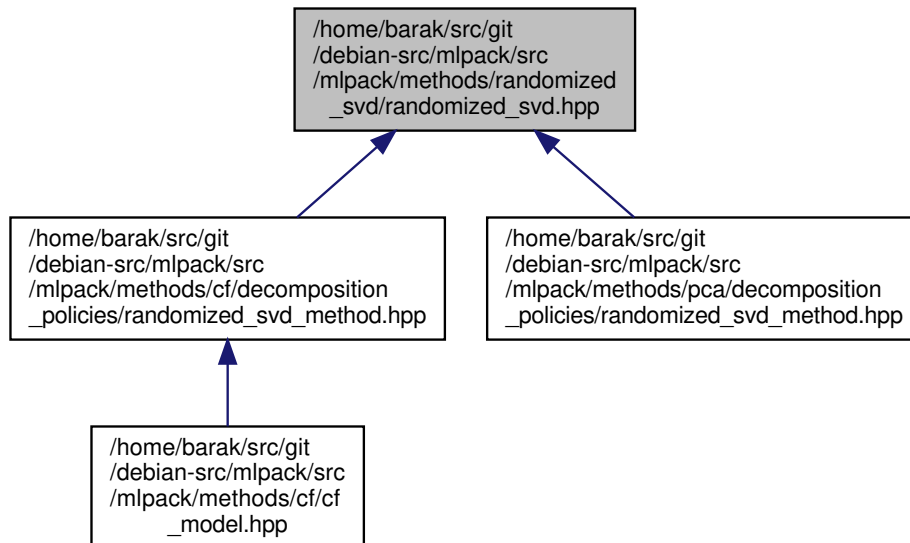

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.632 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/randomized_svd/randomized_svd.hpp File Reference

Include dependency graph for randomized_svd.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RandomizedSVD**

Randomized SVD is a matrix factorization that is based on randomized matrix approximation techniques, developed in in "Finding structure with randomness: Probabilistic algorithms for constructing approximate matrix decompositions".

Namespaces

- **mlpack**
 - .hpp*
- **mlpack::svd**

40.632.1 Detailed Description

Author

Marcus Edel

An implementation of the randomized SVD method.

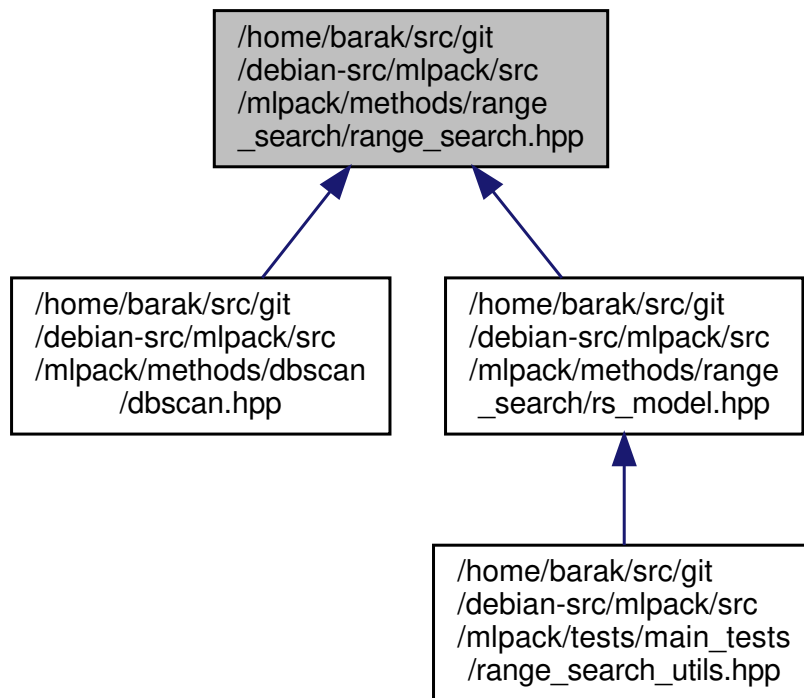

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.633 `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/range_search.hpp` File Reference

Include dependency graph for `range_search.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **RangeSearch**< **MetricType**, **MatType**, **TreeType** >

The *RangeSearch* (p. 1754) class is a template class for performing range searches.

Namespaces

- **mlpack**
.hpp
- **mlpack::range**

Range-search routines.

40.633.1 Detailed Description

Author

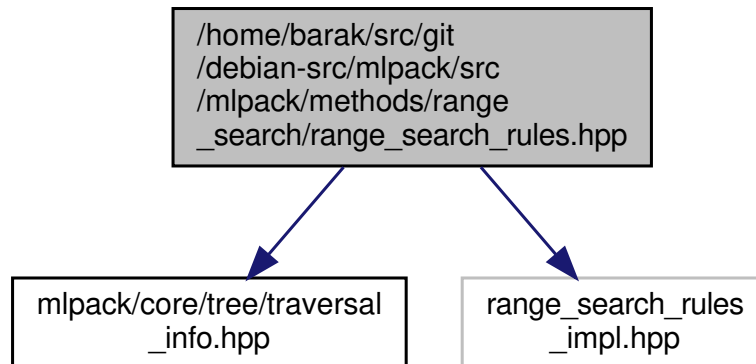

Ryan Curtin

Defines the RangeSearch class, which performs a generalized range search on points.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.634 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/range_search_rules.hpp File Reference

Include dependency graph for range_search_rules.hpp:

Classes

- class **RangeSearchRules**< **MetricType**, **TreeType** >

The **RangeSearchRules** (p. 1764) class is a template helper class used by **RangeSearch** (p. 1754) class when performing range searches.

Namespaces

- **mlpack**
.hpp
- **mlpack::range**

Range-search routines.

40.634.1 Detailed Description

Author

Ryan Curtin

Rules for range search, so that it can be done with arbitrary tree types.

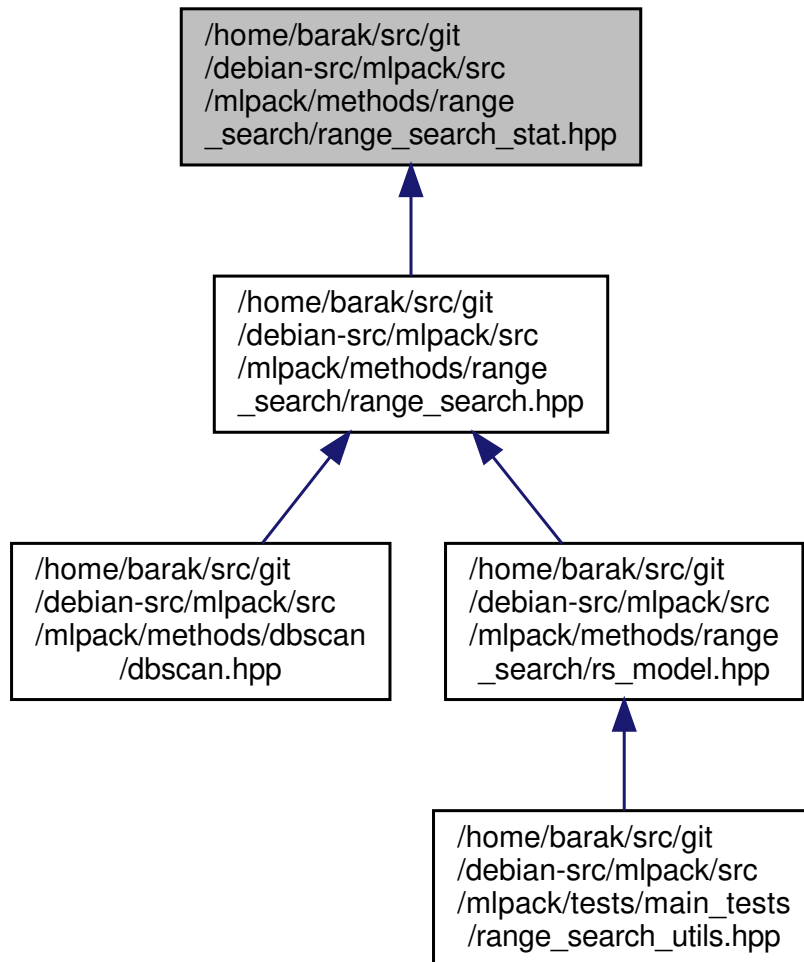

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.635 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/range_search_stat.hpp File Reference

Include dependency graph for range_search_stat.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RangeSearchStat**

Statistic class for **RangeSearch** (p. 1754), to be set to the *StatisticType* of the tree type that range search is being performed with.

Namespaces

- **mlpack**
 .hpp
- **mlpack::range**
 Range-search routines.

40.635.1 Detailed Description

Author

Ryan Curtin

Statistic class for RangeSearch, which just holds the last visited node and the corresponding base case result.

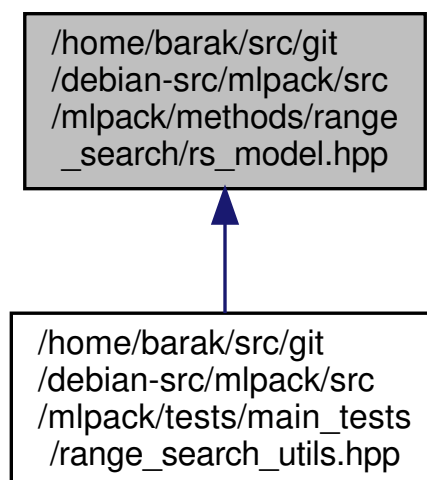

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.636 `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/range_search/rs_model.hpp` File Reference

Include dependency graph for `rs_model.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **BiSearchVisitor**
BiSearchVisitor (p. 1748) executes a bichromatic range search on the given *RSType*.
- class **DeleteVisitor**
DeleteVisitor (p. 1751) deletes the given *RSType* instance.
- class **MonoSearchVisitor**
MonoSearchVisitor (p. 1752) executes a monochromatic range search on the given *RSType*.
- class **NaiveVisitor**
NaiveVisitor (p. 1753) exposes the *Naive()* method of the given *RSType*.
- class **ReferenceSetVisitor**
ReferenceSetVisitor (p. 1771) exposes the *referenceSet* of the given *RSType*.
- class **RSType**
- class **SingleNodeVisitor**
SingleNodeVisitor (p. 1779) exposes the *SingleNode()* method of the given *RSType*.
- class **TrainVisitor**
TrainVisitor (p. 1780) sets the reference set to a new reference set on the given *RSType*.

Namespaces

- **mlpack**
.hpp
- **mlpack::range**
Range-search routines.

Typedefs

- `template<template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType>
using RSType = RangeSearch< metric::EuclideanDistance, arma::mat, TreeType >`
Alias template for Range Search.

40.636.1 Detailed Description

Author

Ryan Curtin

This is a model for range search. It is useful in that it provides an easy way to serialize a model, abstracts away the different types of trees, and also reflects the RangeSearch API and automatically directs to the right tree types.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.637 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/rann/ra_model.hpp File Reference

Include dependency graph for ra_model.hpp:

Classes

- class **AlphaVisitor**
Exposes the Alpha() method of the given RType.
- class **BiSearchVisitor**< **SortPolicy** >
***BiSearchVisitor** (p. 1591) executes a bichromatic neighbor search on the given NType.*
- class **DeleteVisitor**
***DeleteVisitor** (p. 1595) deletes the given NType instance.*
- class **FirstLeafExactVisitor**
Exposes the FirstLeafExact() method of the given RType.
- class **MonoSearchVisitor**
***MonoSearchVisitor** (p. 1618) executes a monochromatic neighbor search on the given NType.*
- class **NaiveVisitor**
***NaiveVisitor** (p. 1620) exposes the Naive() method of the given RType.*
- class **RAModel**< **SortPolicy** >
*The **RAModel** (p. 1669) class provides an abstraction for the **RASearch** (p. 1681) class, abstracting away the TreeType parameter and allowing it to be specified at runtime in this class.*
- class **ReferenceSetVisitor**
***ReferenceSetVisitor** (p. 1701) exposes the referenceSet of the given NType.*
- class **SampleAtLeavesVisitor**
Exposes the SampleAtLeaves() method of the given RType.
- class **SingleModeVisitor**
Exposes the SingleMode() method of the given RType.
- class **SingleSampleLimitVisitor**
Exposes the SingleSampleLimit() method of the given RType.
- class **TauVisitor**
Exposes the Tau() method of the given RType.
- class **TrainVisitor**< **SortPolicy** >
***TrainVisitor** (p. 1707) sets the reference set to a new reference set on the given NType.*

Namespaces

- **mlpack**
 .hpp
- **mlpack::neighbor**

Typedefs

- template<typename SortPolicy , template< typename TreeMetricType, typename TreeStatType, typename TreeMatType > class TreeType> using **RAType** = RASearch< SortPolicy, metric::EuclideanDistance, arma::mat, TreeType >

Alias template for **RASearch** (p. 1681).

40.637.1 Detailed Description

Author

Ryan Curtin

This is a model for rank-approximate nearest neighbor search. It provides an easy way to serialize a rank-approximate neighbor search model by abstracting the types of trees and reflecting the RASearch API.

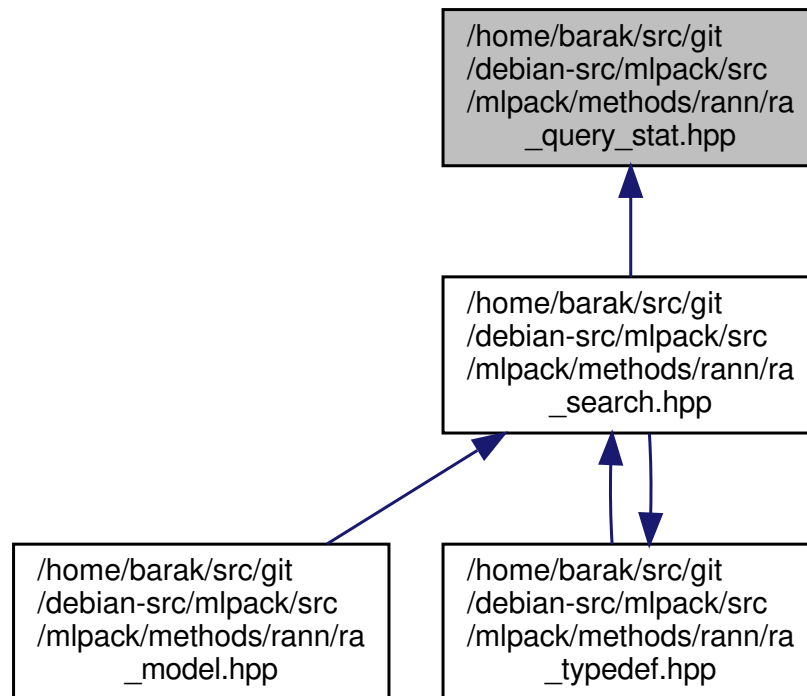

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.638 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/rann/ra_query_stat.hpp File Reference

Include dependency graph for ra_query_stat.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RAQueryStat**< **SortPolicy** >
Extra data for each node in the tree.

Namespaces

- **mlpack**
.hpp
- **mlpack::neighbor**

40.638.1 Detailed Description

Author

Parikshit Ram

Defines the RAQueryStat class, which is the statistic used for rank-approximate nearest neighbor search (RASearch).

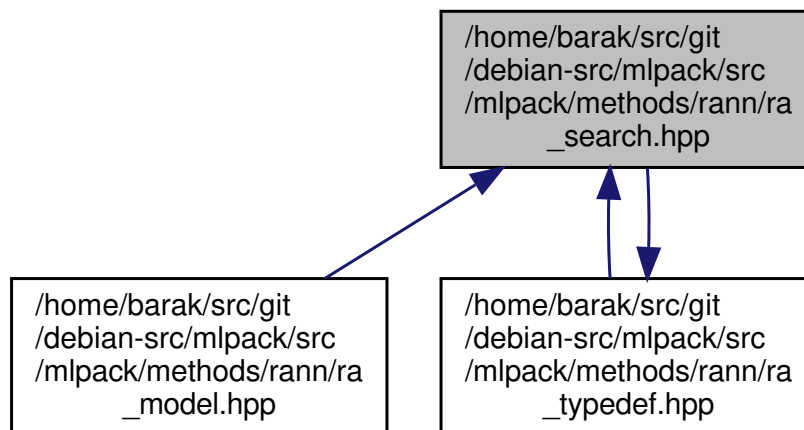

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.639 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/rann/ra_search.hpp File Reference

Include dependency graph for ra_search.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RASearch**< **SortPolicy**, **MetricType**, **MatType**, **TreeType** >

The **RASearch** (p. 1681) class: This class provides a generic manner to perform rank-approximate search via random-sampling.

- class **TrainVisitor**< **SortPolicy** >

TrainVisitor (p. 1707) sets the reference set to a new reference set on the given **NSType**.

Namespaces

- **mlpack**
 .hpp
- **mlpack::neighbor**

40.639.1 Detailed Description

Author

Parikshit Ram

Defines the `RASearch` class, which performs an abstract rank-approximate nearest/farthest neighbor query on two datasets.

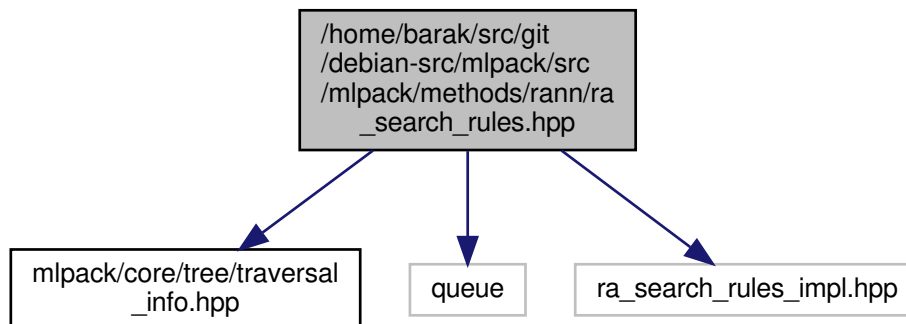

The details of this method can be found in the following paper:

{ram2009rank, title={{Rank-Approximate Nearest Neighbor Search: Retaining Meaning and Speed in High Dimensions}}, author={{Ram, P. and Lee, D. and Ouyang, H. and Gray, A. G.}}, booktitle={{Advances of Neural Information Processing Systems}}, year={2009} }

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.640 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/rann/ra_search_rules.hpp File Reference

Include dependency graph for `ra_search_rules.hpp`:

Classes

- class **`RASearchRules`**< `SortPolicy`, `MetricType`, `TreeType` >

The **`RASearchRules`** (p. 1692) class is a template helper class used by **`RASearch`** (p. 1681) class when performing rank-approximate search via random-sampling.

Namespaces

- **`mlpack`**
 `.hpp`
- **`mlpack::neighbor`**

40.640.1 Detailed Description

Author

Parikshit Ram

Defines the pruning rules and base case rules necessary to perform a tree-based rank-approximate search (with an arbitrary tree) for the RASearch class.

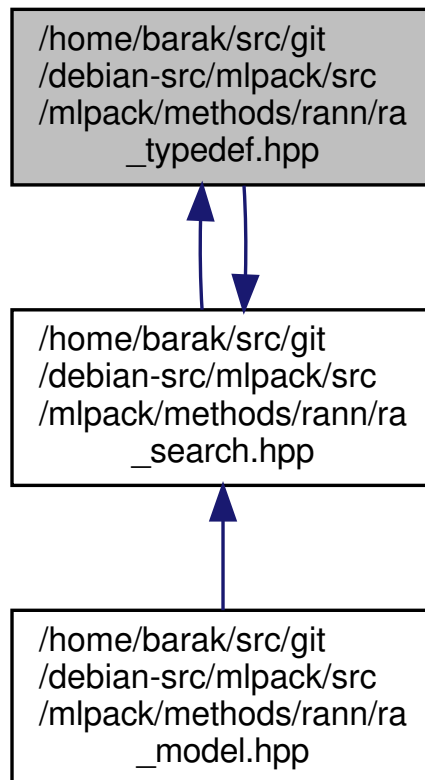

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.641 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/rann/ra_typedef.hpp File Reference

Include dependency graph for ra_typedef.hpp:

This graph shows which files directly or indirectly include this file:

Namespaces

- **mlpack**
 .hpp
- **mlpack::neighbor**

Typedefs

- typedef RASearch< FurthestNeighborSort > **KRAFN**
 The KRAFN class is the k-rank-approximate-farthest-neighbors method.
- typedef RASearch **KRANN**
 The KRANN class is the k-rank-approximate-nearest-neighbors method.

40.641.1 Detailed Description

Author

Parikshit Ram

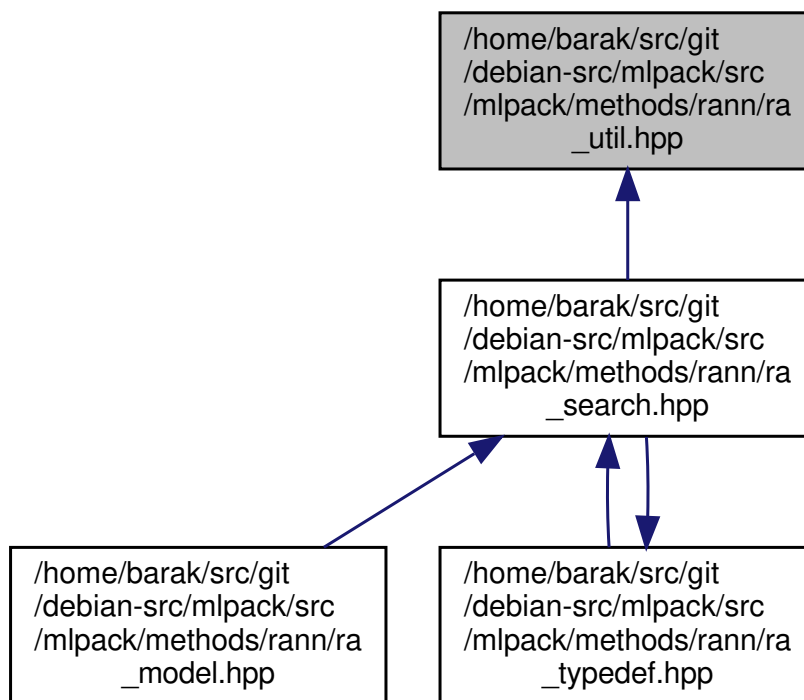

Simple typedefs describing template instantiations of the RASearch class which are commonly used.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

Include dependency graph for ra_util.hpp:

This graph shows which files directly or indirectly include this file:

- class **RAUtil**

- **mlpack**
 .hpp
- **mlpack::neighbor**

40.642.1 Detailed Description

Author

Parikshit Ram
Ryan Curtin

Utilities for rank-approximate neighbor search.

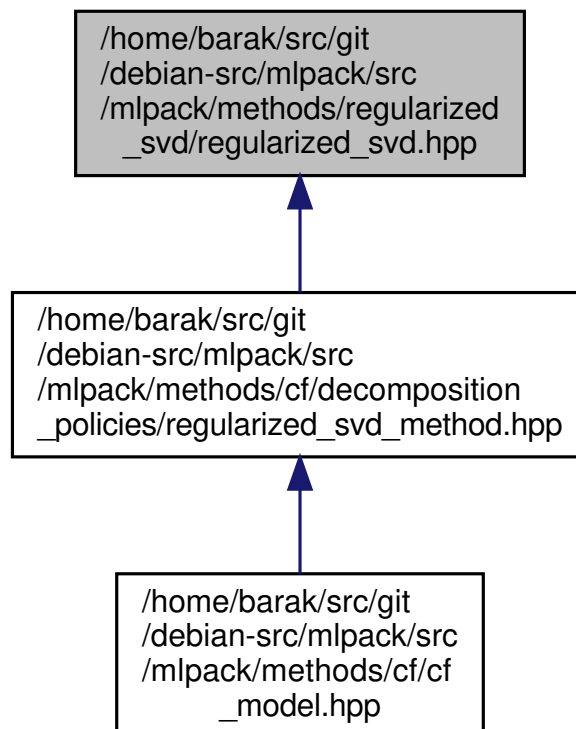

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.643 `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/regularized_svd/regularized_svd.hpp` File Reference

Include dependency graph for `regularized_svd.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **RegularizedSVD**< **OptimizerType** >

Regularized SVD is a matrix factorization technique that seeks to reduce the error on the training set, that is on the examples for which the ratings have been provided by the users.

Namespaces

- **mlpack**
.hpp
- **mlpack::svd**

40.643.1 Detailed Description

Author

Siddharth Agrawal

An implementation of Regularized SVD.

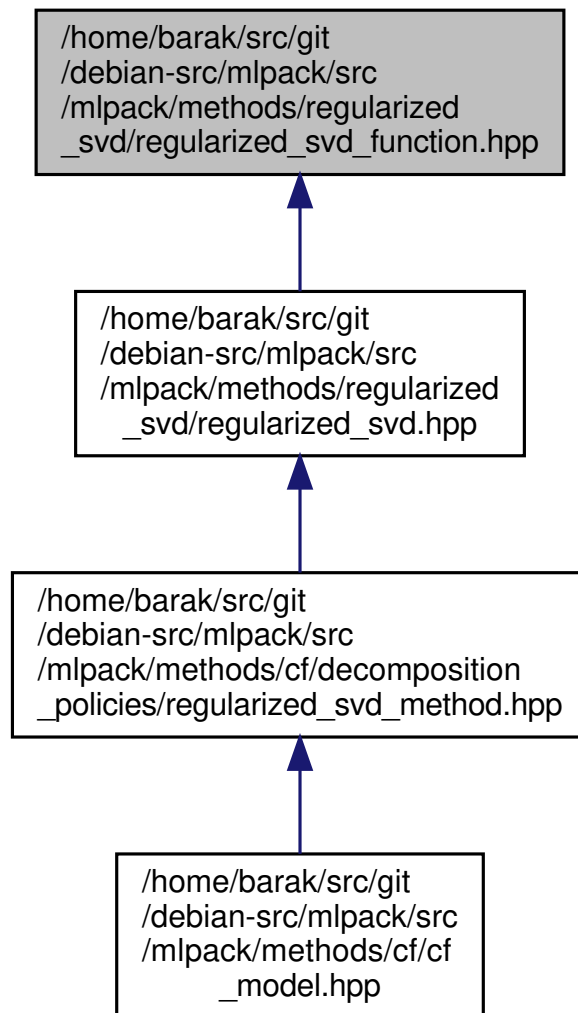

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.644 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/regularized_svd/regularized_svd_function.hpp File Reference

Include dependency graph for regularized_svd_function.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RegularizedSVDFunction**< **MatType** >

*The data is stored in a matrix of type **MatType**, so that this class can be used with both dense and sparse matrix types.*

Namespaces

- **ens**
- **mlpack**
 .hpp
- **mlpack::svd**

Typedefs

- `template<typename EnvironmentType , typename NetworkType , typename UpdaterType , typename PolicyType >`
`using NStepQLearning = AsyncLearning< NStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >, EnvironmentType, NetworkType, UpdaterType, PolicyType >`
Convenient typedef for async n step q-learning.
- `template<typename EnvironmentType , typename NetworkType , typename UpdaterType , typename PolicyType >`
`using OneStepQLearning = AsyncLearning< OneStepQLearningWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >, EnvironmentType, NetworkType, UpdaterType, PolicyType >`
Convenient typedef for async one step q-learning.
- `template<typename EnvironmentType , typename NetworkType , typename UpdaterType , typename PolicyType >`
`using OneStepSarsa = AsyncLearning< OneStepSarsaWorker< EnvironmentType, NetworkType, UpdaterType, PolicyType >, EnvironmentType, NetworkType, UpdaterType, PolicyType >`
Convenient typedef for async one step Sarsa.

40.645.1 Detailed Description

Author

Shangtong Zhang

This file is the definition of AsyncLearning class, which is wrapper for various asynchronous learning algorithms.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.646 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/reinforcement_learning/environment/acrobot.hpp File Reference

Include dependency graph for acrobot.hpp:

Classes

- class **Acrobot**
*Implementation of **Acrobot** (p. 1825) game.*
- class **Acrobot::State**

40.652 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/reinforcement_learning/policy/aggregated_policy.hpp File Reference

Include dependency graph for aggregated_policy.hpp:

Classes

- class **AggregatedPolicy**< **PolicyType** >

Namespaces

- **mlpack**
 .hpp
- **mlpack::rl**

40.652.1 Detailed Description

Author

Shangtong Zhang

This file is the implementation of AggregatedPolicy class. An aggregated policy will randomly select a child policy under a given distribution at each time step.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.653 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/reinforcement_learning/policy/greedy_policy.hpp File Reference

Include dependency graph for greedy_policy.hpp:

Classes

- class **GreedyPolicy**< **EnvironmentType** >
Implementation for epsilon greedy policy.

Namespaces

- mlpack**
.hpp
- mlpack::rl**

40.653.1 Detailed Description

Author

Shangtong Zhang
Abhinav Sagar

This file is an implementation of epsilon greedy policy.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.654 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/reinforcement_learning/q_learning.hpp File Reference

Include dependency graph for q_learning.hpp:

Classes

- class **QLearning**< **EnvironmentType**, **NetworkType**, **UpdaterType**, **PolicyType**, **ReplayType** >
Implementation of various Q-Learning algorithms, such as DQN, double DQN.

Namespaces

- mlpack**
.hpp
- mlpack::rl**

40.654.1 Detailed Description

Author

Shangtong Zhang

This file is the definition of QLearning class, which implements Q-Learning algorithms.

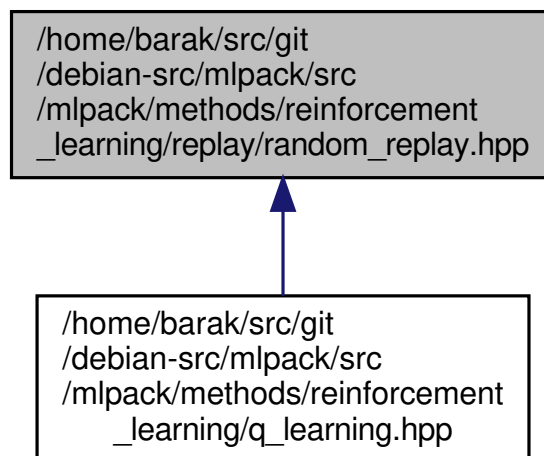

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.655 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/reinforcement_learning/replay/random_replay.hpp File Reference

Include dependency graph for random_replay.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RandomReplay**< **EnvironmentType** >
Implementation of random experience replay.

Namespaces

- **mlpack**
.hpp
- **mlpack::rl**

40.655.1 Detailed Description

Author

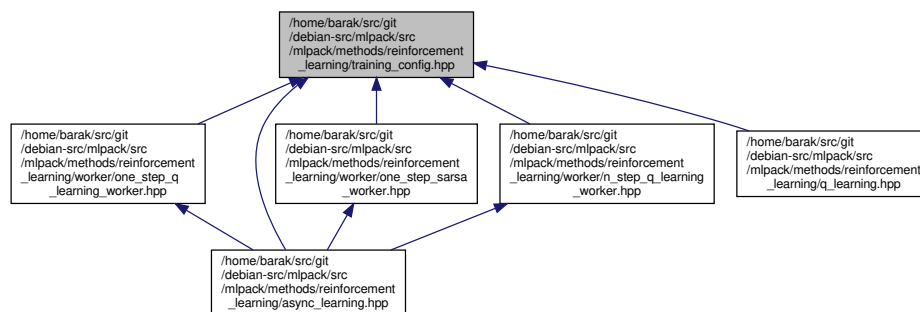

Shangtong Zhang

This file is an implementation of random experience replay.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.656 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/reinforcement_learning/training_config.hpp File Reference

This graph shows which files directly or indirectly include this file:

Classes

- class **TrainingConfig**

Namespaces

- **mlpack**
.hpp
- **mlpack::rl**

40.656.1 Detailed Description

Author

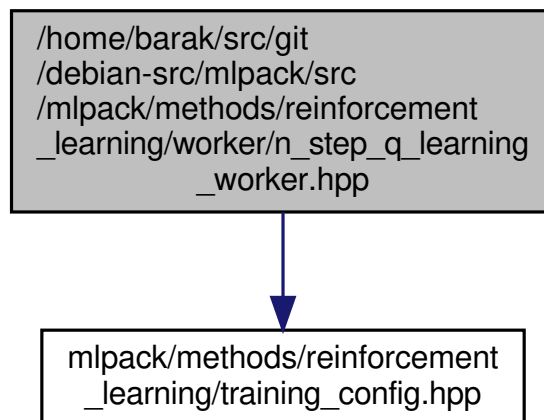

Shangtong Zhang

This file is the implementation of TrainingConfig class, which contains hyper-parameters for training RL agent.

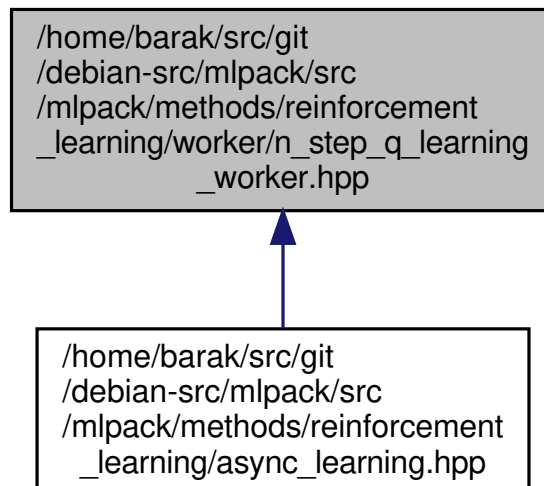

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.657 `/home/barak/src/git/debian-src/mlpack/src/mlpack/methods/reinforcement_learning/worker/n_step_q_learning_worker.hpp` File Reference

Include dependency graph for `n_step_q_learning_worker.hpp`:

This graph shows which files directly or indirectly include this file:

Classes

- class **NStepQLearningWorker**< **EnvironmentType**, **NetworkType**, **UpdaterType**, **PolicyType** >
*Forward declaration of **NStepQLearningWorker** (p. 1868).*

Namespaces

- **mlpack**
.hpp
- **mlpack::rl**

40.657.1 Detailed Description

Author

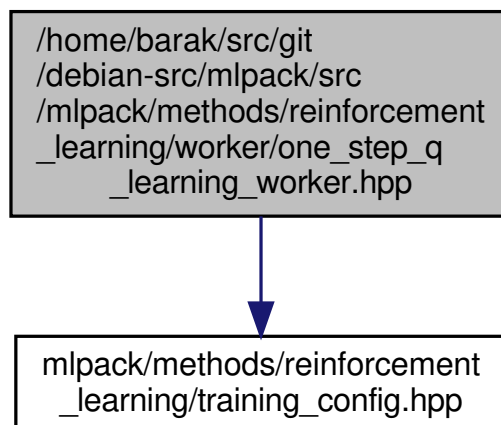

Shangtong Zhang

This file is the definition of NStepQLearningWorker class, which implements an episode for async n step Q-Learning algorithm.

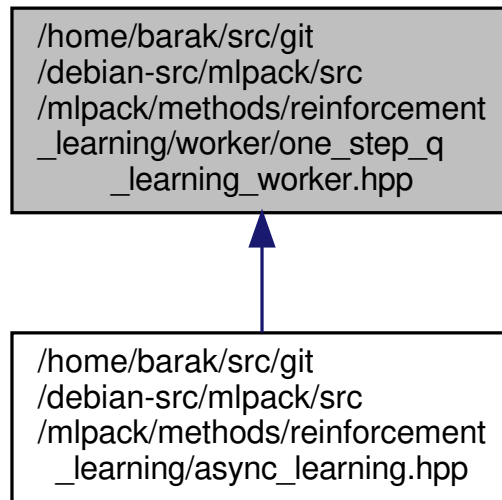

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

Include dependency graph for softmax_regression_function.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **SoftmaxRegressionFunction**

Namespaces

- **mlpack**
.hpp
- **mlpack::regression**
Regression methods.

40.661.1 Detailed Description

Author

Siddharth Agrawal

The function to be optimized for softmax regression. Any mlpack optimizer can be used.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

Classes

- class **SparseAutoencoder**

A sparse autoencoder is a neural network whose aim to learn compressed representations of the data, typically for dimensionality reduction, with a constraint on the activity of the neurons in the network.

Namespaces

- **mlpack**
 .hpp
- **mlpack::nn**

40.663.1 Detailed Description

Author

Siddharth Agrawal

An implementation of sparse autoencoders.

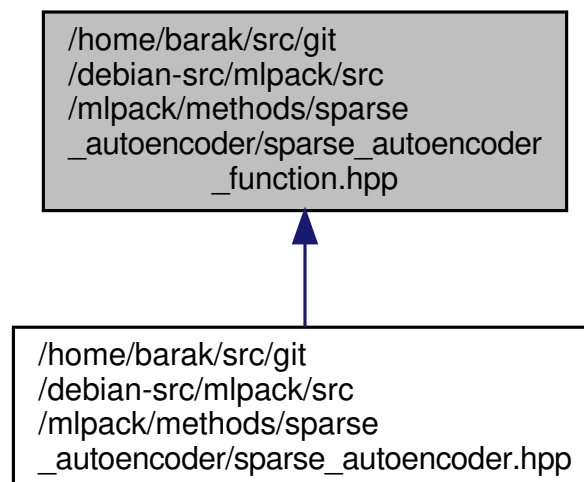

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.↵

40.664 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/sparse_autoencoder/sparse_↵ _autoencoder_function.hpp File Reference

Include dependency graph for sparse_autoencoder_function.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **DataDependentRandomInitializer**
A data-dependent random dictionary initializer for *SparseCoding* (p. 1916).

Namespaces

- mlpack**
.hpp
- mlpack::sparse_coding**

40.665.1 Detailed Description

Author

Nishant Mehta

A sensible heuristic for initializing dictionaries for sparse coding.

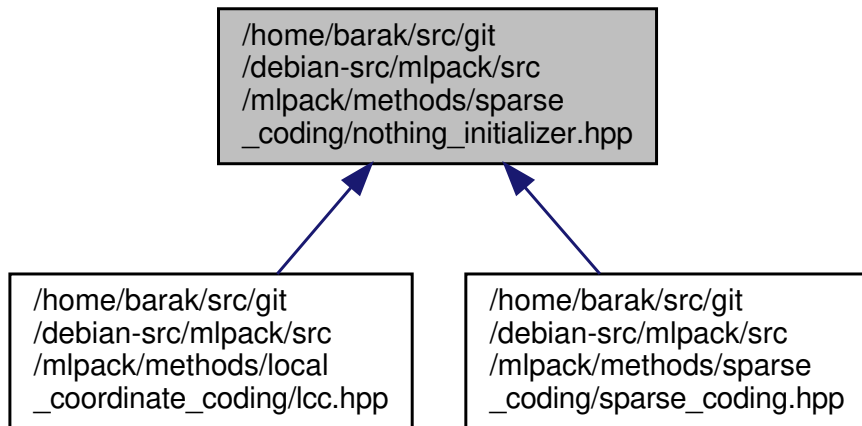

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.666 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/sparse_coding/nothing_initializer.hpp File Reference

Include dependency graph for nothing_initializer.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **NothingInitializer**

A DictionaryInitializer for **SparseCoding** (p. 1916) which does not initialize anything; it is useful for when the dictionary is already known and will be set with **SparseCoding::Dictionary()** (p. 1920).

Namespaces

- **mlpack**
 .hpp
- **mlpack::sparse_coding**

40.666.1 Detailed Description

Author

Ryan Curtin

An initializer for SparseCoding which does precisely nothing. It is useful for when you have an already defined dictionary and you plan on setting it with SparseCoding::Dictionary().

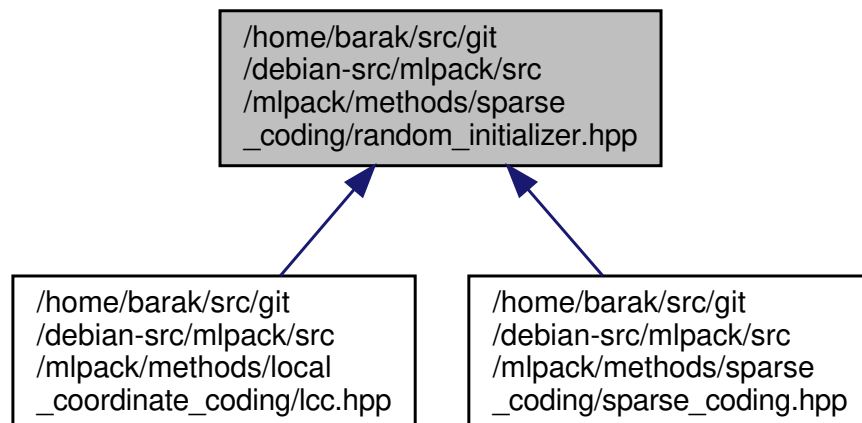

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.667 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/sparse_coding/random_← _initializer.hpp File Reference

Include dependency graph for random_initializer.hpp:

This graph shows which files directly or indirectly include this file:

Classes

- class **RandomInitializer**
A *DictionaryInitializer* for use with the **SparseCoding** (p. 1916) class.

Namespaces

- **mlpack**
.hpp
- **mlpack::sparse_coding**

40.667.1 Detailed Description

Author

Nishant Mehta

A very simple random dictionary initializer for SparseCoding; it is probably not a very good choice.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.668 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/sparse_coding/sparse_coding.hpp File Reference

Include dependency graph for sparse_coding.hpp:

Classes

- class **SparseCoding**
An implementation of Sparse Coding with Dictionary Learning that achieves sparsity via an l_1 -norm regularizer on the codes (LASSO) or an (l_1+l_2) -norm regularizer on the codes (the Elastic Net).

Namespaces

- **mlpack**
.hpp
- **mlpack::sparse_coding**

40.668.1 Detailed Description

Author

Nishant Mehta

Definition of the SparseCoding class, which performs L1 (LASSO) or L1+L2 (Elastic Net)-regularized sparse coding with dictionary learning

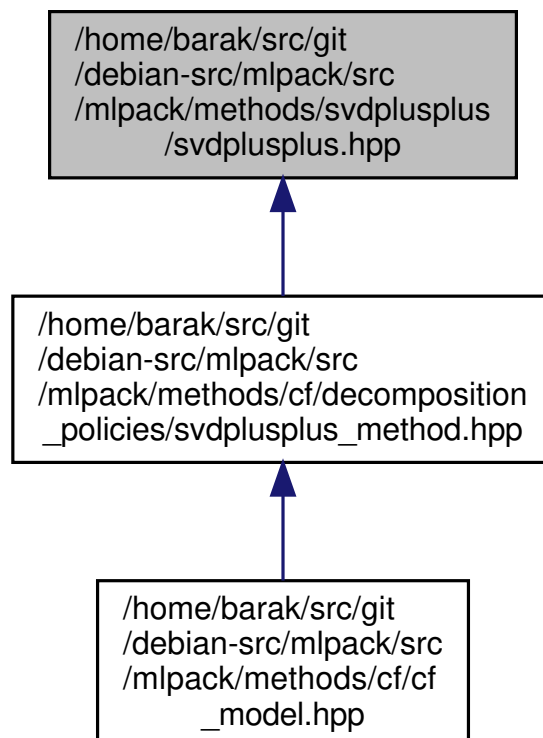

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.669 /home/barak/src/git/debian-src/mlpack/src/mlpack/methods/svdplusplus/svdplusplus.hpp File Reference

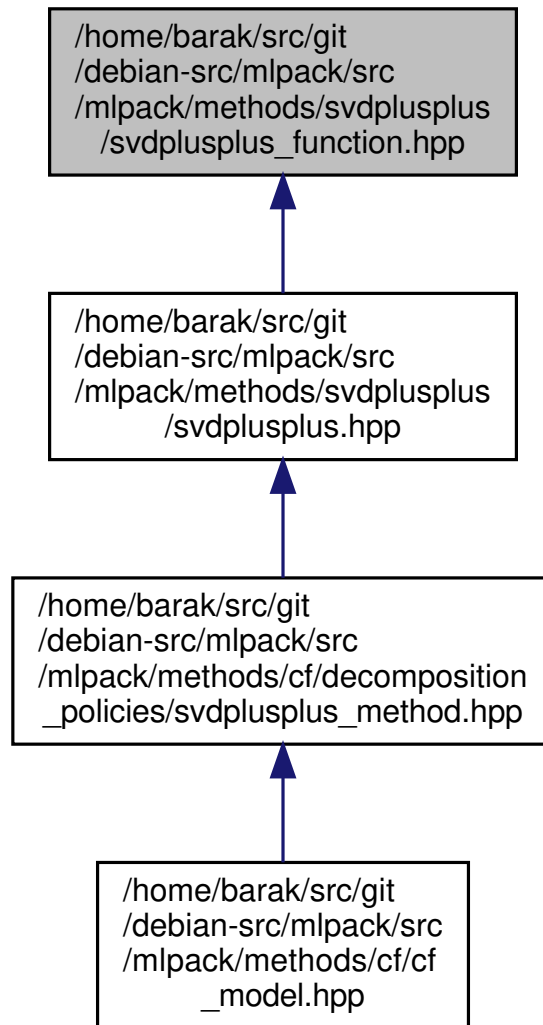

Include dependency graph for svdplusplus.hpp:

This graph shows which files directly or indirectly include this file:

This graph shows which files directly or indirectly include this file:

Classes

- class **SVDPlusPlusFunction**< **MatType** >

This class contains methods which are used to calculate the cost of SVD++'s objective function, to calculate gradient of parameters with respect to the objective function, etc.

Namespaces

- **ens**
- **mlpack**
 .hpp
- **mlpack::svd**

40.670.1 Detailed Description

Author

Siddharth Agrawal
Wenhao Huang

An implementation of the SVDPlusPlusFunction class.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.671 /home/barak/src/git/debian-src/mlpack/src/mlpack/prereqs.hpp File Reference

The core includes that mlpack expects; standard C++ includes and Armadillo.

Include dependency graph for prereqs.hpp:

Classes

- struct **InitHMMModel**
- struct **TrainHMMModel**

40.689.1 Detailed Description

Author

Daivik Nema

Structs for initializing and training HMMs (either of Discrete, Gaussian, GMM, or Diagonal GMM HMMs). These structs are passed as template parameters to the PerformAction function of an HMMModel object. These structs have been adapted from the structs in `mlpack/methods/hmm/hmm_train_main.cpp`.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.690 /home/barak/src/git/debian-src/mlpack/src/mlpack/tests/main_tests/range_search_utils.hpp File Reference

Include dependency graph for `range_search_utils.hpp`:

Functions

- void **CheckMatrices** (std::vector< std::vector< double >> &vec1, std::vector< std::vector< double >> &vec2, const double tolerance=1e-3)
Check that 2 matrices of type vector<vector<double>> are close to equal, using the given tolerance.
- void **CheckMatrices** (std::vector< std::vector< size_t >> &vec1, std::vector< std::vector< size_t >> &vec2)
Check that 2 matrices of type vector<vector<size_t>> are equal.
- std::string **ModelToString** (RSMModel *model)
*Convert a model to a string using the text_oarchive of **boost::serialization** (p. 251).*
- template<typename T >
 std::vector< std::vector< T >> **ReadData** (const std::string &filename)
Load a CSV file into a vector of vector with a templated datatype.

40.690.1 Detailed Description

Author

Niteya Shah

Helper functions used in the execution of the Range Search test.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.690.2 Function Documentation

40.690.2.1 CheckMatrices() [1/2]

```
void CheckMatrices (
    std::vector< std::vector< double >> & vec1,
    std::vector< std::vector< double >> & vec2,
    const double tolerance = 1e-3 ) [inline]
```

Check that 2 matrices of type `vector<vector<double>>` are close to equal, using the given tolerance.

Parameters

<i>vec1</i>	First vector to compare.
<i>vec2</i>	Second vector to compare.
<i>tolerance</i>	Allowed tolerance for values.

Definition at line 41 of file `range_search_utils.hpp`.

40.690.2.2 CheckMatrices() [2/2]

```
void CheckMatrices (
    std::vector< std::vector< size_t >> & vec1,
    std::vector< std::vector< size_t >> & vec2 ) [inline]
```

Check that 2 matrices of type `vector<vector<size_t>>` are equal.

Parameters

<i>vec1</i>	First vector to compare.
<i>vec2</i>	Second vector to compare.

Definition at line 64 of file `range_search_utils.hpp`.

40.690.2.3 ModelToString()

```
std::string ModelToString (
    RSModel * model ) [inline]
```

Convert a model to a string using the text_oarchive of **boost::serialization** (p. 251).

40.691.1 Detailed Description

Author

Eugene Freyman

Helper functions for testing.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.692 /home/barak/src/git/debian-src/mlpack/src/mlpack/tests/mock_categorical_data.hpp File Reference

Generate categorical dataset for tests.

Include dependency graph for mock_categorical_data.hpp:

Functions

- void **MockCategoricalData** (arma::mat &d, arma::Row< size_t > &l, **mlpack::data::DatasetInfo** &datasetInfo)
Create a mock categorical dataset for testing.

40.692.1 Detailed Description

Generate categorical dataset for tests.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.692.2 Function Documentation

40.692.2.1 MockCategoricalData()

```
void MockCategoricalData (
    arma::mat & d,
    arma::Row< size_t > & l,
    mlpack::data::DatasetInfo & datasetInfo ) [inline]
```

Create a mock categorical dataset for testing.

Definition at line 20 of file mock_categorical_data.hpp.

References `mlpack::data::categorical`, `M_PI`, `DatasetMapper< PolicyType, InputType >::MapString()`, `mlpack::math::Random()`, `DiscreteDistribution::Random()`, and `DatasetMapper< PolicyType, InputType >::Type()`.

40.693 /home/barak/src/git/debian-src/mlpack/src/mlpack/tests/test_function_tools.hpp File Reference

Include dependency graph for test_function_tools.hpp:

Functions

- void **LogisticRegressionTestData** (arma::mat &data, arma::mat &testData, arma::mat &shuffledData, arma::Row< size_t > &responses, arma::Row< size_t > &testResponses, arma::Row< size_t > &shuffledResponses)
Create the data for the a logistic regression test.

40.693.1 Detailed Description

Author

Marcus Edel

This file provides some useful test function methods.

mlpack is free software; you may redistribute it and/or modify it under the terms of the 3-clause BSD license. You should have received a copy of the 3-clause BSD license along with mlpack. If not, see <http://www.opensource.org/licenses/BSD-3-Clause> for more information.

40.693.2 Function Documentation

40.693.2.1 LogisticRegressionTestData()

```

void LogisticRegressionTestData (
    arma::mat & data,
    arma::mat & testData,
    arma::mat & shuffledData,
    arma::Row< size_t > & responses,
    arma::Row< size_t > & testResponses,
    arma::Row< size_t > & shuffledResponses ) [inline]

```

Create the data for the a logistic regression test.

Parameters

<i>data</i>	Matrix object to store the data into.
<i>testData</i>	Matrix object to store the test data into.
<i>shuffledData</i>	Matrix object to store the shuffled data into.
<i>responses</i>	Matrix object to store the overall responses into.
<i>testResponses</i>	Matrix object to store the test responses into.
<i>shuffledResponses</i>	Matrix object to store the shuffled responses into.

Definition at line 33 of file test_function_tools.hpp.

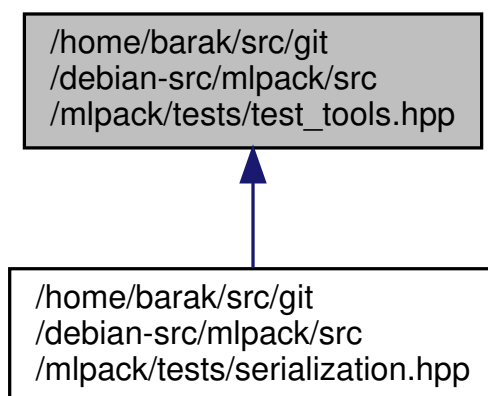

References GaussianDistribution::Random().

40.694 /home/barak/src/git/debian-src/mlpack/src/mlpack/tests/test_tools.hpp File Reference
